these two people. But, when two people thus coalesce, the fundamental elements of their culture unite in various degrees. In the case before us, the language became Semitized. The superior energy of the Semites carried forward the culture of the Turanians, which had probably reached its highest point, to a much greater length; and we have already referred to the influence of the Turanian in the field of religion. In Media, the Turanian tribes became Aryanized, but they were able to exercise a great influence on the Aryan religion. So in India, the culture of the Hindoos spread far among the aboriginal Dravidians, and they became extensively Aryanized, but here also the influence of their religious beliefs greatly affected the old Aryan beliefs.

The bearing of the forgoing becomes apparent when we reflect on the uncertain light afforded us on the vast number of Turanian tribes, of which the Hittites appear as the representative. All along their border, and especially in the land of Canaan, they were subject to Semitic influences. Everyone knows there was a great intermixing of ethnic elements in that section. We suggest that the aboriginal Canaanite tribes represent more or less completely Semitized Turanian tribes. In the meanwhile, from another source, pressure from higher organized races began to be felt. This was from the Caucasian region. Here, is the present home of a large number of tribes of considerable interest to the ethnologist. They are a branch of the White Races, but they are neither Aryan nor Semitic. They constitute what are known as the Alarodian speaking tribes of Caucasia; and, among these, the Georgians are typical.[1]

[1] It is difficult to obtain information on the so-called Alarodian

It is considered that the mountainous region of Caucasia may well have been the place where these Alarodian tribes first originated. At any rate, we cannot trace them to another section. They speak inflected languages, though inflected in a way that is neither Aryan nor Semitic.[1] Physically, they are among the very finest representatives of the White Races. It is possible that the white elements might have entered Caucasia from the north ; that is, from South-eastern Europe, which we know at an extremely early date was in the possession of Aryans.[2] Here, they may have coalesced with tribes already occupying the land, and from this cause, aided by the peculiar condition of their surroundings, the Georgian type may have been evolved. But, of course, this is mere theory.[3]

Be that as it may, there seems to have been a considerable extension of Georgian influence, in prehistoric times, among the Turanian tribes to the south and west of them. In the neighborhood of Lake Van, there arose finally an empire, or powerful confederacy of tribes, which betrays a singular admixture of people and culture. "The sculptures represent the people of Van wearing the same tunics and boots with pointed ends as the Hittites;"[4] This, we might remark, is the same peculiarity that struck the Egyptian artists.[5] The language they speak is, how-

---

family. According to Prof. Hommel's theory, they were once of very great extension, covering large parts of Southern Europe. The Basques on the west he regards as belonging to this family. They further, according to his theory, include the Hittites and all Turanian people to the north and east of Chaldea, such as the Elamites, Cosseans, etc "Archiv für Anthropologie," 1885, Supplement, p. 165.

[5] Wright "Empire of the Hittites," p. xii. and 84-85.

ever, closely akin to the Alarodian, and, finally, to express that language, they borrowed the Assyrian cuneiform characters.[1] These Vannic remains, which are found over quite an extent of country, are found bearing as late a date as 640 B. C.; and so here we are, face to face, with quite a powerful people of whom history is absolutely silent, and yet, for some centuries, they confronted the growing Assyrian power on the south.

How extensive this influence may have been is, perhaps, uncertain. Down to the last, the Assyrians recognized a difference between the *Urardhians*, as they called the people or tribes composing the Vannic confederacy, and the Hittites. It may be that the ancient language of the Hittites belonged also to the Alarodian family. Prof Sayce, in one place, has expressed himself in favor of that view.[2] As to this, we have to observe that the Georgians, who are the modern representatives of tribes using this language, are doubtlessly considerably different, ethnically speaking, from their ancient representatives. On this point, scholars are generally waiting for further light.[3] We are at present inclined to believe that the Alarodian is distinct from the Hittite language. Should it finally be shown to be the same, however, it will not show that the Hittites, like the Georgians, belonged to the white stock. Similarity of language simply shows a social contact.

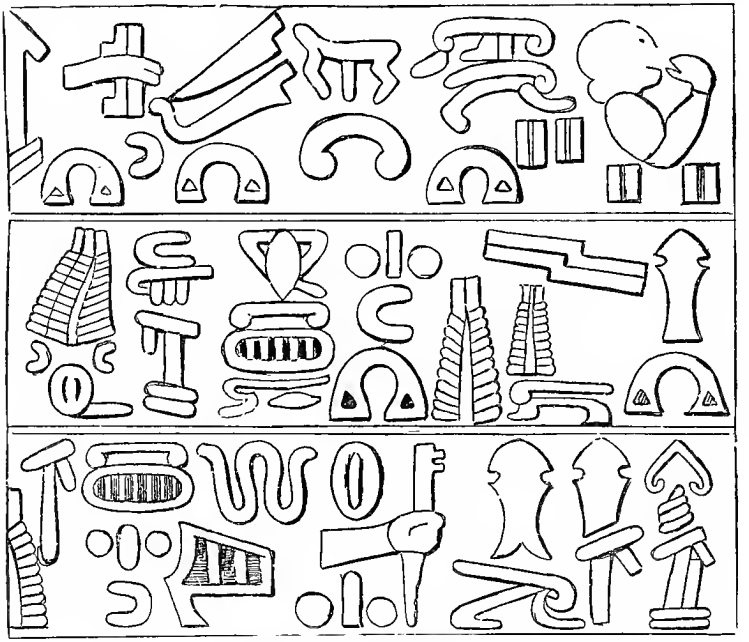
---

[1] Sayce J. R. A. S., 1882.

[2] "So far as it is possible to infer from proper names, the language of the Hittites belonged to the same family of speech as the language spoken by tribes who occupied the country between the Caspian and the Halys on the one side, and Mesopotamia on the other. This family of speech has been conveniently termed the Alarodian." "Transactions of Society of Biblical Archaeology," Vol. VII., p. 235. Quoted from Wright "Empire of the Hittites," p. 83.

[3] Conder "Heth and Moab," p. 27. Sayce "Fresh Light from Ancient Monuments," p. 97. Wright "Empire of the Hittites," p. 83.

It now only remains to point out the influence of Hittite culture upon Civilization in general. Here, as elsewhere, the Yellow Races appear as the ones who laid the foundation upon which the White Races painfully reared the superstructure of ancient Civilization. Like other branches of the Yellow Races, their priests had originated a system of symbolical picture writing, which had finally entered upon a phonetic, syllabic stage. Among the Hittites, however, this writing remained a mixed system,



Hittite Inscriptions.

partly ideographic and partly phonetic. This picture writing was the source of an ancient syllabic mode of writing used throughout all of Asia Minor, and, from it, there was rapidly being evolved an alphabet. In the Island of Cyprus, there still remain traces of such a writing. The spread of the Semitic alphabet, derived from various sources, however, put an end to this alphabet.

Commerce, law and civil institutions had early made great advance among the Hittites. They used silver as the standard of value, balances for weighing it and a regular recognized form of sale and conveyance. And it has been pointed out that Hittite coins continued to be the standard weight throughout Asia Minor and among the Greeks, long after the break up of the Hittite power. Their standards have been found in ancient Troy. In matters of art, Hittite influence has been traced throughout Asia Minor and the islands of the Archipelago in cylinders, sculptures and seals, long supposed to be Phoenician, but which turn out to be after Hittite models.[1]

Hittite Terra Cotta Seal.

We have been able to obtain but brief and unsatisfactory accounts of the religious beliefs of the Hittites. We must remember that the Hittite inscriptions, of which we gave an example some pages back, are as yet almost unread, and, until they are deciphered, we are in great doubt as to names and ranks of their gods. They doubtless had the same superstitions that the Accadians did. They had their shamans and fetiches and were devout believers in witch craft and magic and worshiped, to a greater or less degree, the shades of the departed. But it is not safe for us to go farther. One observation only, we will make. The goddess Ishtar, god of war and of love among the Accadians, re-appears among the Hittites as Atargatis. Her worship was "carried by the Hittites to the western coasts of Asia Minor, and, from thence, made its way across the Aegaean sea to Greece. Even the Amazons of Greek my-

1 See Wright "Empire of the Hittites," p. 67-9.

thology were really nothing more than the priestesses of this Hittite divinity, who wore arms in honor of the goddess. The cities which according to the Greeks were founded by the Amazons were all of Hittite origin."[1]

What we have thus far had to say makes plain to us the presence in all the countries of South-western Asia of tribes belonging to the Yellow Races. Everywhere, they appear as laying the foundation of ancient Civilization; everywhere, they disappear before the advancing Whites. From the north-east, the Aryans; from the south-west, the Semities, and, from the north, the tribes from Caucasia crowd down into their area, impose upon them their language, unite with their culture and are influenced by their religious conceptions: out of that conflict, there emerges the greater nations of antiquity; the Semitic Babylonian, Assyrian and Hebrew on the one hand, and the Aryan Persian, on the other. These are the nations that, together with Egypt whose culture at the bottom is also, probably, Turanian, fill the pages of ancient history. We have tried to show how much they owe to the Turanians who preceded them. Let us now trace the Yellow Races in other regions of Europe and Asia.

We are not yet through with the migrations from the old home land of the Yellow Races. One of the discoveries of this century has been that the Finns of Northern Europe belong to this same Turanian race, and that their mythology, embodied in popular story and song, bears a considerable resemblance to the mythology and legends of old Chaldea. They have not always occupied their present

---

rather inhospitable country. Doubtless, in prehistoric times, they spread themselves over Eastern and Central Europe. They have been, however, gradually forced to the north, by the ever increasing pressure of Aryan tribes[1] leaving,

Lapps.

here and there, detached settlements in Eastern Europe.[2]

SCENE ON THE YANG-TSE-KIANG. 

At a far later day, related bands came from this same home land, and, amongst them, the tribes who afterwards became the Hungarians of history.[1] We have, however, no doubt that the Finns came from from the Altai district. They consisted of many diverse tribes, differing in time of migration and in culture. Doubtless, preceding the true Finns, were the Lapps. The Finns "may be followed along the Kama and Volga to the most advanced outports on the Baltic seaboard."[2] These more northern Turanian tribes were certainly not very far advanced in Civilization when they left the common home. They were in numerous small tribes, and we must notice that the chief or war leader was elected from time to time.[3]

Judging from the evidence of language, they derived considerable of their Civilization from the Aryan tribes. Thus, agriculture and cattle breeding were derived from the Teutons and the Slavs. Before that, they were turf-cutters rather than agriculturists. They must have made considerable advance in metallurgy. Copper was known from the very earliest times. Meteoric iron was also used for ornamental purposes, not until they reached the Baltic, had it become sufficiently common to be used in making axes. Though they had the reindeer, horses and cows, yet not until near the sea coast, did they acquire such animals as sheep, goats and pigs.[4]

When we compare the religious belief of the Finns with the Accadians, we come upon very strong points of resemblance indeed. They believed the universe to be filled with spirits.[5] Fetichism exists to this day among the

Lapps.[1] Small natural objects of wood or stone are supposed to represent the gods, or small figures of earth or snow will do.[2] The belief in magic is particularly strong An old writer tells that the Finns have many runic verses which are called charms and are supposed to contain healing powers. "With them, they heal bites of the serpent and cure sickness, scalds or burns."[3] Since his day, great collections of these songs have been made, and they are found to form a more or less continuous epic, which is very highly praised by our scholars. This collection is known as the *Kalevala*. From it we gather much of our knowledge of Finnish mythology.

"The Finns attributed to the incantation and magic rites, whether used for good or bad ends, an absolute power over the whole of nature and also the elements and spirits. The earth and the air, the visible and invisible regions, water and fire were subject to the power of spells; they brought the dead back to torment the living; they even acted upon the most powerful gods, neutralized their influence, or exerted a sort of restraint over them."[4]

The three higher gods of the Finns are analogues of the Accadian gods Zi-ana, Hea and Mul-ge. In the case of the Finns, the fetich-sky[5] had received another name. He was sometimes called "god-of-Heaven," "*Taivahan Jumala*; or called the "first god," *Yli Jumala*; or, simply, "the ancient," *Ukko*. The god corresponding to Hea, "the spirit of earth and water" appears as the "friend of the waves," *Waia moinen*. He resembles Hea very closely. He is the god of all science. He knew the words which gave life to every-

thing that existed and which had power to bind the gods as well as inferior beings. The god of the lower world was *Ilmarinen*, "the eternal forger."[1]

A Typical Member of the Yellow Races.

In treating of the Turanians of Chaldea, we said nothing about their legendary stories, because we intend treating of them in another chapter. Prof. Sayce shows that

[1] Ibid.

very similar legends, consisting of long poems on the creation, the deluge and the giants of the ancient world, are found not only among the Finns, but among the Esths, Lapps and half savage Voguls of the Urals.[1] Indeed, we are not sure but the Turanian Accads exerted their greatest influence on the Civilization of the world in this direction through the medium of the Semities.[2]

We thus see that we find a great resemblance between these two branches of the Yellow Races, though separated in time by several thousand years, as regards what we can gather of their belief. But of their culture in other respects, the Accadians must have made considerable advance before they arrived in Chaldea, or else we will have to more strongly insist that their culture, by itself uninfluenced by the Semites, has been over estimated. We think that, give them time enough, they would make considerable advance by themselves in fertile Chaldea, but we also think they made their rapid advance through Semitic influence. We question whether the cuneiform writing was not perfected by people of the White Race, for at Tello, where the earliest remains of Chaldean art have been recovered, where we see the hireoglyphics growing into the cuneiform writings, there, also, we are not without evidence that even then another race than the Turanian was present.[3] The pure Turanian races, as far as we know them, never ad-

---

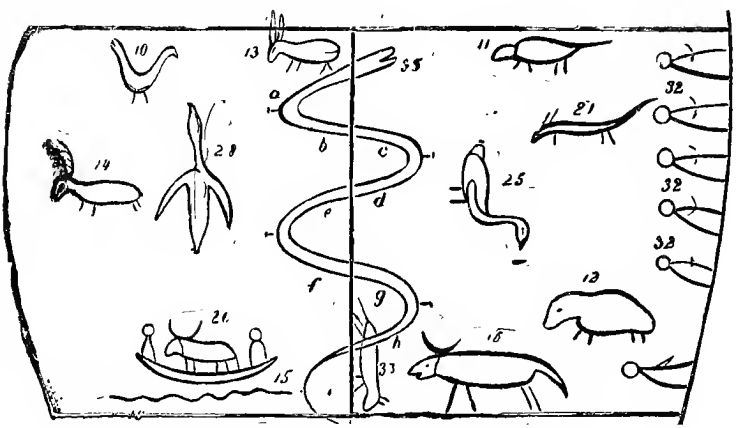
[1] Science of Language," Vol II., p. 198.

[2] It should be said that Prof. Tiele, in J. R. A. S. for 1879, protests against accepting the analogy said to exist between the Finnish and Accadian gods.

[3] See note page 372. In our opinion the Turanian culture of Chaldea has been overstated. Prof. Pinches thinks that Cappadocia was the true home of the cuneiform writing. [See J. R. A. S., 1884, p. 302.] Perhaps the White Races there living made the first great advance from Turanian picture writing to cuneiform, exactly as the Semitic advanced the hieroglyphic writing to the alphabetic stage.

vanced beyond the symbolic stage of writing reached even by our Indian tribes, a stage of writing eminently fitted for Shamanism. Compare this symbolic writing on the head of a magic drum among the Lapps with cut given on page 236.

If any one were asked to name the most striking development of the culture of the Yellow Races, they would probably name China. Everything connected with the early history of China has been so tinged with romance, that it is doubtful if we can ever extract the truth. However, of late years, this question has been scientifically examined, and we begin to see dimly some of the main points of Chinese early history.



Writing among the Lapps.

In inviting the reader's attention to China, it is, of course, well known that only just a brief outline can possibly be given. Yet such as it is, it will prove of great help in considering the development of the Yellow Races. Without a long preliminary, we will commence with a brief consideration of the inhabitants of China, before the arrival of more cultured tribes, who are considered as being the ancestors of the Chinese proper. Of course, such a wide and,

in general, fertile section of Asia as that included in the present confines of China would be one of the first countries to be occupied by the spreading tribes of primitive men. Here, doubtless, the centuries came and went, of which we have absolutely no record. Tribes of primitive men spread slowly over the world; divergences of race types arose and became more pronounced, slow advance in culture took place—but of this, doubtless prolonged period, we know nothing.

The very first gleams of light shed on this country and its inhabitants are obtained from Chinese sources, being compilations made by Chinese scholars some centuries before Christ, embodying traditions, songs and the substance of illy understood records written on bamboo reeds. How far back these records go and the value of their statements we will not discuss at present. They contain some statements in reference to the tribes inhabiting the country, among whom the pre-Chinese tribes had intruded. As might be expected, they found the country fully inhabited. Several races and languages were represented.[1] A general title for these tribes was "barbarians," further specified as the east, west or south barbarians.

Some of these tribes practiced tattooing. They are spoken of as tribes of "perforated breasts."[2] Two of these races are described so Prof. La Couperie thinks he can identify them; one, a race of pigmies, representing the once widespread Negroid race; the other, a race called the

---

[2] De La Couperie in Introduction to "Amongst the Shans," London, 1885, p. xiii. Also see "Bamboo Records," in Legg "Chinese Classics," Vol III., pt. 1. Dr. Legg says this was a fabulous race.

"Long-legged" people. It is interesting to know that the French expedition to Mekong found a number of tribes in Indo-China, whom this designation exactly fits, in close proximity to representatives of the dwarf Negroid race. Perhaps they have both been driven south before the Chinese and other people. It is equally suggestive

Stieng.

to know that there are some grounds, though perhaps at present not conclusive, for considering these "Long-legs" in Cambodia as belonging to the White Races. We present a cut of a Stieng, of Cambodia, and call attention to the fact that the features are not those of a member of the

Yellow Race.[1] So the earliest Chinese records show us a conflict in progress between the three great races: Black, Yellow, and White, in a country watered by the Ho-ang-ho.

Now, who were these invading tribes whom we have designated as the "pre-Chinese" tribes, where did they come from, when was this, and what was the culture they thus introduced among the ruder tribes just mentioned? We will try and give the answers to these questions that seem sustained by our present knowledge. They called themselves the "black-haired people," probably this was one distinguishing trait of appearance from the indigenous tribes. We have seen that black hair is one of the distinguishing marks of the Yellow Races. As far as we can now decide, the language spoken was agglutinative,[2] and, as well as we can judge from the faint traces of this primitive language that can now be recovered, it was closely connected with the Finnic stock of the Turanian language.[3]

Here, then, we once more meet with representatives of this comparatively cultured section of the Yellow Race. It would seem that from the Altai Mountains migrating tribes not only marched forth to the west and south-west, but to the east and south-east as well. Let us see what evidence we possess as to the date of this movement. It seems to us, that we have no very good historical evidence on this point. The simple fact is that, as far back

---

1 See Keane "Asia," p. 671. See by same author, a valuable series of articles in "Nature," Vol. XXIII., on the Indo-Chinese and Oceanic race. Qualifying this last, see Flowers in "Nature," Vol. XXXI., p. 364.

2 See La Couperie, "The *Yh King* and its Authors" in J. R. A. S for 1882, p. 799 and especially note 1. p. 800, where it is stated that the language in China at the present day is more agglutinative than monosyllabic. See this Vol., p. 30. See also Douglas "China," p. 344.

3 La Couperie, "Beginning of Writing around Thibet" in J. R. A. S., 1885, p. 451.

as we can go, we find evidence that the Chinese had then been in China for a long time. There are no monuments existing in China, that enable us to rest with confidence on far away dates, as we can in Chaldea.

Most of the histories start with dates ranging from 2000 to 3000 B. C., but all that can be claimed for these dates is that they may be approximately true. Any one, taking the least trouble to investigate the early history of China, will quickly discover that its chronology rests on a foundation of sand. There are not wanting histories that give what professes to be a full list of the so-called Emperors of China from the very earliest times, giving the years when their reign commenced, the end, their personal traits, their wise enactments, their speeches to their armies and words of counsel to their heirs. This is nearly all fancy. The names of many, perhaps the most, of the early rulers, say for the time preceding 1000 B. C., may have been preserved to us; we have no assurance, however, to this effect. We know nothing with certainty as to the commencement or duration of their term of power, the extent and nature of which have been greatly exaggerated.

Such sweeping assertions call for a statement of the ground on which they rest. We will be as brief as possible in this matter. Doubtless, every one knows that there is in Chinese literature a collection of books known as the "Classics," which are regarded as sacred books. The writer, who can show that his statements are supported by the classics, is not to be disputed. Among their classics is the Shoo-King, or "Book of History." The word *Shoo* means "pencil speaking" and may be applied to any historical document. This Shoo-King is supposed to be a compilation and re-arrangement of previously existing his-

torical documents, by the great Confucius. There is considerable dispute, even among Chinese scholars, as to his share in the work; into that, we need not here inquire. It is enough to know that after Confucius' time, there was such a compilation in existence. Confucius died 478 B. C., so that we can say that the Shoo-King, substantially as we have it now, dates from about 500 B. C.[1]

Now, what was the source of the statements made in the Shoo-King? From whence were the documents compiled by Confucius obtained? The fourth classical book is known as *Chow le*, and consists of an elaborate detail of the various officers under the Chow dynasty, the then ruling house. One class of these officers was called *Sze*, a term meaning recorders, sometimes translated historiographers, annalists or clerks. Their duties are specified, and it seems to be clearly made out that from very early times there was a class of officers whose duties it was to keep what we might call the state archives. How far back in time this organization extends, we cannot say. Chinese scholars claim that such officials existed from the very earliest times, back to confessedly mythological eras.

In the midst of the confusion on this point, we are at least safe in saying that the probabilities are altogether against there being any sort of full and complete documents, the contents of which were understood. The records, if made at all, were on bamboo reeds, a substance not the best qualified for some hundreds of years continuous handling. We are confident there was no strong, well settled government in China at that time. Previous to the Ts'in dynasty, (B. C. 246) it was a time of great confusion, con-

[1] We here say nothing about the destruction of Literature under the Ts'in dynasty.

federacies and tribes striving each to gain the upper hand. Mencius (B. C. 400) tells us that in his time rival chiefs destroyed many of the records of the past. Still more was this likely to have taken place during earlier and ruder ages. The very statements of Confucius show that while in his day some fragmentary documents of early antiquity remained, they were neither numerous nor complete.[1] Still further, if such records had been kept from the very earliest times, the scholar of Confucius' time would not have been able to read them. In the course of time, the writing had changed from phonetic writing back to picture writing. The *Yh-King*, still another classic, was so written that the Chinese scholars of Confucius' time failed to understand it.[2]

The best statement that can be made for the Shoo-King is that its compiler made the best use he could of the materials before him. Living under the Chow dynasty, we may suppose he possessed tolerably full and complete records of the ruling chiefs of this tribe; but he could have possessed only very incomplete records of earlier ages, here and there, perhaps some fragmentary account, but partially understood. For these early times, he must have relied largely on tradition. Let us study Confucius a little and see what sort of a history he would write if he had full accounts before him. The classic known as *Ch'un Ts'ew*[3] is supposed to be more his own work than any other of the classics. Certain it is, that it is regarded with superstiti-

---

1 He says; "I am able to describe the ceremonies of the Yin dynasty, but Sung cannot sufficiently attest my words. They" can not do so because of the insufficiency of their records and wise men. Legg "Chinese Classics," Vol. V., Pt. I., p. 13.

2 See LaCouperie "The Yh-King and its Authors" in J. R. A. S. for 1882 and 1883, and especially the latter volume, p. 272, et seq.

3 This phrase means the same as "Annalists," each confederacy or semi-independant state had such annals.

ous veneration by the Chinese. Confucius is said to have remarked; "It is the Ch'un Ts'ew which will make men know me." It is a simple record of events taking place in the Confederacy of Loo, extending over a period of 242 years, without the least effort on the part of the author to do more than record the events. The fewest words possible are used. No details are given, nothing to express the author's feelings.[1] Yet it seems that in this work he took the liberty of *twisting* the facts so as to set forth his own idea of morals and duties.[2] This fact, admitted by some Chinese scholars, becomes apparent when this record is compared with the commentary on it known as the *Ch'un Tso*, giving more complete details of this same period.[3]

If Confucius took this liberty with the records of his own native state, we need not look for anything better in the records of older times. In fact, the Shoo-King is of very slight worth for history. One writer declares that the Shoo-King "is a collection of excellent maxims, which have been conveniently arranged under different reigns."[4] Another says; "The Shoo is not the work of a historian nor of a poet. It is not allegorical. It is preaching from history."[5]

Is it not then evident that those accounts of ancient life and times, drawn from this collection of confused traditions, and descriptions of what *ought* to be instead of what was, are largely worthless? As for chronology, it is admitted on all hands that it is useless to try to arrange

---

1 La Couperie thinks, in opposition to Dr. Legg, that the very characters used by Confucius did, in effect, denote praise or censure. J. R. A. S., 1882, p. 804, note 2.

any scheme on this work. Legg remarkes; "There is no succession of dates in it—in its present condition, it contains only scanty notice of a few of the sovereigns in the earlier dynasties, and the length of reign of two or three of these is stated." Only a few dates near the close of the period covered by the Shoo-King are known.

We have described the oldest historical work in China. Let us next speak of the so-called "Bamboo Records." These consist of a series of records on bamboo slips *said* to have been found in a tomb of one of the Wei kings, about 284 A. D. They are supposed to have been buried there about six hundred years before. Chinese scholars themselves have little hesitation in declaring this work a forgery.[1] It gives, from a very early period, the cycle year of some events. Dr. Legg, who is inclined to credit at least some portions of these records as being a genuine production of the third century B. C., shows that the dates in it are a later addition. It seems, then, that we need not consider these records longer.

About the year 250 B. C., the state or confederacy of Tsin overthrew the authority of the previous confederacy, in which the Chows were the ruling tribe or people, and took the supremacy. They are credited with a wholesale destruction of these records we have spoken of. They determined to blot out the semi-independent confederacies or states. A new order of things was to be inaugurated. They had no more need for these official documents. They therefore "ordered that the whole existing literature, with the exception of books on medicine, agriculture and divination, should be burned. This decree was obeyed as faithfully as was possible in the case of so sweeping an ordi-

[1] Wylie "Chinese Literature," Shanghae, 1887, p. 19. Legg "Chinese Classics," Vol III., pt. 1.

nance."[1] We may admit that copies of ancient books and bundles of records were hidden away in walls of houses and graves, but it is evident that the official records of the various states were largely destroyed and scattered; and, if at the time of Confucius these ancient records were only fragmentary, we are morally certain that, after this destruction, no records could have existed from which future historians could have compiled a history of China embracing these early periods, giving dates and various details that would be of the slightest worth.

Yet one Chinese writer after another proceeds to give in most voluminous works an account of life and times going back before 2000 B. C. Sze-Ma-Tseen, born about 145 B. C., is sometimes styled the "Herodotus of China." He produced a work consisting of one hundred and thirty volumes covering the period just mentioned. Considerable is said about the immense mass of material that he gathered for this purpose. However, in this series of works, no attempt is made to settle the question of chronology. He contents himself with giving in most cases, simply the names of the kings and the order of the reigns. He certainly would have given the length of reign, if he could. We question whether he could give us a list of kings or any account of their reigns worth having. The Shoo-King, for instance, mentions no rulers of the Hea dynasty after Chung-Kang. How did our present author discover there were thirteen other kings of this dynasty and proceed to give us an account of their reigns? Does any one suppose the bamboo records remained intact, and that Sze-Ma-Tseen could read these ancient records of seventeen centuries before his date?

[1] Douglass "China," London, 1882, p. 77.

We are not saying that he forged these accounts. He probably had in his possession fragmentary records gathered from many sources. He undoubtedly had the names of a number of ruling chiefs, some of one confederacy and and some of another, and he arranged them in what seemed to him a proper order. We are, however, able to prove that the condition of early China gathered from Chinese sources is notoriously exaggerated. What Sze-Ma-Tseen was unable to do, Chinese writers of a later date, writing a thousand years later, find themselves able to accomplish with ease. That is, they are now able to give the dates and length of reigns, of these so-called emperors of China from about 2200 B. C. down. Dr. Legg comes to the conclusion that this chronology is a deliberate invention of later Chinese writers[1] If such be the case, and it is certainly very hard to believe they have any "records" giving them these dates, we need not hesitate to believe that they would arrange the names and order of reigns of those early emperors in the same free and easy way.

We have now set forth our reasons for rejecting the current account of Chinese history. On this point La Couperie remarks; "The stock in trade of misunderstanding, bias and untrue statement with regard to China, its language and races which is commonly used and credited .... is simply apalling."[2] We need then have no hesitation in rejecting most of the current account of early China. But who is able to give us a more excellent account? The only one entitled to speak with authority on this point is a person who has spent years of careful study on the Chinese language, and read for himself the scanty stock of tra-

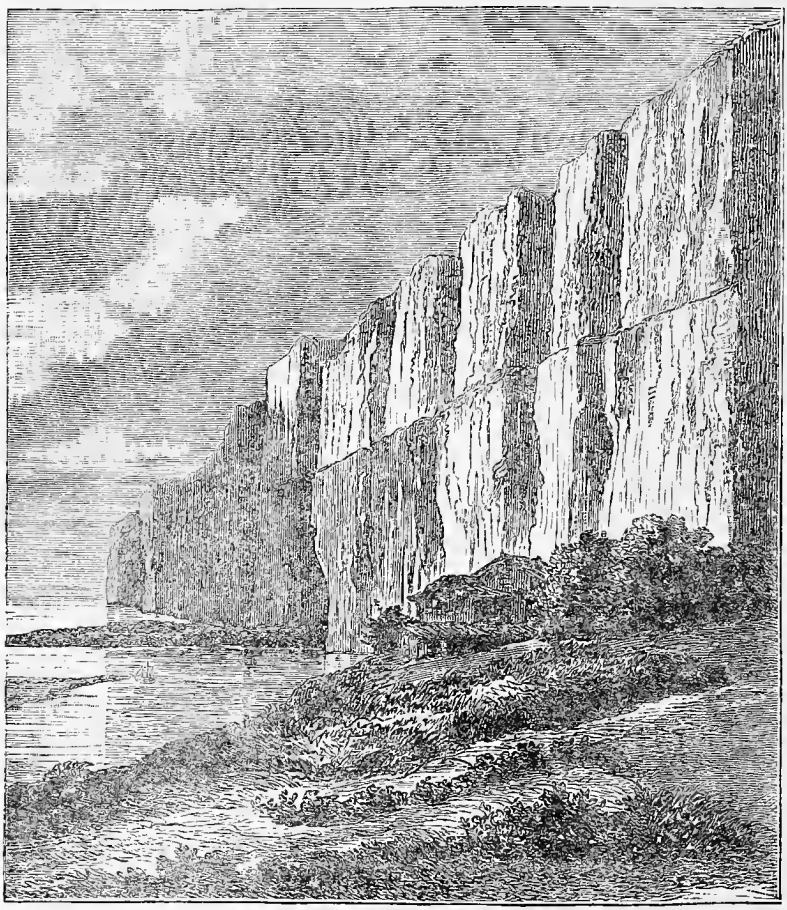
[2] Introduction to "Amongst, the Shans," p. xxiv.

ditions embodied in the older books, and read with care such fragmentary records as are contained therein. We will only attempt to give a brief outline and will rely on the translation of the classics given by Dr. Legg.[1]



Scene on the Hoangho

We have found satisfactory grounds for holding that the pre-Chinese tribes were members of the Finnic stock

[1] "The Chinese Classics" in seven volumes, James Legg, D. D., Hong Kong, 1861.

of the Turanian tribes. It would therefore be naturally expected that their invasion of China should be from the north-west. They seemed to have followed the course of the Yellow or Ho river and finally settled along its banks, mainly in the present department of Honan. Owing to the overflows of the Ho river, this section of country seems to have been covered with lagoons and given up to swampy jungles. They took possession of this country for which, perhaps, they did not have to fight very much. What was naturally the best portion of the country remained in the hands of the former possessors.[1]

The superior Civilization of the invading tribes showed itself in this; they set to work to clear the ground and fit it for cultivation. They dug canals, raised embankments along the rivers, drained the great marshes, set fire to the jungles and, in fact, here performed a work in all respects similar to that by which their kindred tribes had converted the marshes of lower Chaldea into a fertile region of country.[2] All this, of course, took considerable time, but we have no means of estimating the length.[3] They succeeded in making this a fertile section of country, and here they developed quite a degree of Civilization, and built up quite a compact government, one that commanded the respect of the surrounding more barbarous tribes. In after times,

---

1 We know that all the ancient capitals were either in Honan or Shenai, ["Bamboo Reeerds."] At a later date, the original tribes were foreed to remove to the south side by a king of the Shang dynasty. [Book VII. of the Shoo-King.] In regard to the country being a jungle, let us quote Mencius: "The vast waters flowing out of their channels made a universal inundation, vegetation was luxuriant, and birds and beasts swarmed." [Book III., Pt. I, Ch. IV., See. 7.] The earlier dynasties never subdued the tribes along the Kiang.

2 This aceount appears in tradition as principally the work of the great Yu [Shoo-King, Part II., Book IV , Chap I, Sec. 1.] Also see Mencius, just eited.

3 See Legg, Prologomena to Shoo King, p. 50-1.

this came to be looked back to as a sort of golden age. Confucius could not sufficiently praise the virtues of this early time.[1] It is not singular that they bestowed on this dynasty an extent of power far beyond what it possessed, and made it to rule over a much larger section of country than it brought under tribute.[2]

There seems to have been twelve tribes of these early people,[3] each of which was under the rule of its own chief called a *pastor*. The government was a confederacy of these twelve tribes. At the head was an elected chief, the celestial one, the emperor.[4] He was assisted in his government by a council of twenty-two members,[5] composed of the chiefs of the twelve tribes, a president of the council, known as the "Chief of the Four Mountains,"[6] eight officials elected by the council to assist in the affairs of government, and one important official, who exercised imperial authority when the emperor was disqualified by reason of age or infirmity, who was, in fact, a coadjutor with right of succession known as the "General Regulator,"[7] and who appears to have commanded the troops in time of war.[8]

---

1 The Master said: "I can find no flaw in the character of Yu." "Analects," Book VIII, Chap. XXI.

2 Tradition gave it a much larger section than that subject to the Chows, many centuries later. On this point, see Legg Op. cit., p. 50.

3 Spoken of as the division of the empire into twelve provinces. "Canon of Shun," Sec. 10.

4 Traditions all represent the first emperors as elected.

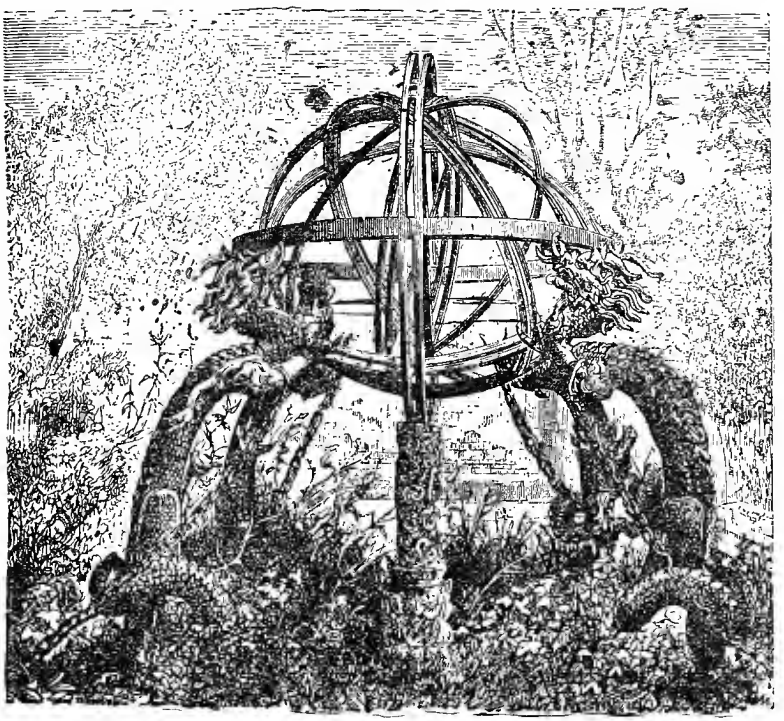
5 The emperor said: "Ah! you twenty and two men be reverent and so shall you aid me in performing the services of heaven." "Canon of Shun," Sec. 26.

6 When the council was in session the emperor generally put his questions to the "Chief of the Four Mountains," at other times he is represented as being in consultation with him. "Canon of Yaou," Sec. 11-12. "Canon of Shun," Sec. 17-23.

7 "Canon of Shun," Sec. 17 to 26. Observe that both Yu and Shun were "General Regulators" before raised to the office of ruling chief.

8 Thus Yu is represented as commanding against the San Meaou "Councils of the Great Yu," Sec. 20.

In other directions, we have not much to guide us. We have seen that they showed a great deal of skill in clearing up their country, so as to fit it for agricultural purposes. They had some knowledge of astronomy, but on this point we have probably overrated them. That mythical personage, Yaou, is represented as forming an astro-



Chinese Astronomy, Celestial Sphere.

nomical board, to observe the various celestial bodies and to deliver "the seasons to the people;" [1] and Shun is said to have "examined the gem-adorned turning sphere and the gem-transverse *tube* that he might regulate the seven directors." [2] Yaou further makes some remarks indicating that

1 "Canon of Yaou," Sec. 3.

2 "Canon of Shun," Sec. 5. There is a dispute as to whether the

the people had considerable astronomical knowledge. In effect, we are told that in his time the equinoxes were in Taurus and Scorpio, and the solstices were in Leo and Aquarius.[1] Two astronomical calculations on this as a basis[2] give 2163 and 2357 B. C. as the time of Yaou.[3] These statements found in the Shoo-King are certainly remarkable. It is stated that the astronomers of the Han dynasty were ignorant of the precession of the equinoxes, if so, the compiler of the Shoo must have had some sort of a record before him. We may find an explanation of this further on.

In religion, we detect the following. They believed in a host of spirits, spirits of hills and rivers.[4] These spirits were supposed to exercise a great influence in all the affairs of men, and consequently were appealed to in divination.[5] A spirit of Fetichism is shown in the worship of hills and rivers.[6] Ancestor worship was certainly very prominent. They had entered on the stage of Polytheism, since we are told of the "six honored ones" to whom sacrifices were offered. The fetich sky had already become transformed into a supreme god known as *Shang te* the "supreme one."[7] There was no priestly class.[8] The in-

"seven directors" refer to the sun, moon and five planets, or to the seven stars of the Great Bear. Compare Legg's note under section just quoted with Chalmer's remarks in same volume, p. 91.

[1] "Canon of Yaou," sec. 3-6. "Classics," Vol. III., Part I, p. 88. Chalmer's article in same volume, p. 92.

[2] See This Series Vol. I., p. 153.

[3] Ideler, the former date, Biot, the latter.

[4] "Canon of Shun," Sec. 6 and 7.

[5] "Councils of the Great Yu," Sec. 18.

[6] "Canon of Shun," Section cited above and 8.

[7] This word was used as synonymous with the spirit of the personal visible "heavens," that is Thi-an which it is well to compare with the Accadian Zi-ana.

[8] That is, none are mentioned. We incline to the belief there were magicians. They certainly had officers of divination. See "Councils of the Great Yu," Sec 18.

fluence of Ancestor worship was sufficient to keep the worship local and tribal. Each joint-family, gens, tribe and finally the confederacy had its gods in an ascending degree, and the chiefs in each case were the priests,[1] and the gods they worshiped were their deceased predecessors.[2]

Some very important considerations center around the subject of their knowledge of writing. The older view generally was that it had a native development in China; but, at present, all who have investigated the subject conclude that they brought with them, not only a knowledge of writing, but some manuscripts as well. There are good grounds for considering that the *Yh King*, regarded as the oldest of the classics, was, as regards its primitive portions, amongst those manuscripts. One fact showing how completely this early culture has been lost amongst the tribes they assimilated is that the Chinese early forgot the significance of this *Yh King*. It became to them a mysterious book, superstitions made use of it for the purpose of divination, and all Chinese scholars have mistaken it. It remained for a modern scholar to develop its meaning.[3]

From a study of this, Prof. La Couperie arrives at some most important conclusions. He considers that he has established the fact that these pre-Chinese tribes were nothing but migrating tribes from ancient Chaldea, taking with them the culture of this section. This view would explain the remarkable statements we have already quoted in regard to the astronomical knowledge of Yaou. Knowledge of which the Chinese of the Han dynasty (B. C. 246.) were ignorant. It would also explain how it comes that a de-

[1] Legg "Classics," Vol. III., Pt. I., p. 193.
Compare this account with the outline of early Chinese religion given in Tiele "Hist. of Religion," Boston, 1887, p. 27.

[3] See La Couperie in J. R. A. S. for 1882 and 1883, "The *Yh King* and its Authors."

scription of an eclipse, supposed to have taken place more than two thousand years before Christ, assigns it to its true cause; but that, at later times and down to modern times, they speak of the sun or the moon as eaten, that is by a dragon.[1]

But La Couperie thinks they took with them Chaldean writing as well. In other words, that the pre-Chinese writing was cuneiform. He thinks it possible to point out the connection between some of the oldest Chinese characters and some of the cuneiform syllable elements.[2] He thinks that this writing was, in its first stage, phonetic. By degrees, however, owing to continual contact with more barbarous tribes, this phonetic principle was lost and hieroglyphic writing resumed it sway.[3] Prof. La Couperie also holds that the name of the Chinese tribes[4] really means the Bak tribes, thus referring us to Bactria and the region of country thereabouts, from whence descended the Chaldeans. He further adds that *Hea*, which is the name of one of the first dynasties mentioned in the Shoo King, was called, in the first instance *Kutta* or *Kutti*, and the reader will recall what we ventured to suggest in regard to the first settlers in Chaldea being the Cushites.[5] Prof. Douglass, in his recent work on China,[6] insists strongly on this identification. He even identifies Hwang-ti, one of the early mythological emperors of China, with *Nakhunte*,

---

[1] The Chinese account says; "On the first day of the last month of autumn the *Sun and the Moon* did not meet harmoniously in Fang," that is to say, the eclipse was when the Sun was in the Constellation of Scorpio.

a god of ancient Susiana whose name appears in the name of several kings.[1] He also points out several other striking points of coincidence which "with a host of others which might be produced, all point to the existence of an early relationship between Chinese and Mesopotamian culture." It is suggested that the great break up of Susian tribes, thought to have occurred in the twenty-third century B. C., is in some way connected with this eastern migration of the Chinese Bak tribes.[2]

We have stated Prof. La Couperie's position in this matter, and such a view certainly clears up a number of difficulties. Before accepting it fully, it would be well to wait for clearer evidence.[3] For our own part, it seems to us to be too strongly stated. It seems to us evident that China was influenced from Chaldea, but can not some of the observed coincidences be explained on the ground that they both started from a common home? We have seen no conclusive reasons for holding that the first writing in China was cuneiform. On this point, however, let us hold ourselves in readiness to accept whatever conclusions to which our scholars may come.

Although we speak of the surrounding tribes as barbarians and as possessed of lower culture, still they had made considerable advance. They are represented as assisting the Chinese in astronomical calculations, in teaching them music and as having considerable influence on their

---

[2] J. R. A. S., 1883, p. 280, note 4. In regard to the proposed date of this migration, that is the twenty-third century B. C., while on some accounts we would think it too recent, yet we must say that the twenty-third century B. C. was a period of great commotion in Western Asia, and, until better informed, we may accept that date.

[3] In 1884, Dr. Edkins writes as follows: "The part that Babylnia, Susiana, and Bactria had in helping forward the early progress of China in knowledge and the arts would be by successive contribution of in-

writing.[1] In process of time, indeed, the distinctive nationality of the first comers was all but blotted out.[2] We will not undertake to give a concise history of these far away times. In fact, we doubt whether such a history can be given. Perhaps the oldest dynasty we know anything about is the Hea dynasty whose organization we have described. We have already called the reader's attention to the interesting observation of Prof. La Couperie, as to the original meaning of the word *Hea*. We notice the office of ruling chief, or emperor, originally elective, gradually passes by inheritance.

We may suppose there were the usual scenes of tribal rivalry, incident to all ancient confederacies. One tribe, after holding the supremacy, forced to give way to another. According to current chronology (the value of which is very doubtful) this state of affairs lasted for five hundred years. Their territory embraced only a very small section of country around the great bend of the Hoangho, though they held some surrounding tribes to tribute. About the middle of the eighteenth century B. C., there is supposed to have taken place a change of dynasty. Chinese histories relate how the ruling house became very corrupted until, at length, one of their subject princes, at the earnest solicitation of some of the wise men, finally marched against the wicked emperor and overthrew him.

We may dismiss this account, change of dynasties seldom happen that way. The conquering tribe or tribes came from Shensi, this is the north-west province of China, and indicate the movement of another body of

formation at different times." [In J. R. A. S., p. 360.] Prof. Sayce in reviewing Prof. La Couperie's article, also takes occasion to dissent from his position, as being by no means proven.

1 Douglass "China," p. 6.

2 "Amongst the Shans," xxv.

people. The darkness resting over Central Asia at this time prevents us from learning anything of the movements of its people at that early date. We may suppose there was a constant movement of migrating people. China, during historical periods, has had to sustain many assaults of Mongolian tribes. It was probably so at that time, and we are to see, in this change of dynasties, a successful invasion by barbarian tribes. Perhaps they united for this purpose with some of the more powerful non-Chinese tribes already in China.

Whatever may be the truth about this conquest, whether by it we are to understand a new invasion of kindred tribes or a successful revolt of one of the confederate tribes, we have certainly but little historical information relating to this dynasty. About five hundred years pass away, and although histories are quite free to relate the events of each reign, such accounts are practically worthless. All the China we have to talk about is confined to the same limited expanse of territory about the bend of the Hoangho. The better portion of the country was still in possession of the non-Chinese tribes. We are now approaching a period when some historic light appears, though for centuries it remains very faint and indecisive.

We are approaching what is known as the *Chow* dynasty in China, a conquest which influenced for a long time the history of the Chinese. Here again, the ordinary representation is that the wickedness of the former dynasty had now become so great, that the virtuous prince of Chow finally overthrew the old government and revived in his own person the glory and virtues of the ancient empire. This is the general way that Chinese historians have of describing past conquests of their coun-

try. It is strange that European writers should follow them in this matter, yet many have done so.[1] In regard to these Chows, who appear as victorious invaders about the eleventh century B. C., it is very hard to come to any satisfactory conclusion. Probably at some no very distant day, when a careful comparison and analysis of ethnological notices, scattered throughout the vast mass of Chinese literature shall have been made, and an analysis of the traditions of the people in Central Asia, at present a veritable *Terra Incognita*, are laid before us, we shall see clearly what is at present very much enshrouded in doubt.

As a further showing of the difficulties in our way, we must recall that throughout all the confines of China, there has been, from the very earliest times, a wonderful mixture of races in progress, and this means a mixture of traditions as well. A further reflection to be borne in mind is that our early history, such as it is, only refers to a small portion of country around the Hoangho. The vast mass of China is almost completely unknown to history until many years subsequent to the time we are now describing. Some of the invasions of China, we can but dimly perceive taking place still earlier than the eleventh century. Such, for instance, are the *Jung* or *Nung* tribes, which are supposed to have made their first appearance in China about the sixteenth century B. C., and which we are inclined to connect with the overthrow of the old Hea dynasty. It was probably their appearance in Shensi which drove the Shang tribes east. The Jung tribes were themselves driven further east by continual pressure of tribes lying still further

[1] See, for instance, "A Sketch of Chinese History" by Gutzlaff, New York, 1834, and, for that matter, see our latest "History of China," by Boulger, London, 1881. The same remarks apply to his first three chapters.

back in Central Asia. The Jung tribes are supposed to have been a mixed people, and one element of them was the White Race to which we belong.[1] Other writers tell us that the main stock of the Jung was the same as the Turks.[2] They certainly were a very warlike people, their name came to be the equivalent of warriors. They followed on after the Shang tribes, and we find them at a later date composing the larger portion of the so-called barbarian tribes surrounding the Chinese states.

According to the faint voice of tradition, about the twelfth century B. C., we find another wave of people advancing eastward through Shensi destined to take the lead among the Chinese tribes. These are variously called the *Djows*, *Tchous*, and *Chows* mostly by the last name. La Couperie tells us that they were a division of the *Tek* race who amalgamated with the Jung remaining in Shensi, and that the *Tek* tribes, afterwards called Tih tribes, seem to have been a Turkish stock. This makes them out a very much mixed people.[3] Kingsmill concludes that the Chows were at first Aryans forced from their home in Western Asia by the pressure of the Turkish tribes, which started the great migration of the Aryan tribes, some to India, and some to the east. They settled first in Shensi, but, owing to the pressure of the Turkish tribes in their rear, they gradually forced their way among the settled Chinese tribes and finally succeeding in establishing a sort of supremacy.[4]

Here seems to be a good place to make some general remarks on the, so-called, aboriginal tribes of China. It is

---

1 La Couperie introduction to "Amongst the Shans," xxxix.

2 Such, we are told, was the opinion of Klaproth. See Kingsmill "Early Hist. of the White Huns" in J. R. A. S., 1878, p. 289.

3 "Amongst the Shans," p. xxxviii.

4 See his article already referred to in J. R. A. S. for 1878.

evident from the foregoing, that China from the earliest times has been the meeting place of wave after wave of people. We must note the significant fact that, while the first wave was Turanian, the subsequent ones, such as the Jung and the Chows, were greatly modified by Aryan blood. (This will be referred to later.) We have been accustomed to hearing these aboriginal tribes spoken of as barbarian, but these accounts come to us through Chinese sources. This is a difficult matter to come to any satisfactory conclusions about, but the tendency of modern researches is to regard these aboriginal tribes as belonging in the first instance to the White Races, though they have been greatly mixed with the Yellow Races.[1] It seems that these tribes, under various different names, are now found in the western and south-western provinces of China. The evidence is that from the very earliest times they have been gradually pressed in that direction by the spreading Chinese, who subdued some tribes and assimilated them among their mixed population, but crowded still other tribes among the hills and mountain fastnesses of Si-Chuen and Yunnan. Many of these tribes are yet independent and breathe defiance to the Chinese government. The two provinces of Kwang-si and Kwang-tung formed an independent government under the name of "The Two Kingdoms of Yueh" until about two centuries ago, when they were finally brought under the imperial dominion.[2]

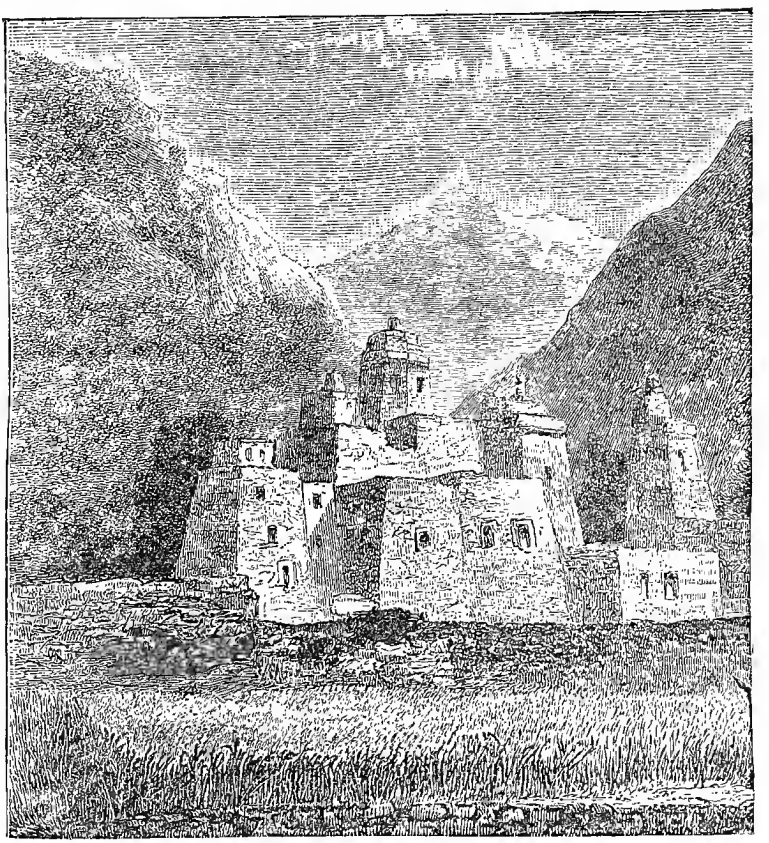
Of late years, this section of China has been traversed by two travellers and thus considerable knowledge has

---

1 See La Couperie: "Beginning of Writing Around Thibet" in J. R. A.S. for 1885, compare with "Amongst the Shans," p. xxix. But see also Keane in Stanford's "Asia," p. 713, where we are cautioned on this point. Also Reclusc: "Asia," p. 210. Also Gill: "River of Golden Sand," p. 123.

2 Colquhoun: "Across Chryse," London, 1883, Vol. I., p. 227.

been gained as to these people. Capt. Gill, who crossed the western portion of China, near the Thibet border,[1] speaking of the *Man-tzu* tribes in western Si-Chuen, tells us that there are in that section altogether eighteen of these tribes each under the rule of its own chief. They have



Man-tzu Village.

been subject to great persecution from the Chinese. "Perched like an eagles' eyrie on the tops of the almost inaccessible hills, or like wild birds' nests on the faces of

1 "River of Golden Sand," London, 1883.

perpendicular cliffs, there were many villages of the Man-tzu and down below on the banks of the smiling river, there were the blackened ruins of many another once peaceful hamlet. In one place, close to the ruins of some Man-tzu buildings, that I could plainly see had been burnt not very many years ago, there was a new and flourishing Chinese village, where the Chinese, having ousted the aborigines, had established themselves."[1] He tells us, in one place, of a tribe known as the White Man-tzu, numbering three and a half millions, always ruled by a queen.[2]

From other sources, we learn that the same tribes, called the *Mo-so*, still form the majority of the inhabitants in Western Si-Chuen. They at one time ruled quite an extensive stretch of country. Kublai Khan found this very state of Mo-so-man in Western Yunnan and conquered it in the thirteenth century A. D.[3] The epithet "savage," applied to the Man-tzu is not justified, for we learn that they till the land, weave textile fabrics and build houses with towers and supports. We give this profile view of a Man-tzu aborigine of North Yunnan and call special attention to the finely formed features.[4]

We have also many interesting details of the native inhabitants of Yunnan.[5] It seems that the majority of the inhabitants in Yunnan belong to the aboriginal stock, some are said to be subdued, that is conquered by the Chinese, others are regarded as wild or independent. It is said "that it is only in the cities of Yunnan that one sees the Chinese. The people of the country districts are all aborigi-

4 Taken from "Across Chryse."

5 A. R. Colquhoun, "Across Chryse," in two volumes, London, 1883.

nes." In the country, many incidents combine to remind the traveler of European lands, men carrying themselves with self respect, with faces showing frankness and intelligence, noses straight and well formed, and hair inclining to brown; women dressed neatly, modest looking and often what might be called handsome.

In the center and southern parts of Yunnan we meet with principally three divisions of the aborigines called the Lo-lo, Pai and Miao. In the north-western part of Yunnan are the Si-fan, shown on page 440. The next illustration shows us types of the Lissou, inhabiting the same section of country. In all these cases, we must notice the absence of features typical to the Yellow Races.

Man-tzu of North Yunnan.

All these aboriginal tribes have been for centuries crowded into the mountainous countries of South-western China, they present in their costume and appearance a pleasing contrast to the Chinese. They are cultivators, herdsmen, and, over quite a large section of country are entirely independent of Chinese. They have good hearts, are simple and sincere, not only are they unlike the Chinese in their virtues, but also in their physique and energy.[1] The only kind of writing known, at present, to exist among these aboriginal tribes, is a symbolical picture writing, exactly in the same stage of development as the symbolical

[1] This account is extracted from "Across Chryse."

writing of the Indian medicine men. They are only understood by the sorcerers.[1]

Types of the Si-ban.

Returning now to the Chows, we conclude that they were an invading conquering, people from the west, who, in

a measure, reorganized the ancient government, probably

[1] J. R. A. S., 1885., p 461.

extended its boundaries some, but they still continued very small as compared with China of to-day, this is supposed to have happened about the end of the twelfth century B. C. The closing centuries of this dynasty lie within the period of authentic history, but, as its light only reaches back to about the eighth century B. C., it is evident that we

Map of China.

know but little of its first three centuries. In order to illustrate the China of the Chow dynasty, we have indicated its extent on the map. It "lay between the 33rd and 38th parallels of latitude, and extended over no more than por-

tions of the provinces of Pih Chih-li, Shanse, Shense, Honan, Keang-se and Shautung."[1]

The supremacy enjoyed by the Chows is certainly very hard to describe. They established a very loose sort of confederacy. We cannot discover that the *Wang*, which is the native title of all the ruling chiefs of this dynasty, had any very great power. There seems to have been a board of six greater officers, who doubtless were to be consulted before any important step was taken.[2] Then there were six ministers. The minister of war is spoken of as commanding "the six hosts." All this seems to point to some division of the conquering tribe or tribes into six parts.[3] The conquerors proceeded to divide the conquered territory among themselves probably paying some regard to the divisions already established. The work already quoted from[4] mentions the division into nine provinces under pastors. However, we can detect no further reference to the nine states, and are of the opinion that this section has reference to the old tradition of the nine provinces of Yu.[5]

Be that as it may, Chinese authorities give an account of the occurrences in the kingdom of Chow from the earliest times down to the fourth century B. C. under thirteen states.[6] These tribes were to be free, but any in-

---

1 Douglass "China," p. 10. The Chows clearly appear in the Shoo King at the head of a confederacy of the surrounding tribes to crush the previously existing confederacy under Shang and Yen. See the "Speech at Muh," Sec. 24. On this point Guignes remarks, "this conquest of China was effected by foreigners on the west of China."

2 "The Officers of Chow," Sec. 5 and 6.

3 From the fact that this governing board of six was divided into two exactly equal divisions the officers of each having the same title, only in the one case distinguished as "grand," and in the other as "juniors," we might decide that the Chows was a tribe of two phratries and six gentes. However it is not best to come to any positive statements.

4 "The officers of Chow," See 13. 5 "Tribute of Yu."

6 Prolegomena to Ch'un Ts'ew, p. 113.

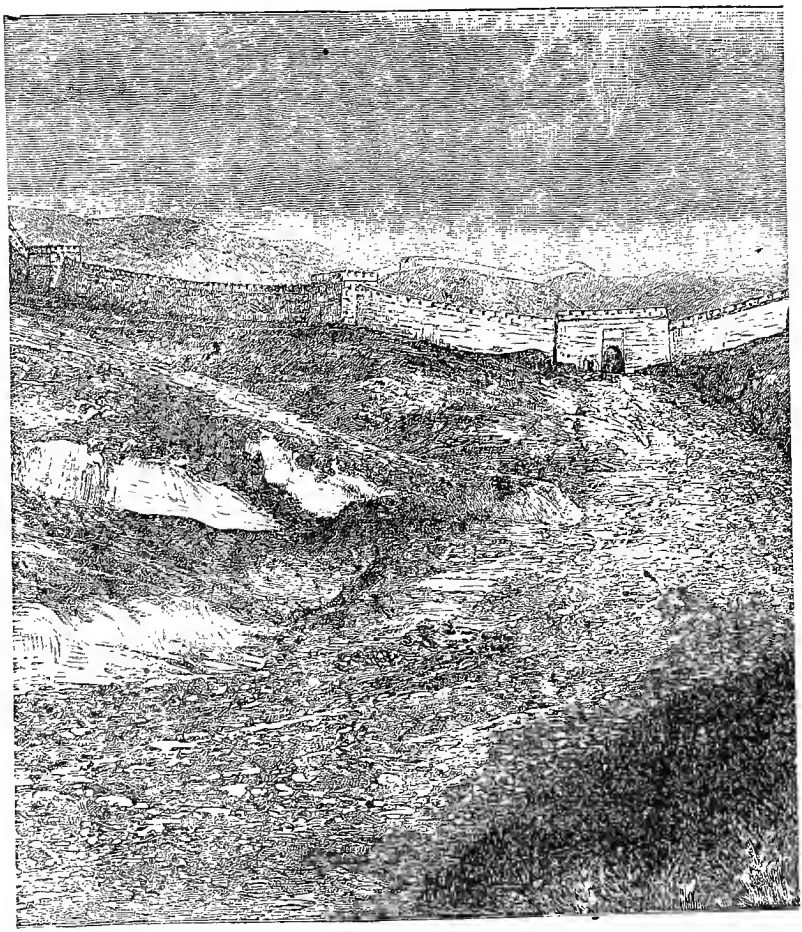
fringement of one state on the other was to be checked by the royal power. Such an arrangement as this was sure to fall through before long. One tribe, becoming strong in numbers, would rob its weaker neighbor of its territory, or perhaps destroy its independence altogether. Hence it is, expecially during the closing centuries of this dynasty, that we are presented with a picture of a singular state of political affairs

The imperial or royal power existed, but in name only. Each separate tribe stood ready to make war on the others, if they thought their interests would be furthered. As providing some relief against the prevailing anarchy, we meet with a singular device of *presiding states*. That is to say, the strongest state, for the time being, was really at the head of the confederacy, and, in fact, exercised royal authority, though the chiefs of the Chows still reigned as emperors, or Wangs, and nominal fealty was rendered them. Five such "presiding states" come before us during a period of two hundred and forty years, covered by Confucius' annals. How many there were before that time, we do not know, but, at the very earliest period, we read of "chiefs of regions." It is evident that all that was wanted was for some one state to gain sufficient strength to subjugate the others, an event which was sure to happen in time.

We must remember that the China of the Chow dynasty has reference, still, to but a small section of country. We know comparatively nothing of the tribes and people inhabiting the larger portions of China. Some of the barbarian tribes coming before us are of interest. First the Jung tribes whose origin we have already glanced at. They were to be free in their own internal affairs, and any in- there were, no one can say with certainty.[1] These tribes

[1] Legg "Classics," Vol. IV., Part I., p. 130.

seemed to have assisted the Chows when they first overthrew the Shang dynasty. They seemed to occupy territory around and right in the midst of the settled tribes. They aided now this state and now that and were ready to



Chinese Wall.

strike on their own account whenever the prospects seemed good. They were especially abundant to the west and south-west. The Tih, or Turkish tribes, on the north and northwest were a constant source of danger. The eastern

barbarians are also mentioned, and especially the *man* barbarians to the south. Some of these barbarian tribes, as their culture advanced, took upon themselves more settled forms of government, and became known as states of of the Chow dynasty; and, from such beginnings, finally appeared the state which gave rise to the first proper "Empire of China."

Here we must point out the difference between the extension of political power and the extension of their culture. Their political power during the first ages remained very feeble; their higher culture, however, was spreading among the surrounding tribes and leavening the whole mass. Consequently, there were growing up, along the borders of the loose confederacy of states belonging to the Chow dynasty, other states or confederacies organized in an analogous manner. These states were but partially Chinese in ethnology. They, in some cases, claimed and were allowed equal rights with other states and were admitted to the confederacy with them. Some held entirely aloof and maintained their independence in the very midst of the Chinese for centuries.

Thus, for instance, to the south of the Chow states, comprising the territory along the Yang-tse-kiang there had been gradually growing up the *Ts'oo* state. This was composed of the most diverse elements. It became a great power among the surrounding tribes, and finally held a most important position among the later states of the Chow dynasty. Yet their constant boast was "we are man-y," that is "southern barbarians." Other states of the Chow dynasty were taunted with being barbarians.[1] What we have to say of *Ts'oo*, on the south, might be repeated in

[1] Legg: Vol. V., Part I. p. 118.

regard to *Ts'in*, on the west. These two virtually non-Chinese states, after subjecting the other states to their power, finally engaged in a struggle for the supremacy, and the result is that, about 250 B. C., the state of Ts'in succeeds in reducing all the states under its control, and then first appeared what might be called an empire in China.

We are not here concerned with writing a history of China, so we need not dwell much longer on this part of our subject. We have given this brief review of early

Chinese Types.

China so as to clear the mind of some misconceptions. Although we have brought it down to the rise of the Ts'in dynasty and the foundation of an empire in China, we must understand that many centuries came and went before China of to-day appears on the scene. We are apt to speak of China as a country enjoying peace, prosperity, internal unity and a high degree of Civilization from the most early period. But in fact, we know but little of its

ancient history except of a few states along the Hoangho, and of these we know nothing with certainty beyond the eighth century B. C. Their ancient culture has been greatly exaggerated, and if it be true that early China is the best result of the Civilization of the Yellow Races, they are not capable of accomplishing very much.

We are now ready to draw some conclusions as to the part that the Yellow Races took in advancing Civilization. We are all fond of repeating that man is capable of unending progress. We conceive this saying to be both true and false. It is not true of man, the individual, since the period soon comes when his powers droop under the weight of advancing years, and finally death closes the scene. The race is much like the individual. There is a necessary limitation to its powers. The part played by the Black Races was, in the aggregate, very great and most important. The Yellow Races represent a great advance over the previous accomplishments of the Blacks. Tribal society and government was brought to its highest excellence under their guidance, but they nowhere succeeded in establishing a true political society and government. This was a task they were never able to accomplish, and only recently has the idea of a nation occurred to the Chinese.

Even to this day in China, we see the plainest traces of previously existing tribal society. There we see clearly that the evolution of society agrees exactly with what we have already pointed out; it has been from the communal family to the tribe, from the tribe to the gens. The tribe has disappeared, nor have we any evidence of the phratry. The gens, however, is a living institution, all its members bear a common name, (Hsing) marriage is not allowed between its members, that is between persons of

the same name, they have a common ancestral temple, and have their own gods, and the members have certain privileges, such as participation in common funds and in common lands. "At stated periods, members of the gens meet at the family temple, and after the performance of prescribed rites, such as prostrations and burning incense to the tablets, arrangements are made with regard to the disposal of the temple funds, and the proceedings wind up with convivialities, in which the partaking, by males, of a meal laid out before the tablets is an essential."[1]

The joint-family is likewise an existing institution, called the *men*. Instances are known where a men consists of two hundred individuals. In such instances, a large space is enclosed by a wall, and the family buildings are thus protected. In the center is the building occupied by the house-father, and it is important to notice that his authority is not arbitrary but is checked by his council. Of course, the size of the joint-family depends on the wealth it possesses, it may consist of but one couple, but its members have rights to the common property from whence they can not be deprived. We have seen that the process of Civilization consists in bringing to the front individual rights and duties. In China, these rights and duties are yet in groups. There is, properly speaking, no such thing as a will, the property is in the group not in the individual. The group is the legal unit. Individual ownership of land is of modern origin, the ancient rule is still largely in force, and the land belongs to the joint-family or the community.[2]

---

[1] See an interesting article on "Chinese Laws and Customs" in J. R. A. S., 1883, p. 221.

[2] Our authority is the article already mentioned by C. Gardner, M. R. A. S.; H. B. M. Consul at Ichong.

The Yellow Races seem to have preceded the Whites in point of time. We can at least say that the spreading White Races found the Yellow Races everywhere before them. So we may perhaps assign to the Yellow Races the beginning of much of our present Civilization; such, for instance, as the art of hieroglyphic writing, agriculture, the digging of canals and clearing of land, as in ancient Chaldea and China, also the arts of metallurgy.[1] But we have to observe that they soon reached the limits of their powers in all these matters. The peculiar claim of the Whites is not that they invented all these arts, or took the first steps in them, but they so greatly improved what was laid before them.[2] They greatly influenced the culture of the White Races through the religious field, not in the line of philosophical belief, that is beyond them, but in the field of mythology. Their religion was Shamanism, an advance over the Fetichism of the Black Races. Their priests were all magicians. But they had quite a rich field of mythological lore, and this they transmitted to the White Races. Thus Brahmanism in India developed the mythology of the Dravidians; the Semites of Western Asia, the mythology of the Accadians; and the Persians, that of the Turanian tribes of Media.

Excepting the first steps, the begining of our present culture, the Yellow Races have played but a small part in the history of Civilization; and, at present, they constitute the non-progressive races of men. And the probabilities are that they never will contribute much to further human progress. It is the old story of brain force as opposed to brute force. In the long run, it is brain force which rules the world and sways the destinies of men and wrests from

1 See interesting remarks "Archiv für Anthropologie" for 1885.
2 On this point see Prof. Tylor, "Nature," Vol. 28, p. 11.

nature her secrets, which, rightly used, advance the material interests of humanity. The White Races represent the brain force of the world. The Yellow Races the brute force. The day for brute force is past. Asia and Europe will never again feel terror at the mention of a Ghengis or a Tamerlane.

It remains for the future to show whether the Yellow Races are capable of accepting and profiting by the superior culture of the Whites. Japan, which is often referred to as an instance of a Yellow Race waking from the slumbers of centuries and making marvelous progress in modern Civilization, is, in several respects, an exceptional country. It, in one important respect, differs from China. It is now about settled that the aboriginal inhabitants of Japan have a large element of White blood in their ethnology.[1] Owing to their insular position this has not been drowned out by wave after wave of Mongolic people as in the case of China, therefore, we can scarcely reason from the one case to the other. We can not fully share the hopeful views of some on this point. We fear they do not sufficiently take into consideration the question of race. Probably before another century rolls around, this question will be solved one way or the other. We have now reached an important point in our work. From this on, we have to inquire as to the development of Civilization among the White Races.

---

1 From two sources, came the White element in Japan. It is about settled that the Ainos are White. [Flowers in "Nature" Vol. 31, p. 389, Keane in "Nature" Vol. 27, p. 365 and 389. Same author in Standford's. "Asia," p. 712.] The second element is from Polynesian sources. The Polynesians are mainly White. [Keane in "Nature," Vol. 23.]

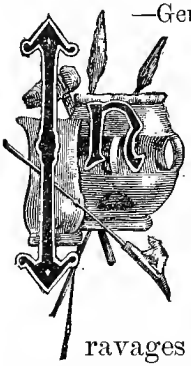
# CHAPTER VI.

## ANCIENT EGYPT.

INTRODUCTION—Physical geography of Egypt—Prehistoric Egypt—Ethnology of the Egyptians—Semitic influence—Antiquity of Egypt—Chronology of Egypt—Epoch of the Old Empire—The first dynasty—Second dynasty—Opening of the historic era—The Pyramid Builders—Tomb of Nofer-ma—Khufa—Khafra—Men-ka-ra—Ptah-ho-tep—The sixth dynasty—General survey of the six dynasties—The culture of the Old Empire—Powers of the king—The council—Egyptian Pyramids—Egyptian religion—Animal worship—Ancestor worship—Polytheism—Egyptian Gods—The Myth of Osiris—Egyptian sacred writings—General conclusions.



A GENERAL way, history is said to commence with the Ancient Egyptians. It is not worth our while to dwell on this well-known statement, but let us turn at once to consider this strange country and people. The encroaching sands of the desert, the ravages of time as the centuries have been told off in rapidly passing years, and the vandal hand of conquering man, combined, have destroyed or hid from our sight many of the monumental ruins of her greatness. But there yet remain mournful ruins of surpassing grandeur, pyramids towering in air, temples flanked by long avenues of sculptured sphinxes, tombs brilliant with painted scenes of home-life, or covered with hieroglyphic inscriptions concerning contemporary events, which can not fail to impress us with a sense of a vanished past. In revery, we live again the scenes, when at the word of command mighty armies

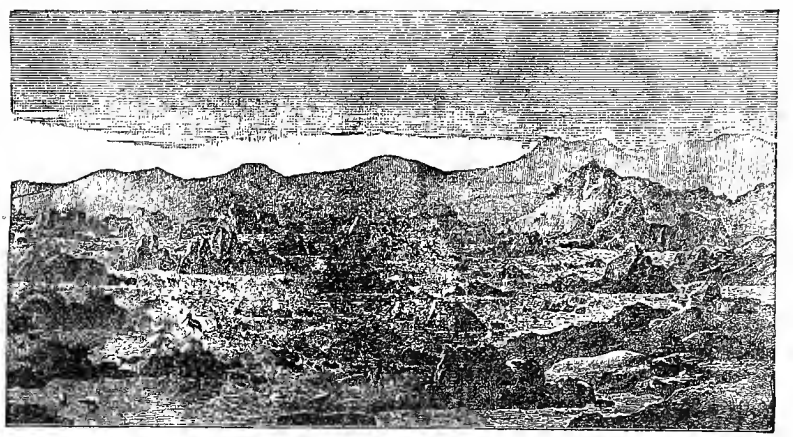
marched forth to carry the terror of the Egyptian name to surrounding people, and, in fancy, we hear the exulting plaudits of assembled thousands when the warrior-king returned in triumph at the head of his victorious forces.

But all this belongs to an almost forgotten past. Civilization, deserting its early home, has experienced a more vigorous growth in other lands, and we, the heirs of this ancient culture, wander along the banks of the Nile, the storied river of Egypt, and seek to understand somewhat of the history of these ruins, inquire as to the nature and extent of the culture that there sprung up in such early and luxuriant growth, and trace the sad steps of its decline and fall. Let us not forget that we are inquiring into the history of the most powerful and brilliant people that stand bathed in the sunrise light of history; but, as the flowers of dawn droop when the sun is higher risen, so did the nations of antiquity decline and fall before the more vigorous nations that came on the stage of action when the light of Civilization and History had stronger grown. Egypt once more illustrates the inevitable cycle of all things human—an infancy of feebleness and growth; a maturity of brilliancy and power; a long, slow decline, with death closing the scene.

When we look at the area of ancient Egypt, we are surprised to see how small it is. In fact, when we review ancient history, we find that all the ancient centers of Civilization were very small in extent. Egypt, Chaldea, Greece, Rome and ancient China are instances. From these, as from a center, an influence extended which affected vast areas of the earth's surface. As all are aware, across Northern Africa there stretches a sandy desert, which is prolonged with occasional breaks nearly across Asia. But in Central Africa is a fertile, elevated section

of country, nearly surrounded with high, and, in places, snow-covered, mountains. Here are located the great lakes of Central Africa, and here is the source of the great river of Egypt, the Nile, which, flowing to the north, receives important tributaries from Soudan and Abyssinia, and finally stretches away across this sandy expanse, flowing through a narrow valley, flanked on either side by a low range of hills—the range on the left known as the Libyan hills; those on the right, the Arabian.

The river, in descending from the more elevated region



Nile Cataract.

of Soudan, in the course of some four hundred miles, makes no less than five descents, which are dignified by the name of cataracts. It is when the last of these is passed that the river enters the confines of ancient Egypt proper. The valley through which the river flows varies in width from two to fifteen miles. At a time not very ancient, geologically speaking, the waves of the Mediterranean washed the foot of the hills near where Cairo now stands. But in the course of ages, the great quantities of sediment brought by the Nile from the highland regions have

formed a wide and fertile Delta. The Nile, entering this Delta, pours its waters through it towards the Mediterranean in seven principal channels, only two of which are at present navigable. Ancient Egypt thus included this Delta and the long and narrow Valley of the Nile, comprising in all an area of little over eleven thousand square miles, between a third and fourth of the size of the State of Ohio.

All are further aware that rain is all but unknown in Egypt, that the fertility of the country depends entirely upon the annual overflow of the Nile, which commences to swell in June, reaching its height in October, about the time of the Autumnal Equinox. Crops can not be grown beyond the limit of this overflow. Now, a moment's reflection will show us how singluarly well adapted to developing ancient Civilization was this Nile Valley. In the first place is the ease with which the country could be defended, thus allowing the tribes settling therein a chance to develop their resources. Beyond this narrow valley, on either side, is a desert expanse; to the west, a sea of shifting sand, with an occasional oasis; to the east, "a barren, rocky, mountainous region, including, only here and there, a few valleys possessing a scanty vegetation, by which a small nomadic population is maintained."[1] The only source of danger seriously to be feared by the Egyptians was from Asia, across the Isthmus of Suez.

We must also consider the fertility of the soil. The life of primitive man was a stubborn battle with the forces of nature for means of subsistence. No great advance was possible until a knowledge of agriculture was obtained. This is, perhaps, the principal reason why the seats of all ancient Civilization were located in fertile

[1] Chisholm: "Two Hemispheres," London, 1882, p. 631.

river valleys. In this respect the Nile Valley is singularly fortunate. As if to atone for the barren scenes around, nature here rewards the labors of man with enormous returns. In Upper Egypt (the narrow valley from Memphis to the first cataract), there grew the dhourra plant, a

Type of Early Egyptian.

species of the millet. Its return was about two hundred and forty to one. In addition to this, there flourished the date-palm. This tree requires little space or labor, and yields an abundant return of nutritious fruit. In addition to the foregoing, other grains can be raised with the

greatest ease.[1] Hence we can see how a teeming population was here maintained, how great armies were raised, and great works executed.

Bearing the foregoing in mind, it is by no means strange that Egypt comes before us, even at the very dawn of history, as a comparatively civilized power, and that its culture bears such strong evidence of indigenous growth. A recent writer sums up the circumstances in their favor as follows: "The wide deserts within which the happy valley was inclosed constituted a vast fortress, within which they were unmolested and undisturbed through long ages; with all the necessities of life supplied in abundance by the bountiful Nile, with the finest climate in the world, freed from the necessity of defending themselves against man or the elements, and surrounded by plenty, which it required only cultivation and industry to secure, everything favored a rapid increase and multiplication, for they had plenty of leisure, more leisure than any other people upon earth at that time, to devote to the arts. Thus it came to pass that they were the earliest among men to attain anything like a highly developed civilization."[2]

The historic period in Egypt is said to open with Menes. But from the very fact that Civilization was then in a comparatively advanced stage, we know that lying back of that epoch is an immensely long period of slow development. Only of late years have our scholars

[1] See Buckle: "History of Civilization in England," Vol. I., p. 60; also, Chisholm: Op. cit., p. 634.

[2] Villiers Stuart: "Nile Gleanings," London, 1879, p. 385. The above is certainly too favorable, as far as climate is concerned. See Chisholm: "Two Hemispheres," p. 633. "In May the suffocating khamsin or simoon begins to blow into the valley from the desert plains on each side of it, raising clouds of fine sand and causing various diseases." We might also question whether this civilization was indeed the first, though, beyond doubt, it was very ancient.

learned to read between the lines, and, by proceeding with caution, we feel safe in outlining, to some extent, this prehistoric period. The first period opening to view shows us both Upper and Lower Egypt in the possession of closely related, independent tribes. The number of these tribes, and the boundaries of the territory they claimed, must have varied from age to age. Just about the time they were being reduced under one government, we know they numbered forty-two, of which twenty-two belonged to Upper Egypt, and twenty to Lower Egypt. In naming these ancient divisions, the Egyptians sometimes used a word representing simply the territory. This word was *he-soph*,[1] used, perhaps, as is our word *county*. In later times, the Greeks used for this purpose the word *nome*, which has generally been employed by writers on Egypt to name these ancient tribal divisions.

Other words were used by the Egyptians also, viz.: *sep* and sometimes *tash*.[2] We would suggest that the latter words meant the people, used in the same way as our word *tribe*. The main thing to be noticed is that, beyond a doubt, each nome was originally the seat of an independent tribe, possessing its own rulers and making its own laws. Their territory, of course, varied in size, but, on an average, each he-soph contained about two hundred and seventy square miles. Being the seat of a fully-organized tribe, each he-soph possessed a central city or citadel, called, in their language, *nut*, where the chief resided, as well as other tribal officials.

At the head of affairs was a ruling chief, the *Hik*. This office is stated to have been hereditary, but it is interesting to notice that it passed, not from father to son,

[1] Sayce: "Ancient Empires," p. 10.
[2] Brugsch: "Egypt," etc., Vol. I., p. 15.

but from uncle to nephew,[1] in the female line of descent. We would expect this statement to be true of the earlier times only. If it remained the custom until the formation of the monarchy, it simply shows how conservative the old Egyptians were.[2] Probably the customs of the different tribes varied in this matter. Each tribe had its own religion and priests, and each he-soph erected its temple of worship in the central city.

Being so largely dependent on agriculture, they, of course, made the most of the limited amount of land at their disposal. As is true of earlier stages of Civilization in general, individual ownership of land was probably unknown, the ownership being in the tribe, and the different kinds of land in the he-soph were carefully distinguished and divided. There was the *uu*, or cultivated land overflowed by the Nile; *pehu*, or marsh land, where they could raise the lotus or papyrus, and flocks of the various water fowl could be kept; and the portion of cultivated land fertilized by the canals.[3]

Who were these tribes? This question speedily resolves itself into another: Who were the ancient Egyptians? for these tribes undoubtedly constituted the principal element in Egyptian ethnology. But this is a question on which our scholars are far from being settled. The most cau-

---

[1] Brugsch Bey states that, according to Egyptian law, descent passed from "father to eldest grandson on the mother's side." (Vol. I., p. 16.) As it stands, this is an ambiguous statement. Whose mother's side? If it means the chief's mother's grandson, then this is simply a clumsy way of stating that descent was in the female line, and hereditary in the gens. This would be exactly in accord with what we found true of ancient society in general.

[2] It will, however, be seen, on consulting the outlines of the fourth and fifth dynasties, that there was no rule of descent.

[3] For information on the nomes, consult Sayce: "Ancient Empires of the East," pp. 10-11. Brugsch Bey: "Egypt Under the Pharaohs," Vol. I., p. 15. Maspero: "Geschichte Der Morgenlandischen Völker im Alterthum," pp. 18–19. Harkness: "Egyptian Life and History," p. 11.

tious among them prefer to leave it an open question. It seems to us, however, that we can determine in what direction the probabilities lie. We shall probably not be greatly in error if we assume that these primitive tribes belonged to the Yellow Races of men, probably near akin to the Turanians of Chaldea. We will, as briefly as possible, give a few reasons for this conclusion. In the first place, we have found, in times preceding the dawn of history, a vast population of nomadic tribes in Southwestern

Type of Egyptians of the Earliest Period.

Asia, who, in all probability, belonged to the Turanian branch of the Yellow Race. It would certainly be strange if they had not passed across the Isthmus of Suez and possessed themselves of the Delta and the Valley of the Nile. As further proof, is the name borne by Egypt in the earliest times. It was the land of *Kem* or *Kami*.[1] In the mind of the later Egyptians, this may have referred solely to the soil; but we question if in the first place it did not refer to the inhabitants, in which case we have to notice the presence of the phonetic element represented

[1] Brugsch: "Egypt," Vol I., p. 10.

by *k*, and recall what we found true of the Turanian tribes in Western Asia.

If our suggestion that these Turanian tribes were collectively known as the Cushites be a sound one, then we have the further fact that a large amount of ancient tradition refers the first settlement in Egypt to the Cushites.[1] From anthropological evidence alone, many modern authorities have maintained that they belonged to the Caucasian Race.[2] This is, however, a very vague statement, and it does not rest on demonstrated facts.[3] On the whole, we think the greater probabilities are that they were Turanian tribes, mixed, in the first place, to some extent, with black tribes whom they probably found in possession of the country, and, subsequently, to a greater extent, with Semitic tribes, as we will soon show.[4]

But we must bear in mind that we are speaking of the tribes previous to the arrival of the Semites; for it is our opinion that Semitic tribes succeeded in greatly influencing these Turanian tribes, in some respects similar to their influence on the Accadians. This requires us to go back very far in time, much farther than history goes. We need not doubt that the Turanian tribes for a long

[1] Rawlinson: "Seven Great Monarchies," New York, 1884, Vol. I., pp. 31–36. Bible, Genesis, chap. x. Brugsch: "Egypt," Vol. I., p. 2.

[2] Osborn: "Ancient Egypt," Cincinnati, 1883, p. 15. Wilson: "Egypt of the Past," London, 1881, p. 1. Sayce: "Ancient Empires of the East," p. 6. Brugsch: "Egypt," etc., Vol. I., p. 2. Wilkinson: "Ancient Egypt," 1879, Vol. I., p. 2.

[3] It seems that Hartman, who has carefully studied them, decides that, anthropologically, they belong to Africa, rather than to Asia, after all. He insists on their connection with the Berber type. It is said that Blumenbach held to this view. See Tylor's "Address before the Anthropological Section of the British Association," 1879, p. 385. As to the presence of a Negritian element in the ethnology of the ancient Egyptians, see Rawlinson: "Story of Egypt," New York, 1887, p. 24. He asserts: "The fundamental character of the Egyptians in respect to physical type is Negritic." See, also, article by Bertien, on "The Bushmen and their Language" in J. R. A. S., 1886, p. 79, *et seq.*

[4] As to the Egyptians being a much mixed people, see Tylor's address, already mentioned; also, Maspero: "Morgenlandischen Völker," p. 15.

time held possession of the country. They were slowly winning their way towards a higher stage of culture, making some slight progress in the upward climb leading to Civilization. They gradually approached the stationary stage reached by all members of the Yellow Races. They had a knowledge of agriculture, doubtless for the time advanced, their picture-writing, and their priestly colleges, composed of their Shamans. There were probably the usual scenes of tribal warfare. Now one tribe, owing to some circumstance in its favor, succeeds in reducing some of its neighbors to tribute, only to experience the same fate itself at a subsequent period. Owing to priestly influence, the picture-writing approached the hieroglyphic stage, and finally assumed a fixed form; and in this matter probably each tribe varied from the others.[1]

Wooden Statue from near Memphis.

We have suggested the idea of a Semitic influence.

[1] Villiers Stuart: "Nile Gleanings," p. 387.

Let us inquire into this matter a little. That some time in the past there was some sort of connection between the ancient Egyptians and Semitic tribes is, probably, not questioned by those who have investigated the matter. Tylor remarks: "There was mixture between the two races, and, what is most remarkable, there is a deep-seated Semitic element in the Egyptian language only to be accounted for by some extremely ancient and intimate connection."[1] And, speaking of these two languages, Sayce declares that "a relationship of some kind certainly exists between them."[2] This point is, probably, not disputed, and it only remains to decide the nature of this connection. Some solve the problem by declaring that the ancestors of the Egyptians and the Semitic people were the same, in the same way that the Greeks and Romans were descended from the same ancestors.[3]

Others are not ready to admit this. Prof. Whitney especially warns us to be cautious in this matter, showing how much there is yet to be determined before we can come to satisfactory conclusions.[4] Now, as similarities of language simply show social contact, we would suggest that the Semitic element in the language of ancient Egypt is due to a conquest by Semitic tribes from the south. We have assigned the origin of the Semitic people to Arabia (p. 38), but we will also show that Abyssinia has some grounds to be considered their original home. This makes but little difference, since Semitic people are found in both localities. But it does show that ancient Egypt

[1] "Proceedings British Association for Advancement of Science," 1879, p. 385.

[2] "Science of Language," Vol. II., p. 178. For further linguistic evidence, this Vol., p. 39.

[3] This is the conclusion of Maspero: "Die Aegyptian Würden, also Zu den Protosemitischen Rassen Gehoren;" "Morgenlandischen Völker," p. 17. See, also, Müller: "Science of Language," First Series, p. 282.

[4] See his "Life and Growth of Language," p. 253.

was exposed to attacks from Semitic tribes from that source.

Every one knows there is a great amount of tradition to the effect that the culture and population of ancient Egypt was derived from the south. As a rule, our modern scholars reject these traditions as of no account,[1] yet they have not been by any means disposed of. It is undoubtedly true that the ancient Egyptians represented Abyssinia as the home of their gods. This can only mean that the ruling element in their population came from thence. A series of ancient bas-reliefs represent an expedition to Abyssinia. The Egyptian commissioner is represented as landing and immediately entering into conversation with the chief of the country, who receives him with every mark of friendship and respect. The people of Abyssinia are represented with the same red complexion, dress and appearance as those of Egypt. We are to notice also that, among the hieroglyphics, occur the giraffe and dog-headed ape, animals native of Abyssinia but not of Egypt. The dog-headed ape was even worshiped in Egypt.[2] It is very difficult to explain all this on any other supposition than that there was considerable truth in the old tradition.[3]

Scribe of the Oldest Period.

The suggestion we have made obviates many difficulties. The probabilities are, we think, that the ancient

---

[1] Maspero: "Morgenlandischen Völker," p. 12, *et seq.* Wilkinson: "The Ancient Egyptians," Vol. I., p. 3. Osborn: "Ancient Egypt," p. 14. Lenormant: "Ancient History," London, 1879, Vol. I., p. 202. Brugsch: "Egypt," etc., Vol. I., p. 3. [2] Villiers Stuart: "Nile Gleanings," pp. 286–9.

[3] See, also, Poole, in "Contemporary Review," 1881.

Egyptians were, at the bottom, Turanian, possibly somewhat mixed with the black tribes whom they first found in possession of the country. As we have several times pointed out, the Yellow Races lay the foundation of culture, but it requires the presence of White Races to carry that culture forward to any degree of perfection. In this case, the Semitic tribes from the south, invading and conquering the valley, constituting themselves the ruling class, but more or less completely fusing with the mass of the people, took up this already stationary Civilization and culture of their subject tribes and started Egypt forward on the great career she was destined to fill.

Where two people, conquerors and conquered, thus live together, a fusion sooner or later takes place between them, and the resulting culture combines the elements of the culture of both people, though in an unequal degree. In matters of religion, the priesthood of the Turanian tribes, who always occupied a most important position, apparently wielded the same influence on Egypt that they did in Western Asia generally. Down to the very last, they remained a strong, compact body, exercising a great influence on the affairs of the country. We detect, also, the presence of a ruling aristocratic element as well as the common people; representations, we think, of the Semitic and Turanian tribes.[1] In language we are presented with a grammar agreeing with the Semitic grammar, but disagreeing in both structure and vocabulary;[2] and, in points where it disagrees, it approaches the Turanian languages of Asia.[3]

---

[1] That there are from the earliest times two well marked physical types in Egypt is admitted. See Rawlinson: "Story of Egypt," p. 25.

[2] Sayce: "Science of Language," Vol. II, p. 178.

[3] Rawlinson ("Ancient Egypt," Vol. I., p. 115) thus describes the language of Egypt: "Speaking generally, the Egyptian language may be described as an agglu-

We have thus spent some time outlining prehistoric Egypt. We may be sure that this period covers a very extensive portion of time. Of late years, we begin to, here and there, catch glimpses of this period. In hieroglyphic inscriptions, it is referred to as the time of *Horshesu*. It is even possible that some of the monumental ruins go back to this epoch, and one manuscript is thought to have been written at that far-away time.[1]

Whether any of the existing monuments date back to this mythical period is yet undetermined. Prof. Sayce is of the opinion that the Sphinx at Gizeh and the so-called granite temple situated near belong to this mythical time.[2] But Mr. Petrie shows very good reasons for not accepting this view.[3] However, as during this time the country was comparatively civilized and manuscript writing was in vogue, we know no good reason why we should not hope to discover monumental ruins, such as temples and tombs, or even manuscripts, that will throw no little light on this yet dark point.

We have, at present, no means of determining how far back in time this prehistoric period extends. We know nothing as to its beginning and nothing with certainty as to its end, or, in other words, when history begins. What we are reasonably sure of is that Upper Egypt was becoming more of a united country. The tribes were forming a closer union. Near the center of Upper Egypt, about

---

tinate monosyllabic form of speech, presenting analogies on the one hand with Turanian, on the other with Semitic tongues." He then proceeds to show that while the grammar is Semitic, its vocabulary has its main analogy with the Accadian, Mongolian and other Turanian tongues. See our remarks on Hamitic language, p. 38. Latham remarks of the Coptic, the modern representative of the ancient Egyptian: "The Coptic has long been recognized as preëminently agglutinative." ("Elements of Comparative Philology," p. 603.)

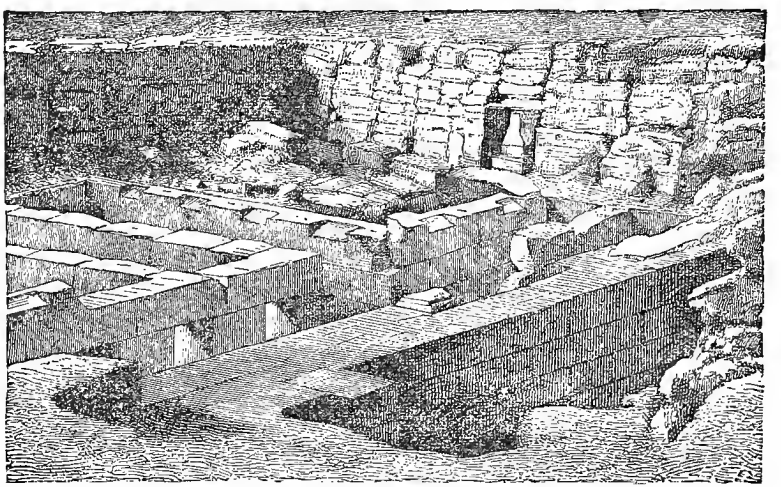
three hundred and thirty miles from Cairo,[1] was the eighth nome of Upper Egypt, called *Teni*.[2] Its capital city was *Theni*, called by the Greeks *Thinis*. This ancient city possesses for our purpose a great deal of interest. It has long since disappeared, and its location is not known with certainty. The modern town of Girgeh is supposed to be built over the ruins of the ancient city.[3] The necropolis of this nome was at Abydos, some twelve miles farther up



Temple of the Sphinx.

the river. Here was the most holy spot of ancient Egypt. Here was the reputed tomb of Osiris, the ancient god of Upper Egypt. According to Plutarch, the wealthy inhabitants were brought from all parts of Egypt to be buried at Abydos, in order that they might repose close to Osiris,[4] and in this vicinity, if anywhere, lie, buried in the sands,

[1] Mariette ("Monuments of Upper Egypt") gives the traveling distance as three hundred and seventy miles. Wilson gives the real distance as above.

[2] See Sayce's list in "Ancient Empires," p. 12.

[4] From Mariette: "Monuments of Upper Egypt," p. 123.

the monuments and inscriptions which will some day throw a flood of light on what is now Prehistoric Egypt.

For Teni was the home of a populous and powerful tribe. Its location was greatly in its favor. Prof. Sayce remarks, of the rich plain composing its area, that it "is at once one of the largest and most fertile of those in the Valley of the Nile, while it is protected from attack on three sides by the Libyan hills, and on the fourth side by the river. Everything was in favor of the progress of its inhabitants in wealth and power."[1] Such a people needed only the guidance of a warlike chief to extend their sway over the entire valley, bringing one tribe after another under subjection. Such a chief was Menes, the first historical figure in Egypt,[2] who placed his tribe at the head of Upper Egypt and then conquered Lower Egypt as well, thus bringing both countries under one government. To securely maintain his hold on the united country, he built a new capital city, which we will soon describe, twenty miles from the beginning of the Delta proper. This new city was called *Men-nefer*, meaning secure and beautiful, names doubtless significant of its location and appearance. This city was the *Memphis* of history.

The events we have thus briefly outlined mark the commencement of the historic period in Egypt, though some centuries pass of which we have only the briefest notices. It is necessary to spend some time on the question of chronology. A vast amount of research has been given to this question, but such are the difficulties in the

[1] "Ancient Empires," p. 22.

[2] We have spoken of Menes as an historical personage. It is scarcely necessary to remark that there are doubts on this point. The records all speak of him as the first king. It may well be that we are here dealing with a personal name made out of a local one. We will, however, only caution the reader. We may some day be able to decide definitely.

way of a satisfactory solution that nearly every eminent Egyptian scholar differs in his conclusion from the others. Of late years, the tendency seems to be in favor of not coming to any definite conclusion. Back of the seventh century B. C., we must be content to reckon by dynasties, rather than by years. Let us, however, see what facts our scholars have to assist them in reaching their conclusions, and why it is that such diverse results are obtained.

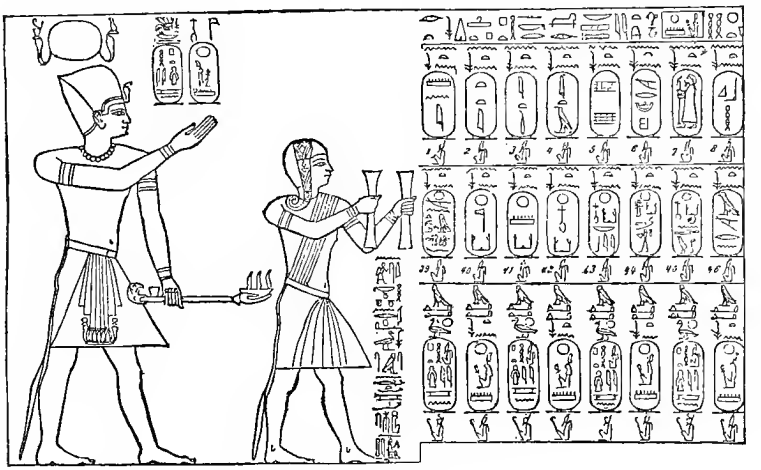
When Ptolemy Philadelphus ruled at Alexandria, near the beginning of the third century B. C., he commissioned Manetho, a priest of Sebennytos, to translate into Greek the records of the Egyptian temples. Manetho made a chronological list of Egyptian kings, dividing them for this purpose into thirty dynasties, giving for each dynasty the names and order of the kings composing it, the length of their reigns, etc. No copy of this work is known to be in existence, and all that we know about it is from meager, and, in some cases, contradictory, extracts made by some of the older classical writers.[1] Two of these, Eusebius and Julius Africanus, profess to give us Manetho's list of dynasties, with the number of years each ruled, and, in some cases, they profess to give us the names and length of reigns of the individual kings of the dynasties.

It is unfortunate that these two accounts do not correspond. It not unfrequently happens that the years of the individual kings, when added together, exceed the number of years that the dynasty is said to have lasted. Furthermore, statements made by these writers, claiming to be taken from Manetho, are often contradicted by the hieroglyphic inscriptions on the monuments themselves. It is plain, therefore, that our knowledge of Manetho's lists can not be relied on. But, even if we had his complete

[1] Such as Josephus, Eusebius, Julius Africanus, and George Syncellus.

work, we doubt whether we could then solve the problem. At the time he wrote, the star of Egypt had forever set. His beloved country had passed under foreign rule; her history was a closed book; all he could do was to pass from temple to temple, compare their various lists and traditions, and settle, as best he could, their contradictions.

When temples were erected from time to time in Egypt, the priest selected or compiled a list of the earlier kings of Egypt. In these lists certain noted kings were



A Portion of the Abydus Tablet.

always included, such as Menes, the first king; Khufa, the builder of the great pyramid, etc.; but in other details the lists undoubtedly varied. At Abydus, for instance, Seti I. is represented as honoring the spirits of seventy-five of his predecessors. It is expressly stated in the preface to the inscription that this list includes the *kings* who had reigned over *united* Egypt, thus throwing out queens and those kings who had ruled only a portion of Egypt.[1] His son, Rameses II., was even more exclusive.

[1] Villiers Stuart: "Nile Gleanings," p. 316. Let it not be forgotten that as

He omits some of his father's ancestors from his tablet. At Karnak, Thothmes III. gives a list of sixty-one kings who preceded him. This is a very exclusive list; about half a dozen names only are selected to represent the first five dynasties.[1] In the tomb of a priest at Sakkarah, dating from the reign of Rameses II., the dead priest passes to the other world in the presence of fifty-eight of the earlier kings of Egypt.

In the museum of Turin is a papyrus, found, probably, in a tomb at Thebes, and dating from the reign of Rameses II.; it is in a fragmentary condition—owing to the ignorant carelessness of the native who found it and of the European who bought it—and consists of a long list of kings, most of the names being, unfortunately, illegible. It was, doubtless, a very complete work, but Brugsch shows that the author arranged these kings according to his own idea of things: "He forgets to give, also, any account of the double reign of two kings, which has been proved beyond all doubt by the inscriptions."[2] It evidently contained, for the period from the seventh to the eleventh dynasty, the names of about forty kings.[3] The tablet of Seti I., at Abydus, gives for the same period about twenty kings.

We must add to the foregoing the fact that, long before the time of Manetho, the Egyptian priests were by no means agreed concerning many details of their earliest pharaohs. As Mariette suggests, "their memories were preserved by tradition rather than by written testimony."[4] We may suppose that Manetho did the best he could to

early as the time of Rameses II. there were contradictory traditions of the earlier kings. (Rawlinson: "Ancient Egypt," Vol. II., p. 28.)

[4] Wilson: "Egypt of the Past," p. 54.

compile a list of the kings of Egypt. We may reasonably doubt whether it was possible for him to do so, and we are certain his list has not come down to us as he left it. Let us now look at the matter of contemporaneous reigns and dynasties. It was the common practice for the heir apparent to be associated with the reigning king as co-regent.[1] We must also bear in mind the probability that one dynasty might have been reigning in one part of Egypt, while, in another part, another tribe or dynasty was in the ascendant. It is not at all doubted that such was actually the case, but it is considered that Manetho made his choice between two rival dynasties, considering one only as legitimate, and giving the kings in that line. Of late years, however, we are not quite so sure on this point. It seems to us extremely likely that confusion has come from this source, especially for the earlier periods.[2]

It must be evident, then, that at present we are entirely at sea in regard to the dates of early Egyptian history. Scholars differ very widely as to the date of the conquest of Lower Egypt by Menes.[3] Still, if we can not arrive at positive results, we are at least sure that no petty term of years expresses this date. Villiers Stuart, in his discussion of the Abydus tablet, comes to the conclusion that the *minimum* date for the accession of Menes is 4124 B. C. He says: "I began my in-

[1] Wilson: work cited, p. 10. Brugsch: "Egypt," etc., Vol. I., p. 37.

[2] Such, for instance, as the period from the sixth to the eleventh dynasty, and from the twelfth to the eighteenth dynasty. We will refer to these periods later.

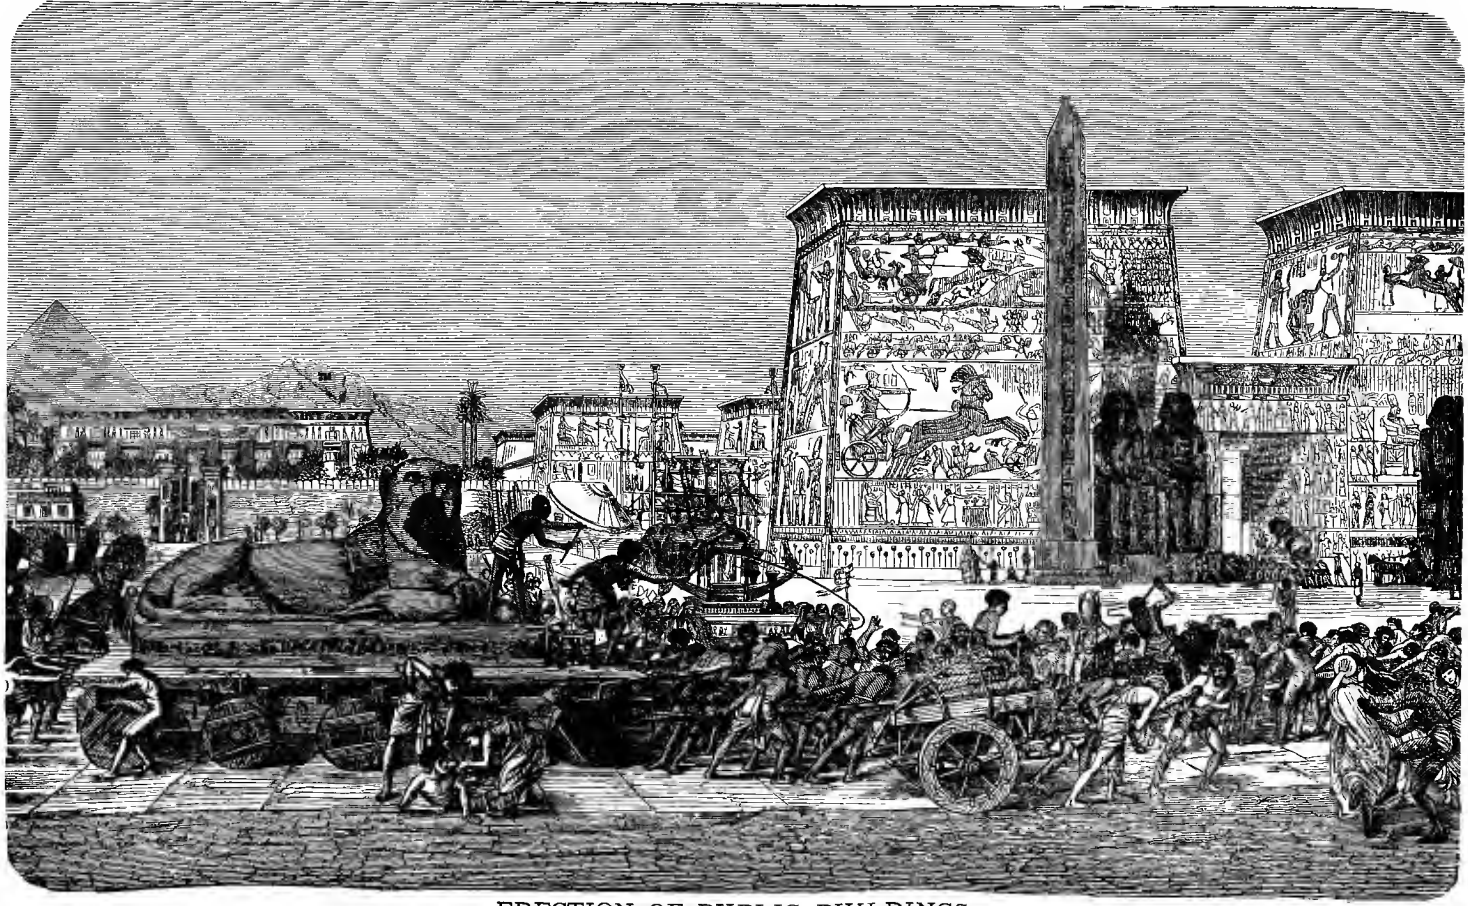
quiries into Egyptian chronology with a strong prejudice against the remote dates claimed, but, after carefully sifting all the evidence I could get at, both from books and from monuments, I can come to no other conclusion." Mariette, who spent a life-time in exploration and study in Egypt, and who carefully considered every side of the question, thinks this event must have occurred upward of fifty centuries before Christ. Prof. Sayce, after remarking that Mariette was exceptional authority on these matters, adds: "But those who have sailed up the Nile, and observed the various phases through which Egyptian art has passed, will be inclined to think that he has rather fallen short of the mark than gone beyond it." [1]

We would advise the reader to consider this question as yet open. While the results of future discoveries may establish a date no farther back than twenty-three or four centuries before Christ, yet the probabilities are, if anything, stronger that, as investigation proceeds, this date will remove even beyond Mariette's estimated time.[2]

We have now arrived at that epoch in Egyptian history known as the "Old Empire." After an unknown number of years, during which the separate tribes had been feeling their way towards a closer national union, the time had at length arrived when the entire country was united under the leadership of one powerful tribe. The seat of this tribe, the home of its worship and culture, was the eighth nome of Upper Egypt, Tenai; but Menes, their tribal chieftain, after securing his conquests, built the city of Memphis, which he made the seat of government for the united country. It is agreed on all sides that he

[1] "Ancient Empires," p. 23.

[2] For an excellent discussion on Egyptian chronology, see Rawlinson: "Ancient Egypt," London, 1881, Vol. II., chap. xii.



ERECTION OF PUBLIC BUILDINGS.

chose an advantageous site for his new city, which was to command both the provinces of Upper and Lower Egypt.

To make it both "secure and beautiful" (the meaning of the name it bore, Men-nefer), the services of the learned men were called into requisition. Traditionally, he is supposed to have built the great dyke still existing, called the dyke or wall of Cocheiche, which diverted the course of the Nile, which formerly ran near the Libyan hills, more to the eastward. On the territory thus gained, he is supposed to have built his new city, with its temples, fortifications and palaces. This city was extended and adorned by the various kings of the earlier dynasties until it became one of the most celebrated cities of ancient times; but at the present day all that remains of it are low mounds of ruins, the *debris* of ancient houses and temples. We have a description of the ruins as they appeared in the middle ages, written by an Arabian physician, in which he declares that "its ruins still offer to the eyes of the spectators a collection of wonderful works, which confound the intellect, and to describe which the most eloquent man would labor in vain."[1]

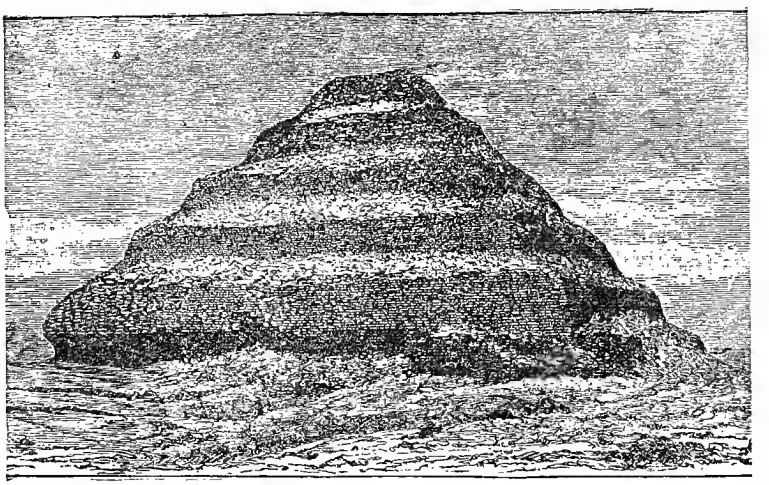
The period of Egyptian history known as the Old Empire generally includes the first ten dynasties, and extends over a period of not far from two thousand years. However, all is confusion before the fourth and after the sixth dynasty. It will be seen that this whole period is one of immense antiquity. According to Mariette, the sixth dynasty came to an end thirty-five centuries B. C.[2] But this date is subject to change, as our views on early Egyptian dates generally change. According to Manetho,

[1] Brugsch: "Egypt Under the Pharaohs," Vol. I., p. 45.

[2] See table in "Monuments of Upper Egypt," p. 22.

the first dynasty comprised a period of three hundred and five years, and a list of nine kings.[1]

We know very little of this first dynasty. It would have been very strange indeed if there was not more or less of disorder, during its course, caused by tribes trying to shake off the authority of the tribe of Tenai. Such a state of affairs seems indicated in the names of some of the kings. The tablet at Abydus, carved by Seti I., gives



Pyramid of Sakkarah.

for the third and fourth *Atoto* and *Ata;*[2] Manetho gives *Kenkenes* and *Unephes* for the same two. A possible explanation suggested by Mariette is that these kings were contemporaneous. Perhaps, for the time, some tribe or confederacy disputed with the Tenai tribe for supremacy; yet the difficulties of deciding on this point are certainly great. We have some reason for supposing that Ata built the stepped pyramid at Sakkarah. This is only a

[1] Brugsch: "Egypt," etc., Vol. I., p. 54. The number of kings and duration of the dynasty vary. See Sayce, work cited, p. 277.

[2] We follow the reading of Prof. Sayce. ("Ancient Empires," p. 283.)

few miles from Memphis, and is, perhaps, the oldest monument of Egyptian art remaining.

We have no record of any foreign wars of the first dynasty, and almost no knowledge of the internal affairs. We need not suppose the three centuries, more or less, of this dynasty were one long period of peace. There were, doubtless, invasions to repulse and rebellions to crush, yet we know nothing of them. Doubtless, advance in Civilization took place. We have seen that one pyramid, perhaps, dates from this dynasty. Certain papyri, found at Thebes, make references to kings of this dynasty. A recipe for making the hair grow is said to date from the reign of Teta, the successor of Menes. Recipes for the curing of leprosy, contained in a papyrus of Rameses II., were said to have been "discovered" in the time of Sapti, the fifth king, and two chapters of the "Ritual of the Dead" are supposed to date from this same early period. Thus it will be seen that, though we call this dynasty historic, after all but little is known about it.

It is necessary to explain somewhat as to a change of dynasty. At the present day, we understand by the word *dynasty* a reigning family whose members succeed each other by right of hereditary succession. When, by reason of revolution or natural causes, such a ruling house comes to an end and a new reigning house is chosen, a new dynasty is inaugurated. To illustrate from English history, the present dynasty is Hanoverian, since they rule by right of hereditary succession from the electress, Sophia of Hanover, on whom the crown was settled by the "act of succession" in the reign of William the Conqueror. As in the case just quoted, a change of dynasty may be provided for and take place in a peaceful manner. Now, the kings of Egypt have been divided into divisions called

dynasties; but a few moments' reflection will show us that it does not necessarily follow that our definition of the word *dynasty* can be applied to them.

The whole conception of a dynasty must remain unknown to a people in a tribal state of society. Of necessity, it can arise only when society has reached a very advanced stage of development. Tribal lines must be removed and the whole people become fused in one. Now we know almost nothing of the state of society amongst the primitive Egyptians; but the presumptions are altogether against there being a state of society such as we naturally picture to ourselves when we talk about dynasties, in the modern sense of the word. The condition of affairs, as regards the ruling house, must have been about as follows: Menes was the ruling chief of the tribe located in the Tenai nome. This tribe succeeds in subjecting all Egypt to its rule. Now, from what we have found true of ancient society in general, no doubt this office of chief was originally elective, the various gentes of the tribe electing their chief as occasion required. The constant tendency of custom is to change this elective office to an hereditary one. No one knows what was the relation between the early kings of Egypt. The son might have succeeded his father in office. The probabilities are that he would do so if he were acceptable to the tribe. We may be equally sure the tribe would reject him and elect another chief if he were not acceptable. There is certainly a large amount of tradition to the effect that the office of king in ancient Egypt was elective.[1]

A change of dynasty, then, in ancient Egypt, must mean that some tribe or confederacy has overthrown the ruling tribe, and their chiefs appear to view as kings of

[1] Wilkinson: "Ancient Egyptians," Vol. I.

Egypt. This result, which we arrive at by simply reasoning on the condition of ancient society in general, is borne out by eminent Egyptologists. Brugsch-Bey, after remarking that the nomes remained in a degree independent, and, consequently, were often at war with each other, continues: "The disastrous results of such feuds sometimes affected even the whole dynasty. The reigning family had to descend from its throne and give up the country and crown to the victorious prince of a nome; hence, not unfrequently, arose the changes of dynasty."[1]

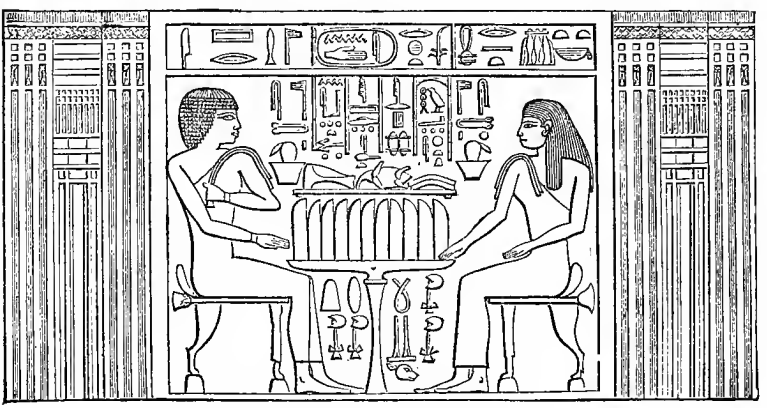
The first dynasty, whose few traditions we have now glanced at, is said to have come to an end with the ninth king. It is called a Thinite dynasty, from the name of the nome or tribe. The second dynasty is also called Thinite. Some suppose there were two branches of the family of Menes, and one, failing direct heirs, was succeeded by the other. We think an explanation more in accordance with the unsettled state of affairs can be given. That the times were turbulent seems shown when we consult respective lists of kings of this dynasty. The Abydus tablet gives us five kings. In the preface of this tablet, we must remember, it was stated that kings of United Egypt were given. The Sakkarah tablet gives seven kings, but only three of these are manifestly the same as those given in the Abydus tablet.[2] Who were these other four kings, and why is it that Seti left them out of his list? Did they rule a part of Egypt only? Prof. Sayce points out one inscription that seems to show the name of a king not down on any of the lists. These examples show that, in the first place, our knowledge of

[1] "Egypt Under the Pharaohs," Vol. I., p. 17.

[2] See Sayce's list: "Ancient Empires," p. 283.

these far-away times is scanty, and, second, that there was considerable confusion.

The records are very scant indeed. In the course of some three centuries no war is mentioned, yet, beyond a doubt, they were almost continually at war. In this connection, we might refer to the meanings of the names of the early kings. In nearly every case these names are just such as would be adopted by warrior chiefs generally. We have Menes, "the constant," or "the firm," "he who resists;" Tota, "he who beats;" Kakau, "the bull of



Sculpture from the Tomb of Senta.

bulls," also "the most manly;" Senta, "the terrible;" Huni, "he who strikes," etc.[1]

We have a monument of the time of Senta. It is a sculptured slab of limestone, forming a part of the door of the tomb of one of his priests.[2] A priest and priestess are seated opposite each other, with an ornamental pedestal table between them, over which are placed meat offerings. The columns of hieroglyphics on the wall back of the table enumerate various funeral gifts, including linen

[1] Brugsch: "Egypt," etc., Vol. I., p. 56.

[2] Found more than two hundred years ago near Memphis, and presented to the Ashmolian Library, Oxford, England. See Wilson: "Egypt of the Past," p. 49.

garments for the mummy. The name of Senta is in the oval in the border above.

Two extracts from Manetho's work concerning this dynasty have come down to us. According to the first extract, it would seem that the worship of the sacred bulls was inaugurated under Kakau. The second extract states that under King Baienneter females were made eligible to the throne. With all due regard to the authority of Manetho, the probabilities are that neither of these extracts is worth anything historically. The probabilities are that Manetho explained, according to his views of what was probable, expressions he found on the old monuments. In regard to the worship of bulls and other animals, we need only remark that, in accordance with what we found true of primitive religion generally, such worship is simply a survival of a more primitive superstition. The probabilities are all against it being a new custom inaugurated by Kakau, of the second dynasty.[1] Further than this, the probabilities are that, long before the time of Kakau, the bull, apis, was worshiped at Memphis. The stepped pyramid, described some pages back, probably built by Ata, of the first dynasty, was perhaps erected in his honor.[2]

With regard to the second extract, we think it equally valueless. Egypt presents us with a strange mixture of Turanian and Semitic culture, as we have already pointed out. As far as the laws of descent are concerned, they may have tenaciously clung to some of the old principles of female descent. Perhaps this is the source of the old

[1] On this point, see Tiele: "Egyptian Religion."

[2] Harkness: "Egyptian Life and History," London, 1884, p. 15. The smaller chambers of this pyramid were intended to receive the mummified apis. We are bound to say there is a question whether these smaller chambers are as ancient as the rest of the structure. (Wilson: "Egypt of the Past," p. 26.)

notion that the children of a queen or royal princess were eligible to the throne, no matter whether her husband was of royal blood or not. "But if, on the contrary, a king married a lady of a noble family, either Egyptian or foreign, the children . . . did not entirely possess a legitimate right to the crown."[1] This is a plain indication of the survival of the old rule in a state of society where we would not expect to find it. It was not a new rule, and from the nature of things each dynasty must have made its own rules.[2] We simply refer to these extracts from Manetho to show with how much care we must examine what is said of ancient Egypt.[3]

The third dynasty is called Memphite. We conjecture that the colony at Memphis at length becomes independent of the tribe at Tenai. There is, as usual, a good deal of discrepancy between the lists of Manetho, as we have them, and the monumental lists of the kings of this dynasty. Manetho, as quoted by Africanus, mentions nine kings; the Abydus tablet gives six;[4] the Sakkarah tablet four, and two of these are different from the Abydus tablet. Now, whether we adopt the suggestion that each temple made its own list and selected those kings who favored that temple, or believe that we see in this confusion evidence of contemporaneous dynasties, one thing is evident—that we have no certain knowledge of these far-away times.

We have, however, now arrived at the opening of a

---

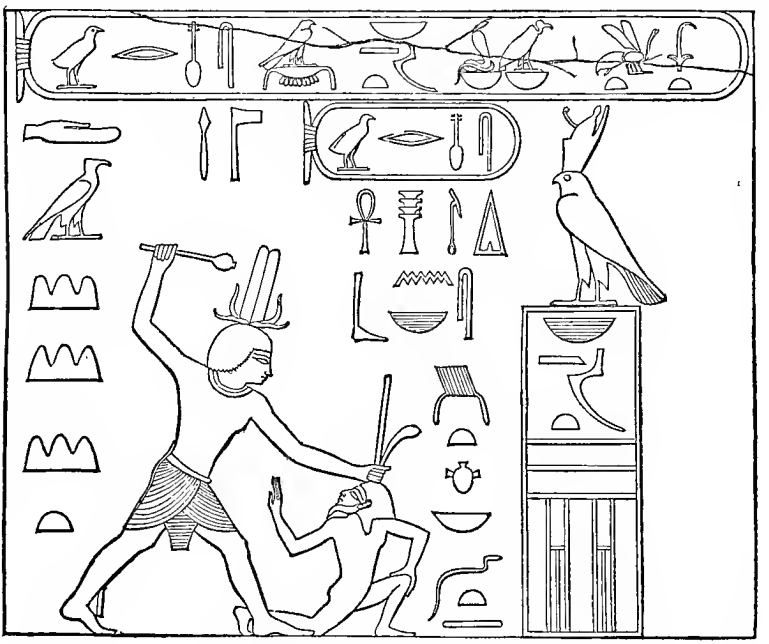
[1] Brugsch: "Egypt," etc., Vol. I., p. 61.

[2] See Bunsen: "Egypt's Place," etc., Vol. II., p. 107.

[3] Rawlinson observes: "It can not be said that any facts are really known of these monarchs." Of the few traditions he says: "Their value would be slight, even were they to be depended on; as the case stands, it is difficult to assign them any value at all. . . . No doubt Manetho found these traditions in Egyptian authorities; but his credulity was great, his critical discernment small, his diligence in research less than might have been expected."

[4] See Sayce's list.

new epoch in Egyptian history. We are able to speak with more certainty, because we have inscriptions and contemporaneous monuments to help us on our way. The first three dynasties are very shadowy indeed. We can but dimly perceive that we are dealing with a confused, semi-mythical period. With the fourth dynasty, we walk in the clearer light of monumental history. The first



Tablet of Seneferu at Wady Magharah.

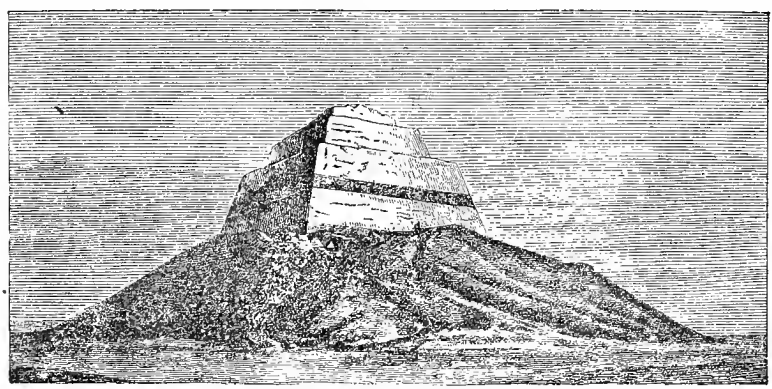
king of this dynasty, Seneferu, is, by the majority of authorities, placed as the last king of the third dynasty;[1] but it seems there is uncertainty on this point.[2] Manetho heads this dynasty with a king whom he calls Soris. There seems to be no doubt that the immediate prede-

[1] Sayce: "Ancient Empires," p. 283. Brugsch: "Egypt Under the Pharaohs," Vol. I., p. 55.

[2] Rawlinson: "Ancient Egypt," Vol. II., p. 46; "Story of Egypt," p. 54. Birch: "Ancient Egyptians."

cessor of Khufa, Manetho's second king of the fourth dynasty, was Seneferu, since the same queen was the favorite wife of both.[1]

The fourth dynasty is also called Memphite. We do not understand the nature of the revolution which placed some other tribe at the head of affairs, but it is clear a change has taken place. Not only do we emerge into the light of history, but we see many indications that Egypt has entered on a new stage of action. Her kings are no longer named by some simple title expressive of personal



Pyramid of Meidoom.

qualities, but by a number of titles expressive of the dignity of their station. Egypt now becomes a conquering power. Seneferu was "distinguished alike as a soldier, an architect and a patron of literature and art."[2] As a soldier, he led his army into the peninsula of Sinai, attracted thence, probably, by the rich mineral mines and especially the copper mines. The inscription, engraved on the rocks of Wady Magharah, commemorates his victory. The long oval at the top reads, from right to left, "King of Upper and Lower Egypt, Lord of Justice, Van-

[1] Wilson: "Egypt of the Past," p. 62. [2] Ibid., p. 55.

quisher of his Adversaries, S-nefer-r-u."[1] In this section, there can still be traced the remains of the fortress, within which the Egyptian garrison was stationed who held the country so valiantly gained.

We have still another monument of this king. It is the pyramid of Meidoom, shown in the preceding cut.[2] It is considered as probable that the body of this warrior king still sleeps in some yet undiscovered chamber of this secure pyramid.

Meidoom is some forty miles south of Memphis, and we can but wonder why Seneferu should have built his pyramid so far away. His was not an isolated tomb; but a few hundred yards away is to be found a collection of tombs of this dynasty, all of great interest. We will present a cut of one of these tombs; it is that of Prince Nofer-ma or Nefermat. He is supposed to have been a son of Seneferu. It is constructed of immense blocks, laid in regular order and built against the vertical face of a rocky shelf. A large portal opens into a narrow chamber visible from without. It will be seen that every part of the wall is carved with bas-reliefs and hieroglyphics, or with figures represented in mosaics, with colored cement. On the left of the entrance is represented Nofer-ma and his wife—the latter figure but dimly outlined—clasping his right arm. On the left is the prince and his son, only a portion of the child being visible.

At the far end of the chamber he is again represented in company with his wife, their names being sculptured over their heads. Above the doorway, but barely visible, he is contemplating his funeral gifts; the sides of the

[1] Rawlinson: "Ancient Egypt," Vol II., p. 48.

[2] Brugsch, Wilson and Sayce all admit this to be his pyramid. Mariette remarks: "There is some reason to suppose that Seneferu was its builder." Rawlinson thinks the data at hand scarcely sufficient to determine this point.

entrance represent triumphal scenes in his life. The tomb of his wife, but a short distance away, is even more richly decorated, and in paintings a curious and happy scene is spread before our eyes. "The husband is employed in netting birds; the game is conveyed by servants to the princess seated on her chair. At the end of the chamber, the wife, in the presence of her husband, lays her hand upon her breast, as though she would express her infinite

Tomb of Nofer-ma.

devotion to her lord, whilst around we see the preparation for a feast, the slaughter of a spotted antelope and the carrying of the provisions to the banquet table: all this is clearly shown, even though the earthquake has seriously disturbed the massive stones."[1]

In still a third tomb of this group was discovered two remarkable statues, being those of Prince Rahotep and his wife, Princess Nefert. We call especial attention to these

[1] Wilson: "Egypt of the Past," p. 62.

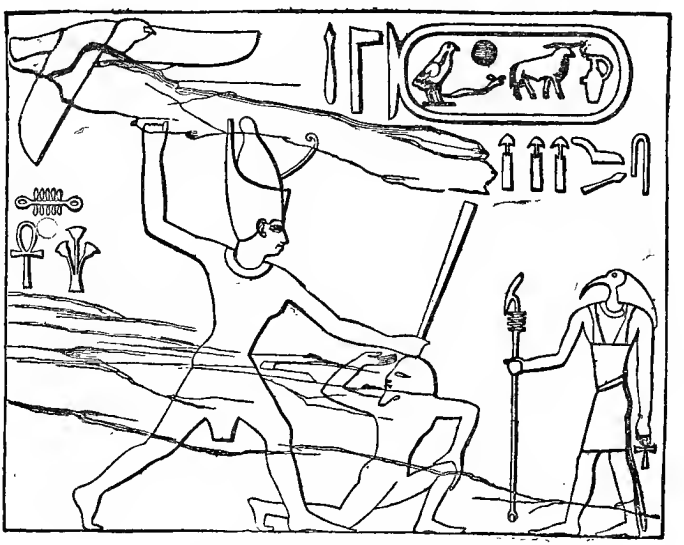
figures, both for the general excellency of the work and the features represented. Villiers Stuart remarks: "On looking at them, one is immediately struck by the European character of the features."[1]

Statues of Rahotep and Nefert.

The other kings of this dynasty emulated the example of Seneferu. Like him, they built for themselves stupendous pyramids for tombs; but as we expect to describe the pyramids more particularly later, we will not attempt it in this place. We wish to remark that the new governing power in Egypt seems to us to display, in several respects, the workings of a tribal state of society. That the ruling tribe dominated over the others is, of course, admitted; but within the tribe itself we have several indications that all stood on a plane of equality. Their chiefs, the kings, were, of course, treated with the greatest of honor and respect; but we doubt if these offices were hereditary. The truth of these remarks will be seen as we outline the history of the fourth and fifth dynasties.

[1] "Nile Gleanings," p. 282.

Seneferu had at least one son who survived him; yet the office of king passed to a third person, who subsequently married Mertetfes, the widow of Seneferu. This king is known to us from the monuments as Khufa, and is the Cheops of history. Some have supposed he was an usurper. The probabilities are that the office of king was elective, and that the ruling tribe rejected the son of Seneferu and chose Khufa in his stead. He is known to be

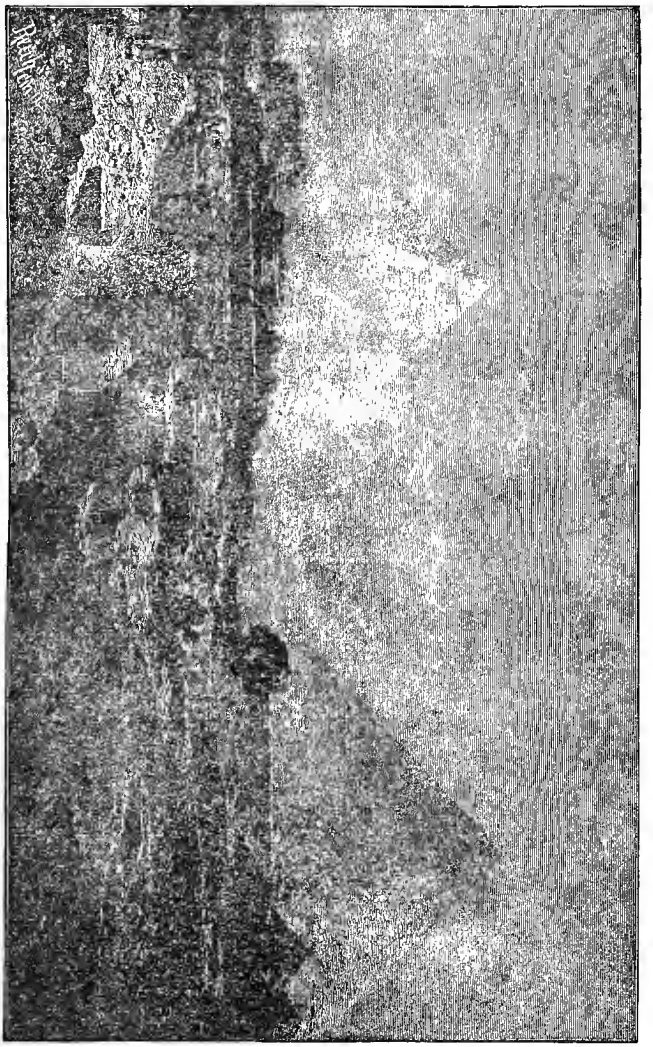


Tablet of Khufa at Wady Magharah.

the builder of the Great Pyramid, and was a warlike prince.

He made at least two expeditions to Sinai, and left the above inscription behind him, carved on the rocks of Wady Magharah, which represents him as striking down the chief of that district. As builder of the Great Pyramid, Khufa comes before us as a king of great ability and power. Passing by, for the present, all questions whether the building of the pyramid was the des-

potic act of a tyrant,[1] or a wise measure, furnishing employment to the people when the overflowing Nile prevented



View of the Great Pyramid and Vicinity.

all other work,[2] it remains true that a large body of inhabitants must have been subject to the ruling tribe.

Statue of Khafra.

According to the Abydus and Sakkarah tablets, Khufa was followed by a king named Ratatf.[1] Several monu-

[1] Wilson gives this name as Tetefra; we follow Sayce.

mental evidences of his existence are known,[1] and it is somewhat singular that these two tablets should contain his name if he were not a noted king. In the tomb of Queen Mertetfes, he is not mentioned. It is, therefore, supposed that he reigned but a few months at most.[2] He was followed by Khafra, the Cepheren of Herodotus. Here, again, we must notice that though Khufa had a number of sons, they were all passed by, and a chief not known to be related to Khufa chosen for the office of ruling chief or king. It is, indeed, suggested that he was married to the daughter of Khufa, and reigned in her right.[3] There is not a particle of evidence for this theory. This king was the builder of the second pyramid, bringing, for a portion of this work, granite from the very extremity of Upper Egypt.

We possess a remarkable monument of Khafra; it is nothing less than his statue. His connection with some other structures near the Great Pyramid will be considered in its appropriate place. Among the titles of this king is one of considerable interest, since, though common on later monuments, it here makes its first appearance; that is, *Sa Ra*, or "Son of Ra"—Ra being the sun-god.[4] The successor of Khafra was Menkara, a person not known to be related to Khafra, who had at least two sons survive him. He was the builder of what is known as the Third Pyramid.[5] It is called the Red Pyramid, because its external casing was the red granite of Seyene. The

[1] Wilson: "Egypt of the Past," p. 84.

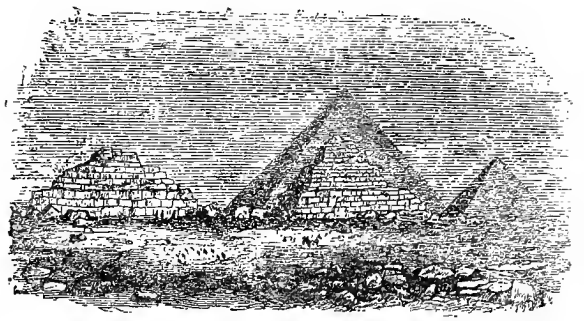
[2] Rawlinson: "Ancient Egypt," Vol II., p. 257. But on this point we can not be sure. We know he had a "prophet" (Wilson, p. 84); so he might have had a pyramid and temple.

[3] Rawlinson: "Ancient Egypt," Vol. II., pp. 61, 62.

[4] Ra was the sun-god of Heliopolis. Perhaps this points to increasing influence of the Delta tribes.

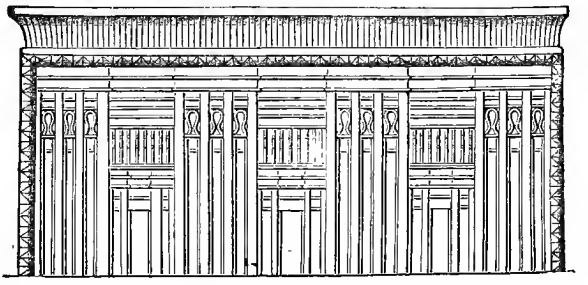
[5] See Petrie: "Pyramids and Temples of Gizeh," p. 63.

design of the pyramid was evidently changed after the construction was commenced; and tradition has it that this was due to a far later sovereign, but tradition is here probably at fault.[1] In this pyramid, Colonel Vyse found the immense sarcophagus of Menkara, and a wooden mummy-case with his hieroglyphics on it. The lid contained, in hieroglyphic writing, the following address to the mummy: "O Osiris, king of Upper and Lower Egypt, Menkara,



View of the Third Pyramid.

Mummy-case of Men-ka-ra.



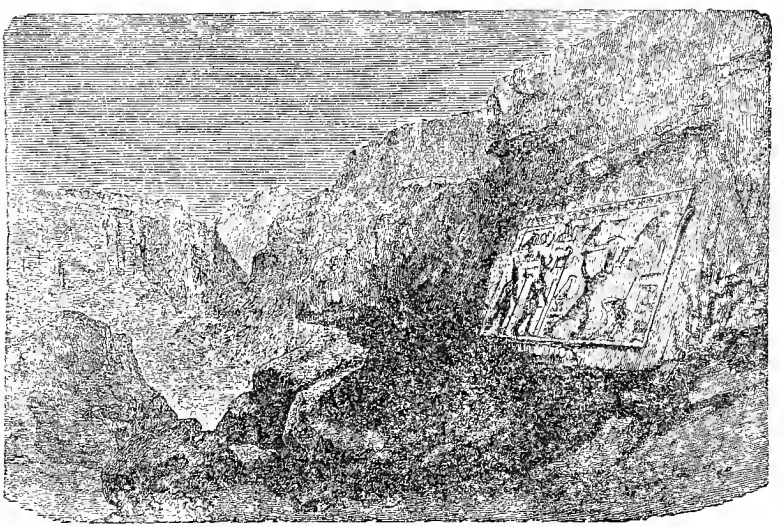
Sarcophagus of Men-ka-ra.

living eternally, engendered by the Heaven, born of Nut, substance of Seb, thy mother, Nut, stretches herself over thee in her name of the abyss of Heaven. She renders thee divine by destroying all thine enemies, O King Menkara, living eternally."[2]

[1] Petrie: "Pyramids and Temples of Gizeh," p. 63.

[2] Rawlinson: "Ancient Egypt," Vol. II., p. 64.

We are now introduced to a long series of years containing but little to detain us. Manetho speaks of a change of dynasty one reign later than the time of Menkara. It is the opinion of some of the later scholars that there was no good reason for him to make such a division. We are, at any rate, ignorant of the revolution, if any occurred. Memphis continued to be the capital, and, as far as we can decide from the monuments, Egyptian



Tablet of Sakura at Wady Magharah.

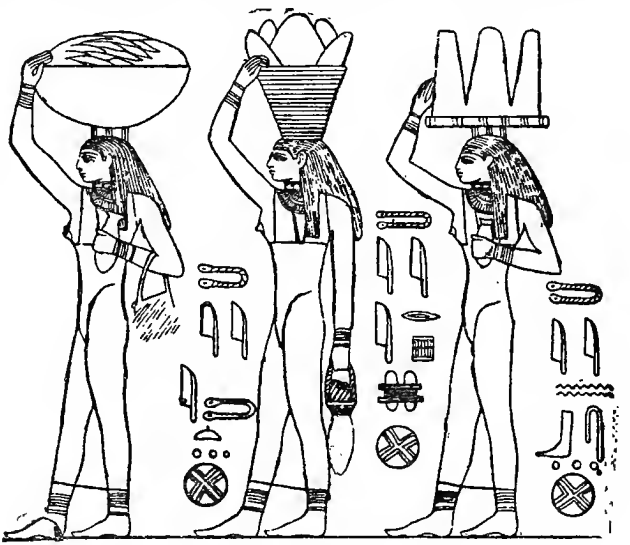
affairs continued in the same channel.[1] Menkara was succeeded by Ases-ka-f, though this name is also spelled differently, some preferring to call him Shep-sesk-af.[2] He also built a pyramid which was called "Keb the Cool."[3]

In Manetho's fifth dynasty we have a list of nine kings. The monuments give us the names of ten. We have but little to say of this dynasty. A tablet at Wady Magharah

[1] Rawlinson: "Ancient Egypt," Vol. II., p. 68.

[2] Sayce and De Rouge prefer the former term; Brugsch and Rawlinson the latter. [3] Sayce says this was the Brick Pyramid; others think it not yet identified.

represents the second king, Sakura, as a conqueror in that section. The fourth king of this dynasty, Nofer-ar-ka-ra,[1] gave his daughter, Nefer-ho-tep, in marriage to a man by the name of Ti. His tomb, discovered at Sakkarah, was brilliantly illustrated with scenes of his life. We present two views of the same. The first represents a procession of his female slaves, each carrying some article of his property; the second, a procession of donkeys, laden with



Scene from the Grave of Ti.

panniers of grain. The load of the second donkey is about falling, and we notice what energetic steps the men servants are taking to prevent the threatened catastrophe. Other scenes represent Ti hunting and fishing in the Nile.[2]

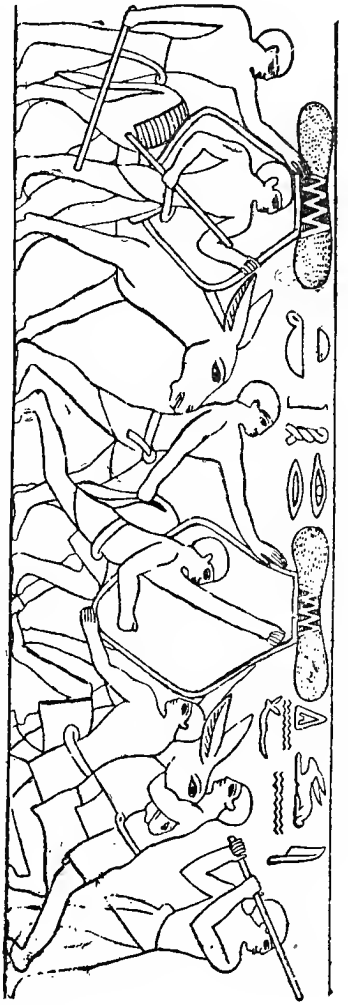
We have a picture of the eighth king of this dynasty, Men-kau-hor, found on a slab built into one of the walls of the Serapeum at Memphis. The reign of the ninth king, Tat-ka-ra, is of interest to us, since, in a tomb of this

[1] See Sayce's list, p. 284. The spelling varies in different authorities.

[2] See Villiers Stuart: "Nile Gleanings," Chap. vi.

period, was found the most ancient manuscript known to us, written by Ptah-hotep, the son of some former king. It is called the "Precepts of Ptah-hotep." It was written when its author was a very old man, and is a treatise on philosophy.

One of its most beautiful passages is as follows: "If thou art become great after thou hast been humble, and if thou hast amassed riches after poverty, being because of that the first in thy town, if thou art known for thy wealth and art become a great lord, let not thy heart become proud because of thy riches, for it is God who is the author of them for thee. Despise not another who is as thou wert; be towards him as towards thy equal." And here is another full of practical sense: "Let thy face be cheerful as long as thou livest; has any one come out of the coffin after having once entered it?"[1]



Scene from the Grave of Ti.

With the tenth king of this dynasty, Unas, about whom but little is known, the period of Egyptian history commencing with Seneferu comes to a close. It is the first

[1] Wilson: "Egypt of the Past," p. 108.

historical period of Egypt proper. During this entire period, we have not one instance in which it is known that a son succeeded the father. We have several instances in which we are sure that surviving sons of a deceased king were passed by and another person elected to the office of king. The probabilities are that this office was elective. The kings are generally spoken of as ruling over Upper and Lower Egypt. Whether this be a fact or not is another thing. Certain it is that all the historical monuments are located near Memphis, though, as we have seen, they worked the copper mines at Wady Magharah, and they also brought granite from Seyene. Still we are not sure of the extent of their territory.[1]

Men-kau-hor.

The sixth dynasty opens up a new chapter. The Turin papyrus regarded Unas as closing an important period of history. It then gives the number of kings up to that time and the years of their reign. Manetho seems to be in some uncertainty as to the name of this

[1] See Rawlinson: "Ancient Egypt," Vol. II., p. 98.

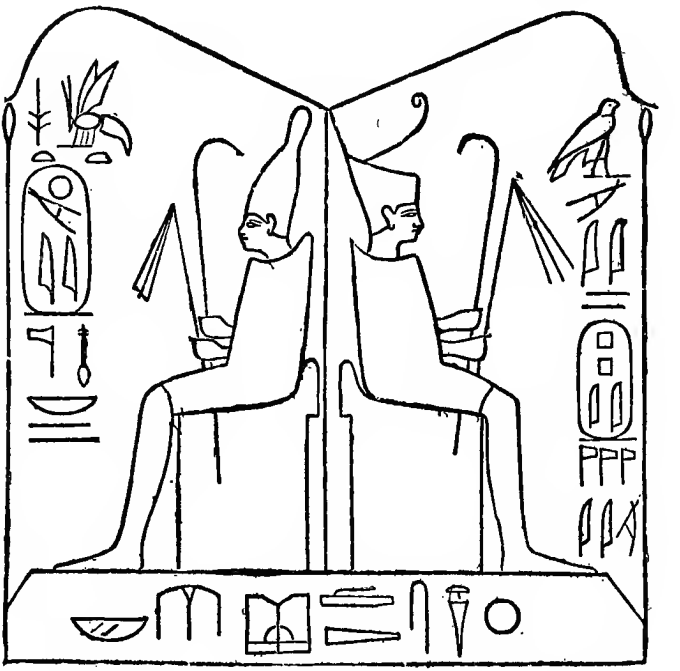
dynasty. He calls the fifth dynasty Elephantine, and the sixth dynasty Memphite, thus indicating that there was considerable difference between these two dynasties. The monuments, as read by modern scholars, change this order somewhat. As we have said, we can detect no reason for dividing the kings from Seneferu to Unas into two dynasties; for all we can see, they were both Memphite. But the so-called sixth dynasty has its seat of power further up the river. It is no more Memphis and its neighborhood alone, but it is in an especial manner Middle Egypt, which, henceforth, reveals to us recollections of the kings.[1] It is certain that the kings of the sixth dynasty sometimes visited Elephantine, whether they came from there or not.[2]

It is to be noticed that the invasion comes from the south. There was undoubtedly a period of confusion preceding the ushering in of the new ruling tribe. It is doubtless for this reason that a discrepancy occurs between the various lists of kings.[3] The first great king of the new dynasty, perhaps the first to securely unite the country under his rule, was Pepi, though he was also called Merira. We have one tablet in which two representations of him appear, seated back to back, one named Pepi and one Merira. With the sixth dynasty we have the first historical evidence of a united Egypt, and Pepi appears as the first great warrior. His name has been found on a carved block at Tanis, in the north-eastern part of the Delta, and the rocks of Seyene are also covered with his inscriptions.

We find Pepi exercising authority over the Negro

[1] Brugsch: "Egypt," etc., Vol. I., p. 96. Rawlinson: "Ancient Egypt," Vol. II., p. 97. [2] Inscriptions of Una, in "Records of the Past," Vol. II., p. 4.
[3] See Sayce's list, p. 284.

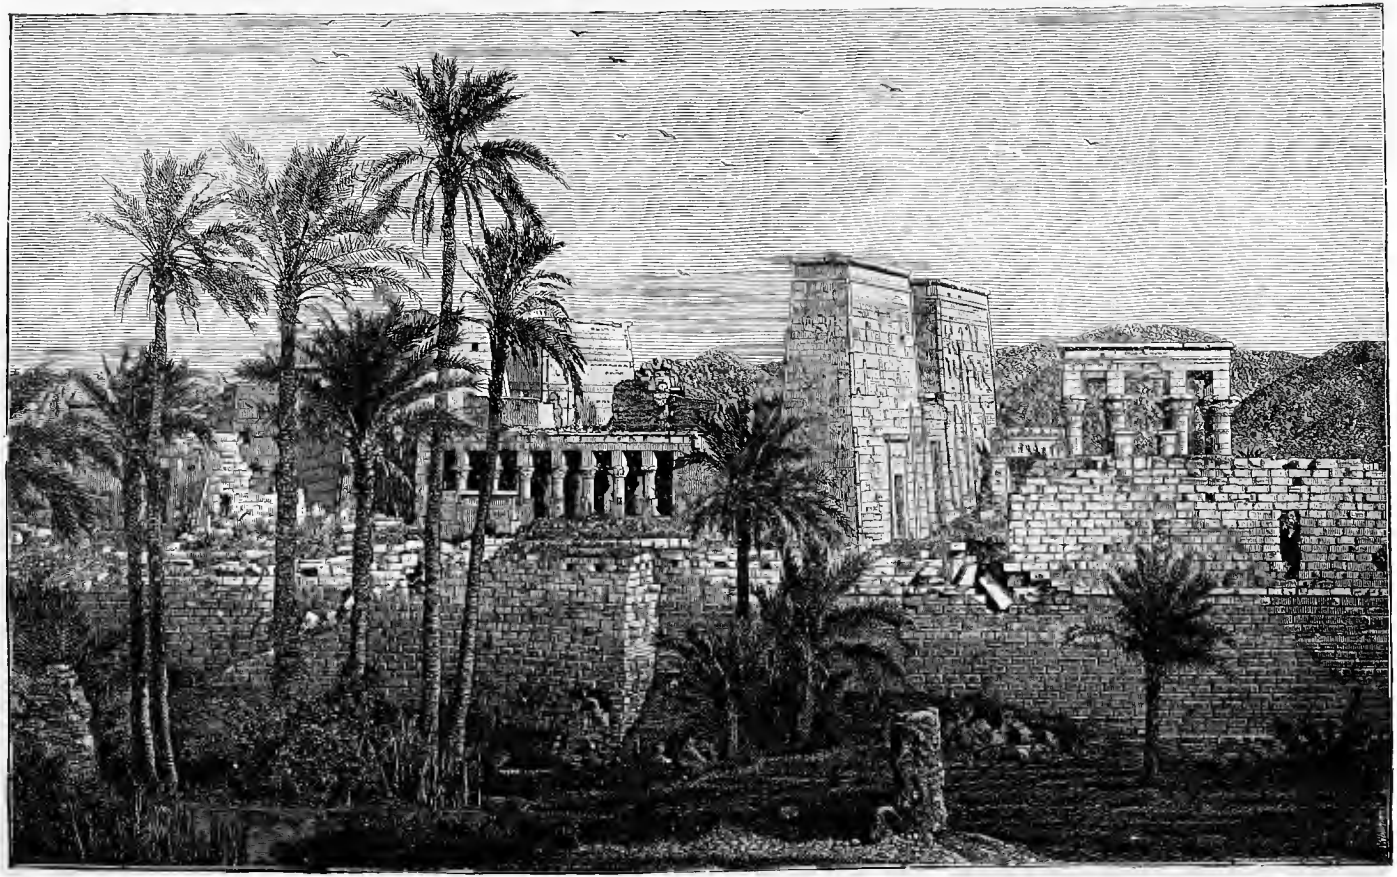
tribes of Soudan. A large part of his army was composed of recruits gathered from thence. Considerable speculation has been indulged in as to when this conquest of Soudan occurred, and why it is that we do not hear of it at an earlier date in Egyptian history. We doubt whether Soudan was ever under the rule of the Memphite kings.



Tablet of Pepi.

It might have been long subject to the tribe at Elephantine, and perhaps this explains why it was that this tribe from the extreme south was able to subjugate all Egypt.

We have already pointed out that we need not be sure of the extent of authority of the Memphite kings in the Delta. Certain it is that King Pepi gathered an army to complete his conquests in that section. We find him subduing and driving out tribes from the Delta. These



502 RUINS—ISLAND OF ELEPHANTINE.

were probably Semitic tribes from Western Asia, or they may have been Hittite tribes from Asia Minor. These various details from the life of Pepi are known mainly from inscriptions in the tomb of his principal minister, Una.[1] Another thing we are to notice is that the crown now passes by inheritance, Pepi being succeeded by his eldest son, Mer-en-ra.

All the great empires of antiquity stood on foundations of sand. They failed to grasp the true idea of empire. They kept tribal lines distinct, and demanded of the subjected tribes tribute, while permitting them to conduct their own affairs as seemed to them good. The empire was a loose conglomeration of separate states held together by fear, which would certainly attempt to recover their independence whenever they deemed the occasion propitious. When by such means the ruling tribe was overthrown, a period of anarchy, of a longer or shorter duration, nearly always ensued. Finally some other tribe or people, by a combination of successful circumstances, would succeed in making themselves masters. It is evident that they held this position only by means of brute force. This was at least true for a time; but when a long succession of vigorous princes had administered the affairs of the new empire, the various tribes, grown accustomed to the new order of things, would not be so apt to attempt a revolution.

We have seen that the fifth dynasty was succeeded by a period of confusion, and then the so-called sixth dynasty comes before us. We have just given a brief sketch of Pepi, the great king, perhaps the founder of this dynasty. His successors were by no means his equal. His eldest son, Mer-en-ra, did not reign long. He was succeeded by

[1] See "Records of the Past," Vol. II., p. 3.

Nofer-ka-ra, the second son of Pepi. Of these two kings we know but little, though the latter is supposed to have reigned for twenty years. His successor is said to have been a queen, Nitocris. We have no monumental evidence of her reign, but Manetho and the Turin papyrus both mention her. Tradition has it that she finished the third great pyramid, begun long before by Men-ka-ra; but Petrie's researches seem to contradict this tradition: he decides that the style of work was all of the fourth dynasty.[1]

The reign of Nitocris, if there were such a queen, is supposed to have closed the sixth dynasty, and with it the oldest period of Egyptian history. A period of unknown duration, lasting possibly for some centuries, intervenes, and, during all this time, we know almost nothing of Egyptian history. The monuments are silent, and we can only surmise that there was no strong and stable government in all Egypt. The country was divided into a number of little confederacies. When next the clouds disappear, we are conscious of considerable change in culture. Let us here stop and summarize the history of the older period, and glance at its Civilization.

Of the six dynasties of the older writers, the first three are in no very strict sense of the word historical. None of the monumental lists of the kings agree. We do not know the grounds Manetho had for his divisions. All we need be sure about is that preceding the fourth dynasty was a period as yet but little known, when a line of kings at Memphis ruled a considerable section of Egypt. It is, however, useless to attempt to define the extent of their territory or power. Commencing with Seneferu, we come upon a line of kings, for the existence of which we have

[1] "Pyramids and Temples of Gizeh," p. 64.

considerable monumental evidence. Manetho divides this list into two dynasties; on what grounds it is impossible to say. A time of confusion now ensues, and a tribe from the south, possibly from Elephantine, who seem previously to have subjected Ethiopia, succeeded in reducing all Egypt to their rule. Their great King Pepi is the first king of whose rule in the Delta we have historical evidence. This energetic tribe, for a brief period, averted the downward course of the Old Empire; for only a few reigns pass until the historic light suddenly dies away: the Old Empire is a thing of the past.

Let us now inquire more particularly into the culture of this Old Empire, whose history we have now outlined. If we have difficulty in drawing up an historical outline, we may expect a still greater difficulty in coming to any conclusion as to its culture. In fact, on some points, we know almost nothing with certainty. We have pointed out that the king seems to have been an elective officer. We have no evidence on this point further than what we have already given.[1] He was, of course, an official of great power and importance, and entitled to and receiving very great respect and honor. We learn in one place that ordinary people, at least, were expected to prostrate themselves before the king.[2] The authority of the king is generally represented as being absolute; but we believe Prof. Sayce is right when he asserts that "affairs were really managed by an organized bureaucracy."[3]

The council, that constant phenomenon of tribal society,

[1] The Prissi papyrus, speaking of the accession of Senefern, says: "Then was *raised up* the holiness of King Seneferu." The language seems to indicate some mode of election As to classical traditions, see Wilkinson: "Ancient Egypt," Vol. I.

[2] Inscription from the tomb of Ptah-ases, at Sakkarah, of the fourth dynasty.

[3] "Ancient Empires," p. 85.

was undoubtedly in existence, but it must have varied under each dynasty. We catch glimpses of a council of thirty at a later era.[1] Each subordinate nome appears to have been free to govern its own affairs, and we may be sure that the usual workings of tribal society were here to be seen. They were compelled to yield tribute to the ruling tribe, and to furnish their complement of soldiers in case of war; but we may be reasonably sure that, in matters of religion and law, the ruling tribe neither claimed nor exercised any authority. In times of war, the king appeared as commander-in-chief, but his council of thirty accompanied him, and probably exercised some sort of authority over him.[2] The soldiers of the subjected nomes were probably immediately under their own tribal officers, but all superior officers were members of the ruling tribe.[3]

Of course, the great monuments of this period are the pyramids. They have been described so often that we need only make some general remarks in reference to them. The pyramids are simply the final development of the tombs of a simpler age. The first material made use of in Egypt for building purposes was undoubtedly wood. All buildings composed of this material long since disappeared, yet in the oldest and most archaic form of stone structures the ornamentations there displayed are clearly copies of wooden structures. Here, for instance, is the door of a tomb near the pyramid. The forms here carved in stone are simply copies of what previously existed, in a natural state, in wooden structures.

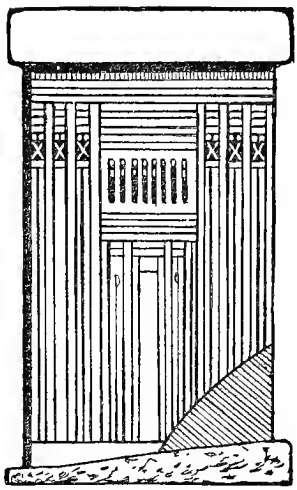
The Egyptians, along with their other religious notions,

---

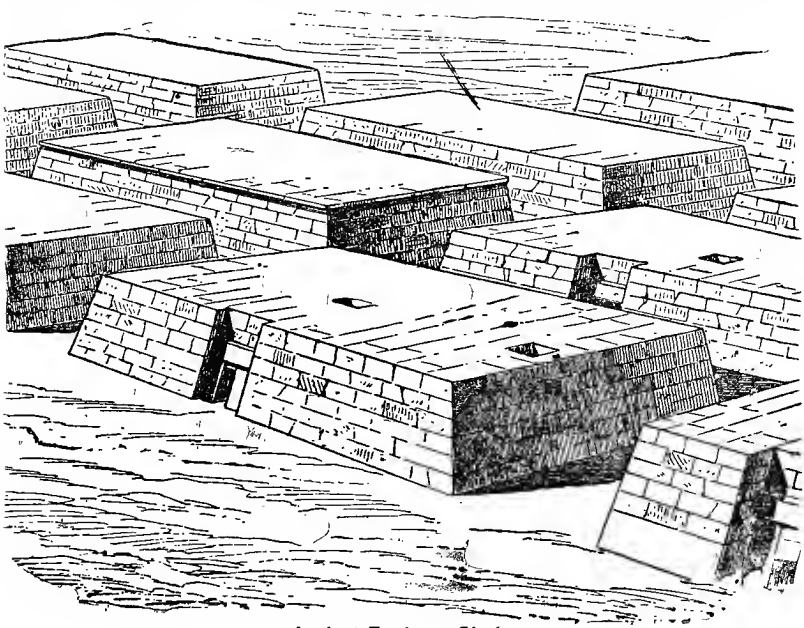
[1] Birch: "Egypt from the Earliest Times," xviii. [2] Ibid.

[3] This appears in the account of the army gathered by Una for Pepi; but supply the reading in note 1. ("Records of the Past," Vol. II., p. 5.)

undoubtedly believed that the future life was to be, in the main, a continuation of the present. Hence their anxiety to build enduring tombs, and to carve and paint on their walls a history of the life of the deceased; for this tomb was to be the eternal home of the departed, and the scenes there portrayed would constantly recall to them happy events in earthly life. So the tomb of the first period took its rise. To make it enduring, they used stone before they thought of using it in other structures; and, as we have seen, the doorways are carved to imitate wooden ones. Such a tomb always consisted of three parts. The first part is

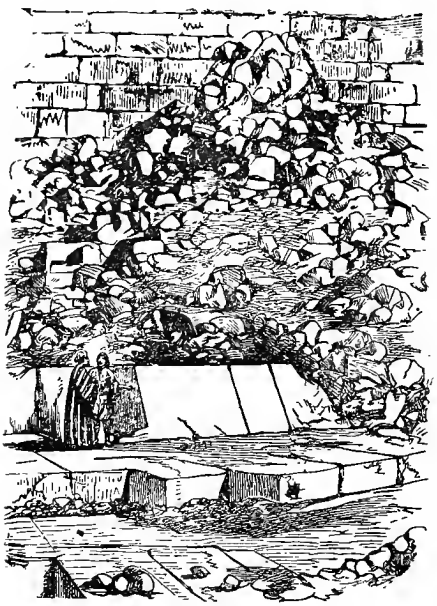


Doorway of a Tomb, Carved to Imitate Wood.



Ancient Tombs at Gizeh.

the small building rising above the ground. This was the ornamented part. In this place relatives assembled from time to time, bringing offerings for the deceased, to whom they prayed for protection, for Ancestor worship was strongly developed amongst the ancient Egyptians.[1] The body was not buried in this part of the tomb. A rectangular and vertical well opens in some corner of this building, the depth of which varies. At the bottom is the subterranean mausoleum, where the mummy was placed; but we are concerned with this external part, the mastaba. The pyramid is this mastaba, greatly enlarged, the sloping sides carried nearly to a point, and mainly built solid throughout. They were built as tombs for the Egyptian kings, and their greater size and magnificence were due to the exalted station of the king.

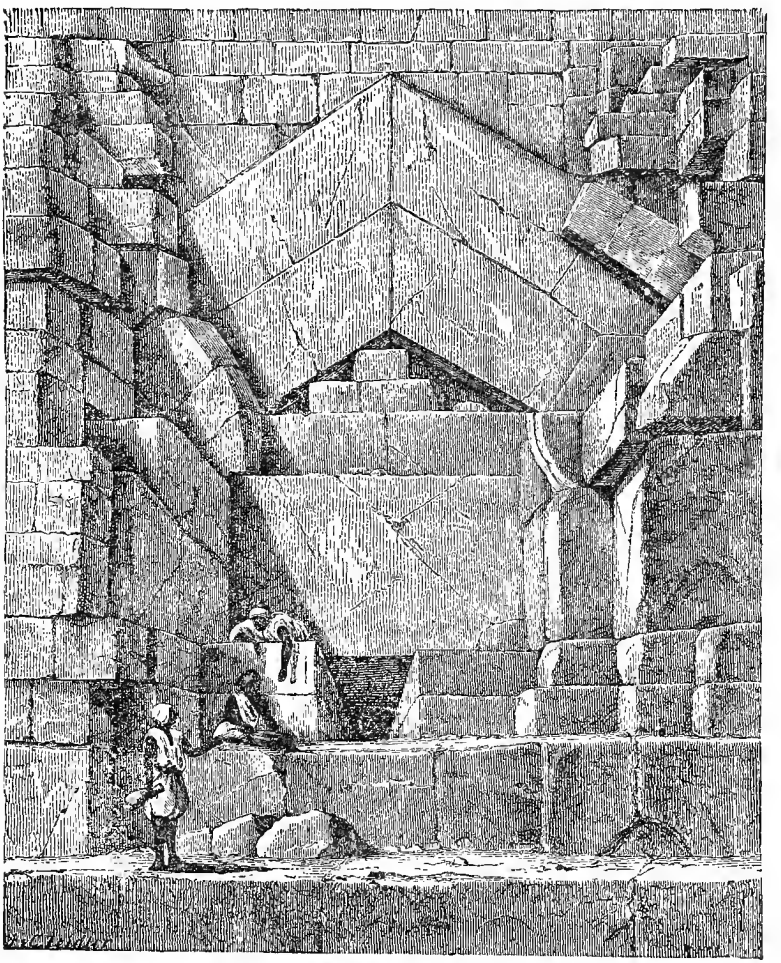


Outer Casing-Stone of the Great Pyramid.

The stepped pyramid at Sakkarah[2] gives us the idea of how pyramids were built. In the complete pyramid, when the structure was brought, by this succession of smaller superimposed platforms, nearly to a point, a facing was added, composed of finely-cut polished stones, which left the outer surface one uniform slope throughout. This has mainly fallen, or rather it has been removed to erect

[1] Rawlinson; "Story of Egypt," p. 58. [2] See cut, p. 478.

other buildings with. Each pyramid contains one or more chambers, in one or more of which kings were buried. True to the original form of the tomb, this

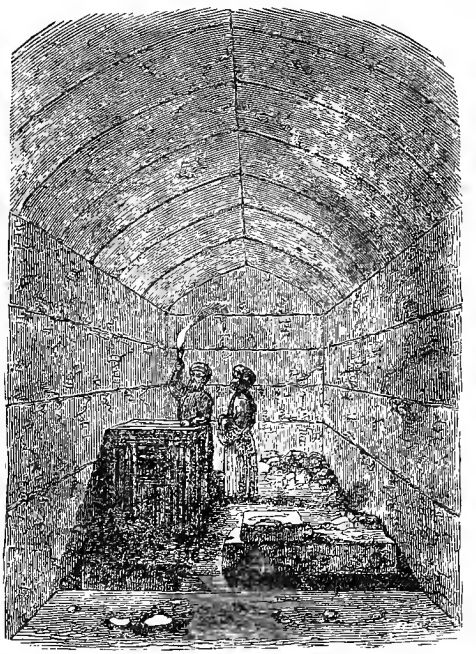


Entrance to the Great Pyramid.

burial chamber was sometimes excavated in the rocks on which the pyramid rested. This was the case in each of the great pyramids. A sloping passage-way, lined with

finely cut and polished granite, led from the surface to this sepulchral chamber. This is a view of the burial chamber in the third pyramid.

Once some seventy pyramids were to be found strewn along the desert from Memphis to Meidoom. Each of these was the tomb of a departed king. None of the elements of Egyptian chronology gives a person a clearer idea of the passage of a long lapse of years than this array of pyramids. We must remember that the building of pyramids went out of fashion about or before the eleventh dynasty; before that time, then, at least seventy kings reigned in Egypt of sufficient strength and importance to rear for themselves these stately tombs.[1] They vary greatly in size.



Tomb Chamber in the Third Pyramid.

The pyramid of Khufa, known as the Great Pyramid, is the largest, and was reckoned as one of the Seven Wonders of the Ancient World. It has been described so very often that we will simply content ourselves with giving in a note some of its dimensions, and other items of interest concerning it.[2]

---

[1] See Villiers Stuart: "Nile Gleanings," p. 316.

[2] For a view of this pyramid, see page 491. The dimensions taken from Petrie's

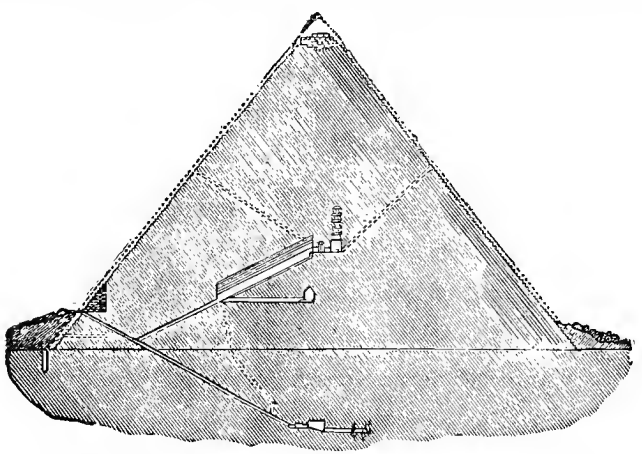
The three greater pyramids are close together. In connection with the second pyramid, that of Khafra, some other structures deserve mention. We have seen that ordinary tombs were provided with a memorial room, where the survivors met to pray to their ancestors, and to bring them offerings and sacrifices. When the mastaba was converted for the kings into a pyramid, small tem-

---

excellent work, "The Pyramids and Temples of Gizeh," are as follows, expressed in British-Imperial inches:

| | |
|---|---|
| Length of north side | 9069.4 inches. |
| Length of south side | 9069.5 " |
| Length of west side | 9068.6 " |
| Length of east side | 9067.7 " |

The height is 5776 inches. Around the entire pyramid there was a limestone pavement, varying in width from 529 to 628 inches; in thickness, from 17 to 27 inches. On the east side was a section of basalt pavement—blocks of basalt laid on a pavement of limestone. This section of the Great Pyramid gives us an idea of



Plan of the Great Pyramid.

the construction of the chambers and passages. The door-way, of which a view has been given, was entirely concealed by the casing, since the Arabs, near the beginning of the eighth century, forced a passage-way nearly one hundred feet in length through the solid masonry of the pyramid before striking the passage-way, following which they found the door-way. Some of the blocks used in the lower part of the pyramid are of very great size, weighing upwards of fifty tons. A great number of theories have been maintained in regard to this pyramid. Later scholars have so utterly rejected them that it is not worth our while to consider them.

ples were built in the immediate vicinity, where the dead kings were worshiped as gods. Such a temple probably stood on or near the basalt pavement of the Great Pyramid.[1] There was, similarly, a small temple in front of each of the second and third pyramids.[2] We might remark, in passing, that the priesthood of such a temple was a position of high honor. From the temple in front of the second pyramid a graded causeway, over a quarter of

The Sphinx of Gizeh.

a mile in length, and about fifteen feet in width, conducted to a second temple situated near the Sphinx, which has occasioned a great deal of discussion as to its age. We have already mentioned it as a possible monument of the age preceding Khufa.[3]

There seems to be some question, also, whether it be a temple or a tomb.[4] We have all evidence that the graded way leading from the temple of the second pyramid was

[1] Petrie: "Pyramids and Temples of Gizeh," p. 50.
[2] Mariette: "Monuments of Upper Egypt," p. 69.
[3] See page 467.
[4] See Mariette's discussion: "Monuments of Upper Egypt," p. 72.

lined with tombs.[1] It was in connection with this temple that the statue of Khafra[2] was discovered, and it is quite probable that this temple was also built by him.

All are further aware that in the immediate neighborhood of the three pyramids there is located that remarkable monument, the Sphinx. This is a natural rock, to which has been given the form of that mythical animal. The head has been sculptured to represent the head of an Egyptian king. Where the natural rock itself was not sufficient, rather clumsy masonry pieced it out. The body has been almost entirely buried in the sand. At present, its age has not been authoritatively determined. Mariette decides that it is older than the reign of Khufa;[3] but the ground of this decision rests on a tablet found in a temple of the twenty-first dynasty, and Petrie shows that we can not rely on it.[4] So we may be very doubtful whether the Sphinx be really a monument of the Old Empire.[5]

As to the customs, manners, mode of life and other details of their home culture, our information is solely derived from the painting on the walls of the tombs of their principal men. Rather than make any long comments on this branch of our subject, we prefer to let the cuts speak for themselves. Those thus far presented are scenes from tombs of the Old Empire.[6]

We now approach an important yet difficult portion of our inquiry; that is, the religion of the Old Empire. It is important because, as we have seen, the religious culture of a people is a good index of the general culture. It is difficult because there are so many conflicting views

---

[1] See Petrie, work cited. [2] See page 492.

[3] "Monuments of Upper Egypt," p. 71. [4] "Pyramids of Gizeh," p. 65.

[5] More recent authority still seems to be in favor of the more ancient date. (See Maspero, in "American Journal of Archæology" for 1886.)

[6] Tombs of Ptaḥ-hotep, etc.

as to what was Egyptian religion. We will attempt to give a general outline of this earliest period. Let us first make some general remarks on this subject. Unless we are completely in error in regard to the development of primitive religion in general, there must once have been a time when each tribe of the primitive Egyptians had a religion of its own, for religion, at an early stage, is always tribal. Though closely related tribes, as the Egyptians undoubtedly were, have much in common, yet the gods they worshiped must have been tribal gods, and the gods of one tribe were not supposed to have any interest in the gods of another.

We have also spoken of the mixture of people in Egypt and the probable conquest of a Turanian population by a Semitic people from the south. This mixture betrays itself in matters of religion and culture; for we certainly have, in the case of Egypt, a strange mixture of the lower and higher forms of religion. A few moments' reflection will show us the truth of this. Every one knows that one of the strangest features in Egyptian religion was animal worship. This is surely a survival of the lower stage of religious conception. We have seen that there are several lines of savage thought leading to the worship of animals. Among these, one of the most prominent is the totemic system. As people approach Civilization, and descent passes into the male line, this form of worship tends to disappear. Its survival amongst the cultivated people of Egypt is certainly very strange.

We have pointed out, also, the prevalence of Ancestor worship. On this point there seems to be no question amongst our modern investigators. As we have seen, the earliest tombs were provided with chambers, in which the members of the family met from time to time "and went

through various ceremonies—sang hymns, poured libations and made offerings—which were regarded as pleasing to the departed, and which secured protection and help to such of their descendants as took part in the pious practices."[1] Further, their idea of a future state was that it was to be a continuation of this life. So, quite naturally, the king, after death, takes his place among the gods, and temples are erected where he might be worshiped. As a necessary corollary of this Ancestor worship was a belief in a multitude of spirits—some evil, others good; and, to protect the living from the malevolent actions of the former, magical songs, holy writings and potent names were to be employed.[2]

All this was not peculiar to the Egyptian tribes, but was simply survival from savage philosophy in general. But, along with all this, we come upon a higher form of religious conceptions, due, probably, to the influence of another people. This is the stage of Polytheism, attained through Nature worship; that is to say, the gods are nature gods. And here we must not be surprised at the great confusion that meets us, for each great dynastic change, implying, as it does, a change of masters, means a change in the state religion; a new set of tribal gods are elevated to the supremacy, at least a new chief god is placed at the head of affairs. Nor is it at all singular to find these nature gods confounded, more or less, with the animal gods of the earlier period. Thus, for instance, Osiris was worshiped in one place as an ape; in another, as the bird bennu; in a third, as a sparrow-hawk, etc.[3]

It is impossible for us to more than give a mere outline

[1] Rawlinson: "Story of Egypt," p. 58.

[2] See "Magic Papyrus," in "Records of the Past," Vol. X. See, also, Sayce: "Ancient Empires of the East," p. 61.

[3] Tiele: "Egyptian Religion," Boston, 1882, p. 46.

of Egyptian polytheistic belief. It is fully in keeping with the development of Polytheism from Fetichism, to find that the oldest Egyptian gods were simply the earth and sky. Man everywhere, as we have seen, conceives the visible sky and the earth as the greater gods. The Egyptians, however, transposed the gender of these gods; whereas, while most of the primitive people conceived the sky as masculine and the earth as feminine, a different custom existed in Egypt. The god Seb represented the earth.[1] He is spoken of as the "father of the gods," or the "leader." The heavens took the form of a goddess, variously called Nu, Nut or Nu-tpe. She is spoken of as the wife of Seb. Her titles are, "the older," "the mother of the gods," "the mistress of heaven" and "the nurse."[2] It is not mere chance that, in examining a primitive Polytheism, we come once more upon the conception of the earth and sky as the first great gods, the parents of all the other gods.

Seb.

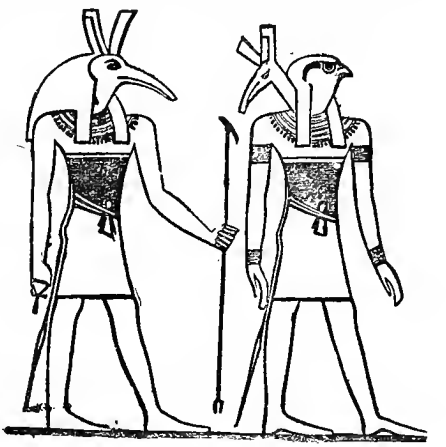
The Goddess Nut.

This is not the only parallel brought

[1] Tiele: "Egyptian Religion," p. 66. Harkness: "Egyptian Life and History," p. 39. The earth was masculine also among the Accadians.

[2] Rawlinson: "Ancient Egypt," p. 382.

to light between Egyptian Polytheism and other polytheistic systems. The night-sky, or darkness, is personified and considered as a god before the bright sky of day;[1] so, in Egypt, one of the most ancient gods of the list is Set, who was primarily the night;[2] but when dualism became a part of Egyptian religion, this god became the representative of evil. It is important to notice that Set was a Turanian god.[3] One form of his name was Suteckh,[4] and this was the god of the Hittites.[5]



Set.

No two people develop throughout in the same way. The ancient traveler, Diodorus, was struck with the fact that the Egyptians spent so much time over their tombs. It is, perhaps, not surprising that the god of the under world assumed such an important position in their mythology, and became, in fact, their supreme god, at least during the continuance of the Old Empire. In their choice of this god, we detect the principle on which they proceeded. The land of disembodied spirits was across the western deserts; when it was night here, it was day there, and so the sun of night, Osiris, became the god of Amenti, the home of the dead.[6] Osiris bore many titles,

Osiris (Louvre Bronze).

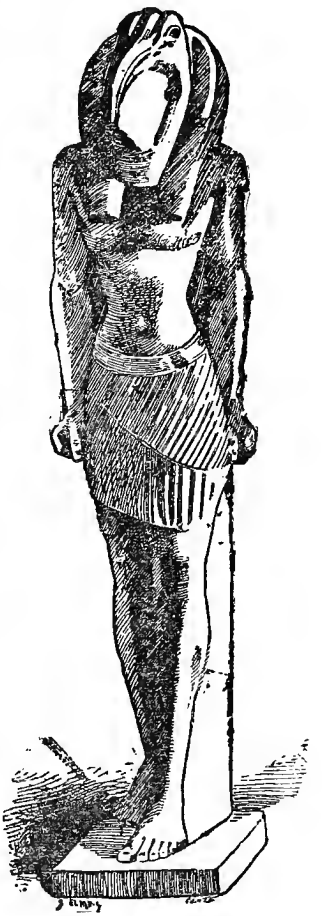
all expressive of his superior station. He is called "Chief of the Gods," "Lord of Life," "Lord of Eternity," etc. In process of time, when Set became the personification of evil, Osiris became the personification of good. He is, therefore, styled "the manifester of good," "full of goodness and truth," "the beneficient spirit," etc.[1]

We are not surprised to find that the moon, also, becomes a most important god. He is called Thoth, and, by a process quite natural, we can understand how he becomes, in a special manner, the god of learning; for science begins, for nomadic people, in observation of the heavenly bodies, and with some accurate measurement of time, and observation of the moon must have been first in both cases. Hence, we understand the old story that Thoth invented draughts and won the five intercalary days. That is to say, as more accurate measurements of time were made, it was discovered that, to complete the year, five more days were necessary. Hence it is that, as god of all science, he was supposed to have invented

[1] Rawlinson: "Ancient Egypt," Vol. I., p. 355.

letters, and so he was the one who inspired the writings of the holy books. We also see why it was that he was the god of the priests, and so the god of the religious. He it was who helped worthy mortals to pass the judgment seat of Osiris.[1]

In opposition to Seb, the god of darkness, we have the god of light, Horus, from *Har* or *Her*, meaning the most exalted, the highest. Originally, he was, we think, the day sky.[2] It is not strange, then, that, to represent this god, various names and titles were used. He did not always represent the sun, for the sun and the moon were sometimes spoken of as the eyes of Horus. As god of light, we have a representation of him destroying the great serpent of darkness, Apap. We must remember that in the name Horus was included a whole class of gods.[3] At Heliopolis, he was especially worshiped as Har-em-akhu—*i. e.*, "sun on the horizon"—and the Sphinx is, perhaps, a symbolical representation of this conception.[4]

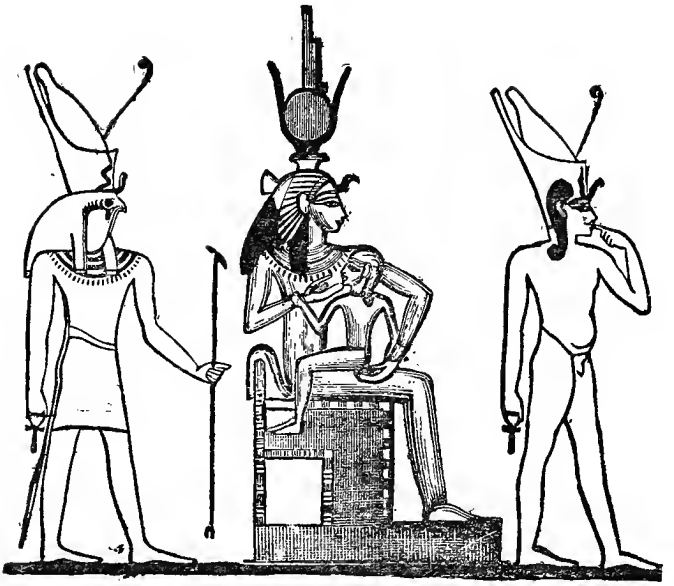


Thoth (Louvre Bronze).

By the side of the three greater gods we have now described, there are also three goddesses, who have much in common, and who are often confounded. These three are Isis (the dawn), Nephthys (the evening glow), and Hathor (the

[1] Tiele: "Egyptian Religion," p. 64. [2] See Tiele, p. 52 *et seq.* [3] Tiele.

[4] The inscription on the Sphinx, addressed to Thothmes IV., says: "Behold me, my beloved son Thothmes; I am thy father, Har-em-akhu."



Three forms of Horus.

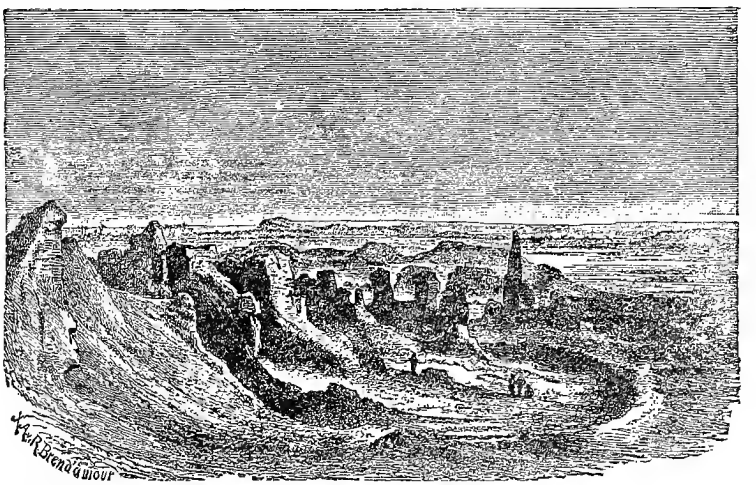
Horus Destroying the Serpent of Darkness.

nether world, the abode of Horus). Isis is generally regarded as the wife (and sister) of Osiris; Nephthys, of Set; and Hathor, of Horus. But the utmost confusion prevails in this matter.[1]

We have noticed that there were two main divisions of Egypt—Upper and Lower Egypt—and that they differed in quite a number of particulars. This distinction showed itself in matters of

[1] See Tiele.

religion as well. This is not at all singular, when we reflect on the probable development of these two sections. In each there probably arose two strong confederacies, contending for the mastery, and so in each there would be developed what we might call a state religion. The religious center of Lower Egypt appears to have been Heliopolis, a city near Memphis, generally called On or An. There was, as we would expect, much similarity

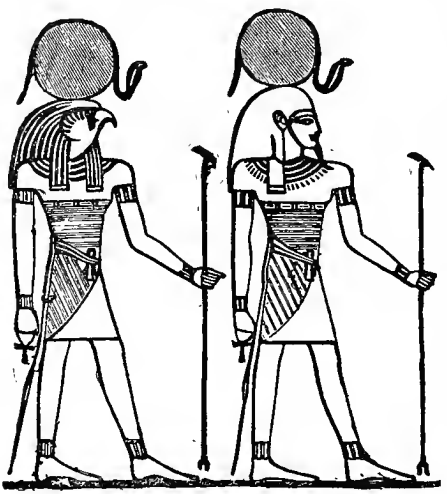


Ruins of Heliopolis.

between these two religions, since the people were closely related ethnically, and had the same elements to work upon. The main difference was this: the people of Upper Egypt had elevated to the rank of supreme god Osiris, the sun of night, the god of the underground world. The people of the north worshiped, as their principal god, Ra, the sun of day. In other respects, the two systems had much in common. Horus was common to them both. Osiris was regarded as the same as Tum, the sun of night of Lower Egypt, and he was frequently confounded with him.[1]

[1] Tiele: "Egyptian Religion," p. 76.

When the two sections became united, there was union of these two religions. As stated, they were but two slightly different forms of the same mythic conceptions. "Upon the same extremely ancient monuments on which we read the names of Osiris and Isis, there occurs, in brotherly union with these, that of Ra, the chief god of On (Heliopolis). The place he takes in the Book of Dead is in no way less honorable and important than that assigned to Osiris. They are there confounded with each other: now the one, now the other, being the greater; now the one, then the other, being mediator."[1] The ancient Egyptians clearly enough understood that there was, in effect, but little difference between the two systems.

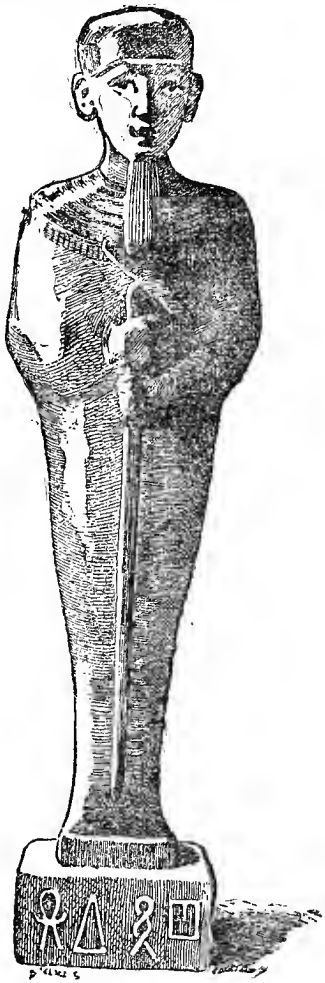


Ra of Heliopolis.

We have now given an outline of the chief gods of the Egyptian pantheon under the Old Empire. These gods were nature gods, and their worship was extended far and wide over united Egypt. Along with them, there were, of course, local tribal gods. We need not stop to learn about many of the latter. We must, however, mention Ptah, the local god of Memphis, who, when Memphis became the capital of the New Empire, became a god of great celebrity. It is difficult to say what, if any, cosmogonic principle he represents. Local and tribal gods may have arisen from

[1] Tiele: "Egyptian Religion," p. 75.

other sources than the forces of nature. The temple of Ptah, at Memphis, was a magnificent structure.



Ptah (Louvre Bronze).

Many have heard of the myth of Osiris and Isis. It is worth our while to examine it, since it will once more illustrate to us how mythic stories originate. Osiris is said to have been an ancient king; Isis, his sister and queen. His brother, Set, or Typhon, desiring to seize on the kingdom, forms a conspiracy to murder Osiris. He succeeds in his purpose, and the body of Osiris, put in a chest, is flung into the Nile. Isis and her sister, Nephthys (the wife, by the way, of the assassin), fill the air with their lamentations. Isis sets out to discover her murdered husband's body. She succeeds in her quest, and, finally, after numerous mishaps, buries him in a stately tomb. Meanwhile Horus, the son of Osiris, sets out to avenge his father's death. The conflict with Set was long and obstinate, but Horus was finally successful. Osiris had indeed become lost to earthly life, but he ruled as king in the nether world.

This is but another form of the story of the conflict between light and darkness, in which mankind, in the infancy of the world, delighted to indulge. It is the poetic

statement that the old sun of day has finally been put to death by oncoming night. Isis, "the morning dawn," and Nephthys, "the evening glow," have wept for their husband and brother, and the heavens have wept with them, until all the sky is suffused with redness. In the meanwhile, Horus, the god of light, has entered on a vigorous campaign against night, and finally is triumphant. Does not day finally triumph over night?

Every nation of antiquity had a collection of writings which they regarded as sacred. In every case these writings form a collection of very different ages and of unequal merit. Egypt is no exception to this rule. Their sacred writings are known to us as the "Book of the Dead." Some chapters are acknowledged to be very old, but the greater part, as it now exists, consists in additions and commentaries on the few ancient sections. It is really a collection of magical papyri, a knowledge of which will enable the deceased one to overcome the many obstacles in the way of attaining eternal bliss. Such was its magical virtue that copies were buried with the dead, or the coffin was covered with inscribed texts. The end of the first chapter promised the reader all manner of blessedness if he would but commit the book to memory. So it became customary for the people to learn it off by heart. Probably some portions of this book were in existence in the time of the Old Empire.

We have now tried to give a fair and measurably full account of the religion of the Old Empire. Quite a number of scholars have insisted that the ancient Egyptians believed in one only God, who had no beginning and would have no end; in a word, that the original faith in Egypt was monotheistic, from which high level the people gradually sank to Polytheism, and then to animal worship.

From all that we can see, this is the exact reverse of the facts of the case. The worship of animals, the strong fetichistic element in their faith, and the belief in magic, are but survivals from the first stage of belief. They had arrived at an advanced stage of Polytheism. Their gods were nature gods. They were the fetich gods of the first stage, now become disassociated from their material objects. But the constant tendency of Polytheism is towards Monotheism. The only question is, how far had the Egyptians progressed in this direction? It is evident, to say the least, that no high conception of God had been formed. Nothing worthy of being dignified as Monotheism existed under the Old Empire.[1] We call especial attention to the fact that in religion, also, we see before us the result of a mixture of two people and two cultures.[2]

We are now to bid good-by to the Old Empire of Egypt. The pyramids still uprear their lofty forms, proud memorials of her palmy days. We gaze on the funeral inscriptions in her tombs, and read the doings of princes and chief men. After all, we see but a dim picture, distorted by the mists of upwards of forty centuries that have rolled by since the last king of the sixth dynasty sat

---

[1] For authority for taking the higher view of Egyptian religion, see Lenormant. ("Ancient History of the East," Vol. I., p. 318.) He supports the "degradation" view of Egyptian religion; also, Wilkinson ("The Ancient Egyptians," Vol. I., p. 471); also, Rawlinson ("History of Ancient Religion," Vol. I., p. 313). On the other hand, see Mariette-Bey ("Monuments of Upper Egypt," p. 24). He shows that from the monuments we have no support for this theory. "They nowhere speak of one invisible God." Sayce ("Ancient Empires of the East," p. 58) contents himself with remarking that the "exact character of Egyptian religion is a matter of dispute." For a discussion of this whole subject, we would refer to Tiele's work: "Egyptian Religion," Chap. ix.

[2] We do not here refer to the supposed fact that the priest had one religion and the common people another; we think there is very little ground for that idea (Tiele, p. 217: "A mere fancy of modern times"); but to the fact that we see a singular mixture of comparatively high and very low religious ideas, ranging from animal worship to almost Monotheism.

on her throne. Other empires have come and gone, a new world has been discovered and settled, since that time when Pepi gathered his armies to subdue the insolent tribes of the Delta. Yet the Nile placidly flows on as of yore, the Sphinx still confronts the rising sun, and the pyramids of Gizeh keep watch and ward over Cairo, as they once did over Memphis, the city of Menes. So, no doubt, the river will continue to flow, and the monuments remain in existence, until the present nations of the earth, if they exist at all, will be so changed that the historian only can reconstruct the past. But let us hope that the course of human progress will ever be upward and onward, and that the people of forty centuries hence can point out wherein their Civilization as greatly exceeds ours as ours does that of Egypt under the various dynasties of the Old Empire.

## EGYPT CONTINUED.

THE period of darkness—Rise of Thebes—The eleventh dynasty—The Middle Empire—The twelfth dynasty—Amen-emhat—The Obelisk kings—The Fayoum—Amen-emhat III.—The thirteenth dynasty—Religion of the Middle Empire—Civilization of the Middle Empire—The story of Saneha—The interval of time between the twelfth and eighteenth dynasties—The Hyksos invasion—The Shepherd kings—The Hittites the Shepherds—The details of this invasion—The culture of the Hyksos kings—The seventeenth dynasty—Expulsion of the Hyksos—The eighteenth dynasty—Invasion of Asia by Egypt—Queen Hatsu—Thothmes III.—Khuen-aten—Peculiarities of his reign—Culture of the eighteenth dynasty—Religion—Rise of the New Empire—The nineteenth dynasty—Seti I.—Rameses II.—The results of his wars—The decline of Egypt.

THE SHIFTING clouds of almost prehistoric times, through the rifts of which we have here and there caught glimpses of what is known as the Old Empire of Egypt, close down on the country near the end of the sixth dynasty, and for an unknown period of years, variously estimated at from one hundred and sixty-six to seven hundred and forty years.[1] We are almost completely in the dark in regard to Egyptian history. In our opinion, this period of time is nearer the shorter estimate than the longer one. The sixth dynasty was not able to weld the rival tribes into one compact whole. Finally, even the semblance of authority over the united tribes ceased, and they resumed their independence; only, we must understand, that here and there con-

[1] For various estimates, see Rawlinson: "Ancient Egypt," Vol. II., p. 123.

federacies composed of a few tribes, uniting for self-protection, were probably formed.

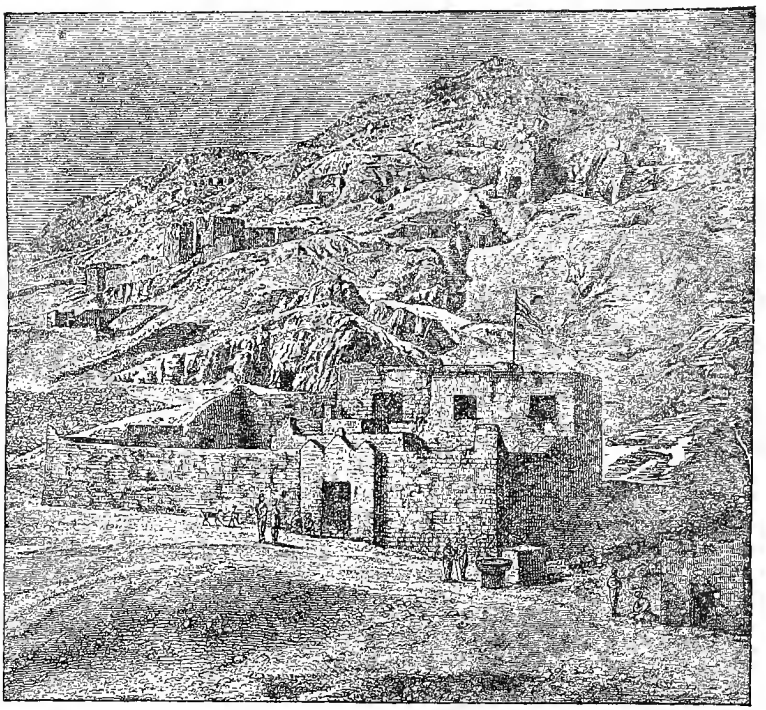
In short, the same fate had befallen Egypt that befell many another Oriental monarchy resting on tribal foundation. The political power of the ruling tribe had become weakened or dissipated. The empire, thereupon, disintegrated into its original elements. It is historically a blank, because no national monuments were erected; all were local and tribal. The time, whether long or short, was necessarily full of stirring events to the various tribes. There must have been the usual scenes of tribal life—the weaker tribes banding together to defend against the aggressions of the stronger. In the Delta, the tribes were exposed to invasions from both Asia and Libya. Probably various confederacies were formed to resist these assaults. The confused lists of the ruling chiefs of these various confederacies formed the dynasties from the sixth to the eleventh. Several of them are admitted by all scholars to have been contemporaneous.

It is supposed that Memphis was the head of one confederacy, and that the kings of the seventh and eighth dynasties of Manetho ruled there. All that we have to guide us are the names of the kings. Taking the Abydus list, it is noticed that the names have a resemblance to the names of the Memphite kings, such as Nefer-ka-ra, or some slight variant.[1] It is considered as quite probable that, while these kings were reigning at Memphis, another confederacy was at the head of affairs in the Delta. Its headquarters were in the Sethroite nome, in the north-eastern part of the Delta. Its capital city was afterwards known as *Herakleopolis Parva*, or Little Herakleopolis.[2]

[1] Wilson: "Egypt of the Past," p. 121.

[2] This is the view of Bunsen: "Egypt's Place in History," Vol. II., p. 243. (See,

This would be just where we would naturally expect to find another center of power. Here the ninth and tenth dynasties of Manetho are supposed to have ruled, while the seventh and eighth ruled at Memphis. We do not know Manetho's reason for dividing these kings into two divisions called dynasties.[1]



Rock Graves to the West of Thebes.

While these confederacies were thus dividing between themselves the power in Lower Egypt, still a third power

also, Rawlinson: "Egypt," Vol. II., p. 122.) Other authorities settle on Heracleopolis in Middle Egypt, about fifty miles south of Memphis. (See Wilson: "Egypt of the Past," p. 121.)

[1] On Manetho's dynasties in general, Rawlinson observes: "It would seem that the Sebennytic priest had made up his mind to have thirty dynasties down to the close of Egyptian independence, and was not very particular how he produced them." ("Egypt," Vol. II., p. 68.)

was growing in Upper Egypt, destined in time to sweep all before it, and to once again reünite the country under one rule, and to raise Egypt once more to the height of power. This new power was situated in the fourth nome of Upper Egypt. The name of the nome was Us, or Uas,[1] the capital city of which was T'Apu, which in Greek became Thebes. This nome was a rich and fertile one. The valley here has an average width of ten miles, through which the Nile flows in a northeasterly direction. "On either side the hills recede, and a broad green plain, an alluvium of the richest description, spreads itself out on both banks of the stream, dotted with dom and date palms, sometimes growing single, sometimes collected into clumps or groves."[2] We, of course, would expect this fertile nome to be in the possession of a rich and powerful tribe—one that would not willingly submit to be ruled from some distant point. We would naturally expect, therefore, that when the Old Empire went to pieces this tribe would be one of the very first to establish its independence, and set about the pleasing task of reducing the neighboring tribes under its yoke.[3]

The kings ruling at Thebes are said to belong to the eleventh dynasty, and the question is, how far were they contemporaneous with the other dynasties at Memphis and Herakleopolis? In other words, what was the length of time from the close of the sixth dynasty to the rise of the eleventh at Thebes? In our judgment, there are not reasons for thinking it very long. In our opinion, some of the more recent scholars have come to the wrong con-

[1] See Sayce's list: "Ancient Empires," p. 12; or, see map in Oncken's "Allgemeine Geschichte." [2] Rawlinson: "Ancient Egypt," Vol. II., p. 125.

[3] It may be that Thebes itself was not in existence during the Old Empire. Rawlinson thinks it was: "Egypt," Vol. II., p. 126. But see Tiele: "Egyptian Religion," p. 121. Lenormant: "Ancient History of the East," Vol. I., p. 213.

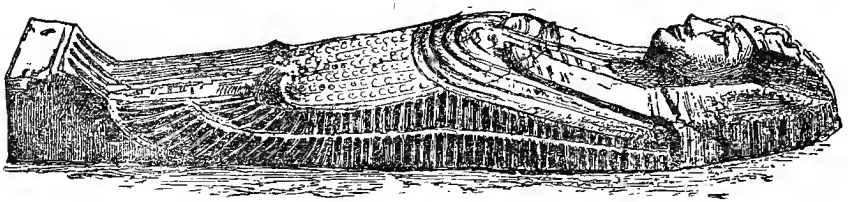
clusion in regard to the evidence of a change in culture observed in Thebes under the eleventh dynasty. Mariette observes: "When, with the eleventh dynasty, we see Egypt awake from her long slumber, all old traditions appear to be forgotten; the proper names used in ancient families, the titles of functionaries, the style of writing, and even the religion, all seem new."[1] Prof. Sayce also argues, from the same standpoint, that probably several centuries have elapsed.[2]

It seems to us that a very simple answer can be made to the foregoing. The various tribes of the Egyptians, though closely related, were by no means all the same. Each must have had its own laws, religion, culture and customs, and, in many small details, may have varied from the others. They may each have had special forms of hieroglyphic writing.[3] It is not at all improbable to suppose that they were even slightly different ethnically. Both Lenormant and Sayce think that the physical type of the Egyptians, from the eleventh dynasty down, is different from that of the Old Empire.[4] Whether or not other writers accept this view[5] is immaterial. The type may well have been different, because the ruling tribe was different. The tribe at Thebes, having such clear traditions of a southern origin, may have been slightly different ethnically. As to the great difference in art, it is sufficient to point out that M. Maspero claims to have established that there is no difference between the art of the sixth and that of the eleventh dynasty.[6]

---

[1] From Lenormant: "Ancient History of the East," Vol. I., p. 213.
[2] "Ancient Empires," p. 28.
[3] See Villiers Stuart: "Nile Gleanings," p. 387.
[4] "Ancient History," Vol. I., p. 212. "Ancient Empires," p. 6.
[5] On this point, see Rawlinson: "Egypt," Vol. II., p. 123.
[6] "American Journal of Archæology," 1885, p. 81.

We therefore think we are justified in saying that, within a comparatively short time after the disappearance of the Old Empire, three confederacies ruled in Egypt—the most southern one at Thebes, the middle one at Memphis and one in the northern part of the Delta. There may have been others, but, if so, their names and locations are unknown. The struggle now lies between these three powers as to which shall finally prevail and rule the whole country; but it is quite probable that this struggle for the supremacy was preceded by a long period of quiet, and we can finally see that when it arose the main competitors would be the confederacy at Herakleopolis and Thebes. Memphis would certainly be crushed between



Coffin of Antef, of the Eleventh Dynasty.

the two. The supremacy finally remained with Thebes, and we enter with the history of the eleventh (Theban) dynasty into the history of what is known as the Middle Empire of Egypt.

The Middle Empire furnishes us with three dynasties of kings. In the first of these three, or the eleventh dynasty of Manetho, we have a succession of kings who mainly bore the name of Antef or Mentu-hotep.[1] Judging from their names, Tiele concludes that their original town must have been Hermonthis, to the west of the Nile,

[1] It is generally stated that these names came alternately—that is, first Antef, then Mentu-hotep, etc. (Birch: "History of Egypt," p. 60.) But see Rawlinson's remarks. ("Egypt," Vol. II., p. 127.) Wilson thinks the Antefs should be set off by themselves into a separate dynasty. ("Egypt of the Past," p. 125.)

generally known as the southern An. The local god of this town was Mentu; hence the meaning of the name Mentu-hotep—*i. e.*, "united with Mentu." This god Mentu was also the war-god of the Thebans.[1]

Their chief city appears to have been Coptos, in the valley of the Hammamat, which contained not only rich stone-quarries, but commanded the route to the Red Sea from Thebes.[2] The local god of Coptos (from which word, by the way, comes our modern word Coptic) was Chem, who in one inscription is named "god of the mountainous tract." As to the number of kings belonging to this dynasty, there is considerable confusion. Manetho gives sixteen; the Turin papyrus mentions six.

From what faint light we have of this subject, we notice, what we would naturally expect to find, a gradual growth in power. Of the first king of this series known to us, it is said that he used no cartouch, and was simply a nobleman, without more title than any other head of a great Egyptian family.[3] The second king of this series has a royal cartouch, but it is said that his title was not the equivalent of the word king.[4] But under the fourth king, Mentu-hotep II., we have reason to believe that all of Upper Egypt, at least, was brought under their rule.

---

[1] That is, of Thebes, under the eighteenth dynasty. At the time of which we are now speaking, Mentu was simply a form of the sun, bearing the strongest resemblance to both Amen and Chem, the other local gods of the Thebiad. (See Tiele: "Egyptian Religion," p. 124.)

[2] Other authorities locate them at Thebes to start with. Those who take the above view generally conclude that Thebes was founded by the kings of the eleventh dynasty. (See Tiele: "Egyptian Religion," p. 21 *et seq.*)

[3] Maspero: "Morgenlandischen Völker," p. 94. Yet this is certainly too strong a statement. His mummy wore a royal diadem, on which was the royal serpent (Bunsen: "Egypt," etc., Vol. II., p. 232), and he called himself "King of the Two Egypts." (Rawlinson: "Egypt," Vol. II., p. 127.) This may be an exaggeration ("Story of Egypt," p. 97), but it is evident he was something more than a mere "local chieftain."

[4] Ibid. See, also, Sayce: "Ancient Empires," p. 28.

In this tablet, carved on the rocks of Konosso, near Philæ, it is shown that his dominions extended over at least the whole of Upper Egypt. He is represented as worshiping Chem, the special god of Coptos.

Tablet of Mentu-hotep.

The last king of this line was Sankh-ka-ra. The most important event in connection with his reign was a commercial expedition to Punt. The location of Punt has been much discussed. Brugsch-Bey, who has studied this point, thinks it must be on the African side of the Red Sea and Gulf of Aden.[1] This land was to the Egyptians a "holy land." According to an obscure tradition, this was the original home of many of the gods. Amen was the king of Punt, Hathor the queen. Horus was honored as the holy morning star which rose to the west of the

[1] "Egypt Under the Pharaohs," Vol. I., p. 114.

land of Punt.[1] We have already referred to the meaning of this tradition.[2]

The nature of the revolution which put an end to the eleventh dynasty and ushered in the twelfth is as yet unknown. The seat of the new power was Thebes: so we know that at this time—probably long before—Thebes was an important place. The local god of Thebes was Amen or Amun.[3] The name of this god appears as part of the name of a number of the kings of this dynasty; of the seven kings, no less than four are called Amen-emhat. There seems to have been a period of disorder intervening between these two dynasties. The first king, Amen-emhat I., left for the guidance of his son a letter of instruction. Speaking of the unsettled times preceding his reign, he says: "There was no stability of fortune, neither for the ignorant nor the learned man."[4] Then he tells him, further, of attempts made on his own life, and how he vanquished all before him.

We are inclined to the opinion that Amen-emhat I. was at the head of some subject tribe, for, in this same letter to his son, he says: "My image lives in the hearts of men, for I have made those that were afflicted free from their affliction, and their cries are heard no more."[5] However this may be, the new king was an energetic one, and after some years of warfare,[6] and firmly establishing his power in the Thebaid, he set out to consolidate and extend the conquests of the preceding dynasty. Here again he was successful, and Egypt, from Elephantine in the south to the marsh regions of the Delta,[7] acknowledged his rule.

[1] Brugsch: "Egypt," Vol. I., p. 115. [2] Page 465.
[3] Tiele: "Egyptian Religion," p. 121.
[4] Maspero: "Records of the Past," Vol. II., p. 12. [5] Ibid., note 4.
[6] Wilson says "ten years." ("Egypt of the Past," p. 135.)
[7] "Records of the Past," Vol. II., p. 12.

He tells his son that he "stood on the boundaries of the land and kept watch on its borders." In the Isthmus of Suez, he built a wall, or at least a chain of fortresses, to "keep off the Sakti;"[1] and a fugitive of that period, fleeing from Egypt, was in alarm when he arrived at this place, and speaks of "seeing the watchers upon the wall in daily rotation."[2]

Probably the work of this king, in various building operations throughout Egypt, illustrates the renewed life and Civilization of the country as strongly as anything else. There are grounds for supposing that he commenced the great temple of Karnak.[3] Fragments of a granite statue have been found there with his name engraved on them. He also worked the quarries of Hammamat and Tourah, near ancient Memphis. He repaired many of the ancient temples, especially that of Ptah at Memphis. His statue has also been found at Tanis (Zoan), where he constructed a temple. The features of this statue represent him with a flat and broad nose, lips thick and smiling, mouth large and cheeks plump.[4] He built himself a palace,[5] which he thus describes: "I built myself a house, adorned with gold; . . . its roof was painted blue, the walls in it . . . and the passages are of stone, (connected with) metal hooks; . . . the bolts are of artificial men-metal, . . . made for eternity: time shrinks before it."[6] He also built a pyramid, known as Ka-nefer, meaning "lofty and handsome." A most interesting and impor-

[1] "Records of the Past," Vol. VI., p. 135.

[2] It was probably this line of fortresses that gave rise to the Hebrew name of Egypt—viz.: Mizraim.

[3] Most authorities state this. Tiele states that the second king laid the foundation.

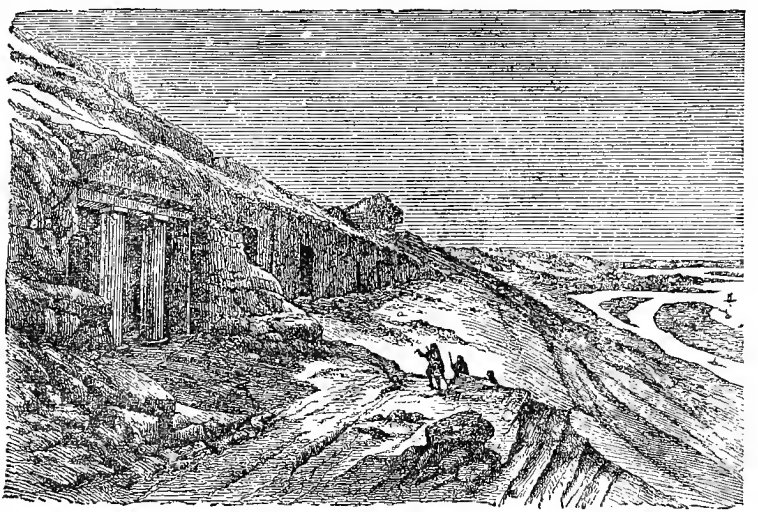
[4] Wilson: "Egypt of the Past," p. 137.

[5] "Supposed to have been situated at Heliopolis." (Rawlinson.)

[6] "Instruction of Amen-emhat," in "Records of the Past," Vol. II., p. 14. Rawlinson translates *men*-metal by iron.

tant inscription of this king is now in the Louvre. It records the destruction of Hittite places on the very borders of Egypt, showing that, as far back as the beginning of the twelfth dynasty, this people were pressing upon Lower Egypt. This has an important bearing on the question of the nationality of the so-called Hyksos kings, soon to be considered.[1]

His successor, Usurtasen I., firmly established the power of Thebes, and advanced Egypt to a high point of

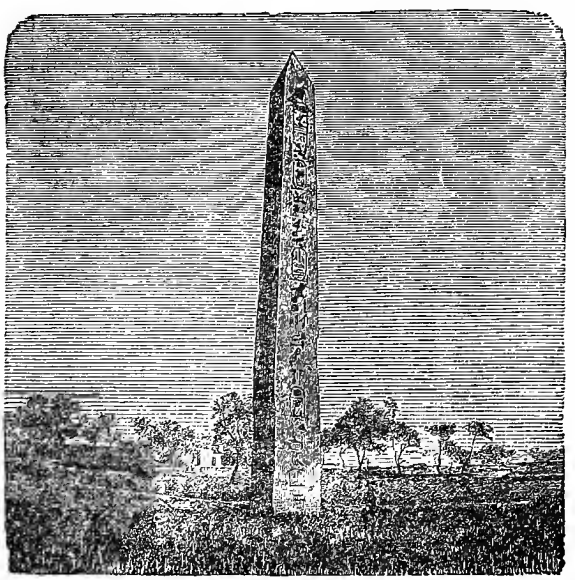


Tomb of Ameni at Beni-hasen.

ancient Civilization. He reigned conjointly with his father—there seems to have been some friction between these two joint-kings,[2] and possibly Amen-emhat was assassinated by orders of his son.[3] The most important foreign work of Usurtasen was the complete subjugation of Ethiopia. His principal general in this undertaking seems to have been the chief of the sixth nome of Upper

[1] Wright: "Empire of the Hittites," p. 47.
[2] See "Records of the Past," Vol. II., p. 13.
[3] Birch: "Egypt from the Earliest Times," p. 63.

Egypt, and bore the name of Ameni. On his tomb at Beni-hasen was carved a full account of his warlike deeds. Usurtasen imitated his father in repairing and building temples and public monuments. At Thebes, he continued the building of the temple begun by his father. Monuments of his time have been found at Abydus, the Fayoum, and the Delta. At Tanis, his portrait has been found among some of the ruins. On, or Heliopolis, was, however, the scene of his principal labors. He repaired or completed the building of the great temple of the sun at that place. An old papyrus gives us some details of the council convened by the king to consider this subject, and contains the address of the king.[1]



Obelisk of Heliopolis.

As the pyramid was a great monument of the fourth dynasty, so the obelisk was the most striking monument of the twelfth. The great Obelisk of Usurtasen was erected at On in the Delta. The obelisk had long been known in Egypt, probably, as a religious emblem, and was employed as far back as the time of Khufa.[2]

[1] Brugsch: "Egypt," etc., Vol. I., p. 130.

[2] Wilson: "Egypt of the Past," p. 83; also, pp. 127, 128.

But the first of any importance, in point of size, dates from the reign of Usurtasen. The one represented in the cut was one of a pair guarding the entrance to the great sun temple. Its companion fell long years ago.[1] Its height is sixty-seven feet four inches. The hieroglyphics on the sides give us various titles of the king and the Egyptian date of its erection. Another obelisk of this king now lies broken and prostrate in the Fayoum.

We can not do more than give a brief outline of this dynasty, and so can not give an account of each king's life. Of this dynasty, there were some seven kings who ruled Egypt for about two centuries. This entire period is one of the most glorious in Egyptian history. Egypt was respected abroad; there was peace at home. During this time, Nubia was conquered, and the peninsula of Sinai again made a subject country. The principal cities were adorned with temples and other public monuments. The strength of the central government was sufficient to insure peaceful relations between the various nomes. One of the kings of this dynasty carried through to a successful termination a gigantic engineering operation; it was nothing less than the erection of a great reservoir in the Fayoum, in which to store up the waters of an unusual overflow of the Nile, to be used when the inundation was defective.

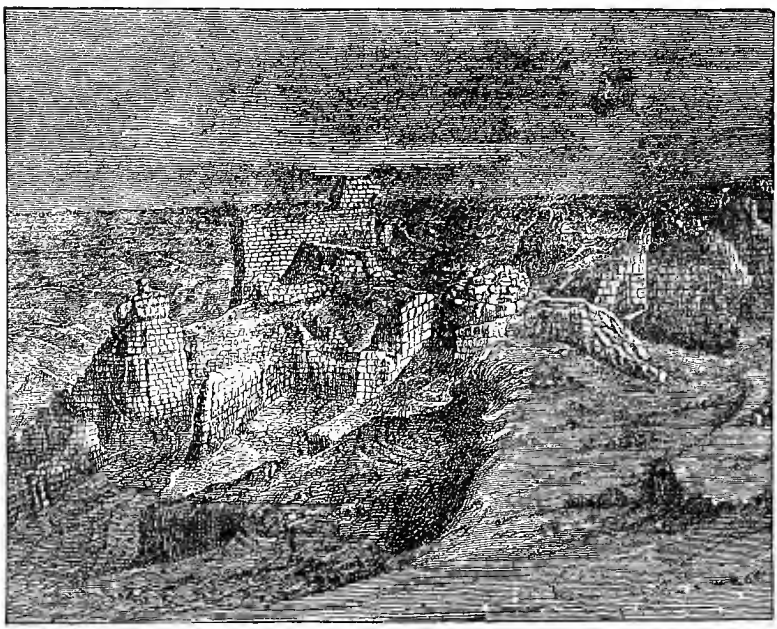
This king was Amen-emhat III.[2] The Fayoum is a great depression in the level of the desert to the west of

---

[1] Wilson: "Egypt of the Past," p. 127.

[2] This is usually so stated. But see Maspero: "Morgenlandischen Völker," p. 112, in which he shows that probably he was only carrying out plans of the earlier kings. Amen-emhat I. and Usurtasen I. both erected monuments in the Fayoum. Amen-emhat III., however, selected that nome for his favorite site, and erected there his pyramid.

the Nile, about fifty miles south of Memphis. Here, by means of embankments and canals, he formed a reservoir, with a superficial area of from seventy-five to one hundred square miles. The canal leading to this lake was cut, part of the distance, through the solid rock. An immense dyke formed one of the boundaries, which is estimated to have been twenty-seven miles in length, thirty feet in height,



The Labyrinth.

and, in places, two hundred feet in width at the base. A system of sluices and flood-gates distributed the water when needed.[1] One of the names of this lake was Mi-uer, which became Lake Moeris of Greek tradition.

The formation of this reservoir made this Fayoum district a most important one, and here Amen-emhat III.

[1] See Rawlinson: "Ancient Egypt," Vol. II., p. 160 *et seq.* Brugsch: "Egypt Under the Pharaohs," Vol. I., p. 168 *et seq.*

built himself a magnificent palace, a view of the ruins of which is here presented. Later writers called this building the Labyrinth,[1] and a number of wonderful stories have grown around it. Lepsius, writing of these ruins in 1843, observes: "An immense cluster of chambers still remains, and in the center lies the great square where the courts once stood, covered with the fragments of large monolithic granite columns, and of others of white hard limestone, shining almost like marble."

The most glorious period of the Middle Empire comes to a close with the twelfth dynasty. Before passing on to consider the more troublous times that follow, when a second long period of almost complete historic darkness settles down over the land, we must glance at the changes noticeable in the culture of the people. In matters of religion, the principal change seems to have consisted in the elevation of the once local gods of the Thebaid to the supremacy. As there were three important towns in this section, viz., Hermonthis, Coptos and Thebes, so we have to consider the local gods of each place. We would naturally expect to find a great similarity between these local gods, and also with the gods of the Old Empire, because they arose out of the same mythic conceptions. But each period has a development peculiar to itself. If we only reflect that this whole period was one of internal prosperity, and that agriculture made great advance, we need not be surprised to learn that the fertilizing powers of the various solar aspects (and so of the gods arising from them) were dwelt upon.

[1] After the death of Amen-emhat, this palace was converted into a temple, and called *Lope-ro-hunt—i. e.*, Temple-at-the-entrance-to-the-sea. It is not strange, then, that the Greeks substituted for this Egyptian title their word *Labyrinth*. (Maspero' p. 112.)

The principal god of Coptos was called Chem, who was also the principal god of Chemnis, or Panopolis, further down the river. As a solar god, Chem was the sun-of-day. Hence he is a Horus-god,[1] and many titles used to designate him admit of ready explanation. Like Horus, he is sometimes styled the son of Osiris or Isis. He is even called the avenger of his father. The same old mythic conception also reappears, and he is called the "husband-of-his-mother;"[2] for is not the sun of day born of the dawn and united to her at sunset? But in accordance with the remark just made, he also represented the fertilizing power of the sun. In this connection, his worship became, in process of time, a corrupt one, and the representations made of him are not fit to be reproduced.

Chem.

What we have had to say of Chem applies in some measure to each of the other local gods of the Thebaid; that is, Mentu of Hermonthis, and Amen of Thebes, though in each case differences are perceptible. Amen of Thebes was destined, at a later date, to become the great god of Egypt, but under the Middle Empire he represented the same conception as Chem.[3] We have spoken of Men or Mentu as the war-god of Thebes; this is probably true of him only at a later date, but Tiele shows that he was really only a local god of the same nature as the other two. One reference to him seems to show that the Egyptians

[1] Page 519. [2] Page 520. [3] Tiele: "Egyptian Religion," p. 123.

were acquainted with the week of seven days.[1] He is worshiped as the father of the child Horus in seven forms.[2] Probably in connection with the worship of all these gods there were licentious practices.[3]

Though we have spoken of animal worship, yet it is well to mention the worship of the crocodile, which assumed great importance during the twelfth dynasty. He seems to have been originally the local god of Ombos.[4] When, by the exertions of Amen-emhat III., the Fayoum was converted into a fertile section, it was placed under the protection of Sebek, the crocodile god; and Lake Moeris became a sacred lake, wherein the sacred crocodiles were kept. The Egyptians had a tradition that the crocodiles deposited their eggs precisely at the limit to which, each

Amen (Louvre Bronze).

[1] This would not be at all singular, since the Accadians had this measure of time. (Page 378.) [2] Tiele, p. 124.

[3] In some instances, in times of war, the female slaves of the conquered were said to be devoted to Mentu. ("Records of the Past," Vol. VI., p. 141.) The meaning of this phrase is unmistakable. [4] Tiele: "Egyptian Religion," p. 134.

Sebek.

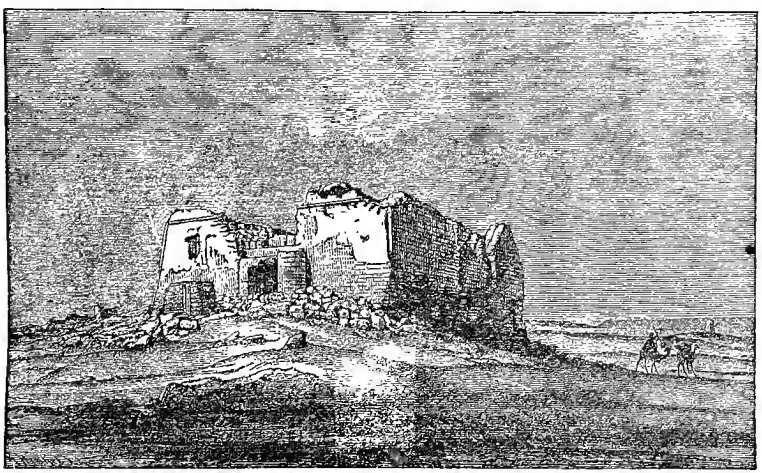
year, the inundation would attain. Hence, it was inferred that it was one of these animals that, as king of the river, regulated the overflow.[1]

It has been observed, by those who have studied the matter, that the Civilization of the Middle Empire was of a much more practical kind than the culture of the preceding epoch. The resources of the empire were not spent in building imposing pyramid tombs for the kings, but in works of public utility. Arrangements were made for keeping a record of the annual overflow of the Nile. A great reservoir was prepared to store up the surplus water of an excessive inundation, against the time of a deficiency. An extensive system of canals lined the western bank of the Nile, capable of irrigating a large extent of country. It was also a commercial age. Exploring expeditions were made to Punt. New trade routes opened. Wells were dug for new caravan routes. Commercial relations were established with Nubia and Eastern Africa. All this must have conduced to the increase of national wealth.

In regard to political power, we think we can detect a change. We have referred to the nomes of Egypt as evidence of a division into tribes. The constant tendency of advancing Civilization would be to sweep away these tribal marks. No doubt the long supremacy of Thebes would do much to bring about such a result. As the power of

[1] Villiers Stuart has left an interesting account of his visit to the crocodile mummy pit, where the mummies of thousands of embalmed crocodiles were stored away. ("Nile Gleanings," Chap. viii.)

the ruling tribe became more and more firmly established, the independence of the nomes would gradually sink. The kings would more and more arrogate to themselves the power of appointing the chiefs of the nomes, or of enlarging or diminishing the powers of the same. The kings of the twelfth dynasty seem to have freely exercised such an authority.[1]



Ruins of Fayoum.

One of the most interesting literary productions is contained in a papyrus at Berlin, and is known as the Story of Saneha.[2] Saneha seems to have been a person of some importance under the reign of Amen-emhat I., the founder of the twelfth dynasty. For some reason, but just what is unknown, he fled from Egypt. The details of his flight are quite graphically told. "When I was on the point of setting out," says he, "my heart was troubled, my hands shook, numbness fell on all my limbs." He,

[1] On this point, see Maspero: "Morgenlandischen Völker," p. 116. This state of affairs appears from the inscriptions in the tombs of Ameni and Khumhotep, at Beni-hasen.

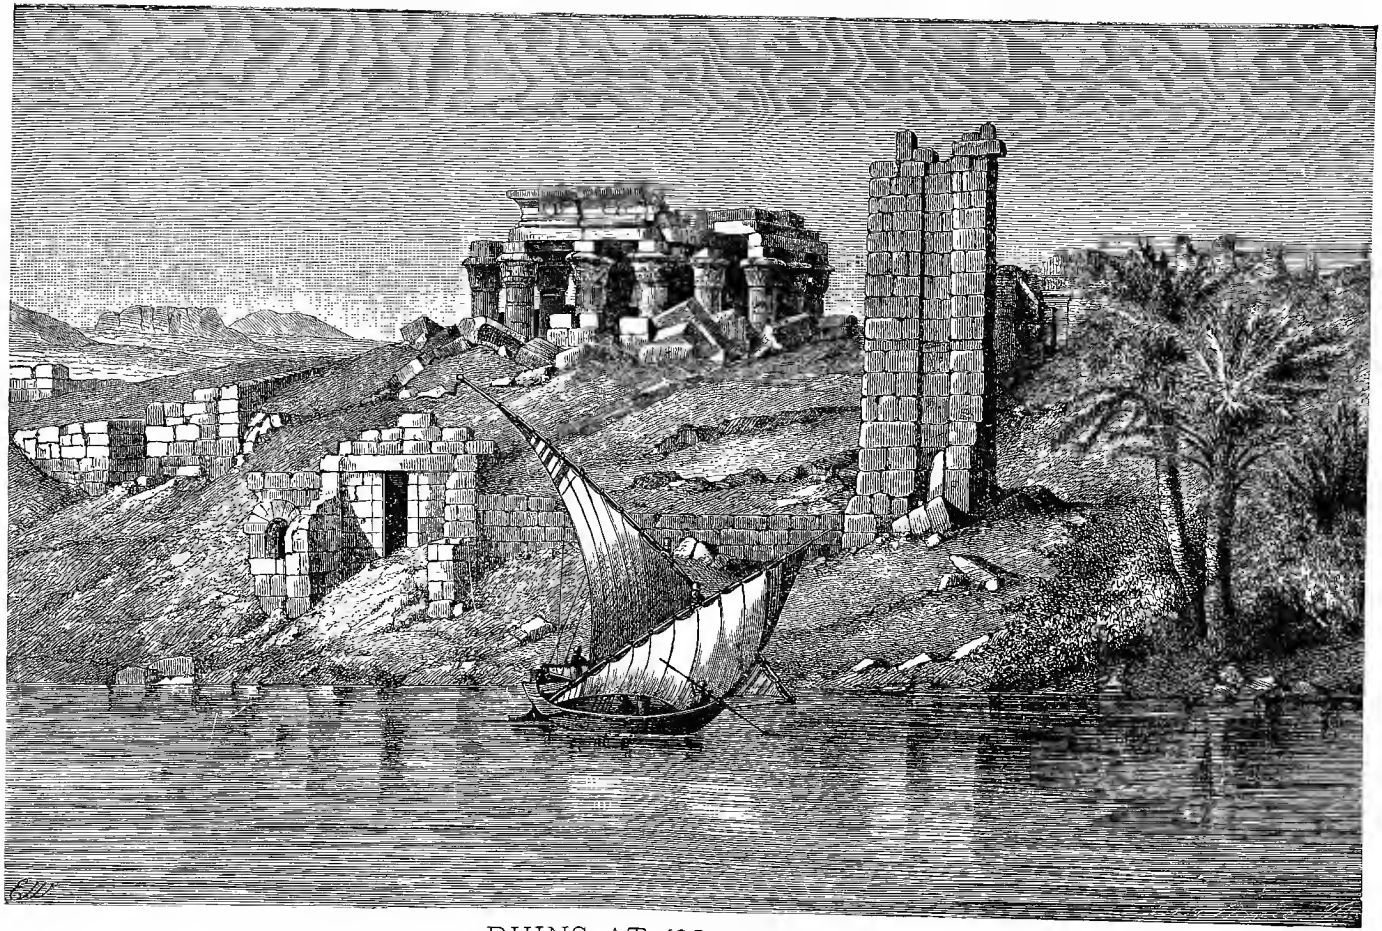
[2] See "Records of the Past," Vol. VI., p. 135.

however, "simulated a herb-seller, in order to travel," and got along very well until he reached the "fortress which the king had made to keep off the Sakti,"[1] where he was "in alarm, seeing the watchers upon the wall in daily rotation." However, he passed them by in the night, and fled into the desert, where "thirst overtook me in my journey; my throat was parched; I said, this is the taste of death."

But this was the darkest hour of his flight. He soon fell in with a Sakti,[2] who took him from place to place, and finally before a king. Unfortunately, we do not know who this king was, nor where he ruled. We are simply told: "It was a good land; *Aam* was its name: there was fruit *tabh* in it, and the fruit *aru*. It abounded in wines more than in water. Its honey was plentiful, and its palms; all its trees were fruit-bearing. There was barley in it, and wheat; there was no limit to its cattle." Seneha's lines had indeed fallen to him in pleasant places, and he was soon on the high road to fortune. He was given the king's oldest daughter for wife; he became a person of great consequence. He says of himself: "All men respected me. I gave water unto the thirsty; I set the wanderer in the way." He became a great chief and warrior.

But, with old age, there came a desire to return to Egypt; hence he addressed a humble prayer to the Amenemhat: "Let god be gracious to him whom he hath raised up, whom he drove into another land; . . . grant me (to return) home. Permit me to show myself. Have I not suffered anxiety? What more is there to boast? (Let me) be buried in the land where I was born. Let there be a fortunate lot hereafter; grant me pardon."

[1] This was the fortress-wall of Amen-emhat I. The Sakti were Asiatic people.
[2] Probably a Bedouin.



RUINS AT KOM-OMBOS.

This the king was graciously pleased to grant. He tells him: "Behold that which thou hast done. Thou shalt not be called to account for what thou hast said, or hast not said, in the assembly of the young men." He even urges his return. He promises him: "If thou comest to Egypt, thou shalt see a house prepared for thee. If thou dost homage to the Great House (*i. e.*, Royal House), thou shalt be numbered amongst the counselors." He reminds him: "Thou hast arrived at middle age; thou hast passed the flower (of youth). Think upon the day of burial, of the passage to Amenti."

Saneha is almost overpowered by the king's goodness. He assembles his household around him, divides his effects among his sons, sets off to Egypt, where he is received with honor, and basks in the sunshine of royal favor until the day of his death. Quite in accordance with Egyptian thought, he felicitates himself on his tomb. "I built myself a tomb of stone amongst the tombs of the chief officers. His Majesty chose its site. The chief painter designed it, the sculptors carved, the chief purveyor who was over the upper country brought earth to it; all the decorations were of hewn stone." Such is the end of one of the oldest stories of adventure and travel in existence. Its perusal tells us considerable of the home life of the Egyptian people in the palmy days of the twelfth dynasty.

The twelfth dynasty did not long outlast the reign of Amen-emhat III. Two short reigns, neither of them noted—the last supposed to be that of a queen—close the series, and we are once more face to face with a break in Egyptian history, a time of obscurity, doubt and confusion, to elucidate which our scholars are not yet able. Neither do we know how long it was. When next the

historic light breaks on the scene, we are in the presence of the eighteenth dynasty of Manetho. We are confident that most important events have happened in the meantime, and know that Egypt itself, during a portion of the time, was in the hands of victorious foreigners.

Let us see what we can learn of this time of confusion, make the most we can of what few gleams of historic light illume the scene. In the midst of so much that is unknown, let us be cautious in statements. Probably at some time our scholars will possess the means for reconstructing this period. A number of Egyptologists have held that while the thirteenth dynasty ruled at Thebes the fourteenth dynasty held power at Xois in the Delta; but others still claim to have shown that the kings of the thirteenth dynasty ruled all Egypt.[1] As far as we know, Manetho's list contains no mention of the names of the kings of the thirteenth dynasty.[2] The Abydus tablet likewise omits all names from the twelfth to the eighteenth dynasty.[3] The Turin papyrus gives the names of more than one hundred and fifty so-called kings of this dynasty.[4] The Karnak tablet gives a selected list of ten kings, most of whom are also mentioned in the Turin papyrus.[5]

It is noticed that, taking this last list, the names of most of the kings indicate that they were worshipers of Sebek, the crocodile god. They are called Sebek-hotep, meaning united with, or servants of, Sebek. Now Sebek had become the great god of Fayoum, and there, as we have shown, Amen-emhat III. had taken up his residence,

[1] For first view, see Wilson: "Egypt of the Past," p. 176. Rawlinson: "Ancient Egypt," Vol. II., p. 175. For contrary view, see Brugsch: "Egypt," Vol. I., p. 185. Sayce: "Ancient Empires," p. 16.

[2] Though he does state that it consisted of sixty kings and held power for four hundred and fifty-three years. [3] Stuart: "Nile Gleanings, p. 316.

[4] See Sayce's list, in "Ancient Empires," p. 285.

[5] See Brugsch's comparison of these lists, in "Egypt," etc., Vol. I., p. 193.

and it is quite probable that he had there transferred the seat of government.[1] The last queen of the twelfth dynasty was Sebek-nefru-ra; perhaps from her descended the Sebek-hoteps of the thirteenth dynasty.[2] However, for reasons we have given, this result does not necessarily follow. Now, if we are at all right in the above suggestions, we can see at a glance that trouble was in store for Egypt. The power at Thebes would not at all relish the idea of the seat of government being removed to the Fayoum. Neither would the priests of Amen, Chem and Mentu, a powerful body, acquiesce with equanimity in the elevation of the god Sebek to the supremacy. Hence, we need not wonder that when, at a later date, Thebes was once more the center of power,

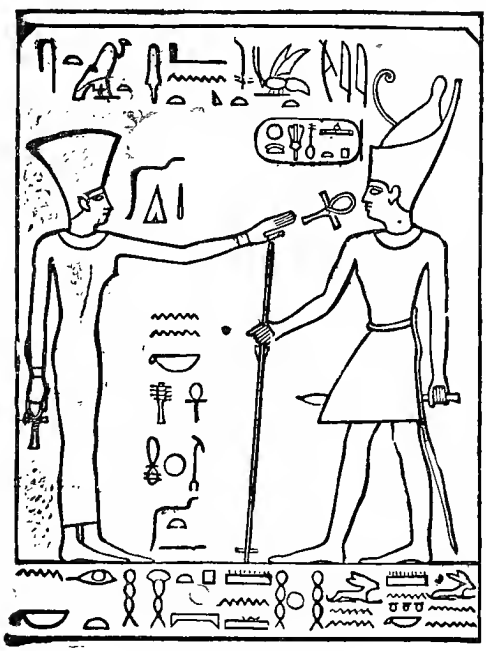
Granite Statue at Tanis of a Sebek-hotep of the Thirteenth Dynasty.

[1] The early Grecian writers declare that the Labyrinth was the place of meeting of the nomes for both religious and legal purposes (Poole, in "Contemporary Review," 1879); that is to say, there was the seat of government.

[2] This is so stated by most authorities. See Brugsch: "Egypt," etc., Vol. I., p. 187. Villiers Stuart points out a singular relationship between the names of the kings of the eleventh and thirteenth dynasties. ("Nile Gleanings," p. 92.)

there should be manifested a determination to blot out, as far as possible, all historic monuments of the thirteenth dynasty, Fayoum itself being not even named in the lists of Egyptian nomes.

It is supposed, however, that for a long time the Sebekhoteps ruled all Egypt. The fifth king of the Karnak list[1] left granite statues inscribed with his name at Tanis, in the Delta. The next king left various tablets in Upper Egypt (one near Philæ is here given), while the next king left his statue at Bubastis, in the Delta, also on the island of Argo, farther south than the Egyptian power had previously extended.[2] These scattered monuments, which are all we have of these kings, are sufficient to show that they ruled an extensive territory. Yet, as we have indicated, there was undoubtedly discontent, and so it is, perhaps, not singular that another disintegration of power took place.



Tablet of Nofer-hotep.

In short, a new confederacy was forming in Lower Egypt. Xois, in the Delta, was the new seat of power, and the confederacy of which it was the head, threw off

[1] The twenty-first of the Turin papyrus.

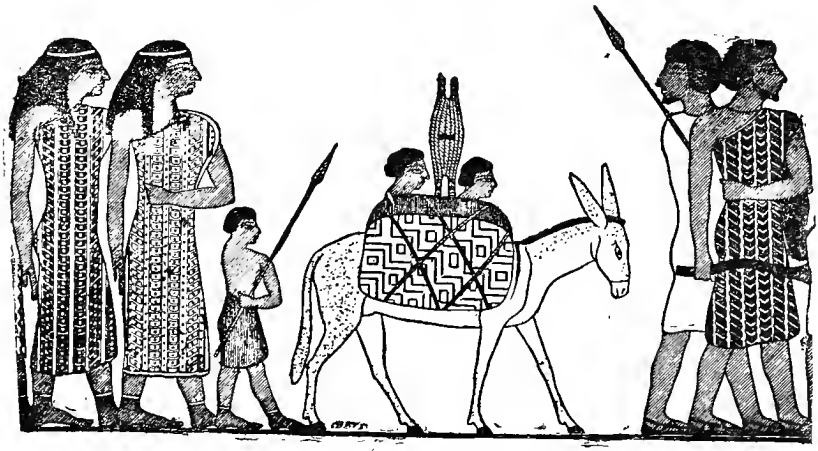
[2] Rawlinson: "Ancient Egypt," Vol. II., p. 176.

the yoke of the thirteenth dynasty, and, in its confused lists, are the names of the kings of the fourteenth dynasty of Manetho. We know really nothing historically about this confederacy. We can, however, see that the country thus divided into two hostile sections would be an easy prey to foreign conquest; and, just about this time, a danger long threatening Egypt from the east suddenly assumed greater proportions, and a conquering host was at her doors, before which Egypt sank to the condition of a subject country.

We have before pointed out that the greatest danger threatening Egypt was from Asia, by way of the Isthmus of Suez. In our opinion, the inhabitants of the Delta possessed from the earliest times more of the Asiatic element than the inhabitants of Upper Egypt. There was, probably, from time to time, immigrations and attempted invasions from Asia. Perhaps from this cause is due the historical *lacuna* between the sixth and eleventh dynasties. The strong hands of the Theban kings of the eleventh and twelfth dynasties controlled affairs in the Delta as well as the other parts of Egypt. A fortress-wall was built, as we have seen, by Amen-em-hat I., to keep off the Sak-ti or Asiatic tribes; yet, from time to time, bands of these people ensconced themselves on Egyptian territory. In the tomb of Khum-hotep, we see a band of thirty-seven, who have but just arrived, and ask for territory on which to live.

United Egypt was able to keep back the tide; but divided, and perhaps hostile, Egypt could not stem it. From obscure statements made by Manetho and a few monuments, we know that while the thirteenth and fourteenth dynasties were dividing Egypt between them, they were both suddenly overwhelmed by an invasion of

nomadic tribes from Asia. All Lower Egypt seems to have been completely subjected. Upper Egypt remained nominally under the rule of the Theban kings, conditioned, however, on the payment of tribute to the conquerors. As yet, we know but very little about these invaders. Manetho calls them Hyksos; that is, "shepherd kings." A number have derived this word Hyksos from the words Hik-shasu; that is, "kings of the Shasu or Bedouins." But the probabilities are rather in favor



Arrival of a Semitic Band in Egypt.

of the view that the Hittite confederacy was the real power that conquered Egypt; but, of course, among their allies were representations of numerous Semitic tribes.[1]

[1] On this point consult Lenormant: "Ancient History," Vol. I., p. 230; Rawlinson: "Ancient Egypt," Vol. II., pp. 190–1; Sayce: Work cited, p. 32; where it is said that the leaders of the Hyksos were, perhaps, Hittites, or at any rate not Semites. Brugsch-Bey, after a long discussion, comes to the conclusion that the Hyksos were Semitic Syrians ("Egypt," etc., Vol. I., p. 235); but he, himself, points out one of the most serious objections to this view (Ibid., 254–5). Stuart Poole, also, in "Contemporary Review," Vol. XXXIV., p. 576, concludes they were Semitic tribes. At the time of the twelfth dynasty, we know the Hittites were confronting Egypt on the east. ("Empire of the Hittites," pp. 47–48–99.) Mariette admits that at least one of the Hyksos dynasties was Hittite. (Ibid.) As far as we can judge, from the physical representations from time to time coming to light in the Delta, the physical type of the Hyksos was the Turanian, rather than

But we are destitute of almost all details of this conquest. The seat of their power was the Delta, and their principal city was Tanis. According to tradition, Memphis was their first capital city. At a subsequent stage, Tanis (the Biblical Zoan) was the seat of their power, and there many monuments of them have been discovered. The last king made Avaris his capital. From the earliest times, this seems to have been an important point. It was strongly fortified and garrisoned, and was, perhaps, the base of operations against Egypt.[1] They seem to have overrun and conquered, not only all Egypt, but some thirty-six districts of Nubia.[2]

But their rule in Upper Egypt was probably never very secure. They seem to have contented themselves with taking tribute. Thebes was the head of the subject nomes of Upper Egypt. As to the nature of this conquest, there is some uncertainty. From Egyptian sources, it seems to have been a cruel one. "Wherever the Hyksos penetrated," says Rawlinson, "they spread ruin and desolation around, massacred the adult male population, reduced the women and children to slavery, burnt the cities and demolished the temples."[3] We are of the opinion that this judgment is too severe.[4] Of course, conquests at that early day, were accompanied by many painful, cruel scenes; but the Hyksos probably treated the Egyptians as mercifully as the latter did those whom they conquered themselves.

---

the Semitic. (Robinson: "Pharaohs of the Bondage," New York, 1887, p. 131. See, also, Payne, in "The Century," for May, 1887.) In considering the date of this invasion, we must bear in mind the great upheaval of Asiatic folks in Asia, at about the twenty-third century B. C., caused, perhaps, by in-wandering Aryans from Europe. (See Vol. III., This Series, Chap. i.)

[1] This follows from the reading of the first Sallier papyrus.

[2] Sayce: "Ancient Empires," p. 34. [3] "Ancient Egypt," Vol. II., p. 192.

[4] See, on this point, Brugsch's judicious observations: Vol. I., p. 256.

The duration of this foreign conquest is yet an unsettled point. Manetho says they ruled Egypt over five hundred years. There is some slight evidence on which to base this assertion. A slab was found at Tanis of the time of Rameses II., dated in the four hundredth year of the Hyksos king Sut-aa-peh-peh Nubti.[1] Nothing definite, however, is known on this point, and, perhaps, it may be much less than the foregoing.[2] One reason why we know so little on this obscure period of Egyptian history is that when the kings of Thebes again gained the control of the entire country, they set about to destroy, as far as possible, all traces of their former masters. As Brugsch observes: "To destroy the monuments of the opposition kings, to annihilate their names and titles so as to render them unrecognizable, and to falsify historical truth by inscribing their own names, was the endeavor of the kings of the eighteenth dynasty."[3]

Let us briefly note the effect of this conquest on the culture of Egypt. The Hyksos, after conquering Egypt, were themselves conquered by the superior culture of the vanquished. They largely adopted Egyptian civilization. They became, to all intents and purposes, Egyptians. Magnificent temples were raised to the Egyptian gods; they were adorned with statues; avenues of winged sphinxes led up to them. They adopted also the official language and the hieroglyphic writing, and formed their court on the old model. In matters of religion, there was such a strong similarity, both in name and nature, between the Egyptian god Seb and their national god Setech, that

[1] "Records of the Past," Vol. IV., p. 38. But compare Sayce's remarks: "Ancient Empires," p. 33, and note 1, same page.

[2] See Rawlinson's remarks, in "History of Ancient Egypt," Vol. II., p. 198.

[3] "Egypt Under the Pharaohs," Vol. I., p. 257.

they at once adopted him as their god.[1] In other respects, they influenced the culture of Egypt for good. They are thought to have given them some idea of fixed eras,[2] and especially did they teach them how to organize a strong

Hyksos King (Statue from the Fayoum).

central government. In a certain sense, they made the glories of the coming dynasties of Egypt possible.

Of the various kings of the Hyksos dynasty or dynas-

[1] Rather, there was no adoption at all. These two deities were the same. The same mythic conception and elementary name were common to both.

[2] Brugsch: "Egypt," etc., Vol. I., p. 237.

ties, we know, at present, almost nothing with certainty, owing to causes we have already named. Two, at least, and probably others, bore the name of Apapi or Apohis. We have a sphinx bearing the name Apohis on it. We present a front view showing the features. This may be a fair representation of the king of this name. These kings, at least the last one of them, ruled at Avaris, and we read in a fragmentary papyrus that thither was sent the tribute from all Egypt.[1]

Sphinx at Tanis, with the name of Apohis.

We are now about entering on the third great period of Egyptian greatness. Let us glance at our surroundings. Whether the rule of the Hyksos kings extended over several centuries, or was of comparatively short duration, we can see at a glance that there would probably be a complete shifting of power. Out of the confusion, Thebes gradually emerges. It was at the head of the nomes of Upper Egypt, though its kings were subordinate to the Hyksos kings of the Delta. When the clouds began to break away, the seventeenth dynasty was reigning at Thebes. The family name of these monarchs was Taa; the throne name was Sen-ken-en-ra.[2] Three of these kings stand out with more or less prominence, and it is

[1] The first Sallier papyrus, in "Records of the Past," Vol. VIII., p. 3.

[2] On these names Birch remarks as follows: "The names of individuals who lived at the period just before and at the commencement of the eighteenth dynasty, are repetitions of those which appear in the eleventh and twelfth; proving that they belong to the same families, and were probably not separated by any great interval of time." ("Egypt from the Earliest Times," p. 80.) It is well to bear this in mind when theorizing as to the length of the Hyksos rule.

interesting to note their titles. The first was simply Taa; the second was Taa the Great (Taa-aa); the third was Taa the Great and Victorious (Taa-aa-ken). These titles were probably bestowed upon them in consequence of their wars with the invaders.

From what we can gather from the papyrus already mentioned,[1] it seems that the Hyksos king, becoming alarmed at the growing power of Thebes (probably scarcely concealing its determination to be revenged), sought frivolous pretenses for a quarrel. He accordingly dispatched an embassy to Thebes, with a command in reference to religion. The command seems to have been to not serve any other god than Amen-ra. How this embassy was answered, it is impossible to say,[2] but a more exacting message was sent a little later. It seems to have borne reference to wells for cattle. Whatever it was, Sen-ken-en-ra "knew not how to reply to the messenger of King Apapi."[3] He had good reason, however, to fear the consequences, for we read that, when the messenger departed, he "bade summon his mighty chiefs, likewise his captains and expert guides: he related to them the tale entire of the words which King Apapi sent to him concerning them. They were all silent at once in great dismay." The result was war between Thebes and the Hyksos. The kings of the seventeenth dynasty certainly did a great deal towards breaking the power of the invaders, if they did not drive them out entirely. We possess some interesting remains of this period: probably one of the most interesting is the mummified body of Taa-aa-ken, the great and victorious king. But we know now that he himself did not live to

[1] The first Sallier papyrus.

[2] Sayce says the command was complied with; Rawlinson says it was rejected.

[3] "Records of the Past," Vol. VIII., p. 8.

know of his victory. He died in battle. His body is disfigured by his wounds, and there is all evidence that it was prepared for burial in a very hasty manner, in the absence of many conveniences usually applied. He was doubtless killed in the Delta, hastily embalmed, and taken to Thebes for burial. That his army was victorious, is shown by the fact that they recovered his body.[1]

The seventeenth dynasty seems to have come to an end with the death of Taa-aa-ken—a successor to him (Kames) is indeed noted; yet nothing worthy of record is known of him. His reign was certainly a very brief one, and we doubt whether he belonged to the same family, or was king in any true sense of the word. In the troublous times of which we are now speaking, when the various sections of Egypt were engaged in a hand-to-hand struggle with a foreign conqueror, what they demanded was a born leader. Aahmes, who appears as the founder of the eighteenth dynasty, was not from Thebes. He was chief of the fifteenth nome of Upper Egypt, whose capital city was Hermopolis. There is no proof that his family was at all connected with the Theban family of Taa. The probabilities are that when Taa-aa-ken was struck down in his fight with the Hyksos, the Egyptians ranged themselves under the leadership of this nome. Possibly Kames, at its head, was made king, but his reign was brief, and Aahmes appears as the founder of the eighteenth dynasty.[2]

Aahmes was the king who completed the work of his predecessor and completely freed Egypt from the dominion of the Hyksos and ushered in the fortunate days of the eighteenth dynasty. Thebes was once more the seat

[1] His body was amongst the number discovered at Dair-el-Bahari, in the summer of 1881. It is now in the museum at Boulak, near Cairo.

[2] This is a perplexing point. See Brugsch: "Egypt Under the Pharaohs," Vol. I., pp. 252, 253. Compare with Wilson: "Egypt of the Past," p. 193.

of power, Egypt was again a united country, respected at home and feared abroad. In leaving behind us the subject of the Hyksos invasion, we can but express our candid conviction that this subject has been but poorly understood by our scholars generally. In our judgment, future discoveries will tend to shorten the interval of time to a comparatively brief period—say one or two centuries. We think they will also give it a different meaning. The people in the Delta were always more than half Asiatics. In-wandering tribes finally gained the upper hand, and then came the Hittites, who were the ruling people in all that section. When the Egyptians regained the supremacy, they did not so much wreak their vengeance on the Semitic tribes as they did on the common ruler of them both, the Hittites. But all this is thrown out as a suggestion, which future discoveries will tend to establish or disprove.[1]

To treat with any fullness the period on which we have now entered, would require a volume by itself. We are compelled, therefore, to give only an outline. Egypt, triumphant over her enemies, became, in her turn, a conquering power, and for several centuries she was the acknowledged mistress of the world. The first ten kings of this dynasty were ruling in Egypt during the height of her prosperity. Then follows a period of confusion, in which four or five kings ruled at Thebes, during which the tribes in the Delta were again coming to the front, and finally the nineteenth dynasty appears on the scene. Of these first ten rulers, one was a queen, four bear the

[1] Most historical writers have had more or less to say in regard to Abraham and Joseph in connection with the Hyksos. Some state that Joseph rose to power under Apapi, the last Hyksos king. For the present, it is sufficient to refer the reader to the chapter on the Hebrews. The Hyksos invasion had probably long passed when the tribes of the Israelites arrived in Egypt.

name of Amen-hotep, and four that of Thothmes. Though the ruling tribe came from Hermopolis, yet Thebes was the capital.

The first two kings of this dynasty restored the authority of Thebes over both Lower and Upper Egypt, reconquered Nubia and chastised the Libyans, who were troublesome on the frontier. The third one, Thothmes I., finding the country at peace, and with a large force at his command, resolved "to wash his heart" of the disgrace of the Asiatic conquest, and forthwith poured his armies upon Western Asia. He overran Palestine, Philistia, and set up his monuments on the very banks of the Euphrates; and when his armies returned to Egypt, vast numbers of captives and great quantities of booty accompanied it. The king celebrated his victories by embellishing the great temple at Karnak.

Bust of Thothmes.

He was succeeded by Thothmes II., who married his sister Hatsu and reigned conjointly with her for a few years. But Hatsu was a woman of no ordinary ability. Probably she connived at the death of her husband and brother,[1] and then, banishing her younger brother[2] to the far-off Delta, assumed the reins of government. Strange stories are told about this queen. She assumed male attire, and demanded to be spoken to, and of, as a man. She ruled with great energy, and brought to a rapid completion public works of importance. She built temples,

[1] Birch: "History of Egypt," p. 86. [2] Thothmes III.

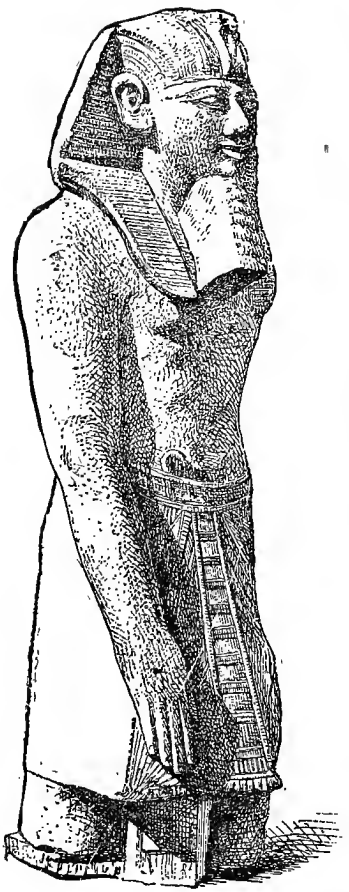
set up obelisks, and arranged long avenues of sphinxes. She dispatched expeditions for discovery and trade to distant Punt. She established friendly relations with that country, and brought from thence into Egypt great quantities of valuable materials, and even made an effort to transplant incense-bearing trees. Of her military expeditions, not much is known; but who can doubt that the rapid and peaceful development of the wealth of Egypt during her administration did much to advance the glories of the reign of Thothmes III.?

Queen Hatsu.

During the reign of this king, Egypt reached the very acme of her greatness. Time after time, Thothmes III.

Inhabitants of Punt.

marched from Egypt at the head of his armies in campaigns against Asiatic people. The combined force of the Hittite confederacy was defeated in a great battle near



Thothmes III.

Megiddo, probably in the great plain of Esdraelon. We hear of him carrying his victorious arms beyond the Euphrates, where he amuses himself by hunting elephants in the vicinity of ancient Nineveh. Great quantities of tribute poured into Egypt from all the adjacent countries. His numerous wars filled the land with captives, who were compelled to labor for the Egyptians. There was scarcely a city of Egypt but what was adorned by some public monument erected by order of Thothmes. He left profuse records of his doings. He caused great collections of rare and curious animals and plants to be transported to Thebes, where he strove to naturalize them, or else to perpetuate their forms in carved inscriptions on the monuments.

But, *sic transit*, it is interesting to know that the mummy of this Egyptian Alexander was among the number found at Dair-el-Bahari, in the summer of 1881. He could have been but a trifle over five feet in height. The mummy was the first to be unrolled. The very flowers with which he was buried "looked as if they had been recently dried in the sun, and even the color of the petals

Sphinx at Karnak, with name of Thothmes III.

could be discerned;"[1] but while the wondering eyes of savants were gazing on the face of this potentate, now first unwrapt from the slumbers of nearly forty centuries, it commenced to fade away, and there was only time for a hurried photograph before it fell into pitiful handfuls of dust, that were consigned to a final burial.

A few more reigns and we find ourselves approaching a period of confusion. The eighth king of the list, Thothmes IV., is known to have cleared away the sand from the sphinx at Gizeh, and set up a memorial tablet, and a small temple for worship. The next king, Amen-hotep III., took for wife a foreign princess named Tii. Considerable speculation has been indulged in as to who she was, but it seems that in one inscription she is called "the daughter of the chief of Naharina;"[2] this would make her a native of Assyria.[3] This

Princess Tii.

[1] Robinson: "Pharaohs of the Bondage," p. 106.

[2] Payne, in "The Century," for May, 1887.

[3] But this is not settled. Wilson says she was a Libyan. ("Egypt of the Past," p. 247.) Sayce shows we are not certain of her origin. ("Ancient Empires," p. 40, and note.) Brugsch does not express himself, but seems inclined to believe her of Abyssinian origin.

is thought by some to account for the singular change in the Egyptian state religion soon to be spoken of. Amen-hotep III. was also a great builder. The great seated statues at Thebes, known as the Vocal Memnon, are representatives of this king. They are carved out of solid sandstone, and the larger must have been about seventy feet high when first erected.

Amen-hotep III.

We have now arrived at a very singular period in Egyptian history, and one that has been, we think, wrongly treated by historical writers generally. We refer to the time intervening between the reign of Amen-hotep IV. and the nineteenth dynasty. In our opinion, this period was considerably longer than it has usually been considered. We think it shows a revival of Semitic influence, and further consider it a period of civil war, of local insurrections, finally put an end to by conquests of a confederacy formed in the Delta, that ushered in the nineteenth dynasty.[1]

It is usually related of Amen-hotep IV. that he made an effort to change the state religion of Egypt; that he sought to substitute for the many divinities of the Egyp-

[1] We are largely influenced in this view by Mr. Stuart's discoveries at Tel-el-Amarna. See "Nile Gleanings," Chap. vii.

tian pantheon one god only, the visible disk of the sun being considered as representative of this one supreme god. This step met with bitter opposition from the priests. Consequently Amen-hotep IV. left Thebes,

Vocal Memnon.

changed his name to Khuen-aten and founded a new capital at Tel-el-Amarna, not far distant from Hermopolis. Here he was followed by at least three successors, but it is claimed there was a gradual return to the old religion, and

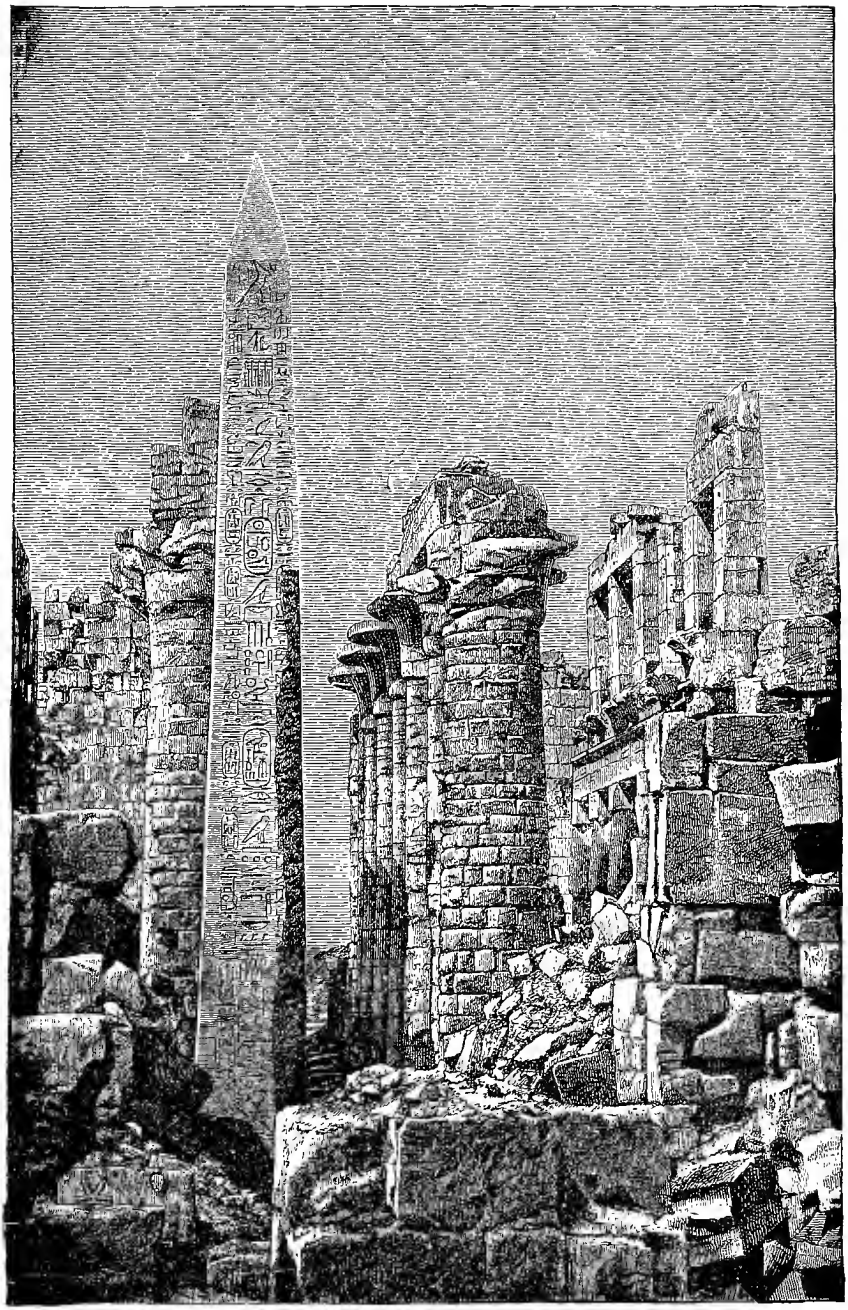
finally, under Hor-em-heb, this restoration was completed and Thebes again became the capital.[1]

It is admitted that this whole period is a very obscure

Statue of Khuen-aten.

one. It is further admitted that the center of authority is no longer Thebes, but Middle Egypt, and that a

[1] This view is the one usually accepted. It is sometimes added that, the mother of Khuen-aten not being of Egyptian blood, he was regarded as an illegitimate king from the start.



OBELISK OF THOTHMES AT KARNAK. 571

complete change in the state religion has occurred. To the above, we must add that Khuen-aten himself, as far as personal appearance was concerned, was very different indeed from the kings of the eighteenth dynasty. This will be noticed in comparing this cut of him with the other members of this dynasty, but this is not all. The court

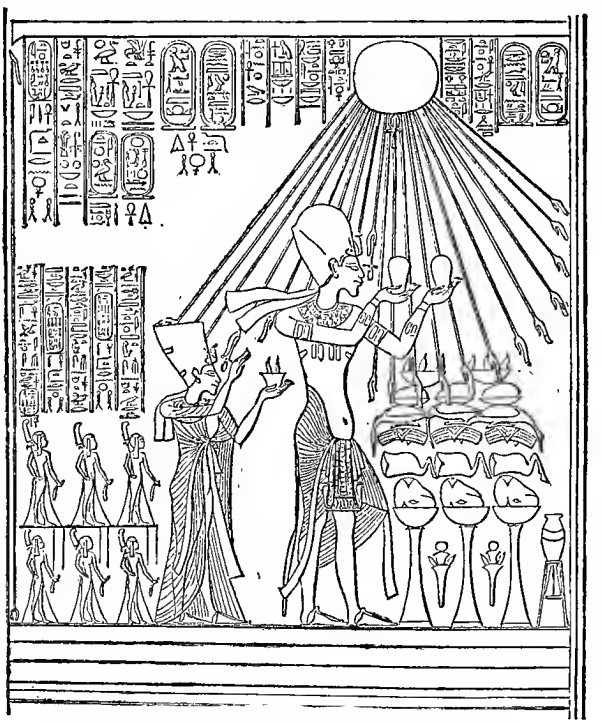
Khuen-aten.

and its surroundings were in some respects different from the ordinary Egyptian court. Birch remarks: "Not only are the scenes represented peculiar — the king is seen showering on his court donations of various kinds from a window of the palace, while the types, features and the abject prostration of his court, and unusual freedom of art, show the introduction of a foreign element into the annals of the country."[1] Villiers Stuart makes the same obser-

[1] "Ancient Egypt," p. 115.

vation, and shows from the portraits of some of his courtiers that we are probably in the presence of a different people than those in power during the eighteenth dynasty.[1]

Now all this certainly points to the rise to power of some tribe in Middle Egypt—probably some tribe that possessed a large Semitic ethnic element. There is cer-



Khuen-aten and His Family Bestowing Gifts.

tainly food for thought in Lenormant's suggestion that possibly the Hebrews were more or less concerned in this matter.[2] Be this as it may, it is certainly true that Egyptian religion had long been influenced by Semitic philosophy, and Tiele shows that under this influence it

[1] "Nile Gleanings," p. 300.

[2] But the Israelites were probably not in Egypt at this time. ("Ancient History," p. 338.)

was verging more and more towards Monotheism.[1] Now the worship followed by Khuen-aten and his court was a form of Monotheism. There ran through it a high tone of devotional feeling, and quite a pure conception of the Supreme Being, though as His representative they adored a visible, material object.[2] This new power arose exactly in that section of country where the sculptors of the twelfth dynasty represent the arrival of Semitic bands. Probably the explanation of this whole period is that it marks the revival of Semitic influence and power, crushed when the shepherd kings were driven out of the country.[3]

As to the supposed connection between Khuen-aten and Amen-hotep IV., it seems that in the tomb of Queen Tii was sculptured a portrait of her son, Amen-hotep IV., and in this cut he does not at all resemble Khuen-aten. Further still, in a tomb at Thebes, discovered but recently, by Mr. Stuart, there were two sculptures: that on the left of the entrance being Amen-hotep IV., with his cartouch; that on the right being Khuen-aten and his cartouch; and we are told that the two figures did not at all resemble each other.[4] From the name of the queen of the Khuen-aten, we judge she was a daughter of Amen-hotep IV., and a granddaughter of Tii,[5] and, from the peculiar mode of address, she seems to have reigned in her own right.

Whatever we may ultimately have to decide as to the facts of the case, it is evident that for a considerable time a line of kings ruled all Egypt from their headquarters at

[1] "Egyptian Religion," p. 146.

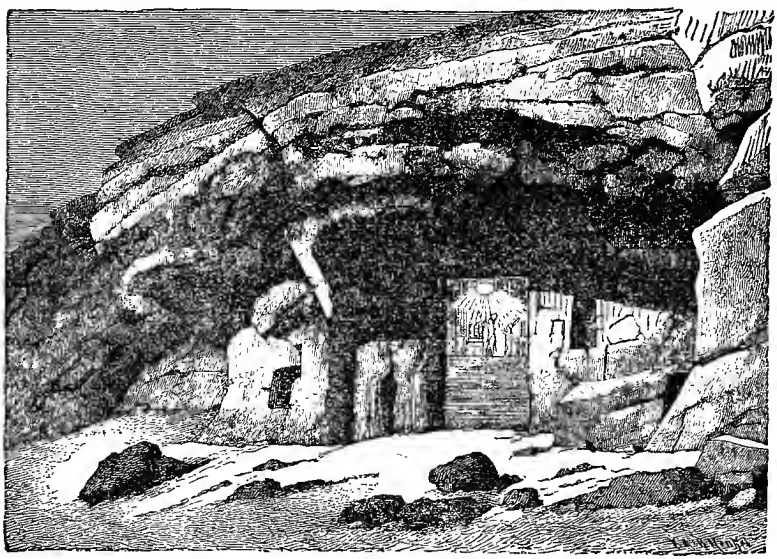
[2] Rawlinson: "Ancient Egypt," Vol. II., p. 273.

[3] See Tiele: "Egyptian Religion," p. 164, note 3. It seems that Sir Charles Nicholson thinks he has proved that the hostility to Khuen-aten arose more from dynastic than from religious causes. This is exactly the position we have assumed.

[4] "Nile Gleanings;" but compare Sayce's "Ancient Empires," p. 40, note 1.

[5] Ibid.

Tel-el-Amarna. The tombs are large and numerous. The scale on which they are excavated shows that a long time was required in this work. "After they were completed and tenanted, they must have been for many years visited by the descendants of the occupants, for they contain enormous accumulations of broken earthenware, the remains of the vessels in which offerings were brought annually by



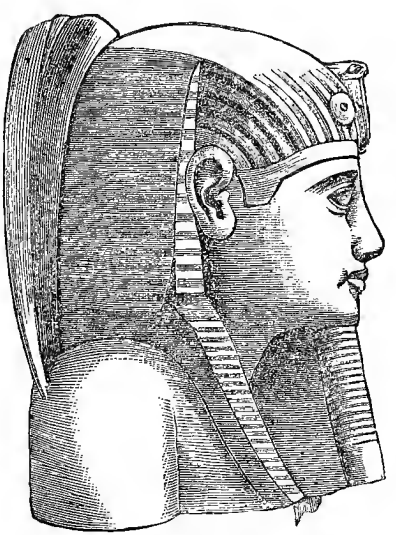
Khuen-aten and Family Worshiping the Disk.

surviving relatives. . . . It must have been a period of much prosperity and luxury, judging from the rich dresses and furniture, and the numerous chariots and horses sculptured on the walls of these stately mausoleums; and the army seems to have been particularly well appointed, as every branch of it is represented in the tableau of a royal review sculptured in one of the tombs."[1]

Still this entire line of kings was cordially hated by

[1] "Nile Gleanings," p. 85.

the Thebans, no doubt largely for the position they took in regard to the religion, and probably still more because they had overthrown Theban power. The immediate successors of Khuen-aten made an attempt to conciliate the rest of the country in religious matters, and adopted some of the old gods. Yet they were mainly unsuccessful, though the last king of the line was granted a burial in the royal tomb of Thebes. When the powers at Thebes had regained the supremacy, they destroyed, as far as possible, all evidences of this line of kings; hence we know but little about it. Three kings are mentioned,[1] but we are not sure that this is the correct number,[2] and are in doubt as to the order of succession.[3] It seems, however, that after a time Thebes recovered her power; the old line seems to have been reëstablished. In the sculptured bust of Horem-heb, we see again the classical features of the kings of the eighteenth dynasty. Still the power of the eighteenth dynasty had been hopelessly weakened. The reign of Horem-heb was the last of the line. Another period of confusion ensues, and we are confronted with the nineteenth dynasty—a very pronounced Semitic one.



Horem-heb.

In regard to the culture of the eighteenth dynasty, we must remember the circumstances under which it

[1] Rawlinson: "Ancient Egypt," Vol. II., p. 277.

[2] See Sayce: "Ancient Empires," p. 42, note.

[3] Ibid.

arose. All the energies of united Egypt had been gathered to free the land from the suzerainty of the Hyksos. That effort being successful, the aroused energies of the people were put forth to develop their resources. "Industry and trade diffused prosperity throughout the thickly peopled land. Agriculture was pursued with especial care, as a sacred task; and the works which, in the Nile Valley, are so indispensable to success, were kept up or improved. Ancient towns grew in extent, and increased in magnificence and wealth of monuments, while new towns were founded."[1] Further, we must consider the wonderful increase of national wealth caused by their successful foreign wars. Western Asia and Northern Africa poured their tribute into the lap of Thebes. In addition to all this, we must take into account the impetus given to the national intellect by the foregoing. Egypt was no longer an exclusive country. They were brought into contact with the culture of surrounding people. It is not singular, then, that the entire period was one of great literary activity. Nor were the arts neglected: temples and public monuments of all kinds were erected; magnificent tombs were hewn out of sold rock, and richly carved and sculptured.

In matters of religion, we are assured that slow but sure progress was going forward, and, in our opinion, this was largely due to Semitic influence. We have pointed out that, from a very early time, Semitic people were passing from Asia into the Delta. When the Hyksos kings were driven out of Egypt, it was not so much the Semites that were expelled as it was their masters, the Hittites. The Semites remained. And we have pointed out our reasons for believing that the line of kings that

[1] Tiele: "Egyptian Religion," p. 146.

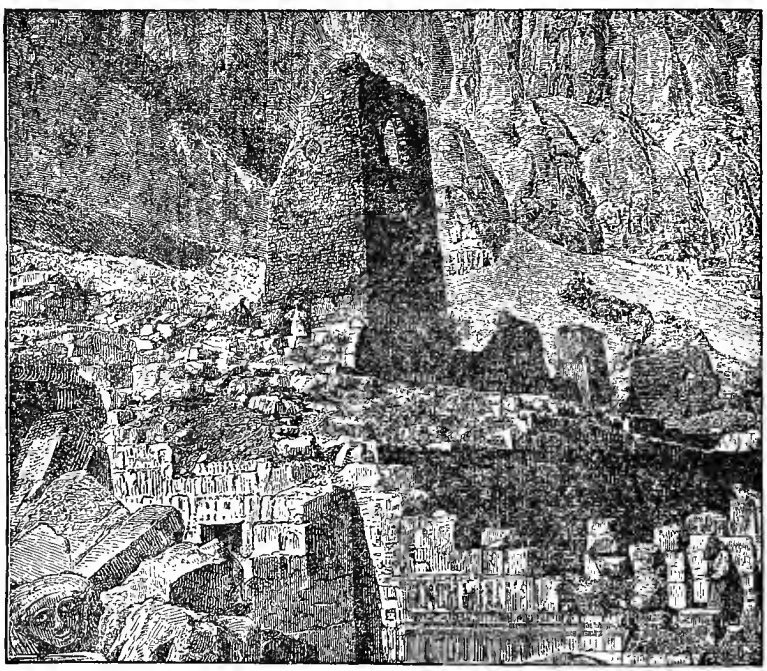
ruled at Tel-el-Amarna were of some Semitic stock. Now, one of the ways in which Semitic influence would make itself felt would be in the field of religion. They, doubtless, assisted the tendency, inherent in all systems of Polytheism, towards Monotheism.

It will be well to recall what was written in a preceding chapter[1] in regard to this last statement. During this period, the Egyptians came the nearest they ever did to Monotheism. Perhaps it was for reasons of policy only that this important step was not taken. Like the Chinese, the Egyptians were very faithful to traditions. It is quite natural that, as the country grew more and more united, the people would see that, after all, they were worshiping the same gods. Just as we have seen that the three local gods of the Thebaid—Amen, Chem and Munt—were considered as really the same in the times of the twelfth dynasty, so, now, the widening horizon of their intellectual sky enabled them to perceive the unity between the greater gods of Egypt, for these gods had all grown out of the same mythic conceptions and had much in common.

It would seem as if the Hyksos kings gave them a start in this direction, since they spoke of Amen of the South, in conjunction with Ra of the North, under the title of Amen-ra; and, in time, this deity became confounded with all of the principal gods. Shu, Tum, Osiris, are all, at different times and places, considered the same as Amen-ra. In addition to this, purer spiritual conceptions of the nature of a god were formed. However, the Egyptians of this time were not able to cast aside all the material conceptions of divinity. To the last, Amen-ra was considered as a god (masculine), and was joined to a

[1] Page 346 *et seq.*

goddess. Thus it will be seen that the religion of Egypt, under the eighteenth dynasty, presents itself to us in a most interesting light. Men seemed conscious that their various gods were but different names of the same god, yet they did not drop the worship of all but one. On the contrary, each god was, when worship was paid to it, considered as the supreme and only god. Side by side, with



Terraced Temple of Queen Hatsu.

purer conceptions of a god, existed other conceptions of a debasing nature. They stood on the very verge of Monotheism, yet did not take the step. We only want to add to the foregoing that they had come to this stage as a result of protracted development.[1]

In resuming the thread of the historical narrative, we

[1] Our principal authority on this subject has been Tiele. ("Egyptian Religion," pp. 141–157.)

find ourselves entering upon an important epoch. This is the so-called nineteenth dynasty, and marks the revival of Semitic influence. In the obscurity concerning the commencement of this dynasty, we can but dimly make out the main points. We have shown that the eighteenth dynasty ended in a great deal of confusion, and have given our reasons for believing that Khuen-aten and his immediate successors mark the rise to power of a new section, with headquarters at Tel-el-Amarna, but have also noted the fact that the last king of the list, Horemheb, marks probably a return to Theban supremacy. Mr. Sayce[1] has shown that room must be found about this time for one or two more kings of which we at present know nothing. All this points to a much disturbed period—a time of civil wars, invasions and insurrections. The Asiatic dependencies not only threw off the yoke, but threatened Egypt with a conquest in turn.

In the midst of such a state of things, a new confederacy seems to have been formed in the Delta. The part most exposed to attack could no longer wait on the tardy action of Upper Egypt, but united its forces for self-protection, and, finding itself a powerful body, concluded to make thorough work by putting itself at the head of affairs in Egypt.[2] Now the Delta had been for a long time infil-

[1] "Ancient Empires," p. 42, note.

[2] Some authorities are willing to admit that the nineteenth dynasty came from the Delta. Tiele concludes this from "his name and the god to whose worship he was most devoted." Sayce contents himself by showing that "Rameses, its founder, came from Lower Egypt, and was probably of Semitic extraction, but was related, probably by marriage, with the eighteenth dynasty." He gives no authority for this view. Wilson does not mention the Delta, but styles Rameses I. "a gallant soldier who seized on the government." Lenormant says nothing about the northern origin of this dynasty, but thinks Rameses I. was the grandson of Horem-heb. Brugsch says nothing as to place of origin, but thinks there must have been a close family connection between the eighteenth and nineteenth dynasties, but says: "Whether Rameses was the son, son-in-law or brother of Horem-heb is as yet undecided." Birch says nothing of place of origin, but says of Rameses

trated with Semitic tribes—tribes who had been more or less connected with the Hyksos conquests. It would, therefore, not be at all singular that the physical appearance of the new dynasty should betray marked Semitic traits,[1] or even their connection with the old Hyksos conquerors be admitted. Both of these conclusions seem to be established by late investigations. The nineteenth dynasty was a rise to power of tribes containing a large Semitic ethnic element, dormant since the expulsion of the Hyksos, with the probable exception of the dynasty of Khuen-aten. The probabilities are all against there being any connection by blood or marriage between these two dynasties. It was a conquest, or at least an enforced union under the leadership of the Delta, to escape a threatened conquest from Asia.

The new dynasty was, however, a very politic one. Though the kings worshiped as principal gods the local gods of the Delta, yet they also worshiped the great gods of Egypt generally, and sought in every way not to offend their subjects in this respect. They were also active in erecting temples to the honor of these various gods. Neither did they seek, at least at first, to transfer the seat of authority from Thebes to another city. Probably with the great mass of people this change of dynasty was scarcely noticeable. No sooner was the new dynasty in power, than they set themselves to work to reconquer the provinces gained by Thothmes but lost in the troublous times following the reign of Amen-hotep IV.

The first king of the list was Ra-meses I.; that is, the

---

that "he is supposed to have been connected by marriage with the previous dynasty." Rawlinson, after noting these conflicting views, concludes that he was unconnected with the eighteenth dynasty; that he was "one who raised himself to power, at a time of political trouble and disturbance, by his own talents and energy."

[1] See mummy of Rameses II., pp. 590, 591.

son of Ra; and Ra was the chief god of Heliopolis. We know but little about the reign of this king. His coronation as king of Egypt is represented on the walls of Karnak. He seems to have waged war with the Hittites in Western Asia, the outcome of which was perhaps not decided, since a treaty of peace seems to have been entered into between these two powers, in which each agreed to respect the other's territory.[1] He seems to have reduced Nubia to his rule, since he built a storehouse for the temple of Bahani at the second cataract, and transported thither captives taken in his wars.[2] He also constructed for himself a fine tomb near Thebes, from the sculptured adornments of which we gather considerable as to the religious culture. It is noticeable that Set, the great god of the Delta, was especially honored.[3]

He was succeeded by Seti I. The exact relationship between these two kings is as yet unsettled,[4] though the probabilities are that Seti was the son of Rameses I.[5] It is stated that Seti I., in order to render his reign more secure, married a granddaughter of Khuen-aten;[6] but nothing is known for certain on this point, and, in our opinion, the probabilities are all against it.[7] Be all this

[1] This fact is only known to us from an incidental mention of it in the treaty made with Rameses II. See "Records of the Past," Vol. IV., pp. 28, 29.

[2] Brugsch: "Egypt," etc., Vol. II., p. 9.

[3] Rawlinson: "Egypt," Vol. II., p. 287.

[4] Some inscriptions speak of him as the son of Rameses I. This is the view of Brugsch, Birch, Sayce and Rawlinson. Lenormant speaks of him as "a soldier of fortune, a stranger by birth to the royal family, who, by marriage with the heiress of the crown, seated himself on the throne." His arguments, however, seem to us to be very weak. Wilson styles him "a young relative [of Rameses], Seti by name."

[5] Rameses II. styles himself "son of Seti and grandson of Rameses I." ("Records of the Past," Vol. IV., p. 28.)

[6] Such is the opinion of Wilson, Rawlinson and Brugsch. See, also, Prof. Payne's article, in "Century," for May, 1887.

[7] The simple fact that the name of his queen was Tuâ, or Tuaa, does not justify us in jumping to the conclusion that she was a descendant of Tii, the foreign

as it may, Set I. was the most energetic and warlike king Egypt had seen for a long time. Travelers and writers generally have spoken with admiration of the "refined, sweet and smiling profile" of this king.[1] A late writer speaks of "his noble head, at once human and heroic, mild and proud."[2] We present a view of the profile of this king. These smiling features were those of a man who knew how to command. Once again the armies of Egypt swept in victorious course through Western Asia. This time, however, they met with more of an organized opposition than that which confronted the armies of Thothmes. The Hittites had now thoroughly organized their forces, and presented a barrier against which the Egyptian army could make no permanent advance. He undoubtedly succeeded in depriving them of their subject tribes in Palestine, and received at least the nominal sub-

Profile of Seti I.

queen of Amen-hotep III. Maspero has shown that Tai-ai was an Egyptian name. (Sayce: "Ancient Empires," p. 40, note 1.) The fact that Rameses II. was spoken of as "king in his mother's womb"—thought to imply that he was the first legitimate king of this line—is, on the contrary, an example of how the obsequious scribes sought to flatter the praise-loving Rameses II.

[1] Robinson: "Pharaohs of the Bondage," p. 54.

[2] "The Century," for May, 1887.

mission of Mesopotamia.[1] He apparently inflicted a heavy blow on the Hittites themselves by the surprise and capture of their capital, Kadesh, on the Orontes; but it is to be observed that this victory is followed by a treaty, in which the Hittite territory proper is returned to them, and each party agrees to respect the territory of the other. This shows that the Hittites themselves were not much crippled by their defeat.[2] It may be that all he wished to do to the Hittites was to compel them to respect the treaty made with Rameses I.[3] In other respects, his campaigns were successful, and the authority of Egypt seems as firmly established as in the days of the great kings of the eighteenth dynasty.

In public buildings and works of public utility, Seti was also active. The Great Hall of Columns, at Karnak, was his work, a view of which, in a restored state, we have presented. One wall of this hall is called the memorial wall, since it is covered with painting and sculpture illustrative of his numerous victories.[4] He erected a somewhat famous temple at Abydus, the headquarters of the Osiris faith in very ancient times. This temple is renowned as being the location of the Abydus tablet. It would seem as if the kings of this dynasty were somewhat given to the study of antiquities, and sought to arrange tablets of the names of the kings who had preceded them. The variations, however, in these lists show that they had no certain

---

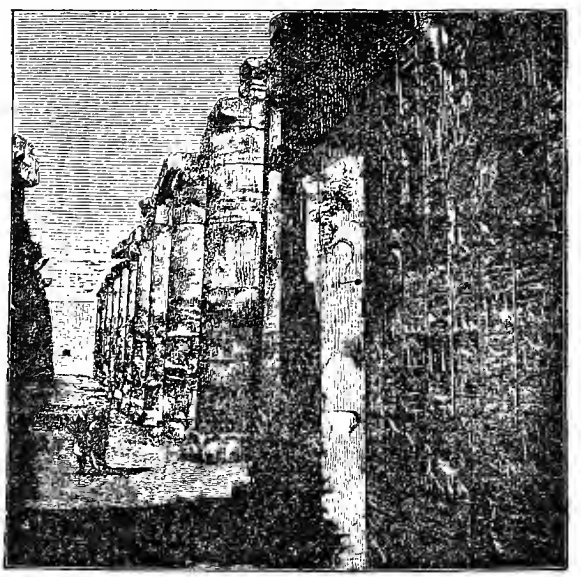
[1] Rawlinson: "Egypt," Vol. II., p. 292.

[2] Lenormant: "Ancient History," Vol. I., p. 243.

[3] See Wilson: "Egypt of the Past," p. 263.

[4] "This hall contained one hundred and thirty-four columns, twelve of which are sixty-two feet high, and nearly thirty-eight feet in circumference. The remainder are forty-two and one-half feet high, and twenty-eight feet in circumference. They are designed after the papyrus plant, are elegant in figure, and superbly decorated with paintings and hieroglyphics." (Wilson.) Only about half the columns were erected by Seti I. See plan in Oncken's "Allgemeine Geschichte," No. 25.

basis to work on. At Quarnah, opposite Thebes, he erected a temple in honor of his father, Rameses I. This temple was completed by Rameses II. Finally he built for himself a magnificent tomb, which was discovered by the traveler Belzoni. This tomb has a number of very interesting points in connection with it. In one small room was a long hieroglyphic inscription concerning the destruction of mankind.[1] The sarcophagus, which probably once con-



Ruins of the Temple of Seti I. at Abydus.

tained the king's body, is now deposited in the Soan Museum at London.

It has remained for the last few years to discover the veritable mummy of this once great king—found in the summer of 1881, in the rock-grave of Dair-el-Bahari, to the west of Thebes, in company with Taa-aa-ken, of the seventeenth dynasty; the redoubtable warrior Thothmes III., of the eighteenth; and the mummy of his greater

Ruins of the Temple of Quarnah.

son, Rameses II. Thanks to the great skill of the Egyptians as embalmers, we are now enabled to look on the very face of Seti. But oh, stop and think how triflingly brief is the span of human life! More than thirty centuries, with their burdens of hopes and fears, have sped away into the illimitable past since that sheeted form was laid in its tomb.

Mummy of Seti I.

Rameses II., the son and successor of Seti, is probably the most renowned king of Egypt, and yet when we ask for the grounds on which this great renown rests, we are conscious that they are not very satisfactory. He was known among the Greeks as Sesostris, and around his name there have gathered events and conquests that properly belong to other mon-

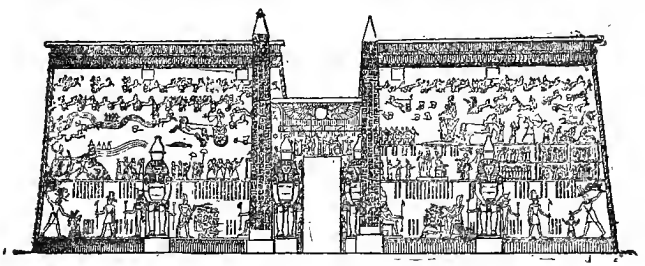
archs,[1] as well as some mythical events. He was a very great builder, and filled Egypt with slaves, whom he compelled to work on public monuments. Of his wars, the most successful ones were directed against the hapless Negroes of the south. Lenormant says: "Man-hunting expeditions among the unfortunate Negroes of Soudan were organized on a monstrous scale, unknown in former times. There was no longer any intention, as under the Thothmes and Amen-hoteps, of extending the frontier of the Egyptian empire so as to include the ivory and gold-producing countries. The chief and, in fact, only aim was to procure slaves. Nearly every year grand razzias were made into Ethiopia, returning with thousands of captives, of every age and of both sexes, loaded with chains."[2]

In the Asiatic campaigns, it is clear enough that the Egyptian power was weakened. It is possible that, nominally, Rameses still held the country first conquered by Thothmes and regained by Seti I. It is evident that the Hittites were able to successfully withstand the might of Egypt, against whom they united all the countries of Western Asia. The great battle of the war was fought near Kadesh, on the Orontes. In the list of the Hittite allies may be recognized Aryan tribes of Western Asia Minor. Though claimed as a great victory by the Egyptians, and extravagant praises heaped on Rameses for his personal exploits, it is clear that it was a drawn battle, if not an Egyptian defeat.

This battle of Kadesh, during which Rameses seems to have become separated from his command and owed his escape to personal bravery and prowess, was, on that account, seized on by court scribes and poets as a topic on which to exercise their skill; and as Rameses was such

[1] Birch: "Egypt," p. 125. [2] "Ancient History," Vol. I., p. 257.

a vain-glorious king, and was anxious to have his deeds known, it is not surprising that we have full accounts of it, written, however, with a full knowledge that the king and Egypt must be set forth in a favorable light. On the walls of the temple at Thebes, this battle is chiseled in deep work in solid stone. The many little details of the Egyptian campaign are represented. We have, also, a prose account of the battle in a papyrus roll, and the whole story is several times repeated on the walls of vari-



Front of the Temple of Luxor at Thebes.

ous temples. This battle was also made the occasion of a prize poem.[1]

The wars with the Asiatic countries did not terminate with this battle of Kadesh, but continued for some years, probably with varying fortunes; but finally a new treaty of peace was made, in which each party agreed to respect the territory of the other. This treaty was soon afterwards strengthened by marriage between Rameses and a Hittite princess. It is clear that this treaty must have undermined Egyptian influence in Western Asia. It is considered, however, that when the Hittites entered into this treaty the several Asiatic dependencies of Egypt, whom the Hittites had stirred up to revolt, were forced to return to their allegiance; but Lenormant observes that the

[1] See "Poem of Pentaur," in "Records of the Past," Vol. II., p. 65.

"bonds of subjection in which these countries were held were much lighter than they had been under Thothmes III., and the Egyptian king prudently contented himself with gratified self-love as a substitute for real power."[1]

It is supposed that Rameses was associated with his father, Seti I., when he was but a boy of ten.[2] He is sup-

Mummy of Rameses II. (Side View.)

posed to have become sole king when he was about twenty-eight.[3] He lived to be a very old man. The sixty-seventh year of his reign is noted, but whether this is counted

[1] "Ancient History," Vol. I., p. 256.

[2] The inscription at Abydus says: "I was a boy on his lap, and he spoke thus: 'I will have him crowned as king, for I desire to behold his grandeur while I am still alive.'" (Brugsch: "Egypt," etc., Vol. II., p. 24.)

[3] Rawlinson: "Egypt," Vol. II., p. 302.

from the time he was associated with his father, or from his sole reign, is not settled. It is evident that for a very long time he ruled Egypt. One result of his wars was to fill Egypt with a vast number of captives, who were kept as slaves. This accounts in some measure for the great number of public works erected by him, and in this matter he was actuated by a desire to excel his predecessors,

Mummy of Rameses II. (Front View.)

and thus hand down his own fame, for he "seems to have made self-glorification the end of his life.[1]

Of his public works, we might mention the fortress-wall, supposed to have extended from Heliopolis to Pelusium.[2] This was commenced by Seti but completed by Rameses. Another work was the great canal, extending from near Bubastis, in an easterly direction, to the

[1] Tiele: "Egyptian Religion," p. 169. [2] Birch: "Ancient Egypt," p. 131.

Bitter Lakes; through them south to the Red Sea.[1] He also built several cities. Tanis, or Zoan, which, as we have seen, had long been famous, and was one of the chief cities of Hyksos kings, he rebuilt and made it his capital. A private letter of that far-away time gives us a description of the city: "I found it flourishing in good things without a rival, like the foundation of Thebes. . . . The abode of felicity. Its meadows are filled with all good things. It is well provisioned daily. Its pools (are filled) with fish, its ponds with fowl. Its fields are verdant with grass. . . . Its threshing floors are full of barley and wheat."[2] The royal court was held here, and here was erected a great statue of Rameses II. It must have been about one hundred and twenty feet high, carved out of a solid block of Seyene granite.[3]

Two other cities of the Delta are of interest because they are mentioned in the Bible, and those in the erection of which the children of Israel were compelled to labor.[4] These were the city of Rameses, the site of which is as yet unknown,[5] and Pithom, the site of which is thought to have been satisfactorily located by M. Naville.[6] At a number of places up and down the Nile, were temples erected by order of Rameses II. As celebrated a one as any is the famous rock temple of Abu Simbel. The facade is formed by four great seated statues of Rameses II., each seventy feet in height. The walls of the room within, all hewn out of the solid rock, are covered with paintings of scenes from the life of the king.[7] All travelers and

[1] It is still possible to trace portions of this canal. ("Store City of Pithom," p. 2.)

[6] Ibid. [7] Page 617.

writers speak in the highest praise of this wonderful temple.[1]

After his long and generally prosperous reign, Rameses was laid to his rest in the "valley of the tombs of the kings," to the west of Thebes, where he had built himself a magnificent tomb. Here he slept undisturbed until nearly two centuries had flown over his head, when troublous times were again upon Egypt. So his body was moved around from place to place; but finally, along with others we have mentioned, it was laid to rest in the rock tomb of Dair-el-Bahari, and so was discovered a few years ago, and hence we also are permitted to gaze upon the veritable features of this king. Of these features it is said: "There is plainly to be seen an air of sovereign majesty, of resolve, and of pride."[2]

When the reign of Rameses Meriamum was brought to a close, we have something more to chronicle than merely the end of a long reign. The glorious period of Egyptian history is now closed. From henceforth we will proceed with greater rapidity, for it is always sad to trace the outline of a nation's fall; so we will hasten along this long period of decline and ever lessening influence. In the drama of the world's history, Egypt had already played her most important part. It is almost startling to reflect that during the many centuries we have thus far traced Egyptian history, we are almost entirely in the dark as to the rest of the world. But the thread of its history now begins to intertwine with that of other people in Western Asia, of whom we have more or less knowledge.

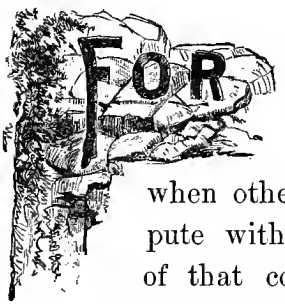
[2] Robinson: "Pharaohs of the Bondage," p. 71. Undoubtedly some will wonder why we do not speak about the Israelite bondage, which is generally thought to have been at its height under this king. This point will be fully considered in the chapter on the Hebrews.

# CHAPTER VIII.

## EGYPT CONTINUED.

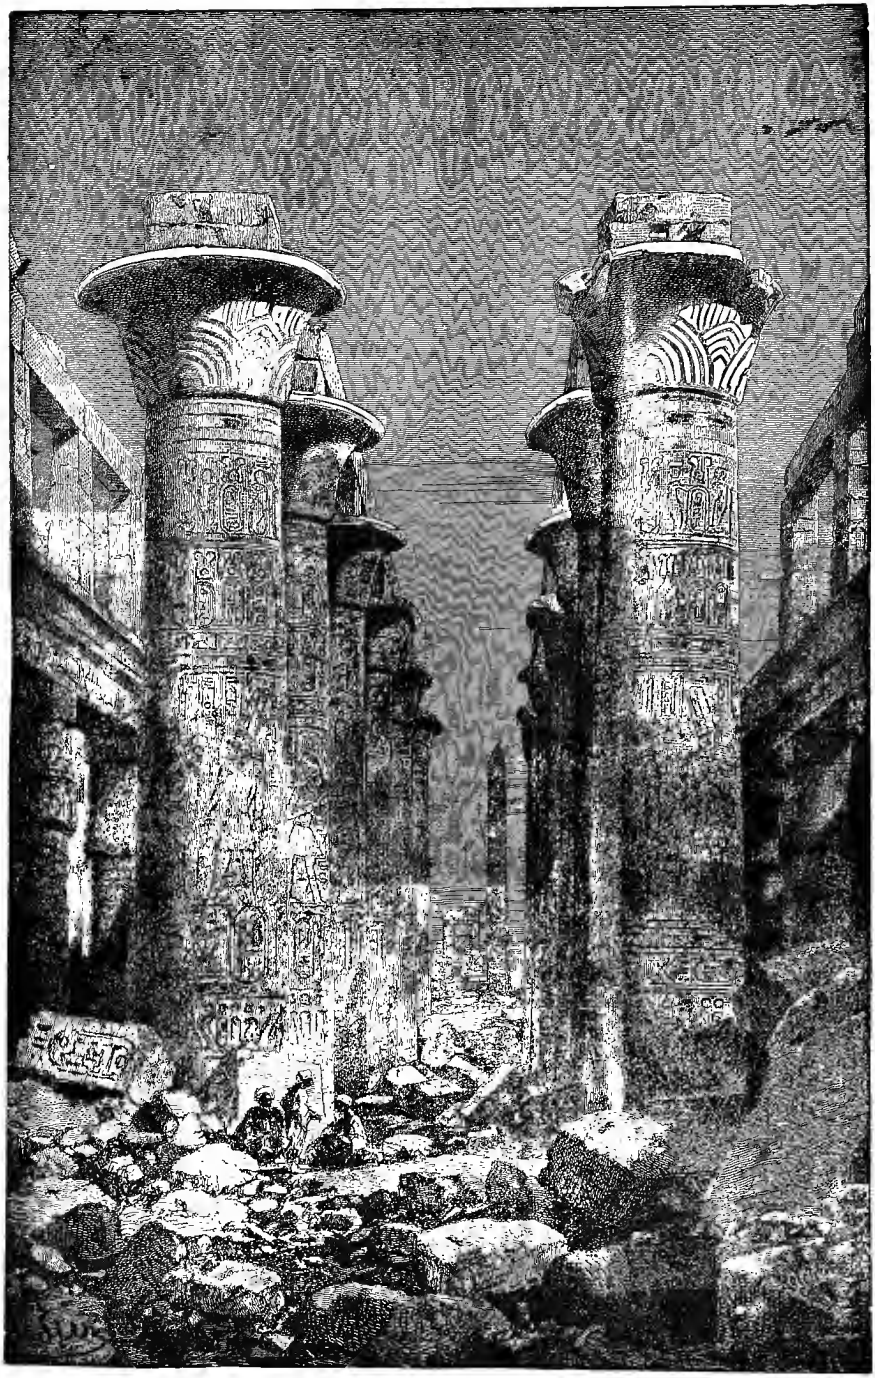
INTRODUCTION — Egypt's decline—Pelasgians—Menephthah—Invasion of Egypt by the Europeans—Seti II.—The Twentieth Dynasty—Invasion of Asia—Conspiracy against Rameses—Culture of the Twentieth Dynasty—Historical Confusion in Egypt—The Assyrians—Conflict between Egypt and Assyria—Influence of Egypt on Civilization—Egyptian Civilization Stationary—Egyptian Society Tribal—The Priestly class—Egyptian Ideas as to Immortality—The Judgment Hall of Osiris—Egyptian Sciences—Their Social Life—General Conclusions.



MANY long centuries, Egypt had been the foremost country in the world. The time was now at hand, when other sections of the earth were to dispute with her for supremacy, and the issue of that conflict was the downfall of Egypt.

Many causes were at work during the reign of Rameses II. to weaken the power of the government. The foreign wars, the introduction of great numbers of slaves and the despotic manners of the court, which adopted many Oriental customs, all tended to weaken the national energy. In fact, the decline that was at hand commenced in the life of Rameses II., and the political sky of Egypt was already overcast, when the aged monarch passed away and was laid in his tomb. This decline is apparent in matters of art, in religion and in material greatness.[1]

[1] Lenormant: "Ancient History," Vol. I., p. 258. Tiele: "Egyptian Religion," p. 170. Brugsch: "Egypt etc.," Vol. II., p. 11x.



THE HALLS IN THE TEMPLE OF KARNAK.

But the wisest king of Egypt could not have entirely averted the impending storm. Causes far beyond the confines of Africa were at work, the results of which were to tell with disastrous effect on Egypt. The first migrating bands of Aryan people of Europe, who had perhaps become more or less mixed with the primitive population, were in turn exposed to invasion from still other Aryan people. When the multitudinous Germanic tribes had firmly seated themselves in Central Europe, there was movement all along the line. The Greeks and Romans were driven into the territory, where they were destined to evolve so brilliant a Civilization. But the former inhabitants of Southern Europe pressed still farther to the south took refuge, some on mountainous tracts, some on the islands of the Mediterranean, others in Northern Africa and some along the shores of Western Asia. If it be asked further who these people were, we can only give a theoretical answer. They were at the bottom undoubtedly Turanian, they were more or less mixed with Aryan people, and seem to have been, in places at least, called Pelasgians.[1]

These people, driven thus away from their original home or confined in very contracted areas, took up the same course of life that the barbarians of Central and Northern

---

[1] This is saying a good deal. There is, probably, no question of the intermixture of Aryan and Turanian blood. [See Third Volume.] Winchell concludes that the Pelasgians were Hamites ["Preadamites," p. 23] but the Hamites were Turanians intermixed with other stocks. [Rawlinson: "Herodotus," p. 526 *et seq.*] It is well known that the utmost uncertainty exists in regard to the Pelasgians. Rawlinson calls them Aryans ["Herodotus," p. 541] but see Winchell's criticism on this. ["Preadamites," p. 24., note I.] For a long discussion on the Pelasgians see Thirlwall's "Greece," Vol. I., Chap. II., and compare with Grote's "Greece," Vol. II., p. 261 *et seq.* Prof. Sayce shows that the word "Pelasgian" is used in two senses, one, and the most common, is in a general sense about the same as our word prehistoric ["Ilios," New

Europe did centuries later. They became expert sailors and made piratical descents on the mainland, striving to establish themselves as colonists, if possible, or else to escape with all the booty they could gather. From time to time they gathered all their forces together and made an onslaught on Egypt. Thus the people of the Nile valley were brought into contact with people from Europe; and, time and again, Egypt was shaken to its very center. We detect the first appearance of the new danger as far back as the times of Thothmes III.[1] The first invasion of Egypt seems to have been in the time of Seti I., while Rameses II. was co-regent with him. The Sardinians and Etruscans united with the Lybians to invade the Delta, but they were defeated by Rameses.[2]

Rameses II. passed away and was succeeded by his fourteenth son, Men-eph-thah.[3] It is usually stated that he was but a feeble and incapable ruler, but we are at a loss to know the grounds of this conclusion.[4] It seems that during the last few years of Rameses II., incursions along the west of the Delta had become of almost habitual occurrence. The auxiliary army had been disbanded and

---

York, 1887, p. 126.] Coming now to the Egyptian side of our statement, it is shown that the Libyans between the sixth and twentieth dynasties, had either become greatly changed in features owing to intermixture with some other people, or else the original people were driven away by the advance of people from Southern Europe [Lenormant: "Ancient History," Vol. I., p. 259] and it is agreed on all hands that the constantly recurring stubborn invasions of Egypt, were led, in the main, by people from Europe. The Etruscans seem to have been active in this matter. [See Poole in "Contemporary Review" for April, 1879.]

1 Poole in "Contemporary Review," April, 1879.

2 See Poole: L. C., p. 113; but see also Brugsch: "Egypt" Vol. II., p. 123. *et seq.* Compare this with Rawlinson: "Egypt," Vol. II., p. 331, and Appendix "B" of same volume.

3 This name is variously spelled.

4 Tiele: "Egyptian Religion," p. 176.

the fortifications of the land neglected. Finally, when Rameses was gone and his son reigned in his stead, the confederates, the Libyans and their allies and the Sardinians, Sicilians and Etruscans, thought it a good time to invade the land. So in the fifth year of Men-eph-thah, a mighty army poured over the border of the Delta from Libya and advanced almost to Memphis. The king with the utmost speed gathered his army, hastily fortified Memphis and Heliopolis, and sent his troops under the command of competent generals to meet the enemy. Victory

European People who Invaded Egypt.

remained with the Egyptians, but it is to be noticed that circumstances of barbarity, such as mutilation of the slain, followed. This shows that the Egyptians recognized that they were fighting for their very existence with a savage enemy.[1] Thus the first trial of strength between Egypt and Europe ended favorably to the Egyptians. It is considered as very probable that like the Romans of a later day, though the Egyptians had conquered in battle, they

[1] See Birch in "Records of the Past," Vol. IV., p. 37. Brugsch gives

were forced to allow numbers of these people to remain in the Delta.[1] The remainder of this king's reign seems to have been peaceful. He built palaces at Thebes and at Memphis, he dug wells in the desert of Arabia beyond the Egyptian frontier. His inscriptions have been found at Elephantine and at Tanis, sometimes on the monuments of other kings, either in conjunction with, or in substitution of, the original name.[2] But Menephthah was not the first

Face of Menephthah.

king who had stooped to such acts as these. His foreign

a different location of these allies of the Libyans "History of Egypt," Vol. II., p. 112, also "Appendix nine" to "Ilios," p. 747, but compare with them Poole in "Contemporary Review," April, 1879. It may be that we are in error in supposing that European nations are mentioned at all. See Rawlinson: "Egypt," Vol. II., p. 331. Prof. Sayce also is skeptical on this point as he thinks these proper names in question are those of Libyan and and Semitic people: "Contemporary Review" December, 1878, p. 75.

1 Lenormant: "Ancient History" Vol. I., p. 261.

2 Wilson: "Egypt of the Past," p. 331.

relations, especially with the Hittites, appear to have been peaceful. He maintained the Egyptian authority over Canaan, and there still survive some curious memoranda on the back of a papyrus roll of the arrival and departure of Egyptian officers on their way to various parts of Palestine with dispatches.[1] He allowed several tribes of Bedouins to graze their flocks on the rich pasture grounds of the Delta.[2] His reign is generally stated to have lasted eight years. His tomb at Bab-el Moulook one of unusual excellence.[3]

Seti II.

The successor of Menephthah was Seti II., but just at this point is another of those confused periods in Egyptian history, and we cannot be sure of the succession of events. The capital from the time of Rameses II. had been located at Tanis. This may not have been exactly relished at Thebes. We have some evidence that during the reign of Men-

1 Brugsch: "Egypt," Vol. II., p. 126.

2 Ibid. p. 127.

3 It is generally stated that the Exodus took place under Menephthah. This has had a great deal to do with the general supposition

ephthah a rebellion broke out in the south. A chief by the name of Amen-mes from Central Egypt was at the head of it, and he seems to have been acceptable to the Thebeans.[1] He called himself king of Thebes, and his tomb was built in the "valley of the tombs of the kings." Probably he disputed authority with Seti II., but, after his death, Seti ruled without further trouble. The only inscription of his reign is in his second year. Yet from many indications we possess, we think his reign must have been long and peaceful.[2] His tomb at Thebes was a very fine structure.

This was a time of considerable literary activity. The priests deemed it a duty to transcribe for the future generations the learning of the past, so copies of important papyri were made. But new works were produced. One of much interest to us is known as the "Tale of the two Brothers." The first part of it is curiously like the story of Joseph's life. We also have a further illustration of how tenacious folk-lore stories are. All have heard of the giant who could not be killed because his soul was hidden far away. So this old Egyptian story of over three thousand years ago, tells us how the younger brother could not be destroyed until the tree in which he had hidden his soul was cut down.[3]

It is the general belief that another period of invasion put an end to the nineteenth dynasty.[4] Although the

---

that his reign was a weak and incapable one, but see our chapter on the Hebrews.

[1] This is the view of both Brugsch and Rawlinson, a slightly different view is supported by Wilson: "Egypt of the Past," p. 341.

[2] Wilson: "Egypt of the Past", p. 338.

[3] Renouf's translation in "Records of the Past," Vol. II., p. 137 *et seq.* Tiele has shown that this whole story is but the working over again of the old mythic conception of the Egyptains As he expresses it, it is "the Ancient Mythology and theology transferred to the region of humanity." "Egyptian Religion," p. 183.

[4] Poole in "Contemporary Review," April, 1879.

monuments are silent, yet we know that a time of anarchy and confusion lasting for some years passed by during which Egypt was broken up into many little powers. A description of that time declares that "the land of Kami had fallen into confusion, every one was doing what he wished, they had no superior for many years who had priority over the others. The land of Egypt was under chiefs of nomes, each person killing the other for ambition and jealousy."[1]

Setnekht.

The Libyans again made invasions into the Delta, and doubtless in this work they were assisted by their allies from the islands and northern shores of the Mediterranean.[2]

We catch a faint glimpse of two or three kings of this period who ruled at Thebes. But finally, after an unknown number of years, a new confederacy is formed, which suc-

[1] "Records of the Past," Vol. VIII., p. 46.

[2] Poole: "Contemporary Review," April, 1879.

ceeds in restoring order throughout Egypt, and freed the land once more from invasion. At the head of the confederacy was the first king of the twentieth dynasty, Setnekht. We do not know that there was any relation whatever between the twentieth and nineteenth dynasty.[1] Judging from the names of the kings, they were from the Delta. The papyrus quoted above[2] declares that Setnekht "adjusted the whole land which was in insurrection, he

Rameses III.

slaughtered the abominable who were in the land of Tameri (Delta), the great throne of Kami was purified."

The second king of this line, Rameses III., revived for a moment the fading luster of Egypt. It is generally stated that one of the first cares of the new king was to re-arrange

[1] Rawlinson: "Egypt," Vol, II. p. 365.

[2] Harris Papyrus, "Records of the Past," Vol. VIII., p. 46.

the caste divisions of the country. The statement is too strong. There had been nothing just like caste in ancient Egypt.[1]

In a tribal state of society, caste can originate only by conquest, with the provision that the conquered tribes shall occupy a subordinate position, and that marriage between the tribes be strictly prohibited. This was not the case in ancient Egypt. But in the time of Rameses III., things were different. There had been conquest and reconquest, great numbers of foreigners had been incorporated into the country, some as prisoners and some as immigrant colonists, and large numbers of mercenaries were now enrolled as soldiers. It is, then, not singular, if the new dynasty made some classification of the various classes of its subjects.[2]

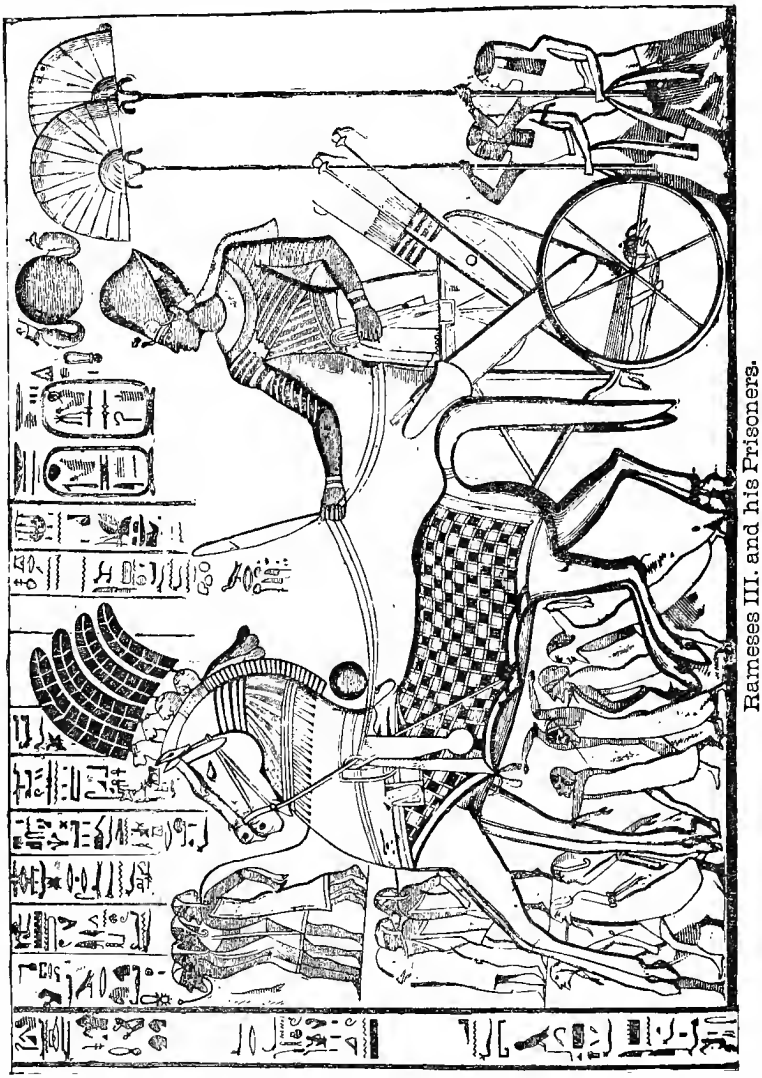
When Rameses had arranged the internal affairs of his kingdom, he set out to reconquer what had been lost. It seems to us, he had far better right than his famous predecessor to the title of "Rameses the Great." We read first of his victories over the tribes in Edom, then he gathers his forces to oust the Libyans and their allies from the Delta. In this he was successful. The Libyans were either taken prisoners or driven out of Egypt. But the greatest danger that Egypt had yet had to encounter was now upon it. The piratical tribes living on the isles of the

---

[1] See Birch's note in Wilkinson: "Ancient Egyptians," Vol. I. p. 158, London, 1878.

[2] Brugsch ["Egypt etc.," Vol. II., p. 140.] and Birch ["Ancient Egypt," p. 144 ] state generally that he reorganized the castes, Rawlinson [Egypt"Vol. II. p. 368., note 4.] thinks this classification could have been but partial. In support of the view stated above, we might take the priests. If there were any caste in ancient Egypt, the priestly caste was one; yet Tiele shows of this period: "A thing *hitherto unknown* in Egypt was now in process of formation there namely a separate spiritual caste, a fixed priesthood." ["Egyptian Religion," p. 179.]

Mediterranean and along its northern shores were gathering their forces for conquest on a large scale. Asia Minor



Rameses III. and his Prisoners.

was the first point of attack. Of this invasion, the Harris papyrus relates "no people stood before their arms, beginning with the people of Khita (Hittites) of Kadi (Galilee)

and Karchemish, Aradus and Alus. They wasted these countries, and pitched a camp at one place in the land of the Amorites. They plundered the inhabitants and the territory as if they had been nothing."[1]

Having thus carried things with a high hand in Asia Minor,[2] they turned their attention to Egypt. "Their hearts were full of confidence and they were full of plans," says Rameses, but an "ambush was prepared to take them in the snare like birds." The Egyptians were ready for them, not only by land but by sea. The allies were most disastrously defeated. "They who had reached the boundary of my country," says Rameses, "never more reaped harvest. Their soul and their spirit passed away for ever. They who had assembled themselves over against the others on the great sea, a mighty firebrand lightened before them, in front of the mouths of the river, a wall of iron shut them in upon the lake. They were driven away, dashed to the ground, hewn down on the bank of the water. They were slain by hundreds of heaps of corpses."[3]

Once more, only, was Egypt invaded during the reign of this valiant king. This time again from the west, and again were the invaders repulsed after great slaughter. In short, Rameses III. seems to have been everywhere successful, not only against Ethiopia, but against Western Asia, and amongst his prisoners was the "miserable king of the Hittites." These wars were probably undertaken for the sake of vengeance, and re-asserting the power of Egypt. A most interesting list of conquered people and places is given, and amongst this number, according to

---

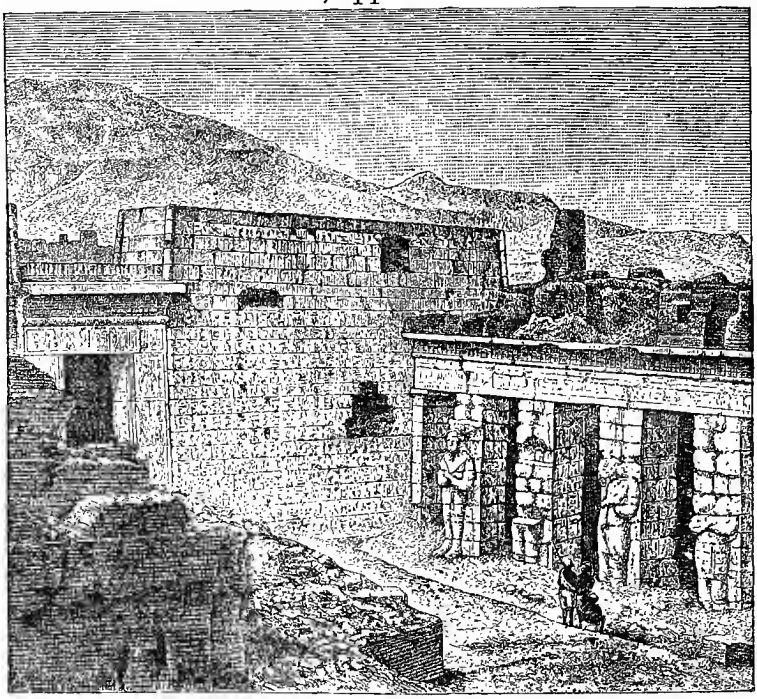
[1] Brugsch: "Egypt," Vol. II., p. 147.

[2] Just about this time is placed the fall of Troy by the most authorities. May it not be more or less connected with this invasion?

[3] Brugsch: "Egypt, etc.," Vol. II., p. 148.

Birch, are the Pelasgians, Etruscans, and inhabitants of the Greek Islands.[1]

With the immense number of prisoners and booty taken in his wars, together with the tribute imposed on the conquered people, it is not strange that he erected and richly adorned numerous temples. Perhaps the one most noted is at Medinet Aboo, opposite Thebes. The walls are



Medinet Aboo.

covered with scenes of his conquests. Yet, strange to say, this valiant king, who had done so much for Egypt, had to contend with a conspiracy within his own court which seems to have been directed against his own life, but which was happily frustrated.[2]

---

[1] "Records of the Past," Vol. VI., p. 18. But compare with Brugsch's list, "Egypt," Vol. II., p. 152.

[2] "Records of the Past," Vol. VIII., p. 51-3.

We will pass rapidly from this point. There seems to be some question as to the extent of the Egyptian territory after the death of Rameses III. Prof. Sayce thinks the territory of Egypt was shrunken to its original limits.[1] But others think Egypt claimed and exercised suzerainty over a large territory in Western Asia.[2] The dynasty continues for nearly one hundred and fifty years after the death

Tomb of Rameses III.

of Rameses III. During that time, we have the names of ten kings, all of them having Rameses as one of their titles. The fourth, sixth, seventh and eighth Rameses were the sons of Rameses III. Rameses V. was an usurper of whom but very little is known. It is supposed that

1 "Ancient Empires," p. 48.

2 Lenormant: "Ancient History," Vol. I., p. 270.

Rameses VI. ruled conjointly with his brother Meritum.

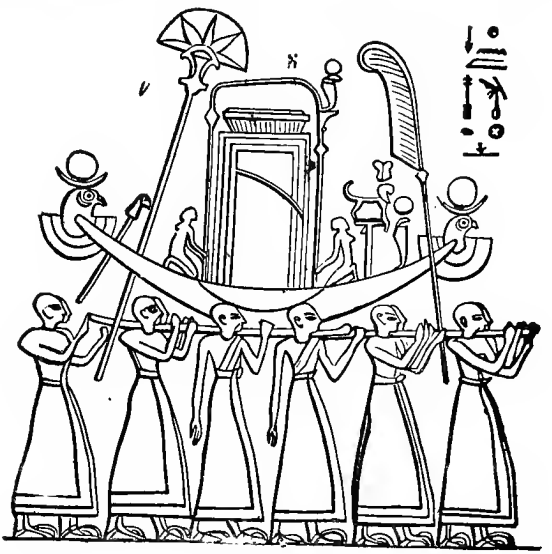
There is a great scarcity of monuments of this period. It seems to have been a time of internal quiet. We are not without some proof that the kings claimed and exercised government over Asia Minor, and, perhaps, even over Mesopotamia. It is generally supposed, however, that there was a gradual decline of power, both on the part of Egypt as a kingdom, and on the part of the kings of Egypt as sovereigns. We have seen that, during the time of Rameses III., we caught sight of the formation of a priestly caste. This priestly caste was steadily growing in power during the continuance of this dynasty, and this growth was at the expense of the kingly office.

We gain a clear insight into one phase of Egyptian philosophy by two papyri of this dynasty. The first is the record of the conspiracy case against Rameses III. It shows that the Egyptians firmly believed in sorcery and magic. The charge against one official was that "he had made some magic writings to ward off ill-luck; he had made some gods of wax, and some human figures, to paralyze the limbs of a man."[1] Of another, it was said: "He formed human figures of wax, with the intention of having them carried in by the hand of the land-surveyor, Adiroma, to alienate the mind of one of the girls, and to bewitch the other."[2] Reasoning on general principles, we would have said that the Egyptians were firm believers in the efficacy of magic names and formulae, only we cannot admit that they had been growing into this belief. It was part and parcel of savage belief in general.

Another interesting papyrus shows us that the Egyptians and surrounding people of that day were firm believ-

[1] Brugsch: "Egypt," Vol. II., p. 146.
[2] Ibid., p. 163.

ers in the evil spirit theory of sickness. It seems that when Rameses XII. was in "Naharana (Mesopotamia) registering the annual tributes," he became enamored of the daughter of the chief of the land of Bakhten, so he married her and took her away to Egypt. Subsequently, her younger sister was taken down with some sickness, and her father sent to his son-in-law in Egypt for "a person acquainted with things to see her." He found that



Ark of God Chonsu.

the princess was possessed of an evil spirit, but was not powerful enough to exorcise it. Application for relief was again made to Egypt, this time with a request to send a god from Egypt. Accordingly, twelve priests from Thebes bore the ark of Chonsu to distant Bakhten, though we do not know just where it was. This was just the remedy needed, the evil spirit acknowledged that he was powerless before Chonsu, and forthwith he departed from the afflicted princess. This belief again, as we have pointed

out in another place, is a necessary corollary of savage philosophy in general. The peculiar value of these two extracts is to show us that the Egyptians must have gone through all the stages of philosophy of other people in general.[1]

When the twentieth dynasty passes away, we enter on a period which is far from being undertsood. It must therefore be understood that the statements here set forth are those which seem to be in keeping with our present light. They may have to be modified by subsequent discoveries. It seems to be evident that Egypt suffered a considerable decline in power. The Asiatic countries recovered their independence Furthermore, troubles were rising in the Delta. So we are not surprised to find a sudden break up of power in Egypt. Perhaps the priestly caste in Thebes took the first step in this matter. At any rate, the royal power passed into the hands of the high priest of Amen, and the adherents of the old line of royalty were driven into banishment. Herhor, the high priest, became the king of Egypt.

If we reflect on the past history of Egypt, we feel reasonably sure that no sooner would a new power come to the front in this way, than other sections of the country would also make an effort for self-government. So it is not surprising to find, either at this time or very soon after, two rival confederacies in the Delta. One setting up its authority at Tanis, the other at Bubastis. They were both, in a true sense of the word, Egyptian, but the confederacy at Bubastis was largely composed of the descendants of invading tribes from Libya and other sources. We can readily enough see that the time must have been

[1] "Records of the Past," Vol. IV., p. 53.

one of confusion, and of internal strife with the advantage resting now with one party and now with the other. But finally, the confederacy at Bubastis bore all before it, and once more united all Egypt under its rule.[1]

The period which we have thus briefly outlined extended over one hundred years. During that period the Israelites had abandoned their loose confederation of tribes and had instituted a more centralized form of government. The monarchy had reached its greatest extent, and a daughter of one of the Tanite kings was given in marriage to Solomon. It was during this period of internal dissention that the bodies of Thothmes III., Rameses II. and other great kings of Egypt in her palmy days were transferred, for greater security, to the rock-hewn tomb of Deir-el-Baharai, where they rested in peace, until the summer of 1881.[2]

Ethiopia, the country to the south of the first cataract, was regarded as a valuable stretch of country, and so the Egyptian kings of an earlier age had firmly established their authority there. It had become virtually a part of Egypt.[3] It is considered that, when the Thebean priests, who had usurped the power of government, were

---

[1] Brugsch, "Egypt under the Pharaohs," Vol. II., p. 191 *et seq.*, presents a very different account of the foregoing. Lenormant largely follows the views of Brugsch. But compare with Birch, Sayce and Rawlinson and it will be seen we have excellent authority for discarding Brugsch's theory of an Assyrian invasion. Tiele's few remarks on this point in "Egyptian Religion" seem to us sound. It is not worth while to enter into details.

[2] Sayce: "Ancient Empires," p. 50.

[3] In this connection, we refer to what is vaguely known as Ethiopia proper, or the kingdom of Meroe. Extending from the third cataract south to the junction of the White and Blue Nile. Of the people of this section, we are told: "they were not very much behind the Egyptians in art or arms, or very different from them in manners, customs and modes of life. Even in race the difference was not very great." Rawlinson: "Egypt," Vol. II., p. 434.

driven out of Egypt, they took refuge in Ethiopia. Here, from time to time, whenever they deemed it safe to make the attempt, they made efforts to recover their power; but these spasmodic efforts only served to keep the unfortunate country in a continual state of confusion.[1] The Bubastis confederacy, who came into power near the beginning of

Sheshank I.

the tenth century B. C., had for a king Sheshank I. His reign possesses for us some interest since, as being the founder of a new dynasty, he made an attempt to re-assert Egyptian supremacy in Asia Minor. This invasion is mentioned in the Bible. He it was who, in the reign of Rehoboam, came up against the kingdom Judah, took their principal cities, Jerusalem among the number. He also overran the southern part of the kingdom of Israel. It is

[1] Tiele: "Egyptian Religion," p. 186.

generally supposed that this invasion was made at the request of Jeroboam, king of Israel. On his return from this expedition, he caused a list of the captured towns to be engraved on one of the temple walls at Karnak. .

But a few reigns pass, before we find ourselves once more in the greatest confusion. It seems that a complete disintegration of power in Egypt has taken place. A number of small confederacies divided the country between them.[1] This was an opportunity that the Ethiopian kings, descendants of the Thebean high priests, would not lightly pass by. Besides, out of all the confusion incident to this matter, we are dimly conscious that affairs were shaping themselves more and more towards a conflict between Upper and Lower Egypt; between Thebes and the Delta, and, in such an emergency as this, Thebes preferred to call in the help of Ethiopia, than to be subject to the Delta. For Ethiopia was nearer to Thebes ethnically, than was the Delta with its Asiatic inhabitants.

Accordingly, when the Saitic confederacy with Tafnecht at its head had made considerable progress towards subjecting both Upper and Lower Egypt, Thebes sent a call for help to Pianchi, an Ethiopian king. He responded, and his armies swept all before him, and, for a time at least, he ruled the entire country.[2] The details of this conquest are gathered from a stele found in the ancient city of Napata in Nubia, and it is interesting to note what a strong element of religious ceremony is apparent

---

[1] Tiele, "Egyptian Religion," p. 194, says there were twelve or thirteen of these little powers.

[2] We have mainly followed Tiele. A different account, given by Birch and Rawlinson, is to the effect that Pianchi had gradually extended his authority over most of Egypt. Tafnecht was one of the subordinate princes who revolted againt him.

in all the movements of Pianchi, fully in keeping with his character of priest-king.[1]

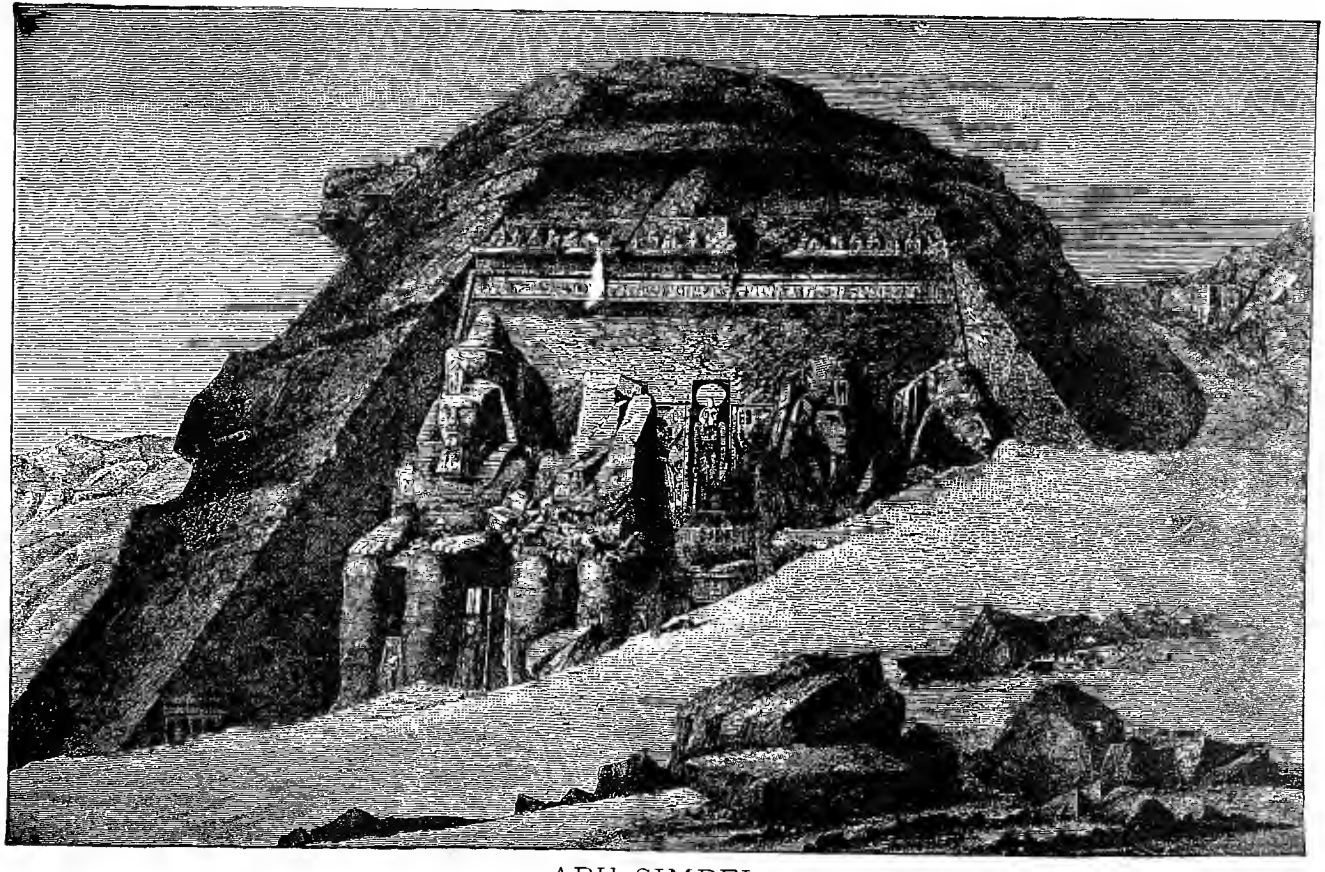
If we will but reflect, we will see that this whole period of confusion is undoubtedly much like those other periods of darkness in Egyptian history. Like that between the sixth and the eleventh dynasty, or between the twelfth and seventeenth. History was in the very act of repeating itself. As the seventeenth dynasties put an end to the long time of confusion and divided power between Upper and Lower Egypt, so the Ethiopian power in the south was about re-establishing order in Egypt; and with this, no doubt, would have come new life and energy, and this marvelous country would have entered on a new era of advancement.[2] But a new people in Asia had commenced to play an important part in the world's history. Egypt had no longer simply its own people to deal with. The Assyrians were now about to take a hand in the affairs of the Orient. The days of Egypt, as a great power in the history of the world, were now rapidly drawing to a close.

We have passed rapidly along and are now near the beginning of the twenty-fifth dynasty in the last quarter of the eighth century B. C. It is considered that, at the close of Pianchi's reign, another effort was made by the Delta for political independence. Bochoris, successor of Tafnekht, at the head of the Saitic nome, which nome was at the head of affairs in the Delta,[3] established, for some years, an independent government in the Delta. But he was soon subdued, and the twenty-fifth, an Ethiopian dynasty, ruled

[1] "Records of the Past," Vol. II., p. 79 *et seq.* Compare with Tiele: "Egyptian Religion," p. 198.

[2] Tiele remarks that it is a mistake to regard this Ethiopian conquest as a foreign one, for the Ethiopian kings were no doubt of pure Egpytian extraction.

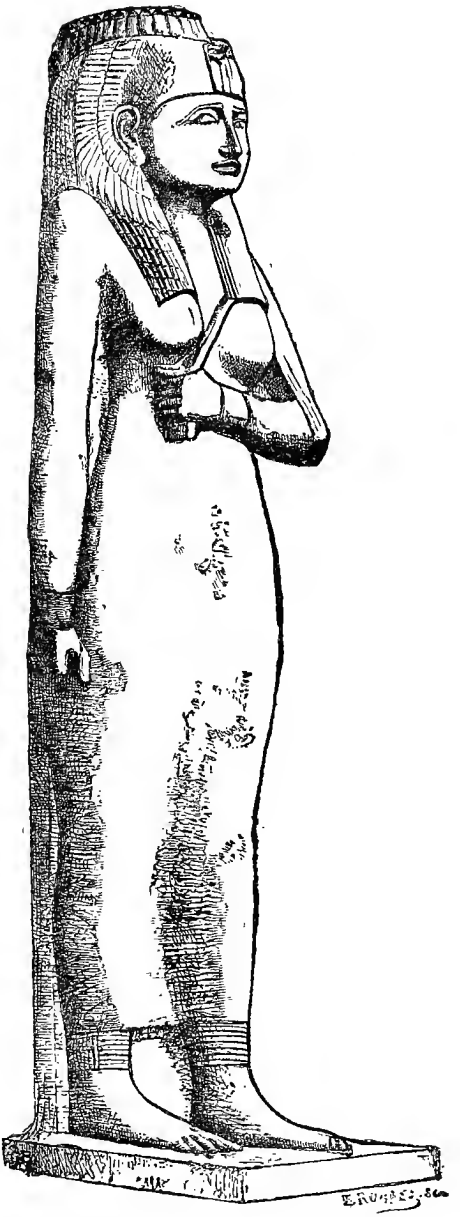
[3] Tiele: "Egyptian Religion," p. 199.



ABU SIMBEL.

an united Egypt. But now the Assyrians interfere, and the downward course of the country is more rapid.

At this point, the history of Egypt becomes so intertwined with that of Assyria and Judah that we will give only an outline of it. From the very start, the twenty-fifth dynasty had to contend with the Assyrians. The Assyrians under Sargon had carried all before them in Western Asia and, in 720 B. C., advanced to meet the Egyptian forces. The battle at Raphia, in Southern Palestine (B. C. 720) is one of the great battles of the world. There the forces of Africa and Asia met for supremacy, and victory remained in the hands of the Assyrians. Shabak, or Sabako,[1] the



Ethiopian Queen, wife of Pianchi.
[*Boulak Museum.*]

[1] Called So in II Kings, vii. 4.

Ethiopian king of Egypt, was completely defeated and made a treaty with the Assyrians, the clay seal of which, with Shabak's cartouch on it, was found at Nineveh by the explorer, Layard.

Shabak's Seal.

A few years later, we find Tirhaka king of Egypt. His entire reign was one series of contests with the Assyrians, and he seems to have had considerable to do with the relations between Judah and Assyria. Sargon was succeeded in Assyria by Sennacherib, and, about the beginning of the seventh century B. C., the Assyrian and Egytian forces were once more confronting each other at Eltekeh near Pelusium. It was here that some mysterious calamity happened to the forces of the Assyrians.[1] The result is that for some years Tirhakah was allowed to rule in peace, but when Esarhaddon, the son of Sennacherib, became king of Assyria, one of his first acts was to finish the work of the Assyrians in Asia Minor and Egypt.

He was everywhere successful. The Assyrian armies overran Egypt, Tirhakah was driven into Nubia, and Egypt itself was divided into twenty satrapies. It is at this point (B. C., 570) that we propose to bring to a close this outline of the political history of Ancient Egypt. It is true that a few years later the power of the As-

[1] The Biblical account of this event is contained in II Kings, xix. 35-37. Some writers suppose this overthrow to have been occasioned by the Simoon or by a pestilence. There seems to have been a battle in which the Assyrians were severely repulsed if not defeated, though as a matter of fact, they claimed the victory, [Sayce: "Ancient Empires," p. 132] but the further fact that they at once retreated to Assyria shows that the battle was at least a drawn one.

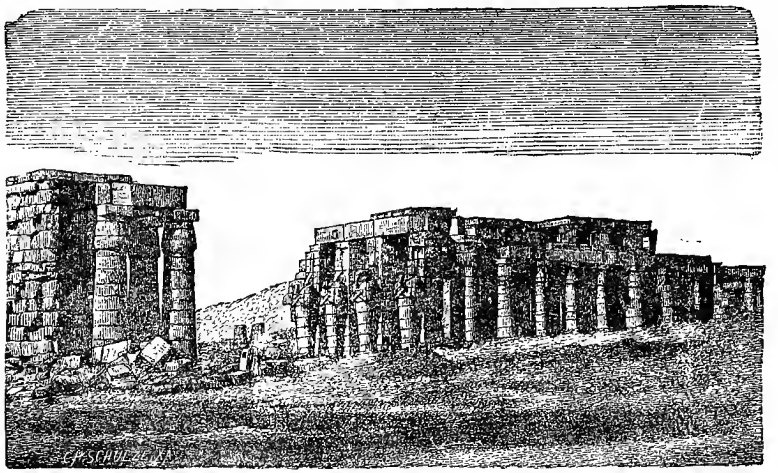
syrians was shaken off, and for a brief time Egypt was again an independent country, but this was but momentary. Every great power that now arose in the Orient[1] held Egypt as one of its tributary countries. Thus after a number of centuries, just how many may not be known, stretching up into the thousands of years, ancient Egypt, as a great power, disappears from the stage of action.

Let us summarize this sketch, and see what influence Egypt has had on the Civilization of the world and note more particularly some of their customs. What must strike every one in this historic sketch are the great cycles of history, the same round of events. Lying back of the first period of Egyptian history, we but dimly perceive a country divided up among a number of tribes. The historic period opens with a conquest of these various tribes by the more fortunate tribe in some favored locality. The conquering tribe ushers in a period of great governmental activity, public buildings are erected on a grand scale, neighboring people are reduced to tribute. Then follows a time of stagnation, there is a scarcity of public monuments, finally the historic light dies out altogether. Once again the country appears divided among numerous small tribes. A long time of obscurity passes by, and then the same round is repeated.

Is not this true of the old Empire? the historic dynasties of which were the fourth, fifth and sixth. Then we have that long break in history of which we now know but very little. Then come the happier days and the clearer historical light of the eleventh, twelfth and portions of the thirteenth dynasties, when Egypt was once more a united country, and public monuments were again

[1] Babylonian, Persian, Greek.

erected. We are then face to face with another break in history, the long interval of time between the thirteenth and seventeenth dynasties. Once more the cycle commences the eighteenth, nineteenth and twentieth dynasties round out a glorious and happy period of Egyptian history. Again the decline comes on, and we have seen that the twenty-fifth dynasty had once again united the country, and only because foreign surroundings were now different were they prevented from beginning the same cycle of changes.



The Memnonium of Rameses II. at Thebes.

Another point that must strike us is the stationary character of the Civilization of Egypt. It will not do to say that there was no progress but, by way of comparison, the progress within the last century certainly far exceeded all the advance made during the many centuries of Egyptian history. We have seen that in the course of time there was introduced into Egypt a considerable difference of population. Yet these various streams of various people could but barely overcome the inertia of Egyptian life. Egyptian life and times under the twentieth dynasty were

not so very different from what they were under the fourth, and yet some thousands of years had passed in the interval. There were, of course, slight changes in progress, but these changes are only preceptible when we mentally survey long periods of time. If we compare the case of Egypt with some European country, for instance England, we will notice the difference. See the enormous strides in everything going to make up Civilization in England within the last two thousand years. Yet the time is probably not as great as is the span of Egyptian history, where progress is but barely preceptible.

In casting about for some cause which shall explain this monotonous round of political changes and nearly stationary character of Civilization, we must take into consideration a number of factors. The climatic surroundings is one. All the meteoric influences seem favorable to changelessness. This must necessarily have exercised an influence on the people. But back of all this, we must consider the question of race. The conclusion we came to in regard to the Egyptian race was that a large ethnic element was from the Yellow, Turanian, Race, and that next to this was probably a Nigritian race. We have frequently pointed out that neither of these races can be regarded as progressive races. The Yellow Races early reach a grade of culture beyond which they do not advance.

If we consider only the political changes in Egypt, we can understand more clearly, if we only reflect that it rested on tribal society. In a thickly settled country like Egypt, the home of numerous independent tribes, no strong and enduring government can be erected that rests on tribal government as a basis. One section of country may get the upper hand of the other and reduce them to tribute. But as long as each tribe retains its own government, laws and

religion, the time must come when some other section will test the question of strength and very likely overthrow the ruling tribe. That means the overthrow of the old government, a period of confusion and the final rise to power of a new section of country. It is only when some strong central government is thus ruling in the country that we have anything like clear historic light to guide us in our investigations. Consequently, we need not be surprised to know that of the vast period of Egyptian history, we have historic light for only about two-fifths of the time.[1]

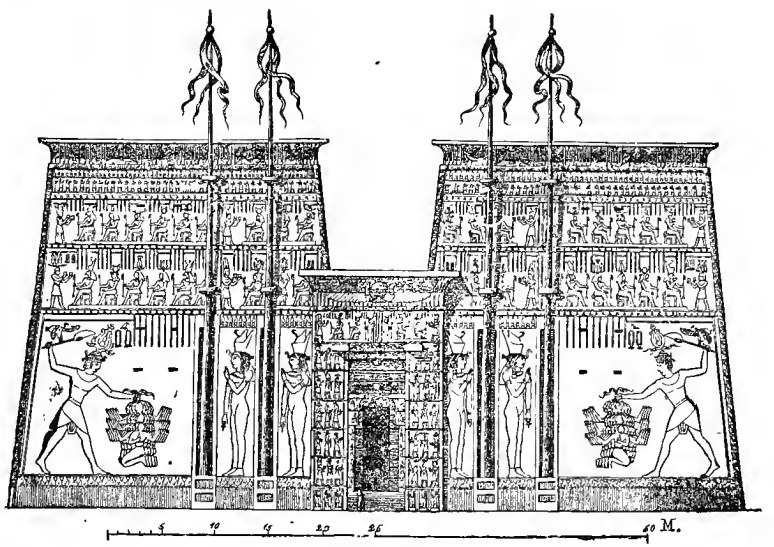
We are afraid that we can not form so imposing a picture of Egyptian life and times as most of the historical writers. There is a great deal that is wonderful in their culture and history, but distance lends enchantment to the view, and this statement is as true of distance in time as in space. Of course, all stand in awe before the pyramids, or gaze in wonder on the monumental ruins of the temples, or ponder over the painted or carved scenes of home life of many centuries ago; but still, all these are what we might call public monuments, and, after all, tell us comparatively little of the home life of the people. We must remember that, from the first to the last, we have the clearest trace of tribal conditions in Egypt. However much the tribal lines might have been again and again broken down and re-arranged, yet the tribes remained a constant factor in their political life.

Never once did they thoroughly coalesce so as to form one united government. This is shown by the simple fact that, from time to time, the government disintegrates, and

---

1 This follows from taking, for instance, Mariette's chonological lists and reckoning up the duration of the historic ones. We are of the opinion, however, and have shown, that some of the other dynasties were contemporaneous with them.

the units into which it disintegrates are found to be the tribes. As long as tribal lines were thus kept distinct, we may be sure that their home life, government, religion and laws, their culture in general must have rested on that as a basis, modified, however, by local coloring. Let us apply this principle to the various departments of Egyptian life, and first as to the office of king. We constantly talk of the powers of this office as if they had been the same at all



Temple of Edfu.

times of Egyptian history. Is it not evident that they must have varied with each dynasty, according as the customs of the ruling tribe varied? We have shown good reasons for concluding that under the fourth dynasty the office was elective. There are certainly no grounds on which to rest the opposite conclusion.

No doubt, under some dynasties, the rule was much more despotic than others. We are also accustomed to speak of the rulers of the various nomes as if they formed a privileged class apart from the mass of the people and

more or less connected with the ruling or royal family. This conception is certainly false for the larger part of Egyptian political history. The nomes come before us as local, self-governing tribes; only a portion of the time were they held in firm subjection under some ruling confederacy or tribe. In general, these tribal officers were members of the tribes to which they belonged. Under some of the more despotic dynasties, they might have been appointed by the king, but we may feel perfectly confident that this was an exceptional state of affairs.

In regard to the so-called priestly class, religion in the first place must have been local and tribal. This is admitted on all sides. The priests, then, must have been just like the tribal priesthood generally. It is only as a result of long, slow progress and development that these various tribal priests coalesce into a national, priestly caste. This result did not take place in Egypt before the twentieth dynasty. Therefore, it is evident that, when we undertake to define the powers of the priestly class, we must know of what period we are speaking. We have already seen that, in general, all tribal officers were priests ,the chief of the tribe being the high priest, and, among the ancient Greeks, one of the principal duties of the so-called king was to act as high priest for the tribe or confederacy. The same state of affairs appears in Egypt, where the king was, ex-officio, the head of the priesthood.

It is sometimes said that they had regular judges who went on a circuit, and that an appeal lay from their decisions to the king. It ought to be added that this was true only under the Ptolemys, a period several centuries later than we have traced their history. That when they ruled in Egypt, political society had supervened in both Greece and Rome, hence it is not strange that such a state

of society existed in Egypt, but this could not have been true in ancient Egypt. Each nome must have conducted its own affairs, and no appeal would have lain to the king unless in cases where two different nomes were involved.

In fact, the picture we would paint is rather of a quiet nature. At times, however, the whole country is united under the sway of powerful dynasties; but, in general, each nome or tribe pursues its wonted way of life, and, in each nome, there are nearly always two great divisions of the people. In each, there was a large body of subject people, slaves captured on their many military expeditions and remnants of subject tribes. Then there was the upper element, the ruling tribe, the one that owned and controlled all the land, filled all tribal offices, and the one that furnished all soldiers for the general government. How quiet and placidly this life flowed on is shown from the fact that for some thousands of years it ran on in much the same way. No sudden change, no great advance. Now and then there were, to be sure, upturnings of the old order of things, a new section of country furnishes the ruling tribe, but affairs were soon adjusted to this new state and life continued as of old.

One other point remains to be spoken of, the Civilization of Egypt seems to have exercised but little influence on the world at large. The Civilization of the world at large owes but very little to Egyptian sources. Egypt was an isolated country. From time to time, waves of other people rolled in upon it. But if they maintained their position in the country, they were sure to become Egyptianized, they adopted the Civilization and language of Egypt and became one with them. There is, in all this, a strange similarity between Egypt and China. Both were isolated countries, both showed a strange ability to

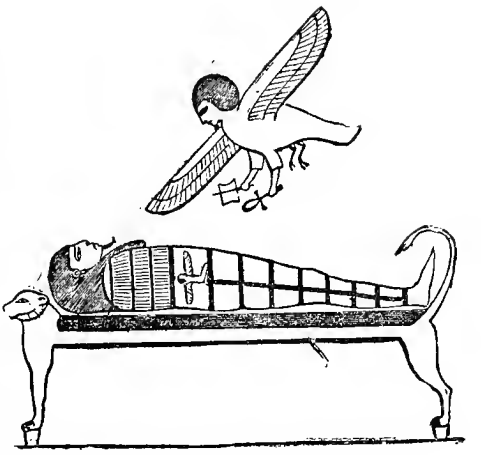
assimilate other people, both built up a high Civilization within their own borders, but neither of them apparently exercised much influence on the culture of the world in general. And in both countries, we see an almost stationary condition of culture.

We have given but a brief account of the culture of each epoch, and here seems to be an appropriate place to give some details of a few points in the culture of the ancient Egyptians that do not seem to belong to any one particular era. First, in order to round out and complete a study of Egyptian religion, let us consider their ideas as to the future world. The first stage of belief of the Egyptians is what we would naturally expect to find among partially developed people. That is a confused belief in the existence of "another-self," called the *Ka*, or double. It was believed "to be a substance scarcely less material than the body, with all of the characteristics of the living person, which must be housed, fed, dressed."[1] So we understand some of the arrangements in some of the oldest tombs known to us. This Ka, or "other self," was the part that was to be worshiped. Perhaps in the firm belief that it might from time to time inhabit the body arose the art of the embalmer.[2] But it could make itself at home in an artificial body as well as not, and so, in some secret chamber in the tomb, were placed a number of small statues, so as to provide against all contingencies of breaking, where it could accommodate itself and enjoy the perfume of the offerings deposited in the memorial chamber, which communicated with this secret chamber by a small orifice.

1 Poole: "Contemporary Review," July 1881, p. 56.

2 Egyptian stories represent the mummies as conversing together and even occasionally as leaving their coffins and visiting the living. Rawlinson: "Egypt," Vol. I., p. 147. In this connection recall what was said above [p. 316] as to the possible origin of idolatry.

It was to this double that prayers were offered, hymns sung and sacrificial offerings made by the surviving members of the household, from time to time. For it, the tomb was decorated with paintings of home life and scenes, more or less complete of the occupation of the owner of the tomb.[1]



Ka, Re-visiting the Body.

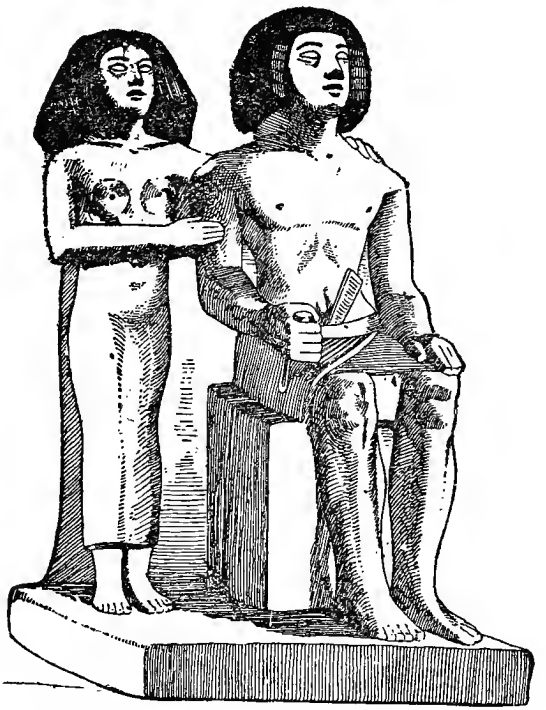
As time passed on, it is not singular that other conceptions should grow up in regard to this "other self." The result is that finally we are presented, under the eighteenth dynasty, with a theory as to three souls. One is the Ka which is still supposed to have some connection with the mummied body; the *Bai* which lived in the blissful fields and served as a body wherein resided the *Khu*, the intelligence of man.[2] As was the case with most partially developed people, they probably held these various confused beliefs in subordination to one principal belief, such as that the "other-self" was capable of living apart from the body.

As to the place where this soul resided and the manner of life there led, the results are equally instructive as showing that the Egyptians also passed through various stages of religious growth. In the time of the Old Em-

1 This was true only of the tombs of the older period. The secret chamber was afterward abandoned.

2 Poole: "Contemporary Review," July, 1881, p. 56.

pire, if we are capable of drawing any conclusions at all, it seems as if they held to the "continuance theory" of the future life. So we find numberless objects placed in the tomb for the use of the deceased, such as vases for unguents, changes of raiment, linen for all uses, vessels for food and drink, table and spoons, chairs and stools, head rests, and



Statues for the use of the Ka.

even viands for food and with men weapons, costly ornaments for women and with children playthings.[1] But this custom becomes in time merely a survival, and we see a change taking place.

Perhaps not immediately at the moment of death, but shortly after, the soul takes its journey to Amenti, the

[1] Ibid.

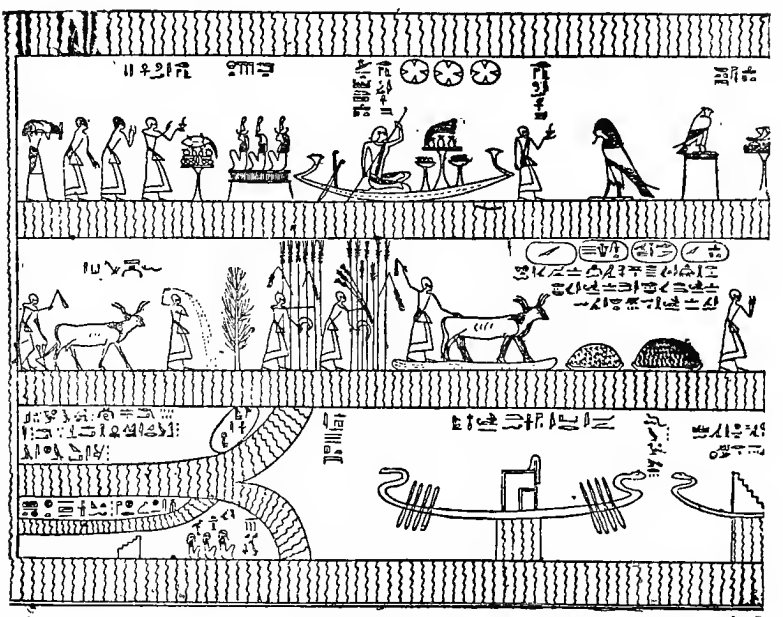
home of the dead. This was the underground world where the sun shone at night. The very place of entrance was known. "It was a cleft in the mountains on the west of Abydus. Here the boat of the sun plunged in its nocturnal course, and the souls of men enter with it under the protection of Osiris." So we have first the farewell funeral feast when the mummy is ready for burial. It is the last sad gathering where, in the midst of his family and friends, the mummy was placed to participate with them in a last feast. Singing women are present who address both the living and the dead, urging both to enjoy the present occasion, "the living because life is but a moment, the dead because he is about to enter on the eternal repose of the tomb."[1]

But the soul is now ready to take up its journey and it seems as if the later in point of time we trace the development of Egyptian life, the more and more mystical grows this journey. We no longer see the pictured resresentations of the various scenes of home life in the tombs but details of this journey of the soul. After entrance is gained to the underground world (Kar-neter) his troubles have but just commenced. Terrible obstacles present themselves in his way. Frightful monsters, servants of Set, crocodiles and all manner of venomous reptiles seek to devour him. Now has he need of all the magical texts and papyri buried with him. Finally, after many trials he arrives at the Elysian Fields, and there we behold him occupied with all manner of agricultural work, and there the soul makes use of the various little

[1] It was the representation of this funeral feast which gave rise to the old notion that the Egyptians at their feasts brought out the mummies of their ancestors, to remind all that death must sometime come to all.

figures buried in the tombs, known as the Aiders, who assist the deceased in the labors of the mystical land.

But one trial remains. That, however, is the most important. It is the judgment scene in the hall of Osiris. This divinity presides over a court of four judges aided by forty-two witnesses.[1] In the center of the hall is a balance, in one of the scales of which is placed the heart, representing the conscience of the deceased,



The Elysian Field.

while in the other is the emblem of the goddess of truth. While the heart is being weighed, the person to be judged addresses in succession each of the forty-two witnesses, and declares that he has not committed that one of the forty-two special sins with which this special

[1] In spite of Mr. Poole's objections given in "Contemporary Review" for August, 1881, we cannot help believing this number forty-two is in some way mixed up with the number of nomes of ancient Egypt.

genius is concerned. If acquitted here, he passes on to final bliss, but if condemned, he wanders for a while, a

Ushabti, the Aider.

tormenting spirit, until annihilated by the second death. Thus we see that immortality was not the lot of all.[1]

[1] We have drawn this sketch from Mr. Poole's article in "Contemporary Review" for 1881. Part from Lenormant: "Ancient History." It would be well to compare it with Perrot and Chipiez,

It must be evident from the foregoing, that the beliefs of the Egyptians were not singular and that they must have traversed the same road that other people did in advancing from Barbarism to Civilization. We are not surprised, therefore, to learn that they were firm believers in other elements of primitive philosophy. They also believed in numberless spirits, everywhere surrounding them. Consequently, they were strongly tinged with fetichistic notions and firm believers in magic and sorcery. Of a certain magic book, we read that it "triumphs over enchantments, connects ligatures, prepares ties, destroys the lock. Life and death proceed from it. If any one falls in its power, he dies, as if killed by blows, forthwith."[1] Of another magical mixture, it is declared of its possessor; "Thou art protected against accidents of life; thou art protected against a violent death; thou art protected against fire; thou escapest in heaven, and thou art not ruined on earth."[2]

Having now a fair idea of the philosophical mode of thought, in which we see it was not of a very high order, let us see how they stood in the matter of sciences. The results of modern research seem, on the whole, to compel us to set a less value on their scientific attainments than we once did.[3] First, with regard to mathematics. At present, we know of but one manuscript treating on mathematics, and this was written under the Hyksos kings.[4] It is a sort of elementary treatise on arithmetic and geometry The only fraction they seem to have known anything about was two-thirds. They had separate signs for thou-

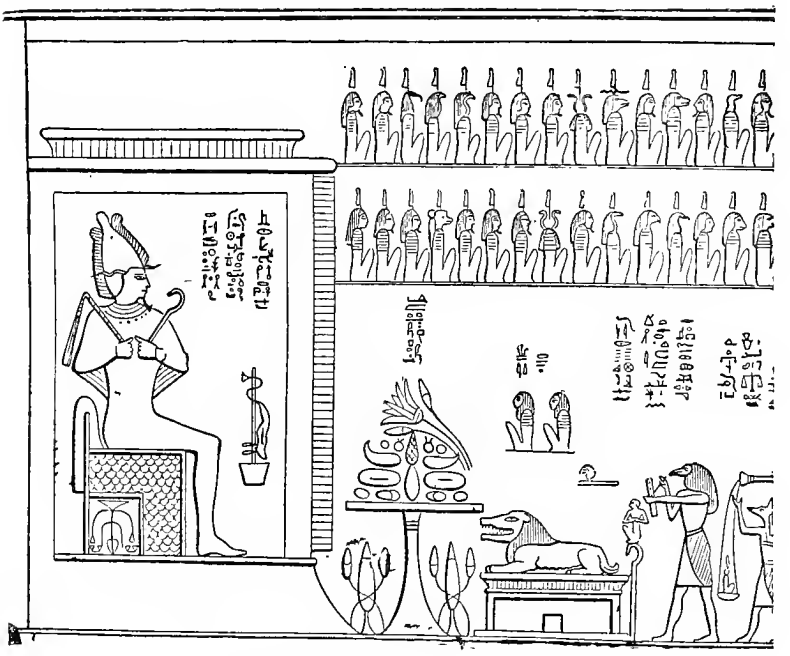
4 Sayce: "Ancient Empires," p. 34.

sands, hundreds, tens and units; for instance, the number one thousand, one hundred and eleven would be represented as follows: . But if their knowledge was limited, they certainly made good use of what material they had. Such structures as the pyramids are before us, which must have had some sort of mathematical design. They



Judgment Hall of Osiris.

must have also understood surveying, so as to re-arrange the boundaries after the annual inundation.

In regard to astronomy, they certainly had no good knowledge. "There is not a single list of observations, not a solitary dated record of an eclipse."[1] The fact is about all the use they had for astronomy was for astrological purposes. "Thus those lists of the positions of

[1] Poole: "Contemporary Review," 1881.

stars which Egyptologists used to consider scientific, as recording the real dates of heliacal risings, are merely conventional lists of an astrological character."[1] Hence it is that we find in Egypt none of that practical application of astronomy, that is as an aid to chronology. All the dates given on Egyptian monuments, with one exception, are in reigning years of some king. There is a great probability that they had what is known as the sothic cycle of 1461 Egyptian years, but if so, they never made use of it. It is generally admitted that their knowledge of astronomy was much below that of Chaldea.[2]

In medicine and surgery, the Egyptians held a high position for the time, though even here they have been overrated. Thus, for instance, Wilson shows that the idea that they had dentists who filled teeth with gold is a mistake.[3] The idea that they practiced dissection of the body to gain a knowledge of anatomy is also false.[4] Their knowledge of surgery was certainly limited since, in some cases, broken bones were allowed to grow together again naturally.[5] There probably were two modes of treatment, one in which doctors, proper, sought to effect a cure by medicine and nursing. But over against this, there was the priestly method of attacking diseases. That is by driving out the evil spirits, by means of the aid of some superior god or magical formulae, charms and incantations.[6]

---

[1] Ibid. But compare this with Rawlinson's discussion on this subject: "Egypt," Vol. I., p. 296.

[2] Rawlinson gives a slightly more favorable account of Egyptian astronomy than we do. See his "Ancient Egypt," Vol. I., p. 246 *et seq.* See Poole in "Contemporary Review" for 1881.

[3] "Egypt of the Past", p. 27, note.

[4] Poole: "Contemporary Review," 1881.

[5] Sayce: "Ancient Empires," p. 77.

[6] Ibid. We cannot believe, however, that this later method of treating diseases gradually superseded the other. It was part and parcel of primitive philosophy in general,

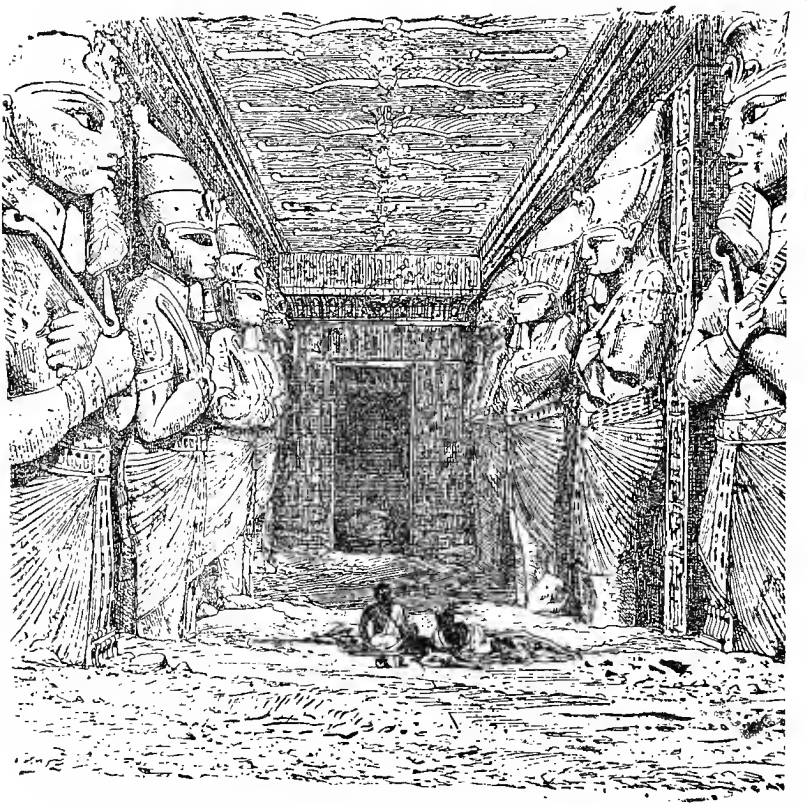
In their engineering science, they certainly made great attainments. Rawlinson observes: "In their cutting of hard materials, in their finished polish of surfaces, in their exact production of whatever angle they required, in their perfect fitting of stone to stone and, again, in their power of quarrying, transporting and raising into place enormous masses, this ancient people was, and still is, unsurpassed."[1] "In massiveness of construction, they far exceed all that any other nation has ever attempted." When we consider the immense blocks of stone they moved about, we are at a loss to know how they proceeded. We hear of obelisks nearly one hundred feet high, that must have weighed over four hundred tons, transported hundreds of miles and set up on a pedestal. Indeed, one of the colossal statues of Rameses II. is estimated to have weighed nearly nine hundred tons.[2] Yet for all this, they probably made use of very primitive means.

One of the most striking points in Egyptian culture, one that must strike every observer, when he compares them with other people of antiquity, is the peculiar respect they showed for women. In their pictured scenes of home life, women are represented quite as often as men. There was none of that Oriental isolation of women. By the side of the king, is represented the queen, she is always spoken of with honor and respect. In the history of Mesopotamia, only one mention is made of a queen by name, and only once is a queen represented in company with the king. And very few times are women represented at all. The case was entirely different in Egypt, and in no one respect is the peculiarity of their culture more strikingly shown.

1 "Egypt," Vol. I., p. 307.

2 Ibid., p. 238, note 4.

We have succeeded in giving but an outline of Egyptian life, but we must now leave them. As the result of our brief study, we give it as a deliberate conclusion that the importance of Egypt, in the culture history of the world, has been overrated. They are indeed a most interesting people, and their monumental records go back to



View in Principal Hall, Abu Simbel.

a profound antiquity. They had, after all, little to do with the ancient world as known to us. Only a few people contemporary with them during the greater portion of their history, are known to us. They had much to do with the Hittites, that is from the twelfth dynasty down, but it is

only within a short time that we have succeeded in locating the Hittites. It is only lately that we think we see any connection between the Egyptians and the Europeans.

Instead of regarding Egypt, as we once did, as the source of all culture and history, we are to see in it an isolated country, whose people early attained their Civilization, built their cities and played their *role* in the drama of history, while, in the great world beyond them, those silent, slow changes were going forward, which in time were to usher in the greater nations of antiquity, before whose superior energy and culture, Egypt stood no chance. In a forest there may be growing two trees side by side. In a few years one has reached its growth and may be pointed out as an object of beauty in forest growth. The second requires almost as many decades to come to its full growth as the other did years, but its limbs will be tossed by the winds of centuries.

So in Egypt, a combination of favorable circumstances, not often met with in the world, produced that strange mixture of people and gave new life and energy to the already stationary culture of the primitive Turanian inhabitants. The issue is the Egyptian people, whose history we have now outlined, and the true value of whose culture we have tried to set forth. In bidding them adieu, we feel that we have now fairly completed the older period of the world's history. With the next chapter we enter on a new period and begin to trace an influence, that has extended in an ever widening circle, and whose end is yet, we trust, far off.

# CHAPTER IX.

## THE SEMITES.

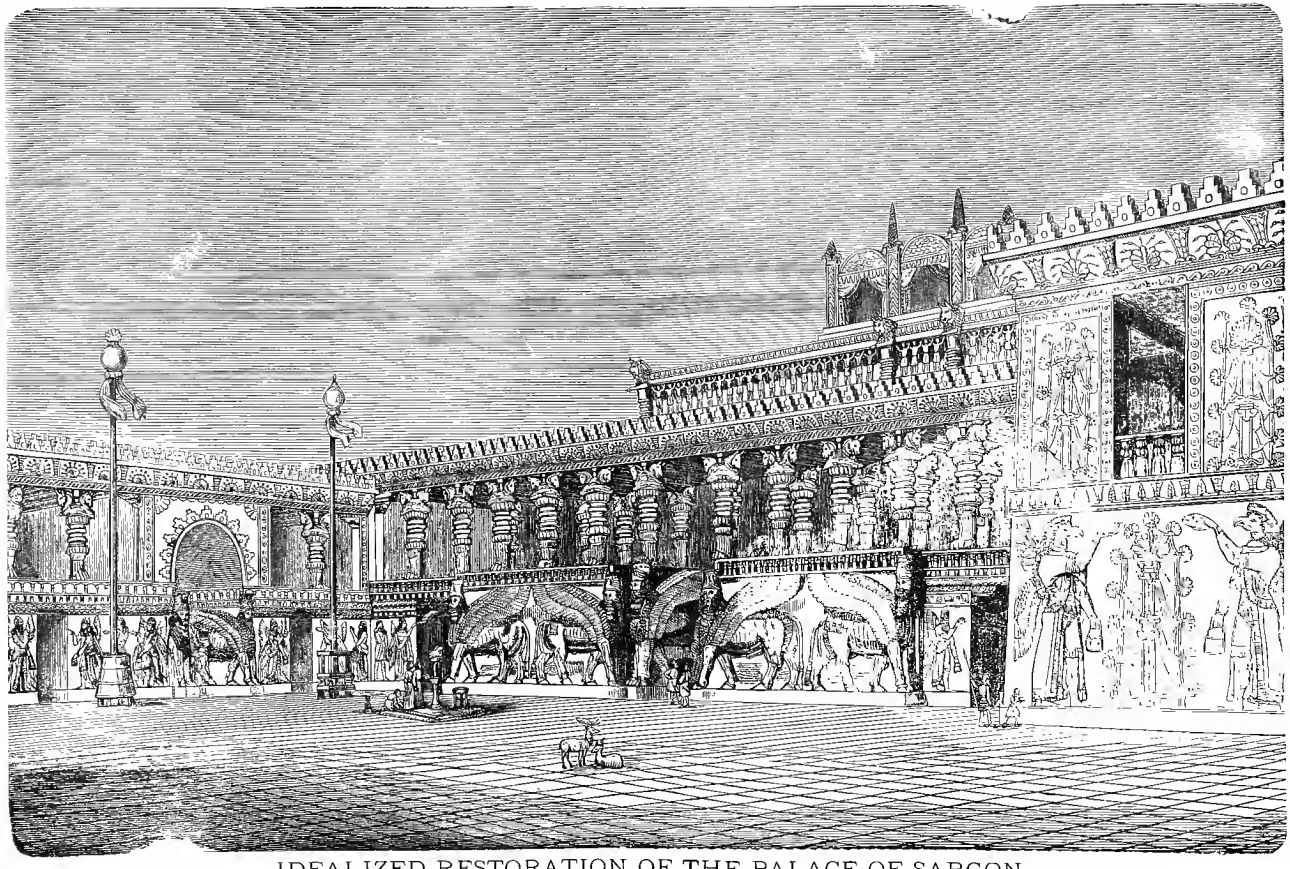
SEMITIC people built their cities, founded their empires, and for a long period of time, swayed the destinies of the Oriental world, before the Aryan nations commenced to play the important part they are now taking in the world's development. In all its elements, our present Civilization shows the influence of Semitic thought. Christianity, built from a Semitic foundation, and Islamism, the religion of Western Asia to-day, sufficiently attest the influence of the Semitic people in the field of religion. When first the morning light of history falls on Western Asia, before the darkness



IDEALIZED RESTORATION OF THE PALACE OF SARGON.

was dissipated in the Mediterranean area, it discloses to us a comparatively highly civilized Semitic people, in the secure possession of the fertile valley watered by the Euphrates and Tigris rivers. To-day, the investigators's spade brings from unsightly mounds the inscribed tablet or discloses to view the pictured walls of palaces, from which we reconstruct, as best we can, the history of these once mighty people, endeavor with what art we have to re-color the all but vanished picture of their material greatness.

Let us now spend some time in studying the Semitic people, determine if we can their home land, trace their separation into closely related people, study their common culture, outline as far as we can, their race peculiarities, and estimate their influence in building up the Civilization of the world. The field is broad, information on many points here outlined is but scanty and difficult to obtain, and we have to guard against preconceived opinions. Let us however enter upon it, and make the best of the materials at our disposal. One lesson following from it will be this, that no people are an especially favored people, but that all have had to advance by slow degrees, profiting by the experience of the past, and handing on the results of their experience to others.

The Semitic people are classed as belonging to the White Races.[1] We are to understand, however, that this classification is one of convenience only; we have in several places pointed out that it is almost impossible to detect any contact between the two principal branches of the White Races, that is between the Aryans and the Semites. If they ever were co-dwellers in some common

1 Above page 82.

home, it was at a time immensely removed from the present, since the two languages are so different in principle.[1] The Semitic people can be conveniently divided into several sub-groups. There are Semitic people in both Asia and Africa, and they occupy adjacent sections of country, spreading both ways from the shores of the Red Sea.

It is at present best to consider the place of origin of the Semitic people, as undecided. The older writers generally assummed that their primeval home was somewhere in the neighborhood of the Caspian Sea. There is no good reason for such a conclusion as this. It is fully in accordance with the line of reasoning that persists in deriving the Aryans from the same source. As far as we know anything about the movements of the early Semitic bands, they have been from the south to the north and west. Very eminent scholars have come to the conclusion that Arabia is the true home of the Semitic people, from whence they wandered forth in various directions.[2] Tiele[3] concludes that all Semitic people were once living together in Arabia, leaving undecided the question where they had first originated. Latham thinks the Semitic tribes originated in Africa.[4] We should not be surprised to see this the generally accepted view, before many years.[5]

---

[2] Sayee: "Science of Language," Vol. II, p. 167. Schrader': 'Die Ursitz der Semiten" in "Zeitschrift D. M. G.," 1873.

[3] "Hist. of Religion," Berlin 1877 p. 62.

[4] "Comparative Philology," London, 1862, p. 524 *et seq.* and p. 602.

[5] See Bertin in J. R. A. S. for 1885, p. 77 where he comes to this same conclusion. We are told that the anthropologist Gerland supports this view. [Tiele: "Hist. of Religion," p. 63.] Noeldeck refrains from coming to any conclusion on this point but seems to favor Arabia. [Article "Semites" in "Encyclopedia Brittanica."] Prof. Hommel casts his influence in favor of Central Asian origin, we think his arguments will apply just as well to Abyssinia. "Babylonien und Assyrien," p. 267.

For the present, we need not consider the African Semitic tribes at all, since they have played but a very small part in history. Taking up the Asiatic Semites, Arabia comes before us as the center of dispersal for these people. When they were living in this section of country as closely related tribes, the Turanians undoubtedly held possession of Mesopotamia and indeed of all Asia Minor.[1] This was at a time long preceding the dawn of history, and before Civiliztion had anywhere attained any great development. Even traditions are silent on this point. But the evidence of language cannot be gainsaid. All Semitic people speak closely related dialects, closer, if anything, than the connection between the various Aryan speaking people.

Arabia is not by any means an unmixed desert waste. The traveler Palgrave tell us that the central table land, comprising nearly one-half the peninsula, is mainly cultivatable land. It is surrounded on the south, east and west by a sandy waste, and towards the north by a stony one.[2] The area of this elevated and comparatively fertile section of country is not far from twenty-five thousand square miles. At the present day, it is entirely occupied by Semitic Arabs. And these Arabs are supposed to represent the primitive Semitic stock in a very faithful manner. It is from them that we are to gather the best details as to the primitive Semitic culture.[3]

At a very early time, still before the dawn of history, a wave of Semitic people appears to have moved toward the north and occupied the shores and islands of the Persian

---

1 Yet see Bertin in J.R.A.S. for 1886, where he states his reasons for thinking that the Semites were in Chaldea before the Turanians.

2 "Central and Eastern Arabia," London, 1865, p. 91.

3 Tiele: "History of Religion," p. 62.

gulf. And one wave of them came in contact with the Turanian settlers in Mesopotamia. The country around the upper reaches of the Persian Gulf thus appears to have become a second center of dispersion. The tribes radiating from here speedily came in contact with Turanian people, and were greatly influenced by their culture. Collectively they constituted what is known as the Northern Semites. This branch includes: The Assyrians and Babylonians, the Hebrews and Phoenicians, and the Syrians.

As the dispersion of the Semites forms a very important epoch, we will introduce a sketch showing the probable movements of the various bands. Of course, everyone will understand that this chart is not given as a result, but is simply to help us form clearer conceptions of the probable course of events. It is, for instance, pointed out on linguistic and other grounds that the Syrians were probably the first to leave the primitive home.[1] The Remainder of the Northern Semites are supposed to have lived together for some time after the separation of the Syrians; but it is further supposed that the Western, or Canaanitic branch, separated before the complete union of Turanian and Semitic culture in Mesopotamia.[2] Still they are not entirely free from that influence, we therefore represent this stream as diverging from the Assyrio-Babylonian near Accad.

It was from Accad that the Semitic influence gradually extended itself throughout Chaldea, and from thence the Assyrians went forth to the land of Asshur.[3] These movements are indicated on the chart. Turning more

particularly to the Western, or Canaanitish stream, we find that all the members spoke closely related dialects of the same stock language, and had many other points in common in their culture. But it seems to have consisted of two portions, and considerable difference of time between the migrations of these two portions seems to have

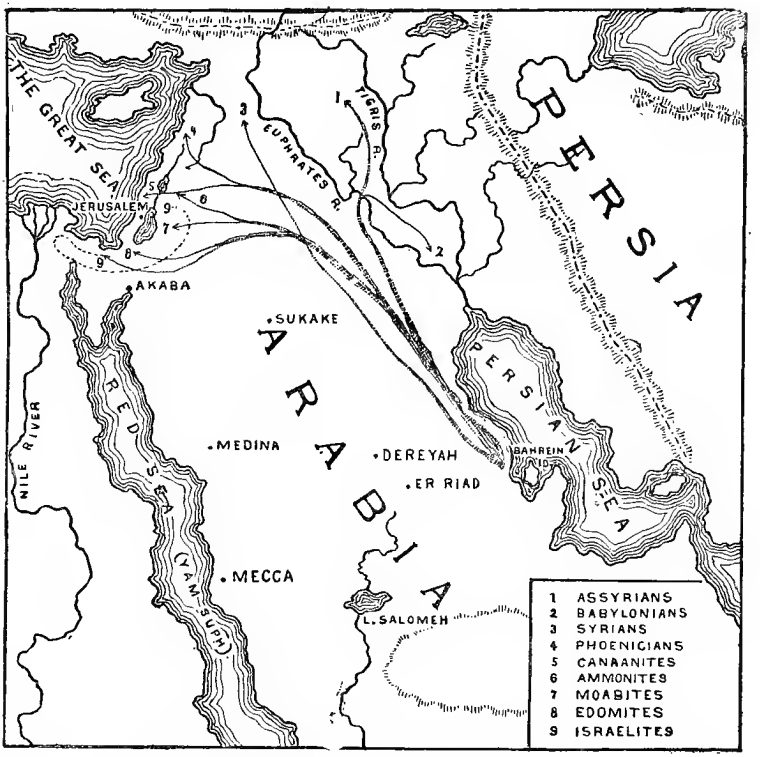

Chart of the Dispersion of the Semites.

elapsed. The first wave consisted of the Phoenicians and the Canaanites, the first occupying the sea-coast, the second the hills and valleys of Palestine. Afterward there followed them, the Hebrew people in four divisions; the Ammonites, Moabites, Edomites and Israelites. These latter people found the best portion of the land already

taken up, and led a more or less wandering life, but gradually settled to the east and south of the Dead Sea and Palestine, though, at a comparative late date, the Israelites forced their way across the Jordan and gradually subjugated the first settlers there. We have indicated, as far as we could, their movements on the chart, and will now turn our attention to the details of the same.[1]

It will be seen that the Northern group of Semitic people contained by far the most important people; those who had a good deal to do with the ancient world. It is to them, then, that we will now turn our main attention. There is not a name mentioned in the foregoing list, which does not possess the greatest of interest for the reader. What visions of antiquity are connected with Babylonia? What scenes of sanguinary warfare with Assyria? To speak of the Phoenicians is to recall that they were the inventors of the alphabet, and were the great traders of antiquity. They were not great inventors, nor warriors, they were skilled neither in arts, literature nor sciences, yet they accomplished a wonderful work in furthering the cause of Civilization. It is not necessary to mention the Hebrews, since every one knows the tremendous influence they have exerted on the world in the matter of religion. It is a thought in which there is an element of sadness to reflect that, though for some thousands of years the Sem-

[1] That the various Canaanitic tribes were Semitic is no longer in doubt. [Sayce: "Ancient Empires," p. 181. Schrader: Z. D. M. G., 1873, p. 402.] We think, however, that Ewald is right in supposing them to be, to some extent, mixed with the aboriginal inhabitants, who were probably Turanian ["History of Israel," London, 1869, Vol. I., p 224] That the Moabites, Ammonites, Edomites and Israelites formed one closely related group is shown by the traditions of the Israelites themselves [Genesis xix. 36-38, xxxii. 3] and by the evidence of language as well; the inscription on the Moabite stone being in nearly pure Hebrew.

itic people were the most advanced in Civilization, and were the most powerful people then living, yet neither of these sayings could be applied to them since some centuries before the Christian era. Races and nations, as well as individuals, run their courses and then forever disappear from the stage of action.

We have in a former chapter pointed out that the Yellow Turanian race preceded the Semitic in ancient Chaldea. There is not much question on that point.[1] In order to give a connected account of the course of events in that interesting section of country, it may occasion a partial review of ground already gone over, but we think this course will be overlooked, in view of the importance of the subject. For we are now about to inquire into the beginning of Civilization in and about Chaldea. That country, which is now a pestilential expanse, or an arid sun-baked waste, was, in all probability, the first place where the stage of enlightenment reached by man was such that we may speak of him as civilized. This is the country, also, to which many references are made in the opening chapters of Genesis. Here was located the plains of Shinar, here were the cities of "Babel and Erech, and Accad and Calneh,"[2] and this probably was the land to which the Hebrew traditions refer as the "Garden of Eden."

Mesopotamia means the "land between the rivers." A glance at the map shows that the Euphrates and the Tigris form the two rivers in question. Flowing in a generally southern direction from their mountain home, these rivers carry every year vast quantities of sediment into the Per-

---

[1] Though M. Halevy disputes this altogether, see J. R. A. S. for 1879, and Bertin, in same journal for 1886, concludes that the Semites were in the country before the Turanians.

[2] Genesis x. 10.

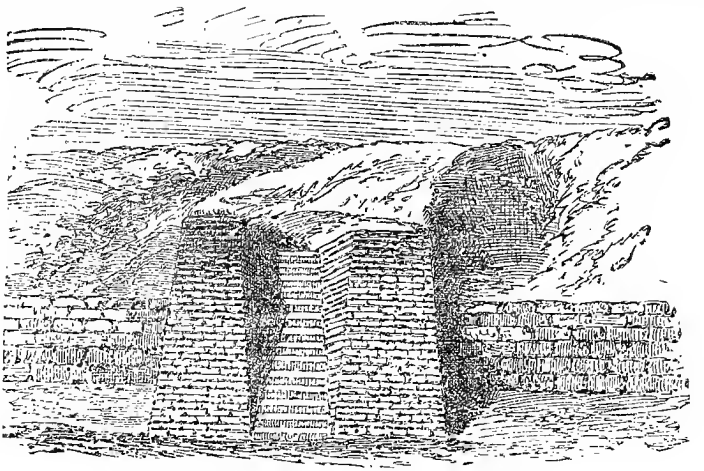
sian gulf. The consequence is that the land has from late geological times continually encroached on the sea. The Euphrates and Tigris now unite their waters and flow in one channel into the sea. Yet at no very distant day, they entered it by separate mouths. It is supposed that, in the long course of ages, all the land south of an irregu-

Map of Chaldea.

lar line running from Hit on the Euphrates to Samarah on the Tigris has been thus gained from the sea.

Everyone knows what sort of a country this must be. One level expanse of very fertile land. When the rivers are at their flood, extensive portions of this land are inundated; and, if not promptly attended to, vast pes-

tilential marshes would be formed The distance from Hit to the sea is some four hundred and thirty miles, though, as just pointed out, anciently this distance was much less. This land was ancient Chaldea. At an extremely early date, the Turanian tribes moved from the highlands of Elam on the east, down into the plains. The usual effects of settlement in a fertile river valley soon followed. The people commenced advancing in culture, canals were dug, temples built, and civilized life began. All this goes back far beyond the dawn of history, and



Ruins at Abu Sharein.

probably before the Semitic bands had arrived on the scene.

One of the oldest settlements in the country was near the modern town of Abu Sharein on the left bank of the Euphrates, known in earliest times, that is Turanian times, as *Nun-ki*, that is "the place of the first water." Now we must recall that Hea was the Turanian god of earth and water,[1] and he was the beneficent god, or god of

[1] See Chapter V.

goodness, and so the place was called the "city of the good god," or *Uru-dug-ga*, which in course of time became shortened into Eridu.[1]

This seems to have been the first starting point of Turanian Civilization. Eridu lived in the memory of the people of Chaldea as a holy place. The god Hea, who played such an important part in ancient Chaldean religion, was regarded as the local god of Eridu. One inscription speaks of him as the "king of Eridu."[2] Long after this, temples were sometimes said to be built like those at Eridu, "to be a holy place." Most of the magical formulae, songs and incantations date from this far away time. When any place is mentioned in the exorcisms, it is Eridu.[3] There was the place where the "holy palms" grew. Some have not hesitated to say that the Hebrew traditions of the Garden of Eden refer to Eridu.[4]

We can see how much interest this place has for us. It seems to have been the earliest religious center of the entire district. How gladly would we learn of its history, but as yet this remains a sealed book. Of necessity, it must once have been the seat of government of that section;[5] but it is probable that as early as five thousand years before Christ its political glory had passed away, and from henceforth it was to the Chaldeans only a holy place, the especial home of their god Hea.

---

[1] See Hommel: "Geschichte Babyloniens und Assyriens" in Onchen's "Allgemeine Geschichte," p. 196.

[2] Ibid., p. 198. [3] Ibid., p. 197.

[4] See Sayce: "Ancient Empires," p. 95.

[5] George Smith, in "Records of the Past," Vol. III., commences his outline "History of Babylonia" with two patesi of Eridu, but compare with this Hommel's note in "Babylonien und Assyrien," p. 266, note 1, where he shows that the patesi there spoken of, probably do not belong to the oldest time here referred to.

A slight digression may not be out of place to explain the reasons for assuming the date, 5000 B. C., just named. It is admitted by all scholars that the Babylonians and the Assyrians adopted a most excellent system for registering events.[1] They had also reduced their calendar to a very good system. At a very early date, they had official astronomers, "who observed the heavens and regulated the calendar."[2] They also kept lists of the years and recorded the most important event occurring therein. Portions of these lists have been recovered for short periods of time, and are of the very highest value. This is sufficient to show us how much better as historians the Assyrians were than the Egyptians, who seemed to have been lacking in historical instincts.

Now Nabonidas, the last king of Babylon, in a certain inscription speaks of repairs he had made in the great sun temple at Sippara. It seems that when a king founded a temple, he inclosed in one of the corners a cylinder giving a short account of himself. Nabonidas in repairing this temple made a search for the cylinder of its founder and thus describes his success: "Shamas the great lord . . . suffered me to behold the foundation cylinder of Naram-sin, the son of Sargon, which for thrice thousand, and twice hundred years none of the kings that lived before me had seen." He herein declares that three thousand, two hundred years had passed from the time of Naram-sin to his own reign. He ruled about 550 B. C., so we have here the date of 3750 B. C. for Naram-sin, and about 3800 B. C., for his father Sargon, of Accad.[3]

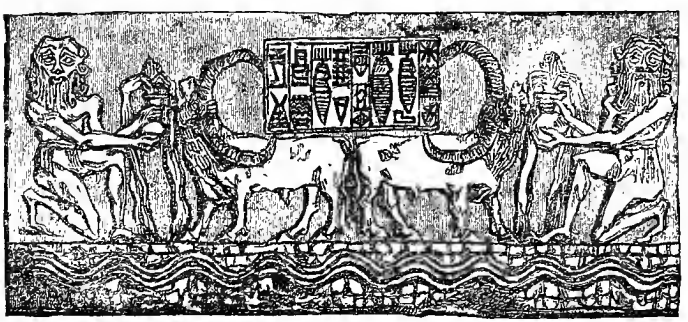
We fortunately possess some monuments of Sargon,

[1] Smith: "Assyrian Eponym Canon," London, p. 17.

[2] Ibid., p. 19.

[3] See above p. 371.

one has been given,[1] another was his cylinder which is here shown. (A cylinder is a sort of seal, and will be explained later.) This gives us a starting point 3800 B. C., now from many points which it is not necessary to enumerate here, such as the characters used in writing, the language employed, the degree of artistic development, etc., etc., we gather approximate dates for the beginning of Civilization in Chaldea. It must be borne in mind, however, that they are approximate only. We may have to change them considerably one way or the other, and we must further bear in mind that this assumed date, that is 5000 B. C., by no means takes us back to the founding



Cylinder of Sargon, 3800 B. C.

of Eridu. Only to a time when its political supremacy had passed away, and it existed as a place so ancient as to be invested with a halo of sacredness.[2]

If Eridu was the center of religious life of the earliest period of Chaldean history, the center of political power seems to have been somewhat further removed to the north. The place seems to have been variously called at

---

[1] See above p. 372.

[2] Sayce remarks that the date of its foundation may be approximately fixed by the rate at which the alluvial soil has grown seaward. ["Ancient Empires," p. 95.] We have not, however, seen any calculation made by competent engineers.

different periods. In very early times, it seems to have been known as *Gir-su*, more generally, however, as *Sir-gulla*, which M. De Sarzec seems to have come across in the low mound of ruins, called at the present day Tello, situated on the left bank of the canal known as Shat-el-hie, flowing from the Tigris into the Ephrates a few miles above Eridu.[1]

At the far away time to which we now refer, viz: about 5000 B. C., we can only recover here and there an historic gleam. Our knowledge is very fragmentary indeed. We judge, however, that a tribe with headquarters at Girsu (Sirgulla) was rapidly rising to importance. The cylinder of one of their chiefs, supposed to date from

Cylinder of a Patesi of Sirgulla.

about 5000 B. C., is here represented.[2] We must call attention to the peculiar features represented on this cylinder. The type, seen also on the cylinder of Sargon, is neither Semitic nor Turanian,[3] but what race is represented is a yet unsolved ethnological problem. A peculiar in-

---

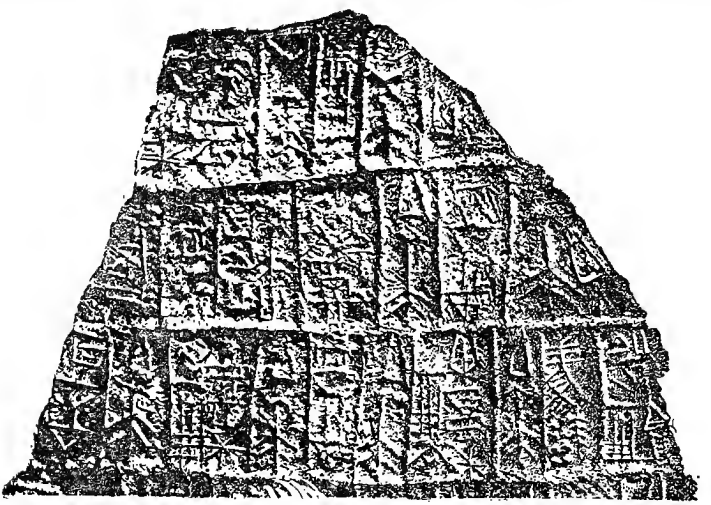
1 We have located Tello by means of a small map, given by Hommel in "Babylonien und Assyrien," p. 115. It is necessary to remark that it is a question whether *Girsu* and *Sirgulla* are the same or not. See Hommel, p. 202.

2 See Hommel: p. 290.

3 Smith suggests that it is an Ethiopian type: "Chaldean Genesis." p. 194.

terest attaches to this physical type since that legendary hero Izdubar (of whom more later) is always so represented.

The reader should also notice the form of the characters employed. The cuneiform shape (tapering to a point) has not yet appeared. The title of this official was *patesi*. Some discussion has taken place over the exact meaning of this title. At a subsequent stage, it meant about the same as viceroy. But this was not its meaning in the first instance. It meant literally the "carrier of the sty-



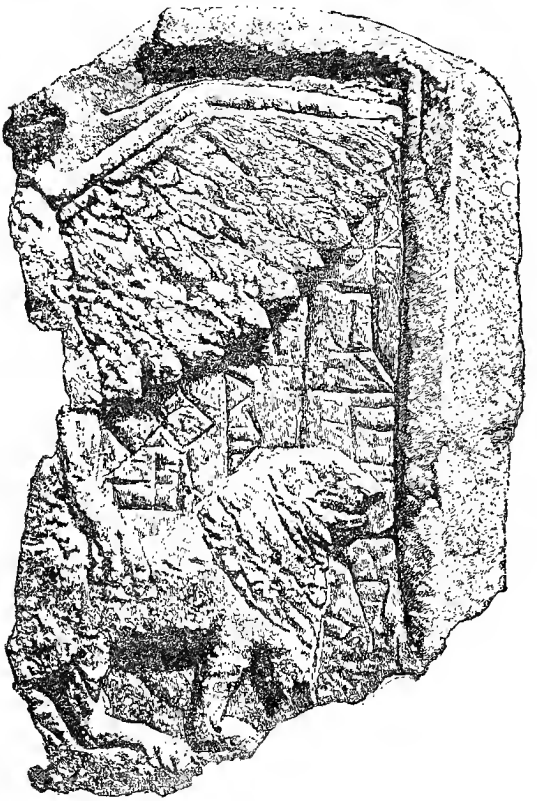
Inscription of Ur-ghanna.

lus," or the tool with which writing was done, but in its use it seems to have been synonymous with the word "priest."[1] We must recall that at first the chief was also the priest of his people, so we conclude that this title of patesi, meant about the same as the word chief generally. Confederacies of several tribes had probably not yet made

[1] See Hommel: "Babylonien und Assyrien," p. 294. He remarks that the original word was something like Ghadda-ti-siddi "Mit der Bedeutung 'Griffel führer' als eines Synonyms für Priester."

their appearance, we are dealing with one individual tribe though doubtless a very prominent one.

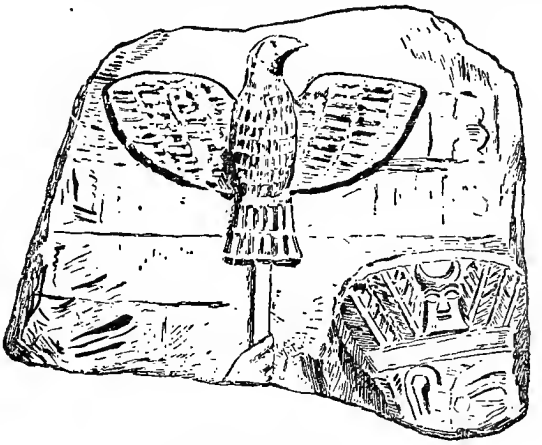
The date of the cylinder is placed at about 5000 B. C. The next figure visible in the dim light of these almost prehistoric times is no longer "patesi" but "king of Sirgulla." This change in title shows that political progress



Bas-relief of Ur-ghanna.

has gone forward. There was probably a union of several tribes under one leader, and Sirgulla was no longer the headquarters of a tribe but of a confederacy. Though the date of the reign of this king is placed at about 4500 B. C., yet he comes before us as quite a real flesh and blood king.

we know his name, that of his father, and some of his achievements. The cut, page 657, is a representation of an inscribed tablet found at Tello by M. De Sarzec. It acquaints us with the fact that Ur-ghanna son of Chalginna was king of Sirgulla, and then tells us of many temples and other buildings he had erected. It further tells us that he had caused his statue to be erected and had built a fortification wall for Sirgulla. All this shows us that even at that early time the foundation of Chaldean culture had been laid.[1] We have also a bas-relief bearing the name of



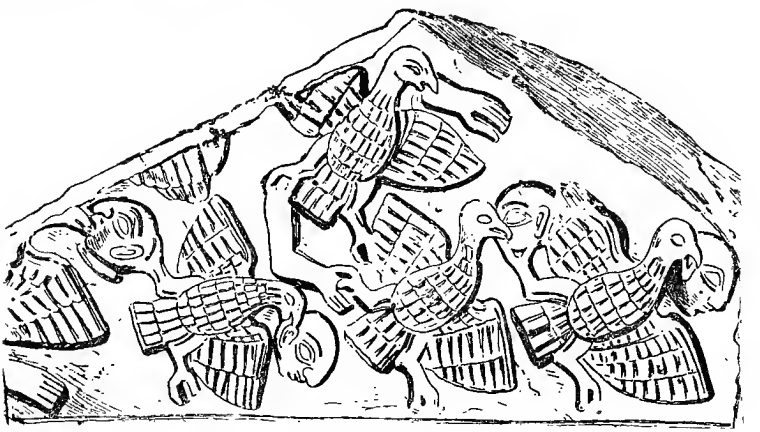
March of an Army.

this king and his title, which is important from an artistic standpoint. The subject of the relief is evidently an eagle with out stretched wings, whose talons are sunken in a lion's back. The material of this relief, as of other monuments of this period, is limestone, which, in the course of time, has suffered from the weather. The writing is nearly illegible, but we can still puzzle it out.

We also know the son and successor of Ur-ghanna, though we are not sure of the first syllable of his name.

[1] See Hommel, p. 286.

Amongst the objects found by M. De Sarzec at Tello, was a stele of white stone, unfortunately broken and not all the fragments recovered, both sides of which are covered with bas-reliefs and inscriptions. The bas-reliefs seem to represent a military expedition. One small fragment, here represented, was probably a part of a relief representing the arrival or departure of the army. "Very little is left, but that little is significant: . . a hand holding a military standard . . and the head of a personage, perhaps the king walking in the procession: and that is all."[1]



Birds of Prey.

Two other fragments are equally significant, one represents birds of prey dismembering the bodies of the slain, perhaps defeated enemies. And one of similar import representing the burial of the dead, perhaps the bodies thus honored are those of the victorious soldiers.[2] The cut on page 661 represents the inscription on the lower part of the fragment whose upper part represents the vultures. Strange to say, it has no reference, apparantly, to the bas-relief. We gather from it that . . . Kur-galla (the first

1 Perrot and Chipiez

2 Prof. Hommel thinks that both of these cuts represent conquered

syllable is uncertain,) son of Ur-ghanna was king of Sirgulla. It tells of a number of temples he built and restored; and, what is important, we notice that the sun appears at this early time to have been worshiped as the representative of the "Spirit of Heaven," that is zi-anna.[1]

We hear of one more "King of Sirgulla" who is supposed to date from about 4200 B. C.[2] Only one or two short inscriptions of him are known. His name, with the first

Burial of the dead

syllable in doubt, seems to have been Uru(?)-ka-ginna. One short inscription is of importance since it contains what is, at present, the oldest known reference to Babylon.

---

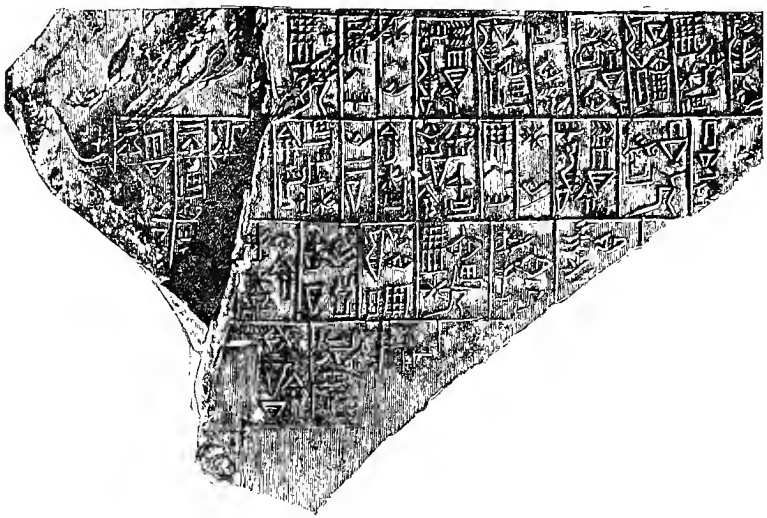
enemies. Perrot and Chipiez suggest the division we hold out as probable above. As to the features repesented, Heuzy remarks that "the Semitic pofile is more strongly marked than in the monuments of the following age," while Prof. Hommel thinks that, in accordance with primitive art, the forehead and nose are represented by one slightly bending line, and that the features "nur scheinbar an Semitisches erinnert," See "Art in Chaldea and Assyria," Vol., II. p. 177, and "Babylonien und Assyrien," p. 241.

[1] See above Capter V.

[2] Hommel, p. 291.

It speaks of building "a palace to the oracle of the god of Tin-tir," which is one of the several names of Babylon of old.

Thus we see that for the centuries lying between four and five thousand years before Christ, the darkness here and there lifts for a time and discloses to us an ancient city near Tello, which seems to have been the seat of considerable political power. We see its rulers exchanging a title about the equivalent of the word chief for that of king.



Inscription on the Vulture Stele.

Those who have studied the question declare that there was an advance in writing and in art in general. We learn of the march of victorious armies. We see the country plentifully supplied with temples. In short, all the elements of Babylonian Civilization seem to have been developed. We have as yet learned nothing of the Semites. But the scene now changes, and we are made aware of the fact that they have arrived in the land and are gradually becoming the masters of it.

It is scarcely necessary to remark that our knowledge

of this period is extremely scanty. Gaps of several centuries occur of which absolutely nothing is known, and when light appears it is but momentary in duration. We need not be at all surprised if future discoveries put a different meaning on our present interpretation. We are not to suppose this period was an altogether quiet one. Intertribal warfare was going on, marauding expeditions were undertaken, and the pressure of invasion from the ruder Semitic tribes had been gradually growing stronger and stronger, until finally a portion of the country passed under Semitic control, and straightway there commenced the process of blending into one the culture of the Turanian and Semitic people. Let us examine this question more particularly.

At what time the Semitic tribes commenced to swarm out of their common home in Arabia is as yet unknown; but, passing to the north, they everywhere found confronting them Turanian people. Intermixture between these two people must have gone forward. That part of Mesopotamia known as Assyria proper was held by a large number of Turanian tribes, known collectively as the Kutu.[1] The first entrance into Mesopotamia by Semitic people seems to have been along the northern part of old Chaldea, though two cities, Accad in Northern Chaldea and Erech in Middle Chaldea, divide between themselves the honor of furnishing the first Semitic kings. We have three cylinders, the inscriptions of which are in the Semitic language, two of them tell us of kings of Erech, and one of a prince of Accad. Our scholars are yet undecided as to their relative age.

[1] See Sayce: "Ancient Empires," p. 91. Notice the presence of the K phonetic element. They were otherwise known as the Guti, which became the *Goyim* of Genesis xiv. 1.

As everything connected with these early times is of interest to us, let us examine these cylinders. This is a representation of a cylinder from Erech. To judge from the writing and the figures represented, it is the oldest of the three. The three personages on the left of the cut are supposed to represent gods. The Semitic inscription reads as follows: "The lord of Erech, In-an-dub of the house of Erech, son of the king."[1] A second cylinder from Erech is shown below. The figures are supposed to represent an immigration or captive soldiers or tribute bringers. The inscription reads as follows: "His servant, the scribe, (devotes this) to U-bil-darra, brother of the king of Erech." These cylinders both refer to Erech in middle Chaldea.

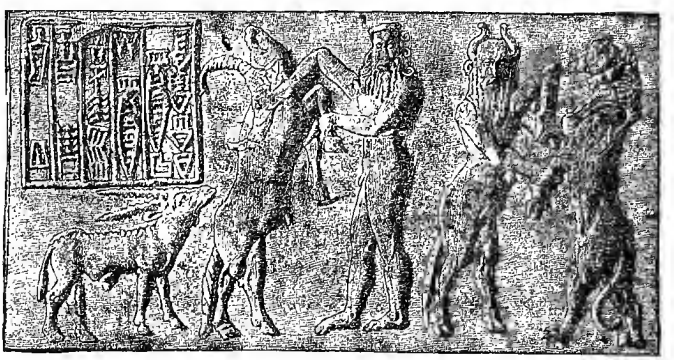
Cylinder from Erech.

Cylinder of Erech, [about 3500 B. C.]

The next cylinder, however, refers to Accad in Northern Chaldea. We call especial attention to the figures. They have to do with the old Turanian legends of Izdubar, which we will speak of soon. The inscription reads: "His servant, Izilum the scribe, (devotes this) to Bin-gani, king of the city, son of the king." If we are ignorant of the order in which these cylinders made

[1] See Hommel, p. 300.

their appearance, we can still draw some important conclusions from them, they show that, at about 4000 B. C., Semitic people had made their appearance in Chaldea. They show further that migration could not have been from the north or east, but must have been from a southwesterly direction.[1] Since the inscription and proper names are Semitic, the Semites must have become the ruling class, but we also learn that they had adopted Turanian writing, art and mythology. All this must have taken no inconsiderable number of years to accomplish.



Cylinder from Accad.

Leaving these little-known kings, we turn to that important personage, Sargon of Accad, whose date has already been given as 3800 B. C. The location of Accad was long unknown, but now it has been identified with a portion of the ruins of Sippar. Two monuments of this king have already been given.[2] We have also some details of this king's life and reign, that are not without interest. They were given in an inscription supposed to have been placed

---

1 There was one solid mass of non-Semitic tribes confronting them in all other directions. Notice also that both Accad and Erech were located along the western border of Chaldea.

2 See above, p. 372 and 654.

on the pedestal of his statue.[1] The original inscription is gone, but we have an Assyrian copy made for the library of Assurbanipal.

We have all heard stories about fated children, who come through all sorts of danger to a life of greatness. Notice in the following account of the infancy and boyhood of Sargon the same mythic conception at work. The inscription reads as follows: "Sharruk-inu, the mighty king, king of Accad am I. My mother was a princess, my father knew I not, while the brother of my father lived among the hills. My mother, the princess, bore me secretly in my city of Azu-pirani, which lies on the banks of the Euphrates; she placed me in an ark of reeds, with asphalt she closed the door, and put me below in the stream, which did not flow over me, the stream bore me to Aki, the water-drawer. In the goodness of his heart, Aki the water-drawer lifted me up. He raised me as his own son, and made me his gardener. The goddess Ishtar felt drawn towards me in my vocation as gardener."[2]

It is generally supposed that the real meaning of the above is that Sargon was a successful soldier, who raised himself from an obscure position to the throne. The reign appears to have been successful, for the account continues: "I became king and for forty-five years exercised royal authority. I ruled the black haired people..... Over difficult places in chariots of honor I rode. I governed the upper countries. (I ruled) the princes of the lower country. Three times I passed through to the sea-coast. Dillman surrendered, Dur-illa, the great, bowed itself." This

---

1 This is Mr. Talbot's view: "Records of the Past," Vol. V., p. 2.

2 We have translated Prof. Hommel's German translation. Two English translations are contained in "Records of the Past," Vol. V., p. 3 and 56

is regarded as an honest copy of an ancient inscription. From it, we learn that Sargon claimed to exercise sovereignty over all of Chaldea. He was ruler in the upper country, and held the "princes" of the lower country in subjection. Three times he marched his army the entire length of Chaldea, from Accad on the north to the Persian sea on the south. Dur-illa was an important town on the boundary of Elam, and Dillman was located on the Persian Gulf.[1]

We possess still another tablet professing to give an account of the doings of this king. It is called the "Tablet of Omens," for at the head of each paragraph, containing an account of a war or military expedition, is a description of the omen from the moon under which the expedition was undertaken, for the Chaldeans never started on an expedition unless the omens were propitious. There are fourteen of these paragraphs, eleven of which refer to events in the life of Sargon. The only copy remaining of this tablet is one made for an Assyrian king. Prof. Hommel, after carefully studying this tablet, which claims to treat of Sargon the first, concludes that it also contains much that does not belong to his reign at all. It includes events belonging to the reign of kings very much later in time. It would not be at all singular were this the case. It would be only another instance of what has often happened in the history of great men.[2] According to this tablet, Sargon played a far more important *role* than the

---

[1] We have translated Prof. Hommel's German translation, but have changed it slightly to agree with Smith's English translation in "Records of the Past," Vol. V., p. 57.

[2] An English translation of this Omen Tablet is given in "Records of the Past," Vol. V., p. 58 *et seq.* Prof. Hommel's criticisms a e in "Babylonien und Assyrien," p. 304-8. It must be said that a number of scholars give full credit to this tablet.

modest one set out above. The three expeditions to the Persian sea are now transferred to the Mediterranean coast, and he is even said to have conquered Cyprus and set up his image there. He is here probably confounded with Sargon II. of about 700 B. C.

Inscription of In-anna-ginna.

Not taking into account this latter tablet, it can be seen that after a prolonged effort extending over probably some centuries of time, the Semitic invaders had established their power, and had assimilated the Turanian culture, and finally had reduced the whole of Chaldea to their reign. What had become of the kings of Sirgulla, whom we have seen at a still earlier time ruling quite an extensive scope of country? If we recall that Sargon speaks of

ruling the princes of the lower country,[1] we shall probably not err if we conclude that among these "princes" are the former "kings" of Sirgulla now playing the part of a vassal or a *patesi* in the secondary meaning of the word, which it came in time to have. Fully in keeping with this is the fact that we come on traces of various patesi of Sirgulla, who belonged to about this time, judging from the style of work.

The preceding cut is an inscription on a piece of hard alabaster containing the name and title of In-anna-ginna, patesi of Sirgulla. Heuzy, who is authority on such topics, tells us that this inscription "has a peculiar style and shows a progress in technic, which bespeaks a parallel progress in art generally."[2] Although the writing is still linear and not cuneiform, yet the characters are clear and are cut with a confidence and precision hitherto unknown. The material used is not the soft limestone of the primitive period but a harder kind of stone. But along with this progress in art, has gone a decline in political power as is shown by the use of the word patesi.

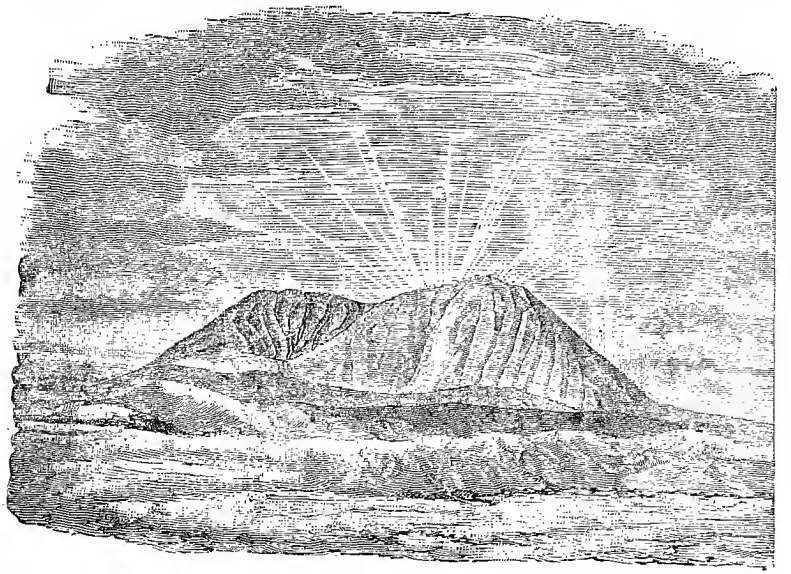
Cylinder of Naram-Sin.

Now returning to the kings of Accad, we find Naram-sin given as the son and successor of Sargon. His seal-cylinder is here shown. There are one or two short inscriptions of him in existence also. The inscription on the cylinder reads as follows: "Mar-Istar, son of Ilubalit, servant of Naram-sin." The figures represented are rather peculiar. There is first, on the right, a priest, the central

[1] Smith renders the word "King;" Hommel, "Haupter,"
[2] From Hommel's German Translation.

figure represents, perhaps, Naram-sin himself, the figure on the left, with the horn-like ornament on the cap, represents a god.[1]

Naram-sin was a builder as well. We must bear in mind that it was his cylinder, placed in the corner-stone of the sun temple at Sippari and discovered by Nabonidas, that gives us the date of his reign.[2] Three paragraphs in the Omen Tablet, which we have described, recount



Ruins of Tell Ede.

events of Naram-sin's life. They tell us first of his conquest of Amar-ak a city supposed to be represented by the mound of ruins known as Tell Ede, which, we shall see, played an important part in ancient Chaldea. They also tell us of a successful expedition to the land of Maganna. This most probably refers to the southern part of Chaldea,

[1] Sayce thinks [probably from the object he holds in his hand, the representation of lightning] that the god Ramman is here represented. Hommel suggests Nergal. See "Babylonien und Assyrien," p. 309.

[2] Page 653

lying on the west bank of the Euphrates and bordering on Arabia. This was noted for its stone quarries. A fragment of a vase at Tello, speaks of a "vase of polished work, from Magan."[1]

As near as we can judge, some centuries seemed to have passed by before we again have the aid of inscriptions and monuments. When light again appears, it is in Southern Chaldea, and it is indeed significant of the direction in which Semitic people entered the land to find that the new inscriptions from Sirgulla, for it is there we return, are in a Turanian language. We find ourselves confronted with the highest developed culture of the Turanian people in Chaldea. The artistic remains of this period are indeed wonderful. They take the shape mainly of statues, containing inscriptions.

This cut is the representation of a certain Ur-ba'u of Sirgulla. M. De Sarzec, whose discoveries on the site of Tello we have often referred to, found some ten statues, all more or less broken, the heads of all being wanted. Nine of them bore the name and inscriptions of Gudea. One bore the name of Ur-ba'u.[2] Prof. Hommel, from a careful study of the form of the writing, concludes that Ur-ba'u was older in time than Gudea and places him at about 3300 B. C. We must pay some attention to this work, since it is regarded as the finest extant monument of ancient Chaldean art, and in noway shows any trace of Semitic or Egyptian art.

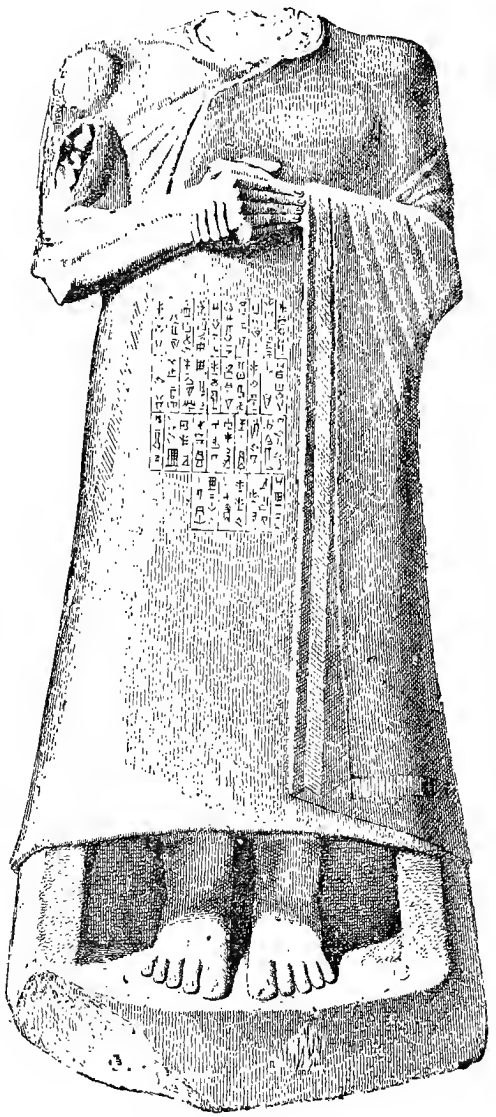
The figure is that of a heavy-set man. Observe the careful attention to details in the exposed portions of the body, the muscles, fingers, toes and nails are all carefully

---

[1] See Hommel: p. 309.

[2] The name is also read Lik-bagas. See "Art in Chaldea and Assyria," p. 180.

represented. The dressing is very plain and simple, but observe the slight fringe and notice how gracefully it is thrown around the body. An inscription is to be seen on the front of this statue, another was cut on the back.[1] The title of Ur-ba'u was "Patesi of Sirgulla." The inscriptions tell us mainly of the building of temples, in some cases the restoration only is meant, since some of the earlier kings and patesis may have mentioned the building of them. The cities of Girsu (Sirgulla), Eridu (Nunki) and more are named. It will be observed that only the south-eastern part of Chaldea is men-



Statue of Ur-ba'u.

[1] See Hommel: p. 218.

tioned. The majority of De Sarzec's great find belong to a somewhat later date, about 3100 B. C. At this supposed date, there was ruling at Sirgulla a most noted personage, whose name is generally read *Gudea*. His inscriptions are still in a Turanian language, but from many sources we know that the Semites are at hand. We detect traces of their influence in the field of religion, and those scholars are probably right who think they can detect Semitic features in some of the sculptures and carvings. Let us examine this question. If we will compare the heads given on page 374 with this cut, we will have the two types in question. The one is broad-headed (Brachycephalic) with a smoothly shaved or beardless head, with slightly prominent cheek bones; the other is long-headed (Dolicocephalic) with a heavy head of black hair, and a long chin beard.[1] Or if we will compare the cut on page 660 with the next cut we will see represented the same two types. It is supposed that the first type represents the Turanian Chaldean, the second, the Semitic people, perhaps from Accad, which at this time had long been in the possession of Semitic people. A fragment of ancient Chaldean bas-relief shows us, in dim outline, the features of a man and woman, supposed to represent a king and a

Bronze Votive. Offering

[1] Hommel: "Babylonien und Assyrien," p. 241. See above, page 665, where Sargon says he "ruled the black haired people." Compare the above with remarks on page 191 of Vol. II. of "Art in Chaldea and Assyria" by Perrot and Chipiez. They seem to regard both types as representations of the same people, the Semites.

queen.[1] The features represented are those of our so-called

The Semitic Type from Tello.

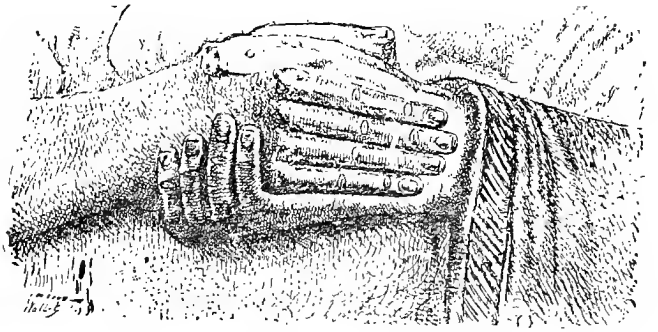
Semitic type. Finally in the cut on page 693 we have again the Turanian features in a statuette from the Louvre.

Semitic King and Queen.

Nine statues were found at Tello bearing the inscription of Gudea. They include both seated and standing figures The cut shown on page 373 is one of the seated statues. On page 700 is represented another one, sometimes called the statue of the architect. But it bears the same royal inscription as the others. One point to be noticed in all these statues is the attitude of the hands. We give a nearer view in the next

[1] "Art in Chaldea and Assyria," Vol. II., p. 191.

cut. This is the attitude often assumed by eunuchs in the presence of their masters, the kings, but found as well in the representation of kings before the effigies of their gods. We can, then, see the propriety of this disposition of the hands in these statues, which were probably placed in some part of the various temples, where the king was represented, as it were, in the attitude of worship before his god.[1]



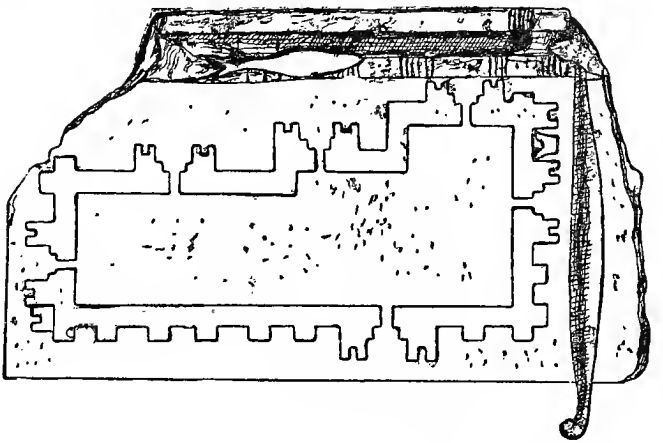
Position of the Hands.

The statue of the architect on page 700 is seen to be holding a slab of stone in its lap. This is of sufficient importance to be noticed by itself, especially as from this, the name of "The Architect" has been given to the statue. On the left is to be seen "one of those styles with which letters or images were cut in the soft clay, at the bottom of the tablet there is a scale which we know from another monument of the same kind to have been originally about ten and a half inches in length, representing the half-cubit or span. The larger part of the surface is occupied by an irregular figure in which the trace of a fortified wall may be easily recognized. Some have supposed this to be the plan of a city, others of a palace only.[2]

1 "Art in Chaldea and Assyria," p. 181.

2 "Art in Chaldea and Assyria," Vol. I., p. 327. See also "Contempo-

Gudea, though he styles himself patesi of Sir-gulla, was not simply some petty chieftain. His monuments are found over a considerable extent of country and on the sites of important cities.[1] He was certainly a king in power, as but few were in these early times. Under him, Turanian art in Chaldea reached its highest point, and his power seems to have extended over at least a part of Elam and the greater portion of Chaldea, perhaps even to the north in Assyria and to the west in Lebanon.[2] It is interesting to



Drawing on the Stone Slab.

note that this powerful patesi, the builder of numerous temples, leaves an account of his early life in many respects like that of Sargon. He declares that the ocean depths were his father and mother.[3]

---

rary Review" for 1886. Mr. Sayce speaks of this statue as proving that the stone was derived from the peninsula of Sinai and showing the influence of Egyptian art. But Maganna, to which the inscription refers, was probably the boundary line between Arabia and Lower Chaldea.

1 "Records of the Past," Vol. V., p. 7.

2 Hommel: "Babylonien und Assyrien," p. 318.

3 Ibid. 320 The relative position of Gudea in history is not yet settled. Budge places him considerably later than our date ["Babylonian Life and History," p. 41.] Prof. Sayce thinks he was the grandson of

From what we can gather from the dim light of history in Chaldea, and have in a measure set forth above, it seems that, though the Semites early gained a supremacy in Northern Chaldea, they met with more of a determined resistance in Lower Chaldea, though their influence was felt there, and they, at times at least, exercised suzerainty over the country. For a long time, Sirgulla had been the principal city in Southern Chaldea. There is a period of nealy two thousand years intervening between the first patesi of Sirgulla and Gudea, of whom we have just treated. During this time, other cities were in existence. We have seen Babylon mentioned as early as 4200 B. C., and from seal cylinders, the kings of Erech vie in antiquity with Sargon of Accad. We would naturally expect the center of political authority in Southern Chaldea to shift from Sirgulla to another point, since in the course of time, some other tribe located elsewhere would be sure to contend with the tribe at Sirgulla for supremacy, and (in a tribal state of society political power changes with kaleidoscopic rapidity) succeed in changing the relation between them.

This introduces us to Ur. We have evidence that this was certainly a very ancient city. Bricks are found here the inscriptions on which are in writing of very ancient characters. The cut given on page 247 is one of this character.[1] At about 3000 B. C., Ur had become the center of political power in Chaldea. Its kings assumed the proud title of

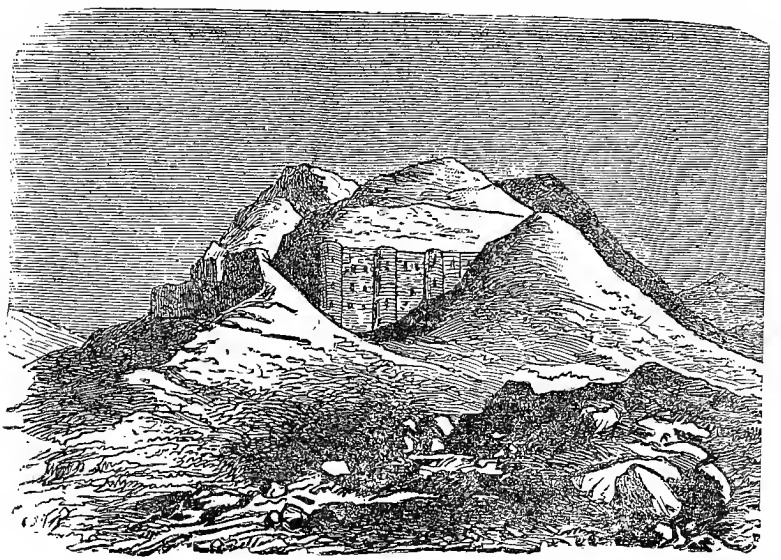
---

Ur-ba'u [Lig bagas] of Ur. and consequently several centuries later than our date. ["Ancient Empires," p, 110.] On this point, see Hommel p. 318. Smith, in "Records of the Past," Vol. III., p. 7, places him long before Sargon of Accad, but when he wrote, we were ignorant of Sargon's date, 3800 B. C. Ragozin, "Story of Chaldea." p. 214. contents herself with showing that he was probably between three and four thousand B. C. Prof. Hommel places him about 3100 B C.

1 Prof. Hommel places the date of this inscription at about 3600 B. C. "Babylonien und Assyrien," p. 113.

"King of Kingi and Burbur,"[1] and their authority seems to have extended over the larger part of Southern Chaldea and at least a part of Accad.[2]

Our next cut is the seal-cylinder of the first known and most famous king of Ur. His name has been read several different ways. Following Prof. Hommel, we will call him Ur-ba'u of Ur.[3] Ur-ba'u was a great builder. His reign



Ruins of Ur.

[1] By this expression, South and North Babylonia were meant. At a later date, the expression was changed to "Sumir and Accad." Eridu, Sirgulla, Ur and Lārsa belonged to Kingi: Erech and the towns to the north of it, to Burbur, or Northern Chaldea. Kingi probably meant "the land," perhaps the home land. The meaning of Bur-bur is more obscure. Possibly it meant about the same as, "The two Rivers," having reference to the Tigris and Euphrates: or perhaps it meant "The two Places," having reference to the double town of Sippar and Accad. Hommel: p. 233-4.

[2] Ragzoin: "Story of Chaldea," p. 216.

[3] Ragozin remarks as follows "This name was at first read Urukh, then Likbabi, then Lik-bagash, then Ur-bagash, then Ur-ba'u, and now Prof. Fried Delizsch announces that the final and correct reading is, in all

must have been long and prosperous. It is said: "That the remains of his buildings even now exceed those of every other Chaldean monarch except Nebuchadnezzar."[1] It has

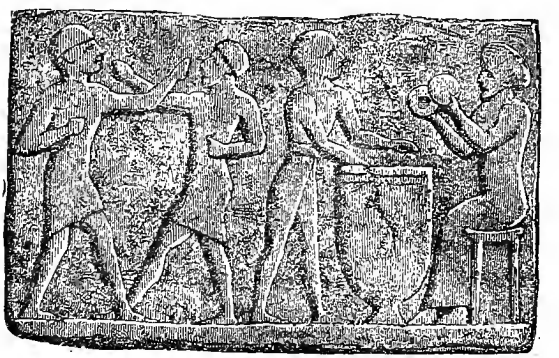
been noticed that in many places where important buildings once stood, the foundation bricks bear the name of Ur-ba'u,



Clay Tablet from Senkereh.

though other kings may have completed them.[2]

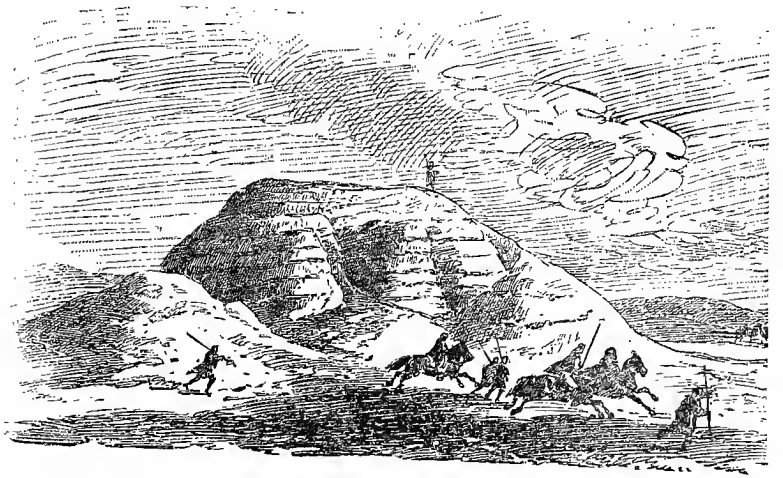
Many other details might be mentioned all going to

probability either Urea or Arad-ea." This Cylinder, long supposed to have been lost, is now in the British museum. See J. R. A. S. 1881, p. c v.

[1] Smith: "Early Hist. of Babylonia," p. 9.

[2] Rawlinson: "Seven Great Monarchies," Vol. I., p. 102.

show that Ur-ba'u was the king whose reign marks the commencement of a new era in Southern Chaldea. Ur was now the capital city and was adorned with temples and public buildings.[1] Larsa, now known as Senkereh, appears to have been founded by him. At any rate, its history does not go further back than his date. This was the site of a famous temple of the sun. For Larsa was devoted to the worship of the sun, as Ur was of the moon.[2] Erech too (though as we have seen there were kings of



Ruins of Temple at Erech.

Erech long before this time) was the scene of his activity. His bricks are found in the foundation of the great temple of Ishtar which is here represented, also at Niffer (the Scriptural Calneh) he founded temples.[3]

These public works undertaken by Ur-ba'u were, some of them at least, of very great size. The platform mound of the temple at Erech is estimated to have required thirty million bricks, and this is only one of several build-

[1] Smith: Op. cit.

[2] This Larsa is the Ellasar of Genesis xiv. 1.

[3] Rawlinson: "Seven Great Monarchies," Vol. I., p. 103.

ings. It is considered quite likely that Ur-ba'u must have had control of captives, perhaps captives of war, the fruits of successful war with the surrounding tribes. His power must have been built up at the expense of Accad and Sirgulla.[1] At this latter place he also built or repaired a temple.[2] It has been observed that while the name of Ur-ba'u and his immediate successor are Accadian and their inscriptions often in that language, yet, from a religious stand-point, we perceive the influence of the Semites.[3] It will be observed on the cylinder of Ur-ba'u, that the moon god (the seated figure) is represented as having features of the type we have called Semitic.

Ur-ba'u was succeeded by his son Dungi, who seems to have completed many of the buildings begun by his father.[4] What traces we have of him at present are principally from Ur and Erech. He styles himself king of "Kingi and Burbur." There is a question whether Ur here mentioned was the "Ur of Chaldea," spoken of in the Bible as the primitive home of the Hebrews.[5] It has been shown that one reading of the cuneiform sign from Accad is *Ura*, and Prof. Budge thinks this is the Ur of the Bible.[6]

With the death of Dungi, we are once more left in the dark, and for an unknown length of time, we know but

---

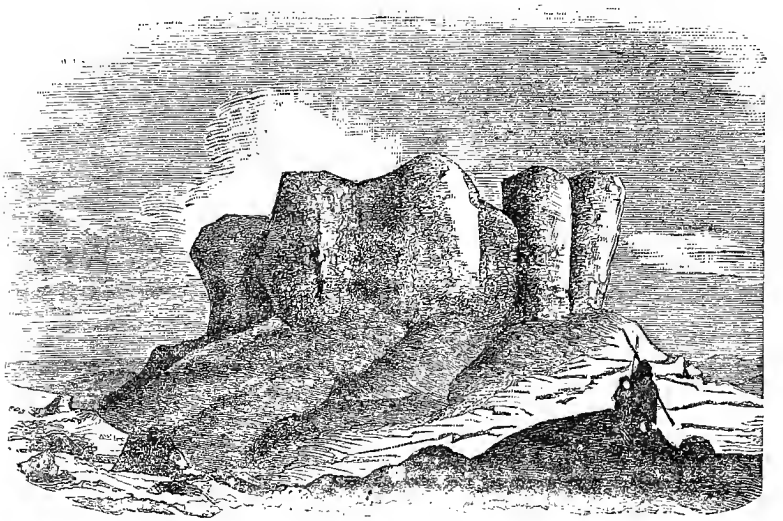
3 Ragozin: "Story of Chaldea," p. 218.

4 The name of this king is in some places given as Ilgi. The syllable dun is but another name for ba'u.

5 Bible, Genesis x. 31.

6 "Babylonian Life and History," London, 1885, p. 25. On this point also, see Hommel: "Babylonien und Assyrien," p. 213. He shows there are strong reasons for supposing that Harran, the second starting point of Abraham, became mixed in popular etymology with Ur, both were places especially devoted to the worship of the moon god, and even the names may stand in some relation to each other.

very little of the course of events in Chaldea. We know the names of a number of kings, who in their inscriptions claim to rule an extensive section of country. Probably some of these were contemporaneous. It seems probable that Ur ceased to be the capital, though it remained a very important city, and Karrak became the new capital.[1] The location of Karrak is not yet fixed with certainty,



Ruins of Hamman.

though it may be but another name for Nisin, which Prof. Hommel thinks is now to be found in the ruins of Hamman.[2]

We have the names, at present, of several kings of Karrak.[3] The names are Semitic. One of the most celebrated ones is Ismi-dagon, who built a palace at Ur. We will quote an inscription of this king, which will give us a good idea of the extent of their power, and what they claimed

1 Budge: "Babylonian Life and History," p. 41.
2 "Babylonien und Assyrien," p. 221.
3 Smith: "Assyrian Discoveries," London, 1883, p. 441.

for themselves. The reference to Niffer in the first line, seems to show that this was a holy city.[1] We must further remember that Niffer is probably the Calneh of the Bible.[2] The inscription in question reads as follows:[3]

"Ismi-Dagon, nourisher of Nipur,
The supreme over Ur, the light of Eridu,
Lord of Erech (the powerful king),
King of Karrak, King of Sumir and Accad.
The relative, the delight of Nana."

The worship of the moon was very widely extended in Chaldea. The moon god's name in Semitic was Sin. It is, perhaps, not singular that a number of kings' names should be known in which the word Sin forms a part. They need not, however, have succeeded one another. Some may have ruled at one place, some at another, and they may be separated by quite a period of time. It is necessary to speak of this because some historians speak of "Monarchs of the Sin Series."[4] There was no series of monarchs of that name, and, further, later scholars are reading these names somewhat differently.[5]

We are now down to near the beginning of the twenty-third century before Christ. Few are probably aware that the twenty-third century before the commencement of the Christian era was a period of great commotion in

5 Thus take the name of Zur-sin, who is stated by Rawlinson and Smith to have built Abu-sharein. This is wrong for Abu-sharein is old Eridu in existence long before. Smith himself later reads the name of this king Amar-agu. Hommel returns in part to the first reading, calling it Amar-sin, and assigns him to about 2400 B. C.

the world's history. It is of course impossible to give exact dates, but the movements of many different people seem to have begun at about that time, all pointing to some great break up in Western Asia. Let us examine this point. In a former chapter, we have shown that, as far as we can draw any conclusion from the scanty traditions of the Chinese, they made their appearance on the headwaters of the Hoangho, about the twenty-third century B. C., as a migrating host, forcing their way among tribes who had long been living in that country. We have also shown that they had probably been driven out of a section of country to the east and south of the Caspian sea.

But this was not the only direction of movement. People from out this same section were propelled toward the west. It was about this time that Chaldea was overrun and conquered by invading Elamites, who, probably, driven by the pressure of invasion from their own home, had to conquer for themselves a new home further to the west. In fact, the waves of these troublesome times rolled far toward the west, until they passed over all Asia Minor and finally spent their force in distant Egypt. Borne along in this western movement, were probably many Semitic people, such as the Hebrews, Phoenicians and Assyrians, who were forced from their homes in Northern Chaldea. For it was probably about this time that "Asshur went forth and founded Nineveh," and the traditions of the Hebrews indicate that it was also about this time that they went out from "Ur of Chaldea."

Let us pause a moment to inquire into the cause of these sudden and vigorous movements. What was it that broke up the numerous tribes to the east and south of the Caspian sea, and drove some to the east, others to the

west, and thus drove so many out of their old homes? A few years ago, no probable answer would have suggested itself. Now, we think we begin to understand the matter. A few words of explanation are necessary. Until within comparatively late times, it has been assumed as a matter beyond all dispute that the Aryan people are of Asiatic origin. On this point, however, a great revolution in opinion has been in progress, until at present, some of the most eminent scholars claim that the Aryans are of European origin. This is not the place to discuss this interesting question.[1] We must reserve it for another volume. Any one, however, who sets out to study this question, will discover that the whole tendency of modern research points to this conclusion. Every year sees some scholar, after careful study, coming to this conclusion. Even so eminent a scholar as Prof. Hommel, who does not accept this conclusion himself, candidly admits, that it is fast becoming a matter of scientific belief.[2]

We suggest, then, that the inciting cause of these emigrations and invasions was the appearance in Asia of a vast body of Aryan people, the forefathers of the Iranian and Indian Aryans. Gathering their forces in Southeastern Europe, to the north of the Black sea, they finally swept in a resistless torrent around the Caspian sea, and scattered before them in all directions the Turanian tribes inhabiting that country. This, we admit, is a rather bold conjecture. It will rise or fall with the theory of the European origin of the Aryans. If that stands, then this suggestion will stand; should it be rejected, then we must

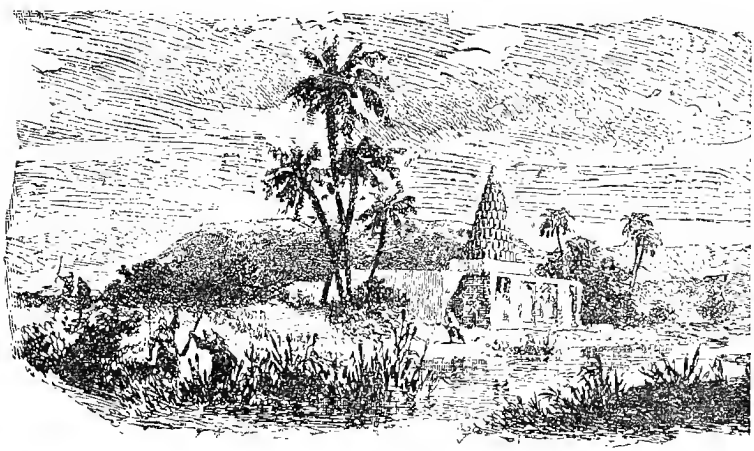
---

1 The Aryans will be fully treated in Vol. III.

2 See his review of several late books on "Die Urheimat der Indogermans" in "Archiv für Anthropologie" for 1885, Supplement, p. 167. "In der yüngsten Zeit fast zum Dogma gewordenen Satz von der Europäischen Urheimat der Indogermanen."

look elsewhere for an efficient cause for the great break up of people in Western Asia, which certainly took place about the time in question.[1]

But now, returning to the history of Chaldea, it is necessary to speak more particularly of Elam. The country known by the name of Elam lay to the north and somewhat to the east of the Persian sea. Its ancient name was Anzan. The ancient Chaldeans called it *Llamu*, that is "the highlands," from whence comes our word



Ruins of Susa.

Elam. The earliest inhabitants, of whom we know anything with certainty, were Turanian tribes, near relations of the ancient Chaldeans.[2] Elam is one of the oldest centers of Civilization known, and was for a long time a much

---

1 This date agrees remakably well with all that we know of the movements of the Aryans in Asia. As early as 2000 B. C., the Aryans were situated along the upper courses of the Ganges.

2 This is the view of a majority of scholars. See Rawlinson: "Herodotus," Vol. I., p. 532; Lenormant: "Chaldean Magic," p. 217, where he cites the concurrent opinion of Norris, Oppert and Mordtmann; Sayce: "Ancient Empires," p. 94. We see no evidence, however, of the Semites being the nobility of the land, as stated by Ragozin. Prof. Hommel, as stated above, page 401, does not fully agree with this view.

feared rival of Babylon. Though overrun by the armies of Assyria, victory ultimately rested with Elam, and under the leadership of their great king, Cyrus, the old empires in Mesopotamia were overthrown.

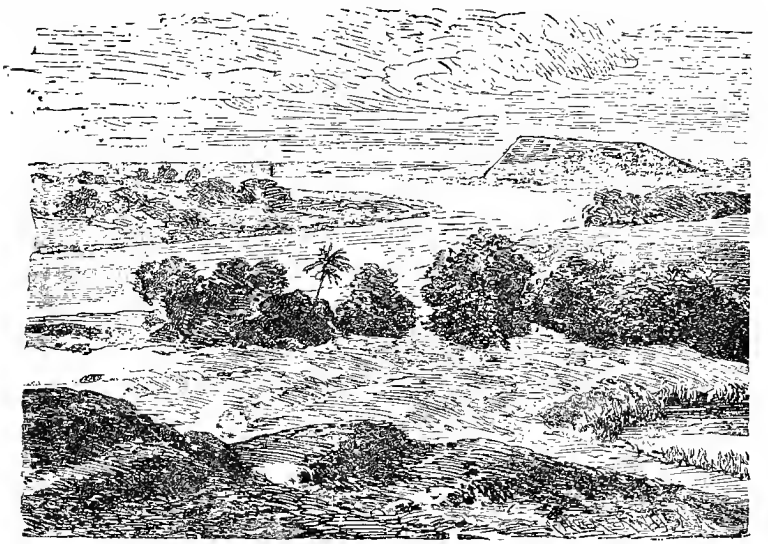
In the year 645 B. C., Assurbanipal of Assyria, in his war with Elam, took the capital city of Susa. He tells us he found in a temple an image of the goddess, Nana, which sixteen hundred and thirty-five years before, had been carried from her temple at Erech by Khudur-Nakhunte,[1] the Elamite, who at that time had overrun and conquered Lower Chaldea. This carries us back to the year 2280 B. C., as the date of the Elamite conquest. It would seem as if the Elamites made Larsa (Senkereh) their principal capital, though subject kings also ruled in some of the older cities. This Elamite supremacy probably lasted about three centuries. We can see that, not being very different from the Chaldeans ethnically, a rapid assimilation of culture would go forward as they gradually extended their conquest.

One of the later Elamite kings was Kudur-Mabug. He is of interest to us because some have supposed him to be the same as Kudur-Lagamar (Chedorlaomer) of the Bible,[2] who is represented as waging war in Palestine. On his inscriptions, he is called "the father of Palestine," so he may have claimed supremacy over that country.[3] The name of a son of the foregoing, who was made king of Larsa, is read Rim-agu.[4] One of the most important events of his reign was the conquest of Karrak. Now Karrak was probably the same as Hamman, and was but a few miles to the north of Larsa. It was of enough import-

[1] See above page 430. [2] Gen. xiv. 1.
[3] Sayce: "Fresh Light from Ancient Monuments," p. 48.
[4] Prof. Sayce reads the name Eri-agu and identifies him with Arioch of Gen. xiv. 1. See also Hommel p. 168.

ance however to serve as a date from which to reckon events. Contract tablets are still in existence dated as follows. "Month Ululu in the fifth year after Karrak was captured."[1] Karrak was one of the old capitals of Chaldea. Perhaps it had been able to maintain its independence up to the reign of Rim-agu.

We must hurry this sketch along. We have as yet said but very little about Babylon. The time is now at



Ruins of Babylon.

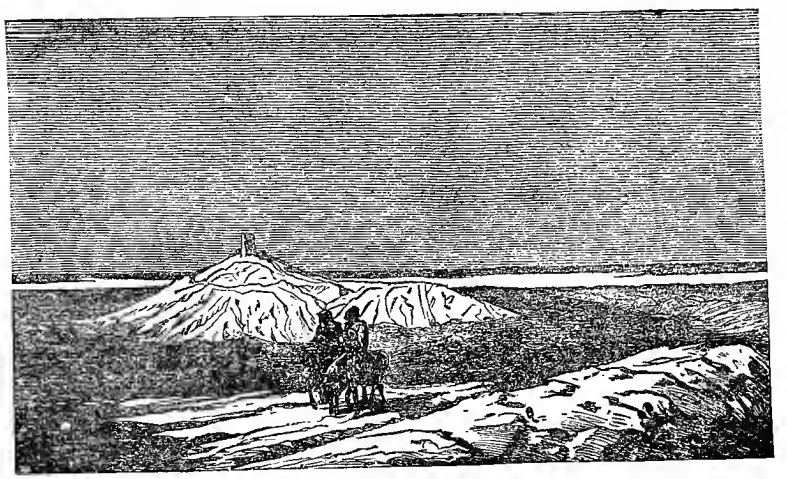
hand when this city is to take the leading place in the history of Chaldea. We have seen that as early as about 4200 B. C., Babylon is mentioned in an inscription of Uru (?)-ka-ginna. It is there called Tin-tir meaning "The Seat of Life."[2] Another name for it in early times was "Ka-din-gir-ra," meaning "The Gates of God." The name by which it has come down into history is simply a Semitic translation

1 "Records of the Past," Vol. V., p. 66.

2 Hommel: p. 229. Budge translates it. "The Wood of Life."

of the last name, Bab-ili. There is in this nothing of the meaning of "confusion."[1]

Babylon, in the earliest times, does not seem to have been a place of much importance. It seems to have been a holy place, the site of numerous temples from an early time. It, or its temples, are frequently mentioned in the so-called penitential psalms of the Babylonians, that probably date, many of them at least, from the time of the Elamite



Ruins of Bor-sippa.

conquest. The greater portion of the present ruins of Babylon are not later than the date of Nebuchadnezzar. In the ruins of Borsippa or Birs Nim-rud is to be seen the ruins of the famous temple of Sagilla which probably figures in the Hebrew traditions as the "Tower of Babel."[2]

Undoubtedly Babylon was the headquarters of an important tribe from a very early time. But no details of its early history are known. When the Elamites conquered Chaldea, Babylon probably remained under the local gov-

[1] There is in Hebrew a root *balbel* meaning "to confuse," which shows how this notion arose. Budge: "Babylonian Life and History," p. 14.

[2] Hommel: Op. cit., p. 232.

ernment of their own chiefs.[1] Mr. Sayce thinks that Amraphel, king of Shinar, spoken of in Genesis, was a Babylonian king, or chief.[2] Babylon gradually grew in strength, probably it came in time to be considered as the champion of the native Chaldean interests as opposed to the Elamites, whose head-quarters were at Larsa. At any rate, about the year 1900 B. C., we find Hammurabi, king of Babylon, engaged in conflict with Rim-agu, of Larsa for the supremacy.[3]

Victory remained with the Babylonian king. The Elamite conquest came to an end, and Babylon entered on her career of greatness. It seems that Rim-agu governed the entire country at least twenty-eight years after the conquest of Karrak.[4] This period was not altogether a peaceful one, since one notice refers to a war with people in the northern part of Chaldea. Perhaps it was when weakened by this war, that Hammurabi of Babylon took up the battle for independence. At first victory remained with Rim-agu,[5] but eventually he was defeated. With the conquest of Hammurabi, we enter on a new period in the history of Chaldea.

He has the credit of being a wise and energetic king. He not only repaired the numerous temples in his kingdom, but he built some important buildings. At the present city of Kalwadha, bronze rings have been found

---

1 We have a list of the local chiefs of Babylon going back to about 2400 B. C. The first dynasty is a Sumerian one. During their reign probably occurred the Elamite conquest. Hommel: Op. cit , p. 175.

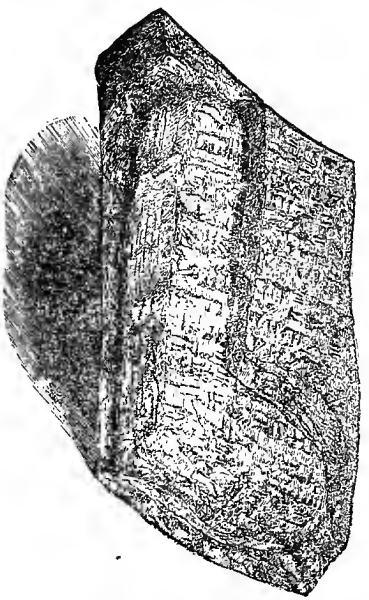
2 Gen. xiv. 1. "Fresh Light from Ancient Monuments," p. 47. This king was a local chief of Babylon and appears in the inscriptions as Amar-mubalit, the father of Hammurabi.

3 We have followed Hommel for the above date. Mr. Budge gives 2100 B. C. as the date of Hammurabi.

4 "Records of the Past," Vol. V., p. 67.

5 Ibid., p. 68.

with the inscription "Palace of Hammurabi."[1] He also dug huge canals to render the country fertile. He especially prides himself on one which he names after himself "Hammurabi, the delight of men." Under his rule, commerce seems to have revived considerably. There are now in the British Museum quite a large number of contract tablets dated in his reign. The contract, or deed of sale, was written on both sides of a piece of clay, which piece of clay, for the sake of better preservation, was placed within a clay envelope, upon which the contract and seal were again inscribed. From the dates inscribed on these contract tablets, we gather much historical information. Here at this point occurs an historical *lacunae*, which we are not as yet able to fill. We know the name of the son and successor of Hammurabi, Samsu-il-una, which is very common on dated contract tablets, but has not yet been found on any of the public monuments. These same tablets, however, speak of canals dug by this king.[2] Probably for a long time this dynasty continued to reign.[3] It is to be noticed that from the time of Hammurabi, the phrase king of "Kingi and Burbur" is exchanged for the phrase king of "Sumir and Accad." We must recall that Larsa,



Contract Tablet.

[1] Ibid., p. 75. [2] Ibid., p. 76.

[3] According to Prof. Hommel's calculation, this dynasty lasted until 1713 B. C.

the Elamite capital, is now know by the name of Senkereh, which Prof. Hommel shows, is probably the origin of the word Sumir. This shows that Larsa had then become a very important place. It gave its name to all of "Kingi" or Southern Chaldea.[1]

About seventeen hundred B. C., we find a new dynasty ruling in Babylon. A change in dynasty meant a conquest in ancient times. The conquering people, in this instance, seem to have come from the north-east. They were the Cossaens whose home seems to have been to the north of Elam. They were Turanian people, though they may have been more or less intermixed with other ethnic stocks.[2] There was probably no very great difference between them and the Chaldeans. Babylon remained the capital. The culture and religion of the Chaldeans were acceptable to the new-comers, and life doubtless went forward much as before. For a number of centuries the Cossaens remained the ruling people in Chaldea, in fact, until the Chaldean empire was subverted by the Assyrians, which happened near the beginning of the thirteenth century B. C.[3]

Of this long period of time, we, as yet, know but very little. The names of quite a number of kings are known, but, of their order in the series and their relations to each other, almost nothing is known. Certain great movements alone are visible. It was during this time that Assyria commenced to come to the front as a great and growing power. It was during this time that Egypt enacted the brilliant part of conquest in Asia. It is not unreasonable to suppose that their conquests had something to do with

1 Hommel: "Babylonien und Assyrien," p. 220.

2 Prof. Hommel classes them with the Alarodians. 3 Sayce: "Ancient Empires," p, 117. Budge: "Babylonian Life and History," p. 44.

the rise of Assyria.[1] Perhaps Chaldea felt the tramp of Egyptian armies. Finally this is the period which terminates the ancient history of Chaldea.

Before we turn to consider the culture of Chaldea, and the influence of the same on the culture of the world, let us briefly summarize this historical outline. Any one who cares to investigate this subject carefully will discover that Assyriologists, those scholars who make a specialty of cuneiform research, are very far from agreement among themselves as to the antiquity and relative location of events in Chaldea. It has only been by the expenditure of very great labor, involving the most patient painstaking care, that we have been able to recover anything of this ancient period of Chaldean history. Fifty years ago the world was ignorant of ancient Chaldea, it is not at all singular that we have had to revise some of the first formed conclusions in this matter, nor need we flatter ourselves that the outline we have laid down will remain unchanged. All we need feel sure about is that it is in accordance with present light, and that future discoveries, though they may change minor points considerably, will not, we believe, materially affect the outline as here given.

At the same time, let us hold ourselves in readiness to accept whatever conclusion future discoveries may bring to light. We are, as it were, gazing on a canvass that was once resplendent with an artist's masterpiece. But time has so faded it that we can not make out the details. With the greatest of care, we have made out here and there a part, and think we begin to understand the general plan. But as yet the larger portion is a blank, waiting the time when skillful workmen shall clean, repair

[1] Sayce: "Ancient Empires," p. 116.

and bring to light what is now unseen and unknown. As to the antiquity here disclosed, we can only say that it is accepted by a number of the foremost scholars, and is not greater than what seems demanded to account for all the circumstances of the case.[1]

In tracing the development of culture in Chaldea, we must constantly bear in mind the peculiar circumstances under which it developed. That is the two ethnic elements in the population of the country. It is difficult to decide just what is due to the Turanians and what to the Semites. Our scholars have a vast amount of work before them in this matter. Assuming, as nearly all do, that the Turanians were the first settlers in Chaldea, we have to decide first as to their culture, and then wherein it was modified by the Semites, this will give us clearer ideas of the culture of the Chaldeans, during the period of time covered by this chapter.

We have already given a brief outline of Turanian culture in Chaldea.[2] The results there obtained, briefly summed up, are as follows: In organization for government purposes, the Turanians had reached quite a high stage of development. In social organizations they were, relatively, not as far advanced. They had descent in the male line, but plain traces of the older rule of female descent are noticeable. We may perhaps doubt whether

---

[1] As in this question of antiquity, so much depends on the date of Sargon of Accad, we would advise the reader to consult Hommel: "Babylonien und Assyrien," p. 166. Budge: "Babylonian Life and History," p. 36 *et seq.* In this connection, we must recall that the important cylinder of Nabonidas, which gives us the date 3800 B. C., was not discovered until 1882. Hence it is that Smith in "Early History of Babylonia," published in 1875, places Sargon so late in time, after Rim-agu in fact. It is somewhat strange that Prof. Sayce still adheres to this view. "Ancient Empires," p. 112 *et seq.*

[2] Above page 374 *et seq.*

they had fully made this change, when the Semites appeared on the scene. The joint-family had, however, made its appearance, and this does not arise until descent has fully passed into the male line. They practiced agriculture, digging for this purpose irrigating canals. They were the inventors of the cuneiform system of writing, and had laid the foundation for a system of mathematics in which twelve and sixty are the bases of calculation, and not ten.

Statue of a Turanian Woman.

This outline has to do with the Turanian culture in general. But the particular body of people who settled in Chaldea, doubtless made further advance before the Semites arrived. It is a law of the Yellow Races that they soon reach a stationary stage of culture, beyond which they advance only by reason of contact with other people. Turanian Chaldea may have reached this stage. We have also given a brief outline of primitive Chaldean religion. It was found to be an *expose* of savage philosophy as outlined in a former chapter.[1] The begin-

[1] Above page 379.

ning only of a pantheon was mentioned. Some of the greater fetich gods were described. We have seen the sky and the earth worshiped as fetiches of great power. In their name, the priest exorcised all evil demons. It is well to take up the thread at this point, and show a somewhat later development of their religious conceptions. Zi-anna meant simply the sky as a fetich. We have evidence that, at a very early stage, the sun was regarded as the representative of this fetich.[1] But another process was at work. One of the names of Zi-anna was very appropriate, In-lilla, "Lord above." In process of time, and in full keeping with the laws of mythology,[2] In-lilla and Ana became differentiated from each other, both become gods. In an entirely analogous manner we have seen Hea derived from a title given to the fetich earth.[3] But Hea, as lord of the earth's surface, was early regarded as the god of the sea. That is in an especial sense the primal sea from whence all was derived.[4] This same conception gave birth to a number of gods and goddesses. The origin of this new religion seems to have been Eridu. Hea was the center of this pantheon, his mother was Ba'u which also meant the primal water.[5] His wife was Damkinna. His daughter was Channa or Chamma, meaning originally "fish", from whence came possibly the fish god. But the most important personage of these secondary gods was the first-born son of Hea. We have stated that one of the

---

[1] In the time of Ur-ghanna, of Sirgulla, the sun was addressed at times in the place of Zi-anna. Hommel, p. 254, note 2.

[2] See above page 336.

[3] See above page 385.

[4] See above page 386. The form I-a means simply "water-dwelling." It must have originated at a time when the earth was regarded as a dwelling, the home of animated beings, and derived from the water. Their belief was that the earth floated on the water.

[5] In Genesis i. 2, this word appears as Bohu.

names of Hea was Dugga, meaning "the good." [1] This important god whom we have just mentioned was called sometimes the son of Hea, at other times the son of "the good" or Mirri-dugga.[2] To these, we must not forget to add the goddess Ninni, who seems in a certain sense to have been the feminine personification of the primal ocean as Hea was the masculine.[3]

This pantheon had become fully established at a very early date. The very earliest kings bear names connected with this pantheon, such for instance as Ur-ghanna, Ur-ba'u, Dun-ginna, in which Dun is but another form of Ba'u. The inscriptions too of these early times are principally concerned with these gods. In the oldest phase of the Sumerian religion, Mirri-dugga and Hea play the most important parts. We have seen that all the ills of humanity were regarded as the work of evil spirits. The remedy then was to drive them away. For ordinary occasions, a magical song or incantation was sufficient. Here is the incantation said over a fever-stricken patient:

"Painful fever, violent fever,
The fever which never leaves man,
Unremitting fever,
The lingering fever, malignant fever,
Spirit of the heavens, conjure it!
Spirit of the earth, conjure it!"

The Shamans had such magical formulae for almost every conceivable case. But here we learn the important *role* played by Hea and his son Mirri-dugga. Hea was the good god, the one who knew all things, in his wis-

---

[1] See above page 651.

[2] We here follow Hommel, p. 255. Lenormant reads this name Silik-mulu-dug. "Chaldean Magic," p. 19, note 1.

[3] Hommel: "Babylonien und Assyrien," p. 256.

dom he knew just what steps to take to put to flight the most powerful demons. His secret name, which he never divulged except to his son, possessed enough virtue for this purpose. But this good and beneficent god could not be approached directly by the priests. Here comes in the good offices of his son Mirri-dugga. He was the mediator between God and man, when the sick persons had submitted to all the purifying processes known, but without avail, then was Mirri-dugga besought to help him, and such appeals were seldom in vain. Let us quote the following tablet of such a cure:

"Mirri-dugga has seen his misery.
He has entered the house of his father Hea and said:
'My father, the disease of the head came from the under world.'
And he spoke to him the second time,
'What shall this man do, he knows not wherewith he may be healed?"
Then answered Hea his son Mirri-dugga.
'Go, my son, take a vessel and put therein a quantity of water from the mouth of the stream.
Impart to this water thy pure, magic virtue,
And sprinkle therewith this man, the son of his god."[1]

But more interesting is it to learn of their mythology. These people, as we have seen true of all races in a certain stage of development, sought to give an explanation to the mysteries of life. Some of these mythical stories probably go back to a most profound antiquity, perhaps to a time when the Yellow Races had not left their common homeland in the Altai mountain regions.[2] But undoubt-

[1] We have translated Prof. Hommel's German translation in "Babylonien und Assyrien," p. 355. Compare with translation in "Chaldean Magic," p. 22. [2] See above page 360.

edly this mythology grew with their pantheon. It is difficult to decide just how much of it is due to the Semites, and how much to the Turanians. At present it is sufficient to say that they undoubtedly had long stories to tell of the creation, the fall of man, the confusion of tongues, and the flood. We will return to this subject again.

Amongst these highly developed Turanian tribes, the Semites appeared at an extremely early date, as an invading people. They were nomads, who then lived doubtless much the same life as the nomadic Arabs of to-day. They overflowed the central table land of Arabia, and, passing to the north, finally effected a lodgment in Northern Chaldea, from whence they gradually extended their influence to the south, until after many centuries of contact, the whole country became Semitised. We have to briefly consider the Semitic character in general, and the probable advance they had made when they entered Chaldea, which, at the lowest estimate we can allow, must have been as early as 4500 B. C.

Speaking of the Arabs, Duncker remarks as follows: "The life of the roving tribes in the interior whom the Arabs denote by the general name of Bedawi,[1] *i. e.* "Sons of the Desert," has undergone few changes; at the present day but slight deviations have been made from the customs and conditions of the ancient time."[2] Elsewhere he remarks that the general features of this life have remained "unchanged for thousands of years." It is quite probable that they are living much the same life and are much the same people as the Semites in general before the separation of the northern branch.[3]

---

[1] Bedouins.

[2] "History of Antiquity," London, 1877, Vol. I., p. 102.

[3] Tiele: "History of Religion," p. 62.

If we now turn to the Bedouin tribes of the desert, we will probably have before us a picture not greatly exaggerated of the primitive Semites. On many points, they are, of course, far in advance, but as regards their manner of life in general, as well as their mental characteristics, it is equally certain they are capable of assisting us to form right ideas of the life and character of the Semitic people, at that far away time, before the great northern migration commenced. Every one has read more or less about the nomadic tribes of the Arabian desert, and of their strange combinations of good and bad qualities, which show themselves in both mental and moral directions.

Living in a healthy climate and passing most of the time in the open air, it is not singular that the Arabs are fine specimens of physical manhood.[1] Their size is about the average of men in general, their figure robust and elegant.[2] They are capable of prolonged exertion. Their intellectual faculties are good, we must never forget that from them came the wonderful Civilization of the Saracenic Empire, but, in common with all Semitic people, there is "poverty of thought, with sharp observation of details, an understanding of the calculating kind, always directed to the practical, thus the imagination is held in subjection, and the flight of fancy in unknown regions is restricted."[3] This quality, therefore, renders them not fitted for original research, though capable of carrying to practical ends the investigations of others.

They are very good examples of a people in a tribal state of society. The several tribal divisions, with almost

---

1 Palgrave calls them "one of the noblest races of earth." "Travels, etc.," Vol. I., p. 24.

2 Clark: "Arabs and Turks," Boston, 1876, p. 31.

3 Hommel: "Babylonien und Assyrien," p. 262.

perfect individual freedom, are fully developed. They have various orders of chiefs, but the power they possess is very limited. The poorest member of a tribe regards himself as the equal of the chief. As to their moral qualities, we are given accounts which do not agree. The explanation

The Architect.

is probably not difficult to find. The Arab is still in that state of society in which all who are not bound to him by tribal ties have no rights he is bound to respect. Towards strangers, he may act with great cruelty, he may even rob or murder with complacency, but within his tribe his actions are regulated by another standard alto-

gether. "Outside of his tribe, the true Arab has little conception of any moral duty or relation whatever, except as the result of a voluntary compact. But within that narrow circle his conduct was often governed by a high and delicate moral sense."[1]

In matters of religion, we find much of interest. The Arabs, and the Semitic people in general, are no exception to the general law of religious development we have already pointed out. We need not go over the ground again. Monotheism, or the belief in one God, was no more instinctive with the Semites than with any other people.[2] In the case of the Arabs, this religious development was affected by local circumstances which we will try to point out. They seem to have started with Ancestor worship[3] and Fetichism. We read that they worshiped "trees, stones and mountains, which were regarded as occupied by souls."[4] Some of the greater fetich gods made their appearance. Fire was an object of worship among them, if we may judge of the reverence shown to it on many occasions.[5] The worship of the sun seems to have been very ancient, the names of the sun god, Illa and Shamash, occur among all the Semitic people.[6] So of the moon. The light moon was worshiped as Allat, the dark moon, as Manat; or the two united, as Al-Uzza.[7]

---

[1] Clark: "Arabs and Turks," p. 34.

[2] On this point, see Goldziher: "Mythology Among the Hebrews," p. 260.

[3] Plain traces of Ancestor worship still exist among them. Palgrave says: "Sacrifices in which sheep or camels are devoutly slaughtered at the tombs of their dead kinsmen are of frequent occurrence." Their dead, they think, are not only pleased with but require "sacrifices at their tombs, and the blood there shed nourishes and satiates them." "Travels, etc.," Vol. I., p. 10 and 33.

[4] Tiele: "History of Religion," p. 63.

[5] Crichton: "History of Arabia," New York, 1855, p. 189.

[6] Tiele, Op. cit., p. 63. [7] Ibid., p. 64.

It has been shown several times in this volume that tribes in the nomadic state assign the highest importance to the personified night sky. "In their journeys and expeditions with caravans or for plunder," says Sprenger of the Arabs, "they generally traveled during the night. When one rides on a camel at a slow pace through the monotonous desert, the nights seem very long. But the heart is filled with quiet delight by the stillness of the night and the enjoyment of the fresh air, and the eye involuntarily looks upwards. Hence we find even in the Koran and in the poetry of the Bedawi frequent allusions to the starry heaven and its motion."[1] It is then no wonder that religion among the primitive Semites took the form of Sabeism, worship of the "hosts of heaven." The stars generally were regarded as fetiches. Some became of more importance than the others. Nearly all the constellations in the Zodiac were thus singled out.[2] The Pleiades and the planets were especially objects of veneration. Astronomy, however, was very rudimentary among them, the worship paid being scarcely more than Fetichism.[3]

We have, in a former chapter, pointed out that in some cases Ancestor worship might lead to Monotheism.[4] It certainly remains true that the political institutions of partially developed people greatly modify their ideas in this matter.[5] Let us see how this applies among the Arabs. A recent writer, speaking of their religion before the age of Mohammed, says: "With some vague notion of one supreme god, their worship was chiefly paid to a multitude of sub-

1 From Golziher, Op. cit., p. 56.

4 Above page 383.

5 Goldziher: "Mythology Among the Hebrews," p. 264.

ordinate deities, called *Djinn* or genii, of which each tribe, and family had its own."[1] This is a direct result of Ancestor worship, the gods peculiar to each family and tribe and division of tribe, are nothing more nor less than the results of worship, once paid to deceased chiefs.[2] To this let us add that tribal life is, at least theoretically, well developed; the several divisions of the tribe recognize, at least nominally, the authority of the tribal chief. The tendency is, then, for each tribe to have a tribal god. Further still, the influence of the old customs would show itself whenever a number of tribes coalesced so as to form a nation. Over all of the subordinate tribal gods, there would be ranged a supreme god. The difference between the development of Monotheism amongst Semitic people and surrounding people is largely to be found in this. The Semitic people approached Monotheism through Ancestor worship, the surrounding people approached it through the stage of polytheistic nature worship.[3]

When in the course of time, migrations carried more or less united tribes, more and more to the north and east, and they commenced impinging on the more highly cultured Turanian tribes of Mesopotamia, we can quite readily picture the probable course of events. With their superior energy, greater mental endowment and greater capacity of endurance, the Semites would surely though gradually gain the supremacy. To this we must add the further fact, al-

---

[1] Crichton, Op, cit., p. 35.

[2] Palgrave tells us that he never met a Bedouin who had any idea of the spiritual nature of God. He was for them simply a powerful chief. "Travels etc." Vol. I., p. 33.

[3] It need not surprise us that the Semites did not develop a rich polytheistic system. We need but recall what was said above, as to the mental traits of Semitic people. It requires differently constitued people for this work.

ready pointed out, that Turnian people seem to be very susceptible to culture influences from other races. They speedily became Aryanized or Semitized as the case may have been.[1] So in the course of time, all Mesopotamia, partially as the result of conquest and partially by virtue of the fact just pointed out, became Semitized. This result was reached at an early day in Northern Chaldea, but was not apparently completed in Southern Chaldea till about the time of Hammurabi. In this section of country, the Turanian influence was very strong.

Now, no two people thus coalesce without the resulting culture showing plain traces of this mixture. The law of the survival of the fittest here comes into play. The old, perhaps already stagnant culture of the Turanians, sprung into new life, when it became the possession of a Semitic people, and at the same time, was modified by the former Semitic culture. This result is to be seen in several different directions. In social organization the more completely developed state of tribal society among the Semities would cause every department of government to become more strongly marked off, but would retain largely the organization already effected by the Turanians. Hence the fact that the titles of many officials are derived from Turanian words.[2] A new energy was imparted to all the departments of government, and now first arose what might be called kingdoms. The whole country was generally, nominally at least, under the rule of one tribe; now it was Accad in the North, now Ur, Karrak or Larsa in the South; finally Babylon, which was made the capital.

In arts and sciences, the Semites had but little to impart to the Turanians. In one direction only were they

[1] Above page 388.

[2] Above page 375. Lenormant: "Chaldean Magic," p. 354.

capable of imparting information. That was in the field of astronomy. To their former fetichistic worship of the stars, and practical knowledge they had gained as to their movements, names, etc., was now added notions of magical influence from the Turanians and the result was the science of astronomy; or, as it was in its first stage, of astrology, which seems to have been practiced in Chaldea, only as Semitic influence was extended.[1] The Semites adopted the cuneiform system of writing, and along with it the literature of the Babylonians. In other branches of knowledge the new culture was the result of a mixture from both sources.[2]

It is not at all singular when we reflect on the new energy and blood imparted to the old Turanian culture, that we should detect what might be called a revival of learning springing up in the wake of Semitic occupations. It seems from all the evidence attainable that from the age of Ur-ba'u of Ur to Hammurabi was a period of great literary activity. Each city that rose to the dignity of a royal city had what might be called royal libraries, and these were evidently well supplied with books, which were nothing but clay tablets. The subject matter of these books were the old mythical stories and legends, vast collections of magical formulae and astrological tablets, long poems of the creation and deluge, descriptions of the underworld, and collections of the folk-lore stories in which occur numerous fables of speaking animals.[3]

Probably in the field of religious culture this mixture

---

1 This view is different from that sometimes stated. See Budge: "Babylonian Life and History," p. 106. But see also Lenormant: "Chaldean Magic," p. 364, also Bertien, in J. R. A. S. for 1886. p. 410.

2 "Chaldean Magic," p. 329.

3 Smith: "Chaldean Genesis," p. 23 *et seq.*

of the two people is most noticable, and here is where it suddenly becomes to us of great interest, since among these Semitic people were probably the ancestors of the Hebrews.[1] The simple system of Semitic religion (that is Ancestor worship, Fetichism, which paid especial attention to the heavenly bodies, and a vague conception of Monotheism) was suddenly brought in contact with the religion of Chaldea. The result was that they adopted this religion almost entirely, though in some important respects it was modified by Semitic thought. We must examine this point more in detail.

The belief in magic and sorcery, and the potency of invisible spirits everywhere swarming about them was common to both, since it is a necessary consequence of Ancestor worship. The Semite may not have reduced this belief to a system, as the Turanian had, but they believed in it just the same. To this day the Arab, though nominally a Mohammedan, and says his prayers with his face turned toward Mecca, bows to the right and to the left to propitiate the spirits he believes to be everywhere about him. It is not strange, then, that they at once accepted all the Turanians had to say on this subject; nay more, that they treasured up the numerous incantations as a most valuable inheritence. The language in which they were written became a sacred language, and the words used were regarded as inspired. Copies were made only with the greatest of care.[2]

In the main, they had also accepted the Turanian Polytheism, though changes are noticable. In some cases, they adopted the name and culture of a god with almost

1 This point will be discussed further on.

2 Any mistake in pronouncing these magical formulae would render them useless, hence the extreme care. Sayce "Assyria," p. 67.

no change. This was the case with the god Hea, more so in this instance than in any other, since he and his wife kept their old Accadian names in the new religion. In some cases, the names were but slightly changed. The Turanian Ana re-appears as the Semitic Anu, but here comes in a principle in Semitic religion, each god must have a goddess, and so as companion for Anu we have the goddess Anat, not known in the earlier period. In other cases, the old Chaldean god was replaced by a Semitic one entirely analogous. Shamas, the sun god of the Semites, taking the place of Ud, or Babbar, Sin the moon-god, the place of Uru-ki. Some times, again, the old gods are replaced by Semitic ones, not the exact analogous, but similar to them. Thus the Semites worshiped the planet Venus as Ishtar. She drove out the old goddess Ninni. Even the old favorite Mirri-dugga was gradually replaced by Merodach, a local solar god of Babylon.

A portion of the old pantheon, the numerous water-gods as set forth a few pages back, is lost to sight, such as remained, together with the new Semitic gods are recast in a new and more philosophical system. In the first place, the monotheistic tendency was satisfied by placing Shamas, the sun god, at the head. He was addressed as Bel or Baal, meaning the supreme lord, and worshiped under various forms. It would be tedious and unnecessary to extend this part, we give in a note some further remarks concerning the twelve greater gods of the new pantheon.[1]

1 The twelve greater gods of the new pantheon are the following: Anu, Hea and Bel; gods respectively of the heaven, surface of the earth and the under-world. [The Bel here mentioned must not be confounded with Bel or Baal, the title of the sun god.] The next are Sin, Shamash, [who was indeed the most important of all] and Raman; gods of the moon, sun and atmosphere. Then we come to the planetary gods, this

In another direction, it is supposed that Semitic influence worked for good. Believing with the Chaldeans that all evils were the work of spirits, they had advanced to the further thought that the gods were abundantly able and willing to protect them from these evils, consequently whenever sickness or other trouble came upon them, it must be because they had sinned. There was then but one course to pursue; to confess his sins, declare his good intentions, and seek reconciliation with his god. This was certainly an advance over the older conceptions. In the first stage, morality was not a part of religion. Here we find morality and religion approaching each other.

So, when in distress, through a calamity or any other cause, the Babylonian would fain ask himself such questions as these: "Have I estranged father and son, brother and brother, or friend and friend? Have I not freed the captive, released the bound, and delivered him who was confined in prison? Have I resisted my god, or despised my goddess? Have I taken territory not my own, or entered with wrong motives the house of my fellows?"[1] With many similar questions he sought to know the reason of his sufferings. He enumerated every relation and circumstance of life. "He besought the forgiveness of the gods and prayed with sobs and tears for reconciliation with them."[2]

Sometimes this longing found expression in beautiful penitential psalms. Let us quote one, which was written

---

arrangement being probably true only of a late period. Nindar, Merodach, Nergal and Nebo, or Nabu; gods of Saturn, Jupiter, Mars and Mercury. The goddess Ishtar, a very famous goddess, was god of the planet Venus

[1] Budge: "Babylonian Life and History," p. 14.

[2] Delitzsch, from Hommel: "Babylonien und Assyrien," p. 264.

before the use of the Turanian language had entirely died out:[1]

"My lord in the wrath of his heart has punished me.
God in the strength of his heart has overpowered me.
I lay on the ground and no man extended the hand.
In tears I dissolved myself, and none my palms took.
I cried aloud; there was none that would hear me.
The feet of my goddess I embraced.
To my god, who knew, though I knew not, I made supplication.
To my goddess, who knew I made supplication.
How long, O my god?
How long, O my goddess?
O my god, seven times seven are my transgressions, my transgressions are before me.
My transgressions are before me, may thy judgment give me life."[2]

The union of morality with religion had not gone to the extent of enabling the Semites to form the conception of a life beyond the grave, which was to be a recompense for the life led here. On this point they could teach the Chaldeans nothing. All they believed in was of a shadowy existence in a shadowy land, which they called *Shu-alu*, the origin of the Hebrew *Sheol*.[3] This is not singular, since the Semitic tribes of the desert are not at all given to speculations.[4] They had not developed a rich mythological system. Therefore it is not at all singular that they should have adopted the mythology of

---

[1] Sayce: "Records of the Past," Vol. VII., p. 151.

[2] Budge, Op. cit., p. 149.

[3] Hommel, Op. cit., p. 265.

[4] On this point, see interesting remarks by Palgrave, "Travels, etc.," Vol. I., p. 68-9.

the Chaldeans, to which we must now make a brief reference.

It seems that at a very early date there were extant in Chaldea long poems on the creation of the world and kindred topics. These doubtless existed as oral traditions long before they were reduced to writing.[1] Some of the scenes depicted on the cylinder seals of the very earliest times are now known to refer to these subjects.[2] When the great revival of learning took place, of which we spoke some pages back, these numerous poems were reduced to writing, Many copies of them were made and they formed a large part of the literature in the various royal libraries. We have recovered almost nothing of this literature. It is to be hoped that at least a portion of it may yet be discovered in the mounds of ruins which dot the plains of Chaldea, in many cases all that remain of once prosperous cities.

Asurbanipal, king of Assyria in the seventh century B. C., took great pains to build up the royal library of Nineveh. For this purpose, his agents made thorough search in the yet existing libraries of Chaldea for copies of those ancient "books," for so we may call them, of which the leaves were clay tablets. Such tablets were copied for Assurbanipal's library. In the ruins of this library building, discovered by Layard, were found thousands of fragments of these tablets. These have been most laboriously compared and pieced together, and thus we have at least the outlines of some of these grand old poems. We may hope that some day more perfect copies will be obtained and that we may fill out the details.

---

[1] Smith: "Chaldean Genesis," p. 29.

[2] See above cuts, page 654-5. Reference is there made to what are are known as the Izdubar legends.

But as it is, most important and interesting results have been obtained. It must be remembered that the Assyrian tablets claim to be copies of older Babylonian tablets, and further, in one or two instances, we have actually found the older tablets from which they were copied.[1] There can be little doubt that the various poems and stories were cast in the forms in which they now exist, at least as early as 2000 B. C. There is, further, no reason to doubt that, in their origin, these stories go back very much further in time. We have no reason to suspect they are of Semitic origin, or even that Semitic influence greatly modified the original accounts. They are poems and stories of Turanian Chaldea which the Semites received along with so many other elements of Turanian culture.

There were three slightly different versions of the Creation. The one, of which we have perhaps the fullest account, consisted of several tablets, none of them exist entire, and even of the best we have but few fragments. As the account of the Creation as given in Genesis bears a great likeness to the account set forth in these tablets; we will spend some time with them. It is, indeed, interesting thus to find such an early copy of the Creation-poem, of which the writer of Genesis saw fit to retain at least the outlines. It seems to us that one of the strongest arguments that the writer of Genesis was in some way assisted in his work by Divine guidance lies in the fact that he rejected so many details, set forth in the Babylonian account. What he has compiled for us is a brief account from an old poem, one of the very oldest in the world, from which we draw the conclusion that God created all

[1] Smith: "Chaldean Genesis," p. 29-33.

things. All hail the day when we will cease to draw any scientific conclusions from this account, or insist on giving any literal meaning to the words.[1]

The first tablet begins as follows: "When above were not raised the heavens; and below on the earth a plant had not grown up; the abyss also had not broken open their boundaries; the chaos (or water) Tiamit (the sea) was the producing mother of the whole of them." "These waters at the beginning were ordained, but a tree had not grown, a flower had not unfolded. When the gods had not sprung up, any one of them; a plant had not grown, and order did not exist." The tablet then goes on to tell of the creation of the gods. We must notice how much simpler is the condensed account given in Genesis: "In the beginning God created the heaven and the earth. And the earth was waste and void; and darkness was upon the face of the deep." The tablet we notice speaks of the sea water as Tiamit. In the original Hebrew, in the verse just quoted, "the deep" is T'hom.[2] We see we have here not only an exact agreement in sense but even the same word is used.

Of the second, third, and fourth tablets, we have at present only a few small fragments, as far as we can judge they seem to refer to the creation of a firmament, and of land. The fifth tablet is a valuable one. We have made out the following, from the fragments we have. "It was delightful all that was fixed by the great gods. Stars, their appearance (in figure) of animals he arranged to fix the year through the observation of their constellations,

---

1 This account is mainly drawn from Smith: "Chaldean Genesis," London, 1876. Prof. Sayce in "Fresh Light, etc.," 1885, gives another version, but no changes of importance occur.

2 See also Budge: "Babylonian Life and History," p. 142.

twelve months (or signs) of stars in three rows he arranged, from the day when the year commences unto its close." "He marked the positions of the planets to shine in their course, that they may not do injury, and may not trouble any one..... And he opened the great gates in the darkness shrouded, the fastenings were strong on the left and right. In its mass (the lower Chaos) he made a boiling, the moon he caused to rise out, the night he over shadowed, to fix it also for the light of the night, until the shining of the day, that the month might not be broken, and in its amount be regular. At the beginning of the month, at the rising of the night, his horns are breaking through to shine on the heaven. On the seventh day to a circle he begins to swell, and stretch toward the dawn further .... When the god Shamas (the sun) in the horizon of heaven, in the east,..... formed beautifully and ... to the orbit Shamas was perfected... the dawn Shamas should change....."

The fifth tablet was as we see taken up with the creation of the sun, the moon, and stars. We notice some astrological references to the influence of the stars and planets. In true barbarian style, the moon is represented as of more importance than the sun. The gradual growth of the moon is noticed. The fragment becomes too broken to read when we come to the creation of the sun. We must compare this account with the greatly condensed account in the Bible. "Let there be lights in the firmament of the heaven to divide the day from the night; and let them be for signs and for seasons, and for days and years ... And God made the two great lights, the greater light to rule the day, and the lesser light to rule the night."

We have two fragments which probably belonged to the seventh tablet. They seem to refer to the creation of

animals, and possibly to the creation of man. It will be noticed that, at the end, two very important creatures, before whom the animals had to go, are mentioned. The inscription with many breaks reads as follows: "Were delightful the strong monsters .... they caused to be living creatures .. cattle and creeping things of the city they fixed .... the assembly of the creeping things, the whole which were created ... which in the assembly of my family ... and the god Hea (the lord of noble face) caused to be two ... The assembly of the creeping things he caused to go." Here unfortunately the tablet stops. Still the parallelism between this and Genesis will be noticed. The account in Genesis being much the more simple of the two.

Ancient Cylinder.

Mr. Smith supposed he had discovered in the fragments of this royal library an outline account of the fall of man. That, however has been called in question.[1] So we cannot certainly say that the Chaldeans had this legend. The subject of a very ancient cylinder is by some supposed to refer to the temptation in the Garden, perhaps however this is a forced interpretation.[2] Prof. Sayce thinks that this series of tablets ended with an account of the institution of the Sabbath. At all events, this was an institution among the Chaldeans. It was called "a day of completion of labor." It was enacted that on that day "flesh cooked on the fire may not be eaten, the clothing of the body may not be put on, a sacrifice may not be offered, the king may not ride in his chariot, nor speak in

[1] Sayce: "Fresh Light, etc." p. 25.

[2] See "Art in Chaldea and Assyria," p. 95, note 2.

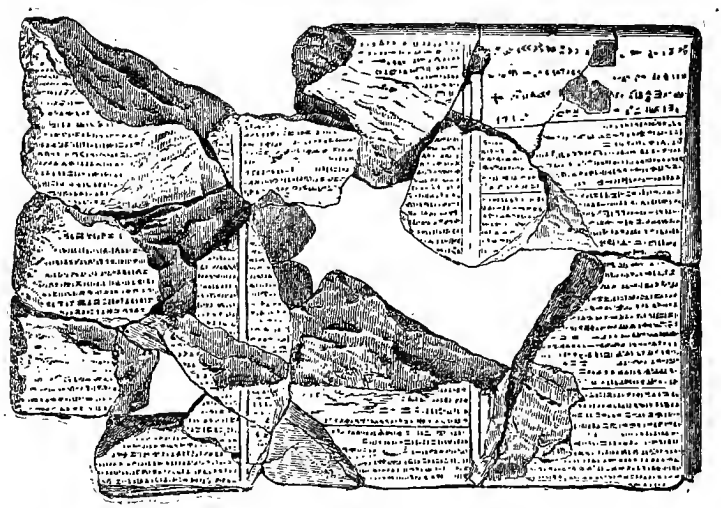
public."[1] A few words as to this account in general. No one conversant with the facts, seriously doubts that the account in Genesis was drawn from the same original as this. As Prof. Sayce remarks: "Even the very wording and phrases of Genesis occur in it." Both accounts are, beyond a doubt, drawn from ancient Turanian sources. But we must equally notice how the account in Genesis has been purified from Polytheistic coloring, and made to conform to Monotheism. It will be observed further that each tablet corresponds to some day's work in Genesis. Possibly this arrangement in tablets suggested the idea of days or divisions of time to the author of Genesis. One point more let us notice. It was long ago pointed out by Sir Henry Rawlinson that the Babylonians believed in two principal races; the Adamu, or Brown race, and the Sarku, or light race. These probably referred to the swarthy Turanians, and the lighter Semitic people. From numerous inscriptions we know that the Adamu were considered as the first created men, and as being under the especial care of the gods. A fragment reads: "May he be established, and may his will not fail in the mouth of the dark race which his hand has made." After the Semitic conquest, the Semites naturally gave themselves the honor of being the first created men, and so the phrase "Adamites" came to mean the white race of Semitic descent.[2]

We have scarcely made a beginning in this interesting field of Chaldean literature, but we must desist. In

[1] Sayce: Op. cit.

[2] Sayce: "Fresh Light, etc.," p. 27. Let us pause to observe how sadly the cause of Biblical interpretation has been hindered by an effort to read into the beautiful poetical language of Genesis a literal meaning. We all ought to be glad to see this burden lifted off of its pages. Once more the truth is taught us, that the mission of the Bible is infinitely higher than to teach us the petty details of science. Let us not strain the poetry of the Orient above what it will bear.

the long poems of the conflict of Mirri-dugga and the dragon Tiamit, the journey of Ishtar to the under-ground world to claim her husband and the Izdubar legends, we would find the original of much of the mythology and poetry of the Greeks. The Izdubar legends was a mythical poem on the year. Izdubar is a solar hero, who performs a succession of feats. It was divided into twelve tablets, one for each month. It becomes of very great interest to us since the eleventh tablet of the series, cor-



Deluge Tablet.

responding to the rainy month of the Chaldean year, gives a quite complete copy of an early form of the flood-poem. The correspondence between this cuneiform account and the Genesis account is very striking. The difference is one of detail only.

With very great care, all fragments of this important poem have been pieced together. The preceding cut gives us an idea of the work involved. We are to make the same remarks on this legend as on the others. It is a part of an ancient poem, retained by the author of Genesis, but

freed from all traces of Polytheism and teaches the power and omnipotence of God. We regret that want of space prevents our tracing out the close parallelism that exists between these two accounts. The Izdubar legends belong to the very oldest periods of Chaldean antiquity. Prof. Sayce and others think that Izdubar is the Nimrod of the Bible.

We must now take our leave of ancient Chaldæa. It is indeed a most interesting country. The period of which we have treated is one that has only been recovered by the exertions of modern scholars. A few years ago, all was darkness where now we have considerable historical light. Let us hope that much greater results will reward the labors of our present explorers. We find in Chaldea the place of contact between the Semites and the Turanians. We have seen the country remain finally in the hands of the Semites. But the resulting culture is a mixture of the culture of the two people. We have paid especial attention to the religious culture, since in this direction the Turanians exerted perhaps their greatest influence, one which still makes itself felt. We will now turn our attention to other branches of the Semites, as they continued their further migrations in Asia Minor, carrying with them in all their wanderings this new culture, the origin and development of which we have now considered.

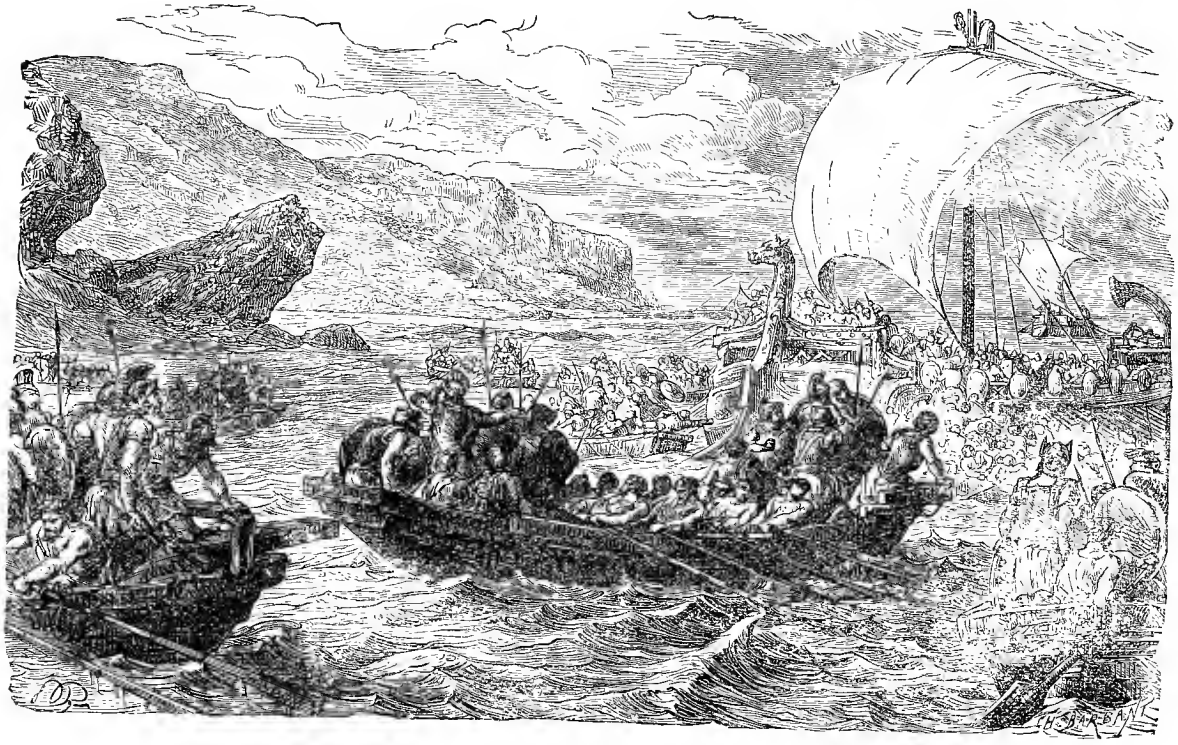
# CHAPTER X.

## THE SEMITES.—Continued.

INTRODUCTION—The Syrians—The Egpptians and the Syrians—Syrian Culture—Syrian Religion—The Phoenicians—Date of Phoenician Migration—Phoenician Cities—Phoenician Art—Phoenician Commerce—Phoenician Influence on Civilization—Phoenician Colonies—The Canaanites—Ethnology of the Canaanites—Canaanite Culture—El—Baal—Ashtoreth—Ashera—Sacrifice among the Canaanites—The Hebrews—Their Divisions—Chemosh Worship—The Israelites—Peculiar Relations of the Israelites—Outline of Israelite History—The Egyptian Period—Their Final Settlement in Palestine—Their Union with the Canaanites—Outline of Israelite Religion—The Popular Belief—Not different from that of the surrounding People—Rise of Judaism—Conclusions.

STUDENT of culture, when he takes a mental survey of the past, can trace the course of some people steadily forward in the career of Civilization until their sad decline commences. Of no people is this remark truer than of the several branches of the Northern Semitic people.

Thanks to the labors of scholars in many departments, we can conceive their condition as they move out of the Arabian desert; a nomadic people, in many respects like the nomadic Arabs of to-day; with strongly developed ideas of tribal life, which exert a great influence on all branches of their culture, including even their religion. We can follow these several people as they come in contact with the culture of the Turanian people surrounding them; see them absorbing that culture, ex-



PHŒNICIAN SHIPS.

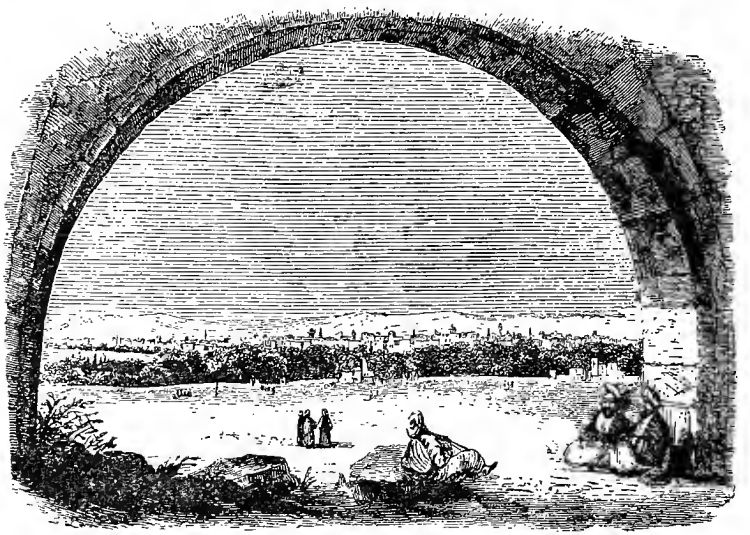
tending and developing it, until they assume the commanding position in the Ancient World. From this position they are driven only by the superior energy of the Aryan people.

We have traced, in the preceding chapter, the contact of a Semitic and Turanian people in Chaldea. We have seen this extending over some centuries of time, ending finally in the triumph of the Semites, but have also noticed that the resulting culture was largely a mixture of the culture of the two people. But while all this was in progress in Chaldea, other movements were going forward amongst other branches of this people. We are not yet able to say when the Syrians commenced to move into the country afterward known as Syria. From linguistic considerations, we judge them to be one of the first to leave, and this migration probably took place before much of any contact between the other members of the northern branch and Turanian Chaldea.[1]

Still we are not able to say when this was. The Syrians called themselves, in ancient times, Arameans. The country they took possession of was, taken all in all, a fertile one, and some portions, as for instance the plain of Damascus, very rich. Probably in very early times, the Arameans extended over a larger section. The name given in very ancient times to Mesopotamia was Aram-Naha-rain, *i. e.* "Aram of the rivers." When the Syrians commenced their movements into this section, the country was probably in the possession of the Hittites. In all probability, the course of events in this section was not essentially different from what it was in Chaldea, save that the Hittites were not as cultured a people as the Accadians.

[1] Sayce: "Science of Language," Vol. II., p. 167. Schrader, Z. D. M. G. for 1873, p. 423.

But of all this conflict, we have no details whatever. We know that after the expulsion of the Hittites, and when the Egyptians entered on their career of conquest, they found Syrian tribes in firm possession of the country, and, further, they seemed to be second only to the Hittites in importance. The Egyptian name of Syria was *Rutennu.* Thothmes I. invaded Syria, but his greater son, Thoth-



View of Damascus
[*From a Tomb.*]

mes III., made expedition after expedition throughout that country. All the great conquering Pharaohs mention the Rutennu. The point to be noticed at present is that at as early a time as the sixteenth century B.C., the Aramean tribes were in firm possession of the country afterward called Syria. There was no strong, well-developed government, but numerous petty, independent tribes divided the country between them.

Furthermore, they had arrived at a settled mode of life, and had made considerable progress toward Civiliza-

tion. Thothmes III. levied on them as tribute "a great quantity of grain, corn, barley, incense, fresh dates, wine, fruit," all the agreeable things of the country.[1] The Pharaohs failed, however, to secure any lasting supremacy over the Rutennu. Our next source of information is the historical books of the Bible. We notice that concentration of government has gone forward. In the time of David we find several petty principalities in Syria. In the northern part, extending quite to the Euphrates, was Zobah.[2] Hamath seems to have been the capital.[3] Ancient Palmyra (Tadmour) seems to have been situated in this province.[4] Damascus was at the head of another important principality.[5] Of still smaller provinces we will mention Maachah[6] and Rehob,[7] both to the south-west of Damascus.[8]

In the process of time, Damascus became the recognized head of the Syrian power, and, under the rule of the Hadads, it was the most influential kingdom of Western Asia. The kingdoms of Israel and Judah more than once felt the weight of their oppression. But the end was near. About the middle of the eighth century B. C., Damascus was overrun by the Assyrians, and became simply a province of that great empire.

It is very difficult to decide what part the Syrians took in the work of advancing Civilization. From the position of their country, we see they held the great trade routes from Chaldea to the West. It is therefore not at all singular that we detect a brisk trade with Babylon.[9] Now trade

---

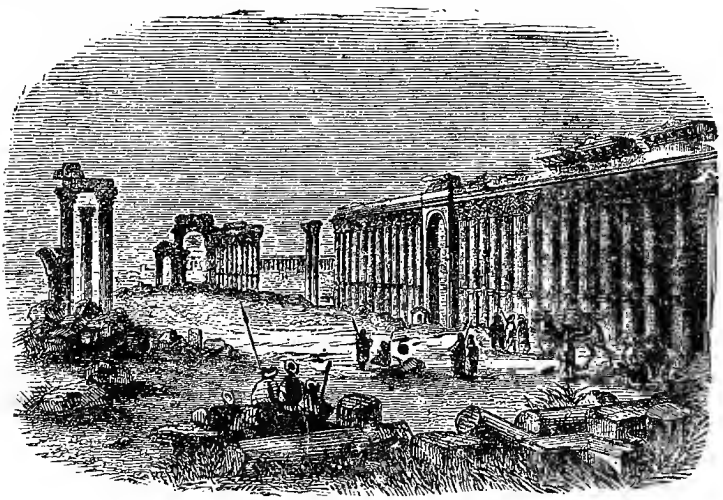
or commerce is one of the foremost agents in advancing Civilization, and, in this direction, we have no doubt the Syrians took a leading part. In matters of religion, it is almost impossible to speak with certainty. It is not to be expected that there was any great differenee between them and the other Semitic people. We know that at Damascus Raman,[1] was worshiped as chief god. We must observe further that they seem to have understood the nature of



Ruins of Palmyra.

prophecy, doubtless there was in their population people claiming to possess prophetic power.[2]

Brief and unsatisfactory as is the foregoing, it is about all of importance that can be gathered of the Syrians. Turning now to the western branch of the Northern Semites, let us consider the Phoenicians, and here we have to regret the limited space at our command. It will be seen in the sequel that Civilization owes a great deal to the Phoenicians. Strabo found among them traditions of their

1 Above page 707, II Kings. v. 18.

2 Kings v. 1-19, vi. 12, viii. 7-16.

migration from the shores of the Persian gulf, and the Islands of Bahren are named as the starting point.[1] It is a question when we first have historical notice of these people, some think that the Egyptian monuments of the sixth dynasty speak of the Phoenicians;[2] others would connect Phoenician with the land of Punt of the Egyptian inscriptions.[3] When the Egyptians commenced their invasions of Asia, they found the Phoenicians in secure possession of their coast cities. An Egyptian officer of the time of Rameses II., in an account of his travels, mentions the Phoenicia cities. He knows that Gebal was a holy city, wherein was the shrine of a famous goddess. Of Tyre, he remarks: "Water is carried to it in barks, it is richer, in fish, than in sands."[4]

So we see that we are not yet able to say when the Phoenician first migrated from the Persian gulf. According to Lenormant, an Egyptian officer of the twelfth dynasty[5] made an expedition to the Dead Sea. In his report no Canaanite towns are mentioned.[6] We have already suggested that the Elamite invasion of the twenty-third century B. C., was the real cause of this up-turning of people in Western Asia. When the Phoenicians commenced their movements, Syria was probably already occupied by the Aramean tribes, their near allies, the Canaanites, pressed them out of Palestine and they had to be content with the sea-coast.

If ever a people made the most of its opportunities, that people was the Phoenicians. Their territory was a

mere strip about one hundred and thirty miles in length along the shore, from the island of Aradus on the north, to the Crocodile river south of Mt. Carmel.[1] Along this distance, but a few miles from the coast, rise the precipitous flanks of the Lebanon mountains. About the middle of this coast-line was located the ancient city of Gebal, this seems to have been the first Phoenician city. As is so often the case in other localities, this ancient city became in time the holy city. We have seen that in the time of Rameses II. this holy character was attached to Gebal. There was a famous temple to Astarte, which we find figured on some of the later coins of the place. The cone of stone rising from the center of the enclosed court represents the goddess.

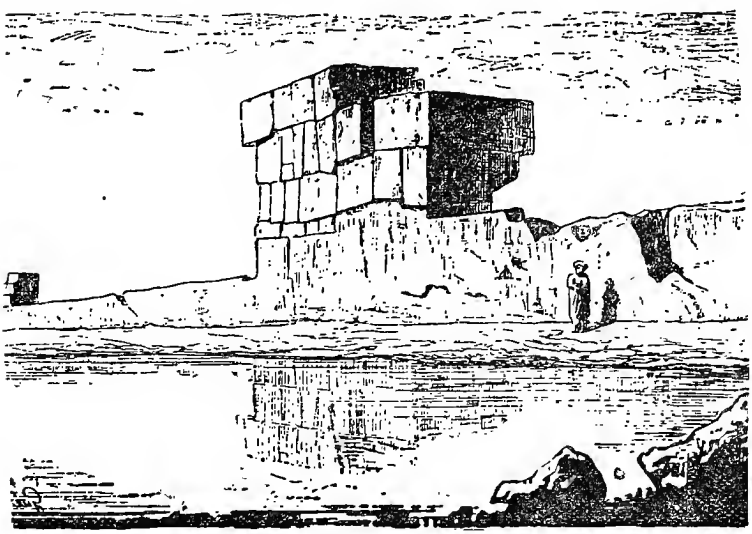
Coin of Bybylos.

A few miles to the south, flowed the ancient river sacred to Adonis. When in the Fall its waters plunged into the sea, tinged with red from the in-washed earth, the Phoenicians of old pretended it was reddened by the blood of Tamuz, the sun god, wounded by the boar of Winter, this as we shall soon show, was but a variant of that older myth of Ishtar and Izdubar. But whatever supremacy Gebal enjoyed, it was soon taken

[1] Conder: "Heth and Moab," p. 87.

from her. Sidon, further to the south, became at an early date an important city and soon was the recognized head of Phoenicia. At first this was but a fishery, but it had a good harbor, and the surrounding plain is fertile.

In the meantime, two other Phoenician cities were rapidly rising to importance. These were Arvad on the north, and Tyre on the south. Tyre, in time, came to be the principal city of Phoenicia. Both were built on islands a short distance from the main land, and consequently



Walls of Arvad.

could bid defiance to an enemy that did not command the sea as well as the land. Without specifying the order, we may say that when we begin to catch historic glimpses of Phoenicia, we find nine principal cities on their coast. The sites of all were well chosen, and even at present they are not deserted. Nor have modern nations discovered any better locations for their cities. They have simply continued to build on the sites selected by the Phoenicians.

From the very circumstances of their location, the Phoenicians were driven to the sea. They became fishermen, then traders, and then colonists on a grand scale. The practical trading instincts of the Semitic race here found full expression. They were not great artists themselves, but they understood to perfection how to take the artistic products of others, and, with them as models, perhaps improve in their own work, but all the improvement that was put forth was with the sole desire to make salable wares.

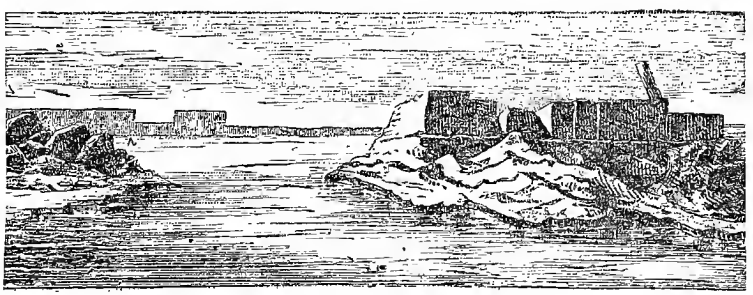
Take, for instance, the potter's art, or ceramics. They undoubtedly brought this art to great perfection, but it was for the sake of building up a trade with the yet uncivilized tribes of Europe, settled along the northern shores of the Mediterranean. What the Phoenicians did was to combine in a very skillful manner the art of Egypt and Chaldea.[1] From very early times, Egypt knew how to make a kind of enameled pottery called Egyptian faience. The surface of the pottery was covered with a mixture of powdered glass, of various colors, and gum, and then exposed to a heat intense enough to vitrify the mixture. This art was so peculiarly Egyptian that the Greeks called it Egyptian stone. This was a most profitable article to trade with. It was like the glass beads, with which modern traders bought valuable cargoes from the savage people with whom they came in contact, but, in this matter, the Phoenician articles were "got up to sell," the enamel being less brilliant and solid.

And so in many other departments of industry. They knew how to work metals, and made exquisite articles in gold, silver and especially bronze. At this time,

---

1 "Art in Phoenicia," Vol. II., Chap. V.

European tribes were probably in the later stages of the Bronze Age, and Phoenicia flooded certain parts of Europe with articles of bronze.[1] And the same is true of the manufacture of glass. This was probably an invention of the Egyptians, its origin perhaps dating as far back as the Ancient Empire.[2] But here again, the Phoenicians were too well aware of its value as an article of trade not to attempt its manufacture. The pupil soon surpassed the teacher, and for centuries this art was of the very highest value to the Phoenicians.



Walls of Tyre.

Probably the one article that did more than any other to advance the interest of the Phoenicians, was the knowledge of how to dye woven fabrics all shades of purple. The profits drawn from this industry were simply enormous. The dye stuff. is said to have been worth its weight in silver.[3] It was obtained from a small mollusc, which abounds in the Mediterranean, about one drop from each little body. This was the celebrated Tyrian purple, and garments dyed with it were in great demand in the ancient world.

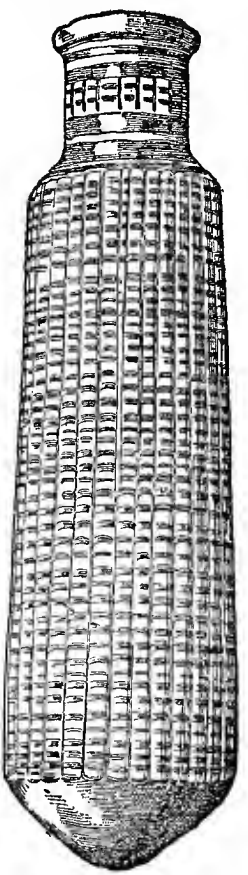
2 "Art in Phoenicia," Vol. II., p. 326, note 3. The oldest dated object of glass is of the eleventh dynasty. [Sayce.]

3 "Art in Phoenicia," Vol. II., p. 424.

Now if we recall their location, stretched for about a hundred miles along the shore, with no chance to develop themselves on the land, we can see how with their trading instincts and practical abilities, they would turn to the sea. All primitive people were afraid of the sea, but the Phoenicians must soon have made themselves familiar with it. Their boats which at first would creep up and down the coast, and only occasionally venture from one headland to another, would gradually be trusted farther and farther from land, until, in time, the Mediterranean was explored from one end to another.



Phoenician Bottle.

At that time, Europe was in the culture of the Bronze Age. All their primitive arts and industries were rude indeed compared to what the Phoenicians knew, profiting by the knowledge of Egypt and Chaldea. The pottery and the glassware of Phoenicia, the gorgeously colored woven fabrics, and the articles of cunning workmanship in gold, silver and bronze, must have seemed priceless treasures to the barbarians of Europe, for which they cheerfully gave in exchange many times their value in raw material. And some of this raw material was greatly prized in the Orient; such as amber from the Baltic, and tin from Spain or even Britain, and thus in both ways the thrifty trader reaped his profit. What wonder, then, that the Phoenician cities became famous

throughout the ancient world for their wealth. The wealth of Tyre is strikingly described by the prophet Ezekiel.[1]

But all this took many centuries of time. Only by slow advances was a chain of trading posts established up and down the shores of the Medeterranean. It was perhaps as early as 1100 B. C. that the foundation of what afterward was known as Carthage in Africa was laid, which was destined to become the most famous city of all the Phoenician colonies. At length, but just when is not known, the Phoenicians came to Spain. This became one of their most famous trading countries. They established

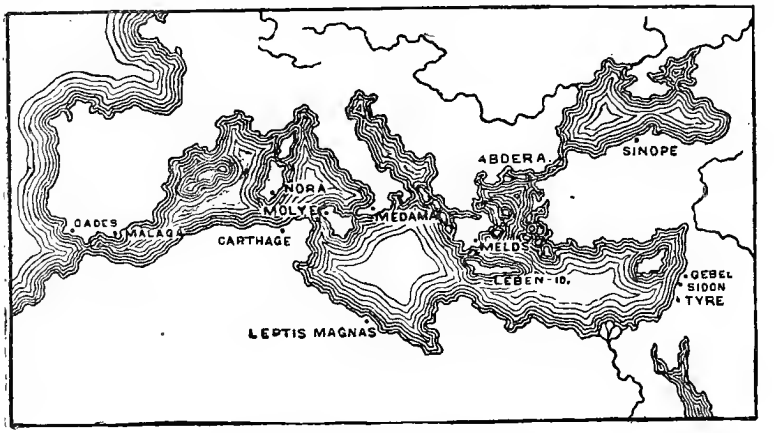
The Shell-Fish from which the Phoenicians obtained their Purple Dye.

their trading stations in the south of Spain, and called the country Tarshish. At that time, the country was rich in metalic wealth. Gold, silver, tin and copper were abundant, and some centuries of careful mining were required to exhaust them. The country was also fertile. Fabulous stories were in circulation throughout the Oriental world of the wealth of Tarshish, but no one knew just where the happy country was; the Phoenicians guarded their secret well.

But this is not all we can say for the Phoenicians. Every one knows that Cornwall in England and the Scilly Islands off the coast were rich in tin. At a very early

1 Ezekiel, Chap. xxvii. and xxviii.

date indeed the Phoenicians were aware of the fact; and, long before the foundations of Carthage were laid, they drew form thence supplies of tin. At first the tin was probably brought overland through France.[1] Afterwards, they ventured out into the Atlantic and so reached the shores of England by sea. It is even said that they established a station on the Isle of Wight.[2] Here again, as time passed on, the utmost pains were taken to prevent the other nations of the Mediterranean, who were beginning



Map of the Mediterranean.

to show a maritime spirit, from learning the secret of the Tin, or Cassiterides Islands, as the Scilly Islands were then called. Strabo gives us an interesting account of a Carthaginian captain, whose ship was pursued by the Romans, and, to avoid capture by them, he deliberately wrecked his vessel, preferring to cast it away rather than allow the Romans to learn the secret of the way to the Cassiterides.[3]

We have, in several places, pointed out that the victories of peace, as far as advancing Civilization is concerned, are far more important and lasting than those of war. It

[1] Lindsay: "Merchant Shipping," London, 1874, Vol. I., p. 10.
[2] Ragozn: "Story of Assyria," p. 91. [3] Stabo iii. 5.

was just in this respect exactly that the Phoenicians were able to do so much for Civilization. They have never had justice done them in this respect. The Greek and Roman writers were probably ignorant of the fact that the foundations of their Civilization were due to the Phoenicians. They inherited from their ancestors, an extreme dislike of these Semitic traders. The reason for this is not far to seek. Part of it is founded on racial antipathy, of all antipathies the most unreasonable. The Aryans and the Semites never did have much love for each other. "Between the two races, there has been from the beginning of things both constant and fertile communications and a perpetual misunderstanding; they have never been able to let each other alone, and they have never agreed."[1]

Undoubtedly the Phoenicians were to blame for some of this dislike. "They were moved neither by the passion for truth nor by that for beauty; they cared only for gain, and, thanks to the condition of the world at the time they entered upon the scene, they could satisfy that lust to the full. In the barter trade they carried on for so many centuries, the advantages must always have been for the more civilized, and the Phoenicians used and abused that advantage. Tyre and Sidon acquired prodigious wealth; the minds of their people were exclusively occupied with the useful; they were thinking always of the immediate profit to themselves in every transaction; and to such a people the world readily denies justice, to say nothing of indulgence."[2]

At this distance away, we ought to be able to calmly sum up the results. The simple fact is Civilization is greatly in debt to the Phoenicians, quite independent of

---

1 "Art in Phoenicia," Vol. II., p. 429. 2 Ibid., 430.

the spirit with which the Phoenicians did their work. To illustrate, they gave the world the alphabet. It is needless to dilate on the importance of this invention. The mere fact that they invented it as an aid in keeping their books, has nothing to do with its value. When they commenced to cautiously feel their way from point to point, and from island to island along the Mediterranean; the tribes of Southern Europe were not farther advanced than Upper Barbarism, they knew but little of each other, and all their arts and industries were crude and feeble: when the Phoenician period ended, great nations had arisen, commerce was active, international law had made its appearance; arts, science and industry were all flourishing. "The seamen of Tyre and Carthage, the Hannos, Hamilcars, and a crowd of others whose names have long ago been forgotten, played on the narrow stage of the Mediterranean and the threshold of the Atlantic a part analogous to that of the great voyagers of later centuries, of those who discovered America and Australia, of the missionaries who have buried themselves among savage tribes, and of those indomitable explorers who are now spending their lives in laying bare the interiors of unknown continents to the Civilization of modern Europe."[1]

We must speak of one more result wrought out in Phoenicia. We have pointed out that Civilization is simply a process of diferentiating the individual from the mass. Savagery knows only of groups; Civilization, of individuals. It is claimed that Phoenicia was the first to arrive at this stage. It is said that Phoenicia, "created what the great Oriental states, or rather agglomerations of men, had never known, namely, the citizen, the individual citizen, full of

[1] "Art in Phoenicia," Vol. II., p. 430.

pride in the independence of his narrow fatherland, full of ambition for himself and for her. By enforcing on each individual a sense of his own personal value, this regime made him capable at certain critical moments of extraordinary devotion and energy."[1]

We will, for the time being, pass by the question of religion. Before passing on to consider the Canaanites, let us dwell a minute on the duration of Phoenician supremacy. Seen from a distance, houses miles apart seem near each other. It is just so in history, events that are in reality separated by long periods of time, seem to be but little removed from each other. Yet time went by no faster then than now, and a hundred years was the same length of time as at present. We have been a nation a little over one hundred years. It becomes us to be modest when we reflect that for more than one thousand years, the Phoenicians were the masters of the Mediterranean. Their base of operations was a country about as large as two average counties in an average state. Yet from this as a starting point, they exerted an influence on nascent Civilization such as was the lot of no other nation in antiquity. Only within the last few centuries have the Anglo-Saxons and their descendants enacted on a larger scale, and possibly with more momentous results the *role* of the ancient Phoenicians.

The Phoenicians had probably been driven to their location on the sea-shore by pressure from tribes of the Canaanites; a people very closely related to the Phoenicians, who probably marched with them from the common home-land on the Persian Gulf. Perhaps it would be better to consider the Phoenicians and the Canaanites as

[1] Ibid., Vol. I., p. 27.

really one people; or, if we wish to make any distinction at all, call them respectively Canaanites of the North and Canaanites of the South. "In language, race, culture, and above all religion, they differed only as one Greek state differs from another."[1] We will understand, then, when we talk about Canaanites, those Semitic-Phoenician tribes who settled in that portion of the country afterward known as Palestine.[2]

Of these tribes, we have almost no political history. We know them only by scattered notices of the Egyptian writers, and slight notices here and there in the Old Testament. We can form some conclusions, however, of them which are not devoid of interest. The date of their migration into Palestine must have been somewheres between the twentieth and twenty-third century B. C. According to Lenormant, at the time of the twelfth Egyptian dynasty, they were not in possession of the country around the Dead Sea.[3] But the Pharaohs of the eighteenth dynasty found them in secure possession of the land.

When the Canaanites entered Palestine, they, of course, found it in the possession of other people, and undoubtedly centuries of inter-tribal warfare passed away. In some places, the aborigines probably held their ground; in others, the Canaanites were successful; while in others still, the two people coalesced. Even as late as the time of the Israelites, these aborigines still remained in places. We shall probably not err if we conclude that, ethnically, these aborigines were Turanian, akin to the Hittites on the north, though it is also probable that, in course of time, they had become intermixed with the Arabs from

---

[1] Sayce: "Contemporary Review," 1883, p. 386.

[2] Sayce: "Ancient Empires," p. 181.

[3] "Art in Phoenicia," Vol. I., p. 15, note 1.

the south, and so more or less completely Semitized.[1] We can see how it would be that such of the aborigines as maintained their independence would be given the credit of being great warriors and fighters, in fact, something altogether above ordinary men. In the Bible they are generally spoken of as giants.[2] We need simply remark that these people were more numerous in Southern Palestine. Hebron seems to have been their head-quarters.[3] The Amalekites were probably the descendants of these people.[4] The position of the Amorites is still a matter of dispute, they were probably Canaanites, who had intermixed considerably with the aborigines.[5]

In the great battle of Megiddo, between Thothmes III. and the Hittites, the Canaanite tribes were present as allies of the Hittites. Thothmes gives us a list of one hundred and nineteen towns of the Upper Rutennu. In a number of them, we recognize the names of towns of Palestine. This shows us that at that time Palestine was in the possession of a number of tribes, whose kings, or chiefs, dwelt in the fortified towns. Fully in keeping with this conclusion, are the Old Testament accounts. Quite often these people are referred to, in a collective sense, as Canaanites.[6] In some cases the

---

1 While this is conjecture, there are good reasons for it. Originally all the northern part of Asia Minor was Turanian. In the long course of time, when the Northern Semites were diverging from the head of the Persian Gulf, it is extremely likely that the Southern Semites, the Arabs proper, were also pushing north. Nothing is to hinder the idea that they came in contact, and intermixed with the Turanian inhabitants of Palestine.

2 II Samuel xxi. 16-22.

5 Sayee: "Contemporary Review," 1883, p. 386. Compare with "Ancient Empires," p. 181. Ewald makes them nearly pure aborigines: "History of Israel," Vol I., p. 235. 6 Genesis xii. 6.

name Amorite is used with this same extensive meaning.[1] In other cases they name one or more tribes, and the number ranges from two to eleven.[2] We have almost no details of the home life of these Canaanite tribes. They seem to have led a quiet agricultural life,[3] owning and selling land[4] and acquainted with the use of money.[5] In the main, the tribes must have been mutually independent of each other, governed by their tribal councils,[6] and in times of war led by their chiefs to battle.[7]

In matters of religion, we come to a most interesting field which we will now briefly outline. This branch of the Semitic folks, although they were to some extent, influenced by the Turanian religion of Chaldea, remained much nearer the original Semitic system of religion. We notice clear survivals of Fetichism. They worshiped mountains, or indeed any striking feature of nature; grottoes, mountain vales, caverns, springs, rivers and trees. The cavern from which rushes the Adonis[8] has for thousands of years been considered one of the most sacred spots in Syria. Especially was this culture shown in the worship of stones, aerolites and strangely shaped stones were objects of veneration. We must not forget that at this day the fanatical Mohammedans regard with the greatest veneration the sacred stone at Mecca.[9]

Though thus plainly presenting traces of Fetichism, the Canaanites had advanced considerably beyond that stage. It is, however, with the utmost difficulty that we

1 Genesis xlviii. 22. Numbers xxi. 13. Amos ii. 9-10.

2 This latter number is given in Genesis xv. 15-19, but it includes the Phoenicians and some people, as the Hittites, who were not Canaanites. See Genesis xv. 19-21; Exodus iii. 8, 17, xxiii. 23, 22; Deuteronomy vii. 1.

can form any conception of their religion. We must constantly recall the Semitic foundation on which Turanian influence would build. And, in the structure thus reared, we are sure to find traces of some confusion in thought.

Source of the Adonis.

Along with all the rest, is that mythic tendency in thought, by virtue of which names of some attributes of the supreme god loose their primary significance and become

the names of distinct gods. We have before pointed out that all branches of the Northern Semites worshiped the sun. Hence it is, that whatever god was recognized as the supreme god partakes of the nature of a solar god.

The general name for god among the Semitic people was El. At Gebal the sun was worshiped as El. As Elyon, the "most high god," he seems to have been known among some of the Canaanite tribes, for we read that Melchizadek was priest of "Elyon."[1] But at Gebal, El was simply a name of the sun. Hence we understand the mythic story told of El how "he rent his father, the sky, into pieces, filling the streams and rivers with the blood that flowed from the mangled corpse;" this is the rain spilled upon the ground when the sun pierces the storm clouds of the sky.

Baal, meaning "lord," was another word used several different ways. Often it meant about the same as our word god. "We hear of Baal-Peor, the god of the mountain of Moab; of Baal-Berith, the covenant god of Shechin; of Baal-Zebub, the god of Ekron . . . of Baal-Hamman, "of Carthage, who represented the fierce heat of summer." In addition to these, there were innumerable local "Baalim." "Wherever the high place had been consecrated on the sacred summit of the hill; wherever the temple had been founded in the midst af the populous town, there was the special Baal, who looked after the interests of his adorers, hating their enemies and loving their friends." This is a plain trace of fetich worship of an earlier stage, only we must notice that now the idea prevails of one universal fetich; but observe, further, that this cult was local and tribal.

---

[1] Genesis xiv. 18.

Another title of this sun god was "Melech," king. At Tyre he was worshiped as "Melkarth," "king of the city," or as "Moloch," in still other places. But the sun god did not stand alone. The goddess Ishtar of old Accadia was adopted into the Canaanite religion as Ashtoreth or Astarte, she was regarded as the wife of Baal;

Baal-Hamman.

and, just as Baal represented the sun, so did Ashtoreth represent the moon. She was sometimes addressed as the "Queen of Heaven." She was not the only goddess whose worship was wide spread among the Canaanites. The goddess Ashera was also known. She "was the goddess of birth and growth; the season over which she presided was the season of Spring, and to her the first-

fruits were offered. She was symbolized by an upright cone of stone, or the trunk of a tree which had been chipped of its branches." She also was the companion of Baal. Near every altar to the god, there was raised also a symbol of the goddess. The Old Testament writers confounded the goddess and the symbol.[1]

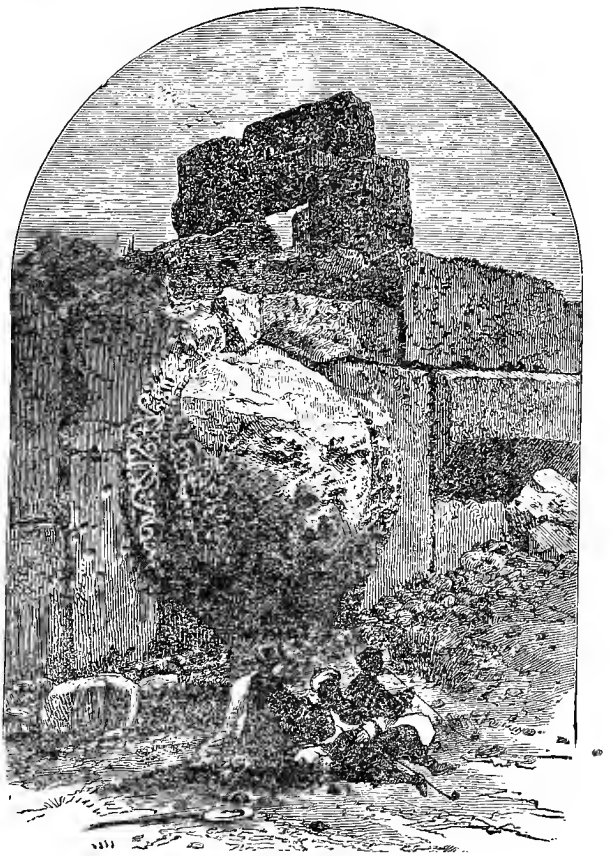
Religion among the Canaanites exerted an unhealthy influence in two directions. The worship of the goddess was at times the occasion of the exercise of rites which seem to us very strange to have been practiced in the name of religion. In a former chapter, we have suggested, that possibly here was a faint echo of a still earlier state of society.[2] Their ideas in regard to sacrifice led them to another extreme as well. To trace the rise of the idea of sacrifice is a most interesting procedure, but one to which we cannot give the necessary time. Beginning with the offerings of material objects buried with the deceased, it passes into the form of feasts for the dead: and, finally in the Barbarian world, whenever any important concession is wished from the gods, or whenever any calamity would be averted, or curse removed, it is deemed necessary to approach the gods with sacrificial offerings.

So among the Canaanites, we find that the first fruits of the harvests, cakes, milk and cream; or if animals, oxen, kids, rams, lambs, goats and birds were placed on the altars. We have found tables enumerating the various objects of sacrifice suitable for Baal, and the price at which

---

1 Most writers decide that Ashtoreth and Ashera were different goddesses. See Kuenen: "Religion of Israel," Vol I. Sayce: "Contemporary Review," 1883, p. 392. Tiele: "History of Religion," p. 82. Ragozin regards them as the same: "Story of Chaldea," p. 112. Nothing is clearer than that Ishtar was worshiped in two different ways in Assyria. We should not be surprised if it should finally be decided that both of these names referred to Ishtar. 2 Above page 141

each could be commuted. There is no question but at times human beings were offered up in sacrifice; and these victims were not simply slaves and captives of war, but included sometimes the children of the noblest families of the



Baal of Baalbeck.

land. The victims were burned alive, an offering unto the stern Moloch. At a later date, circumcision probably took the place of human sacrifice.

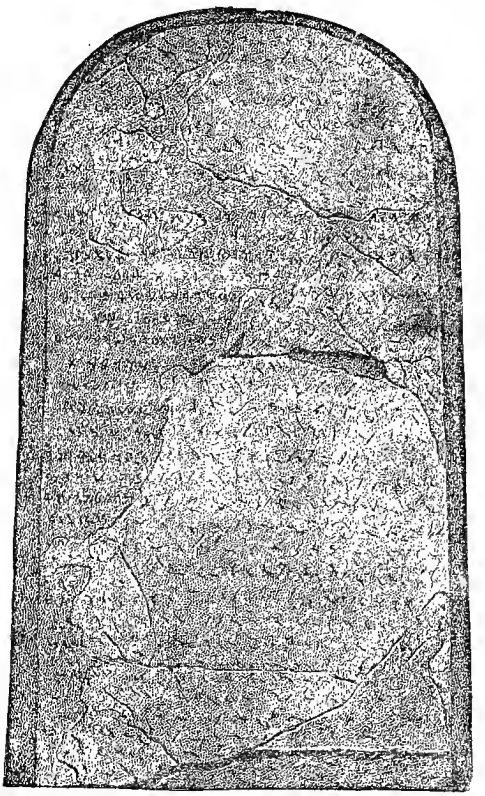
If we will compare this sketch of the religion of the Canaanites with that of the Babylonians, we will notice that it is much nearer the original Semitic religion. It

was but little influenced by the Turanian religion. They borrowed, however, some mythology from the Accadians. They knew of the descent of Ishtar to the underground world to release her husband Tamuz. They had also formed a myth to explain the origin of human sacrifice. The inhabitants of Gebal told how El adorned his only begotten son, Yeud, with emblems of royalty, and took him to the highest peak of Lebanon, and there offered him up in sacrifice to appease the angry gods. But, as we have pointed out, the Semites were not given to forming mythological stories. We must further notice that nothing worthy of Monotheism was known to the Canaanites. Each local tribe had a local god, who like their local chief was supreme in local affairs. But he had no voice in what happened outside of his bounds. It matters not that these local gods were but varying names of the sun. Going along with all this, there was a scarcely concealed belief in Fetichism.[1]

We have now before us an important branch of the Western Canaanites. We refer to the Hebrews. "The Hebrews" is the general name for four closely related bands: the Moabites, Ammonites, Edomites and Israelites. We will first give what little there is to be said of the first three people. They seem to have moved to the west at some date, later in time than the Canaanites. The Ammonites settled to the east of the Jordan, the Moabites to the east of the Dead Sea and the Edomites south of Palestine; the Canaanites being too strong to be dispossessed. Ancient history knows almost nothing about these people; and they are unimportant, as far as the development of Civilization is concerned. Their chief interest lies in their association with the Israelites.

1 For this sketch of Canaanite religion, we have drawn quite freely from Rev. Prof. Sayce's article in "Contemporary Review" for 1883.

When they first appeared in the west, they probably were not as far advanced in Civilization as their near relatives, the Canaanites. In all that goes to make up their religion, they must have been very similar. They had their innumerable local "Baalim, "[1] and some were of celebrity, such as Baal-Peor.[2] Among the Ammonites they worshiped, as their peculiar god, the sun under the name of Milcom, a variant of Malech,[3] while the Moabites worshiped the sun as Chemosh; but both people knew of other names of this deity, such as Moloch.[4]



The Moabite Stone.

A great deal of interest has been excited, of late years, in the discovery of what is known as the Moabite stone, a cut of which is here shown. It is covered with inscriptions and turns out to be an account of the successful rebellion of Mesha, king of Moab, against the kingdom of Israel, mentioned in the Bible.[5] The interesting

1 Numbers xxii. 41. 2 Numbers xxv. 3.
3 Above page 741.
4 Judges xi. 24. I Kings xi. 5., xii. 33. 5 II Kings iii.

point about it is that it was written in nearly pure Hebrew, and it abounds in expressions showing the nature of Chemosh worship. It ascribes the victory of the Israelites to the fact that "Chemosh was angry with his land." Spoils taken in war are offered before Chemosh. War is declared in accordance with his command. "Chemosh said to me: Go take Nebo against Israel." If successful victory is ascribed, to Chemosh. "Chemosh drove him out before me." The goddess Ishtar is mentioned, and women and maidens taken in battle were dedicated to her.[1]

Passing now to the Israelites, a few words of explanation are necessary. An entire volume could be devoted to this interesting people, their history, culture and religion. Practically, however, they cut but very little figure in the Ancient World. Only once in their checkered career, and then for a brief period only, did they occupy a commanding position. The greater portion of the time they constituted but one of the petty nationalities of Western Asia, the vassal of Egypt or Assyria. Their importance lies altogether in the field of religious culture. Religion, assuming that form peculiar to the Israelites known as Judaism, remained nearly stationary among the people who founded it. That modification and enlargement of the Jewish religion known as Christianity, becoming the religion of the European Aryans, has had a wonderful growth and exerted a very great influence on the culture of the Medieval and Modern Worlds. Christianity, however, being unknown in the Ancient World, we need not here discuss it.

All we deem necessary to give is a brief outline of their political history, and some points in the history of

---

[1] Sayce: "Fresh Light, etc.," p. 74 *et seq.*

their religious culture. This is, however, a very difficult task to perform. Probably no two minds see things in exactly the same light. Statements in regard to the culture and history of the Jews, which would be at once assented to if made of any other people, are examined very closely; and sometimes the party who makes them finds, to his great surprise, that statements that seem to him very moderate and reasonable are bitterly excepted to by others. But the world moves, and every day we are learning more and more of the past and probably, at no very distant day, our scholars will come to an understanding among themselves on this and other points.

We trust that few will be found to take exceptions to the following statements: God–who is no respecter of persons, and is near to every one of us, and hath in every nation those who fear him–has at all times and all places done all that he could for all people. We may be very sure that the Israelites formed no exception to the general rule. Their national development, their growth in every department of culture, including religion, must have been by substantially the same stages as those of all other people of antiquity, they seem to have been the first to form worthy conceptions of God, and were the first to develop a Monotheism in any just sense of the term, and this conception existed among the leaders of the people, if not among the mass, as early as the eighth century before Christ. At this early date, the Persians only, of all the people of Asia, had made any advance in this direction.

The outline which we shall give of their history and culture seems to us to be clearly indicated in the books of the Old Testament. Biblical criticism is such a vitally important point that only those should enter on it who have devoted years of study to the work. Those who are

versed in the intricacies of Hebrew grammar, and thoroughly posted, not only in Old Testament literature, but in Semitic literature in general. But few come up to this requirement, the great mass of us must wait patiently for final results in this discussion, which, when reached, let us fearlessly accept.

At present, we have to admit that our scholars are not agreed among themselves, and we may have to change the outline which we have to present of Israel's history. We believe, however, that not only is this outline, as drawn from the Old Testament, in accordance with the book itself, but has on its side the very best scholarship of the day, and we believe as these critical studies continue, it will become more and more clear that no people have been an especially favored people, but that all have had to advance by slow degrees, with many a halt, to their present position in the scale of culture. If the Author of All, in His infinite wisdom, has seen fit to so order the course of events, we may be sure it was for the best.[1]

One who will reflect on the manner in which tribal people split up into branches and sub-branches, would naturally conclude from what he had already learned as to the location of the several Hebrew people, that the Edomites and Israelites were not only younger in time than the Ammonites and Moabites, but, further, that the Israelites were a later separation still from the Edomites.

---

[1] Consult Wellhausen: "History of Israel," Edinburgh, 1885. Kuenen: "Religion of Israel," London, 1875. Bishop Colenso: "The Pentateuch," London, 1862. Ewald: "History of Israel," London, 1869. Savage: "Beliefs about the Bible," Boston, 1883. The above represent one side of the case. Among the many presenting the opposite view, we would name Bissel: "The Pentateuch," New York, 1885. Here is found an excellent historical review of the discussion. Of less value is Green: "The Hebrew Feasts," New York, 1885.

This is in accord with all the beliefs of the Israelites on this subject.[1] Now, when tribal divisions take place, the migrating bands that form the new people, simply leave the old home land and journey on in search of a new country. In this case, the Israelites must have parted company with the Edomites after they were in possession of Mt. Seir and the country round about.[2]

Now, it is interesting to inquire where would they go? The country in their immediate vicinity was very dry and poorly suited to the wants of herdsmen. Canaan, at this time, was in the firm possession of the Canaanite tribes, probably the superior of the various Hebrew people in the scale of Civilization. But we may rest assured that attempts would be made to invade and conquer this much coveted land. The Moabites and Ammonites doubtless made similar efforts from their location.[3]

So the Israelites must have made an attempt to establish themselves in Southern Canaan, and, as far as we can judge, some success must have attended their efforts; and Hebron, near the center of Judea, seems to have been the seat of their power.[4] Though their relations with the Canaanites are sometimes represented as friendly,[5] yet such could not have been the universal rule.[6] They could only

---

1 Thus, the Ammonites and Moabites were descendants of Lot, Genesis xix. 37-8; while the Edomites and Israelites were descended from Isaac; the Edomites from Esau, the older brother. Genesis xxxv. 1.

2 Genesis xxxii. 3. Observe that the Israelites, under Jacob, are leading an unsettled life; but the Edomites, under Esau, are settled. That is what we would expect since the Edomites are the older people.

3 Genesis xiii. 10. Lot is said to have chosen the plains of Jordan, *i. e* the country opposite Moab and Ammon.

4 Hebron was the home of Abraham. [Genesis xiv. 18.] Here was the burial place of Sarah. [Genesis xxiii. 17.] Nearly all the places mentioned in connection with the life of Abraham and Isaac are in South Palestine; Hebron, Gerar [Genesis xx. 1.,] Beersheba [Genesis xxvi. 37.] It is especially mentioned of Isaac that he "dwelt in the south country." [Genesis xxiv. 62.]

5 Genesis xxiii.

6 Genesis xxxiv.

have held their own by subjecting the neighboring people, and for this they were probably too feeble.[1]

Be this as it may, their stay in Southern Palestine was probably not very long. For some thousands of years, the Semitic, Turanian and mixed tribes in Western Asia had been, from time to time, making forays into Egypt. Whenever Egypt was torn by internal convulsions, the Delta was sure to be over-run by nomadic tribes, eager to pasture their flocks in that fertile section. When order was once more restored, these tribes were either expelled or placed under tribute. In the course of time, these subjects were Egyptainized. In this manner, wave after wave of Asiatic folks had swept over the Delta. Probably the most successful being that mysterious Hyksos invasion, when for some centuries Egypt was under the rule of these invading tribes and their descendants. This wave was probably set in motion by that great upheaval of folks in Western Asia about the twenty-third century B. C.

The reign of the Hyksos was, probably, long past when the Israelites parted company with their Edomite brethren. According to the belief of the Israelites themselves, as the result of a severe famine, they also sought the plains of the Delta.[2] It is as yet premature to decide when this move was made. Judging from what light we have at present, we conclude it was early in the nineteenth dynasty, perhaps in the last quarter of the fifteenth century B. C. We must recall that the nineteenth dynasty was a Semitic one,[3] and that the first pharaohs were engaged in war with the Canaanites, Phoenicians and Hittites, the very people who had probably expelled the Is-

[1] They are represented as giving away before the Canaanites. Genesis xxvi. 17-26.

[2] Gensesis xlvii. 4.

[3] Above Chap. vii.

raelites from Canaan; such a dynasty would be apt to grant an asylum to the fleeing Israelites.

Being but few in number and but a portion of the somewhat numerous Semitic people in the Delta, the probabilities are that the Egyptians never distinguished between the Israelites and other Semitic tribes subject to them. This is, probably, one reason why we search in vain for any mention of the Israelites, as such, in hieroglyphic records of Egypt. The common Egyptian word *Shasu* probably includes them all. Some have thought the expression *Aperu*, used of some captives or slaves of Rameses II., referred to the Israelites; this is, to say the least, doubtful.[1] The belief of the Israelites is that after a time the Egyptians changed their friendly attitude and treated them with great oppression.[2] This would be quite in accordance with Egyptian custom. We must further recall that the third pharaoh of the nineteenth dynasty entered into treaty relations with the Hittites;[3] and, further, that the immense public works he executed called for the employment of vast bodies of men. It is possible that, as a matter of policy, he deemed it wise to exact a severe tribute from them in the shape of public labor, with the object of keeping them in subjection, and of preventing them uniting with the enemies of Egypt.[4]

This oppression being harder than the freedom loving Semites cared to endure they left Egypt, and in this "mixed multitude" who left were the various tribes of the Israelites.[5] Quite a number of Egyptian scholars think this departure from Egypt occurred in the reign of Menephthah. This would make it near the end of the fourteenth century

---

[1] See Kuenen: "Religion of Israel," Vol. I., p. 171. Compare with Brugsch: "Egypt," Vol. II., p. 88 and 128-9

[2] Ex. i. 8-13. [3] Above, Chap. vii. [4] Ex. i. 10. [5] Ex. xii. 138.

B. C. It is barely possible that Manetho refers to this exodus, but it probably cut no very great figure in Egyptian history. The Egyptians had been used, from the very earliest times, to Semitic tribes coming and going in the Delta; and, even in the reign of Menephthah, we know that some tribes asked and obtained permission to pasture their flocks in the Delta.[1]

The probabilities, then, are that by the end of the fourteenth century B. C., the Israelites, in company with some other tribes,[2] had resumed a more or less nomadic life in the vicinity of Kadesh.[3] This would make their stay in Egypt some over one hundred years, and this we find to be in accordance with their belief. They generally reckon about four generations for the Egyptian period; but the first were in the prime of life when they went into the country; and they left in the life-time of the fourth.[4]

The Israelites could not yet have been very numerous. We may suppose that they made an attempt to force their way into Palestine, but whatever success may have attended their first efforts, they were, as yet, no match for the Canaanites.[5] As before observed, this country was not at all suited to their wants. It is a dry and semi-desert place, besides there were other wandering tribes to dispute with them for possession; their relations with these tribes are sometimes represented as friendly,[6] and sometimes hostile.[7]

---

1 Above, page 601. 2 Numbers xi. 4.

3 Numbers xx. 1 *et seq.*

4 Gen. xv. 16. If we examine the various genealogies in the Pentateuch, it will be found that, counting the children of Jacob who went down to Egypt, as the first generation, Moses, Aaron and their contemporaries are the fourth generation. Compare Ex. vi. 16-20. Liv. x. 4, Numbers xxvi. 7-9. Colnso: "The Pentateuch," Vol. I., p. 96 *et seq.* Kuenen: "Religion of Israel," Vol. I., p 159.

5 Numbers xxi. 1-4. We must observe, however, that the final conquest of this place was later. Compare Judges i. 17.

6 Numbers x. 29-33. 7 Numbers xxxi. 1-4.

We are, therefore, not surprised that they soon abandoned the country, and we learn of their presence on the east bank of the Jordan.

Let us now stop to inquire into contemporaneous movements in Palestine. The Amorites, under which name the Canaanites generally are sometimes referred to,[1] had succeeded in wresting from the Ammonites a considerable part of their territory.[2] The tables were, however, suddenly turned against the Amorites by the Israelites, who dispossessed them of their recently conquered land and took it for their own use.[3] But this is not all the change that had come over Canaan. The nineteenth dynasty in Egypt had come to an end and, after some years of confusion, the twentieth had succeeded. In the interval of confusion, Egypt had undoubtedly been exposed to invasion from Asia. When Rameses III. took the reins of government, he at once took summary vengeance on Asia.

One of his first moves was against the tribes in the vicinity of Mt. Seir.[4] To reach this place, he must have come in contact with the tribes at Kadesh. It is at least possible, that this invasion had something to do with the further migration of the Israelites and their sudden appearance on the east of the Jordan. But this is not all; if we may trust the records, this valiant king swept Palestine and utterly defeated the Hittites and the Amorites.[5] In the Old Testament accounts of these early times, we seem to have a clear reference to this invasion of Rameses III.[6]

---

6 Exodus xxiv. 28-29.

The Israelites seem to have settled down in Gilead, where they soon commenced to affiliate with the surrounding people, and especially with their near relatives, the Moabites.[1] This result, we would certainly expect to follow from the customs of the people generally. A portion of the Israelites made the land of Gilead their permanent home.[2] But another portion crossed the Jordan and established themselves in the land of Canaan. It is at least possible that the terrible defeat that the Amorites sustained at the hands of Rameses III. made this attempt a success. We must understand of this conquest, what we understand in general of tribal invasions and conquest. It was a long, slow process. The two people had much in common, there were no racial antipathies to overcome, they were not widely separated even as regards religion. The Israelites crowded in wherever a chance offered itself. In many places, they were successful and got the upper hand. In other places still, the Canaanites maintained the supremacy.

We must reflect that time went by no faster then than now; as generation after generation passed away, the two people, who were thus confronting each other, must have inevitably approached each other more and more, the line of separation must have grown fainter and fainter; and, finally, the inevitable result stands before us; we learn of one united people, with one common culture. In the case before us, this formative period extended over two centuries of time.[3] At its commencement, we know of a few tribes forcing their way into Canaan. During its continuance, we know only of the gradual co-

[1] Numbers xxv. 1-4. [2] Numbers xxxii.

[3] It was the belief of the author of Chronicles that seven generations of the ancestors of David lived during this period, I Chronicles ii. 1-13.

alescing of these tribes and the Canaanites, the development of a culture common to the two people, and a gradual growth of the idea of political unity. At its conclusion, we see before us a united people, with tribal lines, however, very distinct, under the rule of a king, with the capital city at Jerusalem.[1]

Without further argument for the credibility of this historical outline, we will leave it to the judgment of each individual reader whether we have not fully established one of our main propositions–that the national development of the Israelites forms no exception to that of other people. Neither do we deem it necessary to extend this outline further. As far as the Ancient World is concerned, they played but an insignificant part. It is true that under David they became an important people of Western Asia, but this importance disappeared in the reign of Solomon; and at his death, two petty kingdoms took the place of David's kingdom. Henceforth they were often at war with each other, and generally one or both were under tribute to their stronger neighbors, until, finally, both disappeared as independent people before the resistless march of the Assyrians to whom we will soon turn.

Let us briefly consider the development of religion. Here, owing to the very great interest taken by the whole Christian world in the subject, no one should presume to discuss it until after years of study. In this matter, also, considerable depends on the date and historical order of the various books of the Old Testament. We have already referred to the fact that a great dispute is at present waging over this very point, a dispute mostly confined to theological fields, but its waves swing in an ever widen-

[1] The entire account, as given here, is fully in keeping with the book of Judges. The gradual coalescing of the two people is there indicated.

ing circle. Into that question, we can not possibly enter, but we can take a general view of the whole field.

It is a matter of history that, about eighteen hundred years ago, Christianity made its appearance in Palestine, at first but a Jewish sect. Only by slow degrees, did it become apparent to the Apostles that they were at liberty to depart from Jewish traditions on many points. The stone which the builders rejected has since become the head of the corner; but, if Christianity thus arose from a foundation of Judaism, we are at liberty to ask from what did Judaism itself arise? What religious culture was it of which Judaism took the place? And what were the probable steps of advance. We feel perfectly at liberty to ask these questions, feeling sure that our scholars will some day be able to answer the same fully and to the satisfaction of all. In the meantime, we will indicate what we think was the line of advance.

In this inquiry, we must state, first, that we are here concerned only with the belief of the *mass* of the Jewish people; what some of their leaders, their prophets and priests believed, taught and urged this "stiff-necked people" to accept, lies outside of our quest. What we want to know is the first stage of *popular* Jewish belief on this subject. The Bible was not written to afford us light on this point. Still, a careful reading of it will show, in the clearest possible manner, what that belief was. It is surely worth our while to understand this point, and to see under what difficult circumstances the great leaders of the Israelites struggled to bring their people up to a higher plane of thought.

We have dwelt with sufficient emphasis on the religious conceptions of the western branch of the Northern Semites. It is scarcely possible that, at the start, the re-

ligious views of the Israelites were materially different. Even a very superficial reading of the historical books of the Old Testament clearly establishes this position. Of king after king, it is told how he built high places, which were nothing but altars to the local Baal; and set up the Ashera, that is the symbol of the goddess Ashera; we are told, time and again, that these emblems were on every high hill, and under every green tree; and when we recall the lascivious worship of the goddesses Ashtoreth and Ashera, we know what to make of some verses in the Old Testament.

The above is not true of simply one period of history. From the opening chapter of Judges to the closing chapter of the historical books, including the writings of those prophets who wrote before the captivity, stronger language than we have used is employed to depict the religious culture of the people of Israel. These things are not glossed over one whit by the writers of the Old Testament books. All should understand, however, that what we have had to say, we apply only to the *mass* of the people. We fail to see any essential difference between the first stage of *popular* belief of the Israelites, and that of other branches of their kin-folks. The Phoenicians mourned the untimely death of Tamuz; so did the Israelites.[1] The Phoenicians worshiped Ashtoreth as the "Queen of Heaven" and offered cakes and fruits; so did the Israelites.[2] Each city of Phoenicia had its local Baal; so had each city of Judah.[3] The surrounding people sacrificed their children to Moloch by fire; so did the people of Israel.[4] The common Semite belief was in witch-

1 Ezekiel viii. 14. 2 Jeremiah vii. 18. 3 Jeremiah xi. 12.
4 Hosea xiii. 2; [R. V. Marginal reading] II kings xvii. 17, xxi. 6; Judges xi. 30, 31, 39; II Kings xviii. 10, and other places. Compare with

craft, magic, divination, the evil spirit theory of disease, and they had their household gods; passage after passage in the Old Testament shows that the mass of the Israelites held all these superstitious notions.[1]

This is not all that we are at liberty to say. Bearing in mind that we are talking only of the *popular* idea of the *masses* of the people in the first stages, we have no hesitation in saying that their conception of Monotheism was similar to that of their kin-folks. We have seen that the Semites, generally, held a qualified Monotheism. Each important branch had a national god, who, as far as that branch was concerned, was regarded as the supreme god, but he was not considered as exercising any jurisdiction in the affairs of the other people, save that national vanity in each case claimed that each individual national god was the strongest god. Such was the Assyrian conception of Ashur; the Moabites, of Chemosh, and the Ammonites of Milcom. Now, losing sight entirely of whatever conceptions the priests and prophets may have entertained of the nature of Yaveh,[2] the general mass of the people held exactly the same view of him as above set forth.

Hear how Jephthah answers the children of Ammon: "Wilt not thou possess that which Chemosh thy god giveth thee to possess? So whomsoever Yaveh, our god, hath dispossessed from before us, them will we possess."[3] So when Sennacherib sent his representatives to demand that

---

I Samuel xv. 33. Agag was hewn in pieces "before Yaveh." Also consider the symbolical sacrifice of circumcision.

[1] Of the many passages, consult II Kings xvii. 17, xxi. 6, xxiii. 24; I Samuel ix. 9, 13, 16; Judges xvii. 5, xviii. 14; Genesis xxxi. 19, 30, 32, 34; Zechariah x. 2. [R. V.]

[2] Such seems to be the original form of the word translated Jehovah. See Sayce. "Contemporary Review," 1883.

[3] Judges xi. 24 [R. V.] The word "Lord" here is Yaveh.

Hezekiah should surrender Jerusalem, the wily diplomat proceeded to harangue the Jews in their own language, taking occasion to institute comparison between Yaveh and the gods of the surrounding people. Hezekiah's embassadors begged him to speak in the Syrian tongue. They knew well enough that the common people would be impressed by his argument.[1]

But enough has been said. As far as we are authorized to draw any conclusion at all from the Bible as to the religious culture of the mass of the Israelites, it is exceedingly plain that it was not materially different from that of the other branches of this people. If any one thinks we have overstated the case, we advise them to consider the severe denunciations of the Israelites by the prophetic writers, such as Isaiah, Jeremiah, Ezekiel, Hosea and Amos. Let us now turn to consider that higher stage of culture, known as Judaism, to which the prophet had been laboring to bring the people.

It is not expected that we should enter into any analysis of Judaism, nor are we concerned as to where the leaders of the people got their ideas. All that we need inquire about are some of the main points wherein they wished to correct the popular mode of thinking; and when this change was fairly effected among the mass of the people. First as to the idea of Monotheism. The qualified Monotheism, of which mention was just made, was really nothing but Polytheism. The prophets of the eighth century B. C. were almost in dispair because their people refused to accept their teachings—that Yaveh was their only god. Their writings abound with denunciations of the people for their actions in this matter. It was their belief that the impend-

1 II Kings xviii. *et seq.*

ing political ruin was the punishment of Yaveh on their country for this sin. A people, however, very slowly change a matter of religious belief. It was not until during the capivity that the people accepted this view.

But a belief in but one God necessarily denies the existence of other gods; therefore Yaveh was not only their sole national God, but was God of the whole universe as well. This conception, which is strongly urged in the Old Testament, was accepted by the Jews generally, when they gave up their idolatrous observances. But the further idea, that God's loving kindness was extended to all nations, that he was as much their god, by whatever name they might worship him, provided they worshiped him in spirit, as he was of the Israelites, was not adopted by the Jewish people. Even some of the Apostles in New Testament times could scarcely believe that the gentiles had a part in their inheritance.[1]

Th second point, of which we will speak, consisted in attaching morality to their religion. We must remember that, in the earlier stages of society, morality and religion were not at all connected, religion was simply a mass of ceremony. The Old Testament writers urge on the people a reformation in this respect. It is scarcely necessary to cite examples on this point. Jeremiah tells the people that circumcision of the heart is what is wanted,[2] and Joel tells them to rend their hearts and not their garments.[3] Ezekiel eloquently writes to show that the ceremonial observances are nothing compared with doing "that which is lawful and right."[4] Isaiah enumerates their sacrifices, their feast

1 Isaiah and Micah do teach that the worship of Yaveh was to extend to all the earth. Isaiah ii. 2-3. Micah iv. 1-2.

2 Jeremiah iv. 4, Compare, ix. 26.

3 Joel ii. 13. 4 Ez. xviii. *et seq.*

days, their Sabbaths and New Moons, and explains that Yaveh is weary of them but rather: "Wash you, make you clean; put away the evil of the doings from before mine eyes; cease to do evil; seek judgment, relieve the oppressed, judge the fatherless, plead for the widow."[1] His contemporary, Amos, just as emphatically condemns their ceremonial observances; but tells them to "let judgment run down as water, and righteousness as a mighty stream."[2] Micah answers the supposed inquiries of an anxious Jew, with the remark that Yaveh requires nothing of him "but to do justly, and to love mercy, and to walk humbly with thy God."[3]

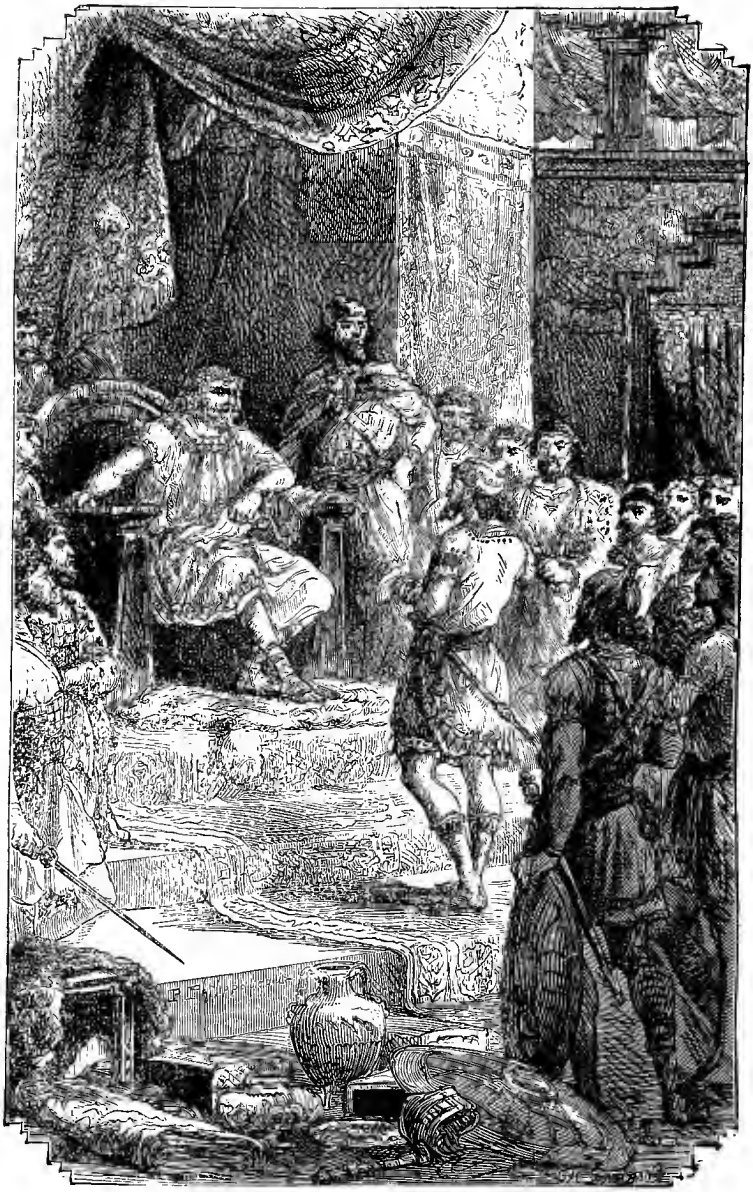
When, now, did the popular mind begin to respond to this urging on the part of their leaders. The answer of the Bible is very clear: not until after the captivity. What went back from Babylon to Jerusalem, was not a nation but an organized church. Then, first, was Judaism, as far as the *mass* of the people was concerned, established. A result not brought about until the dawn of the fifth century B. C. So we conclude—entirely independent of the beliefs and teaching of the leaders of the Jewish people, with no inquiry whatever into the source of their ideas, and speaking only of the mass of the people—that the first stage of *popular* belief of the people of Israel was in all respects similar to that of their kin-folks in general; and it was only after some centuries of time, centuries of slow advance in Civilization, that they occupied that more elevated plane of thought known as Judaism.

We will leave the forgoing result to the good judgment of each individual reader. We have paid more attention to the Israelites than their importance deserves,

---

[1] Isaiah i. 10-17 [2] Amos v. 21-24. [3] Micah vi. 6-10.

speaking of the Ancient World in general. For the greater portion of time, they formed two feeble nationalities, scarcely known beyond the bounds of Palestine. We deemed it best to examine into their case to some length, since we wish to make it clear that they formed no exception to mankind in general. Everywhere men have had to advance by parallel lines, with many a halt, from plane to plane of culture. Some have achieved more in one direction, some in another; the People of Israel achieved theirs in the field of religious culture. After weary years of patient waiting, the cactus bursts into a profusion of blossoms. After some centuries of time, Judaism underwent a still greater transformation, and became the religion of the Aryan World, and is by them being carried unto the uttermost bounds of the earth. We may look forward to the time when the prophetic utterances of Isaiah of old shall come to a happy fulfillment, when many nations shall say: "Come ye, and let us go up to the mountain of the Lord, to the house of the God of Jacob: and he will teach us of his ways, and we will walk in his paths."



764 EMBASSY TO THE ISRAELITES.

# CHAPTER XI.

## THE SEMITES CONTINUED.

WILL now return to Mesopotamia, "the land of the two rivers," and learn of the history and culture of the remaining branch of the Semitic people, the Assyrians. In many respects, the fortune of this people was peculiar. If we may say that the *forte* of the Phoenicians was commerce and trade; that of the Israelites, religious culture; then we may assign to the Assyrians the field of statesmanship and war. Tiglath Pileser II. really built up an empire. The first worthy of its name to appear in the ancient world, since it did not rest on tribal society as a basis. The whole policy of Assyria was in this direction. With remorseless energy, they proceeded to crush the life out of the petty nationalities of Western Asia, to break up and

scatter their constituent elements, and to re-arrange them into one compact whole.

Assyria was that part of Mesopotamia lying to the north of Chaldea. From what faint light we possess, we can but dimly make out a few points in the early history of the country. All they teach is that for a long time, indeed, a mixture in culture went forward in that section. At first, that country was roamed over by numerous Turanian tribes. They were spoken of collectively as the Gutim, or Goim, a word translated "nations" in the Bible.[1] At a very early date, the Accadians seem to have

Emblem of Asshur.

established a colony on the Tigris midway between the Greater and the Lesser Zab. They called their principal city Asshur,[2] a word significant of their location, meaning, perhaps, "water-boundary,"[3] or "well-watered plain."[4]

In process of time, the Semitic tribes succeeded in establishing themselves in all that country. They slightly changed the old name of the city and called it Asshur, with the meaning of "gracious." It so happened that in their system of mythology they worshiped the visible sky as a god under the name of *Sar*.[5] In process of time, this

[1] Genesis xiv. 1.
[2] Ragozin: "Story of Chaldea," p. 2.
[3] Sayce. [4] Ragozin.
[5] Smith: "Chaldean Genesis," p. 50, 69.

became their national, supreme god[1] and his name was changed to that of the country of Asshur, which again was the source of the words Assyria and Assyrians.

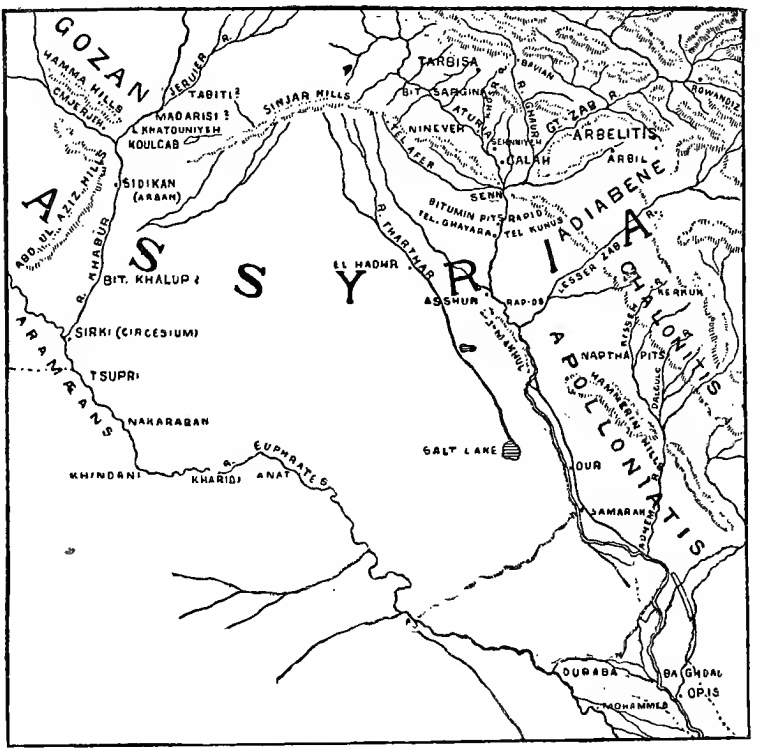
But it was some time before the town or city of Asshur became of sufficient importance to give its name to a section of country and to a distinct people. We do not possess any notices of Asshur or its people until comparatively late in the history of Chaldea. According to an inscription of Tiglath-Pilesar I., about the middle of the niteteenth century B. C., the city of Asshur was ruled by patesi. The names of two of these are known, Ishmi-Dagon and his son Shamas-Raman. Temples had then been erected to the honor of Anu and Raman.[2] This shows that the government was fully organized. The title patesi is generally thought to indicate that the people were tributary to Babylon.

The people prospered and occupied the country farther up the Tigris, and, finally, the seat of power was transferred to a section of country about sixty miles above Asshur. Here, in very ancient times, stood two important cities, in close proximity to each other, known as Nineveh and Resen; the site of the latter has never been satisfactorily determined; on the ruins of Nineveh, stands the modern town of Kouyunjik. We might remark, in passing, that Asshur is now represented by the modern town of Kalah Sherghat.

From Egyptian monuments, we learn somewhat of the condition of Assyria in the reign of Thothmes III. In the annals of that king, we read how he set out to "plow the country of the vile Mesopotamia," an account of his victory follows. We read: "His majesty then

1 See remarks page 758.
2 Sayce: "Ancient Empires," p. 104.

came to the city of Nineveh on his return." A list of tribute then follows. The tribute brought especially by the chief of the *Assuru* is mentioned, this must refer to the Assyrians.[1] These events happened in the sixteenth century B. C. We gather from this scource that the Assyrians were simply one of the several people living in Mesopotamia.[2]



Map of Assyria.

We discover from other sources that the Assyrians were the growing power in Northern Mesopotamia. Perhaps as early as the sixteenth century B. C., the title of

1 "Records of the Past," Vol II., p. 17 *et seq.*

2 It is well to see Max Duncker's criticism on this Egyptian account. "History of Antiquity," Vol. II., p. 29.

their ruler was changed from patesi to "Lord of countries" or king, and they began to dispute with Babylon about the boundaries of their land.[1] About the middle of the fifteenth century, it required a treaty to settle this point. A fragment of an ancient tablet mentions this fact in the following words: "Kara-Indas, king of Kar-dunias[2] and Assur-Bel-Nissu, king of Assyria, a covenant in their borders with each other covenanted, and a pledge concerning those boundaries to each other gave." Another fragment, dating about the beginning of the fourteenth century, tells of the renewing of this treaty.[3]

A few years later, and we discover that Assyria has grown stronger than Babylonia. The tablet just referred to tells us that the Babylonian king married the daughter of the Assyrian king, but when the child of this marriage ascended the throne, he was murdered by the party opposing Assyria; thereupon, the Assyrians interfered, and placed a king of their own on the throne. This may be considered the turning point in the history of these two kingdoms, from this time, for many centuries, Assyria was the greater power in Mesopotamia. About 1320 B. C., there was a king in Assyria named Rimmon-nirari I., who has left us an inscription, in which he speaks of wars with the surrounding people. Calah is supposed to have been founded by his son Shalmanesar I.

Quite a long time now passed away, and about all we know of it is that Assyria is steadily growing stronger. Late in the twelfth century B. C., we come to the reign of Tiglath-Pileser I., who is regarded as the founder of the

---

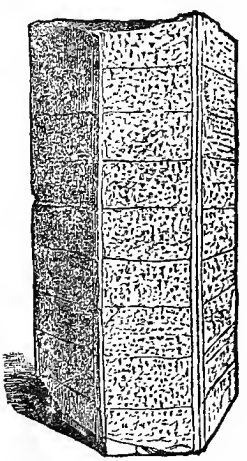
2 Babylon.

3 "Records of the Past," Vol. V., p. 82.

first Assyrian empire. When we are dealing with ancient history, we sometimes fail to note the length of time of which we are speaking. In the case before us, let us not forget that eight centuries are included between the first glimpses of Assyria and the formation of the first monarchy. For all that time, we have only here and there a few facts. During that time, Egypt had been the great power, and second to it was the Hittite confederacy in Asia Minor. During that time, the Phoenicians had become the great traders of antiquity, and had established their chain of trading stations here and there on the Mediterranean, which became centers of Civilization for the yet barbarian tribes of Europe.



Inscibed Prism of a King.

During that time, life in old Chaldea must have flowed on in the placid channel it had pursued for some thousands of years. In other parts of Asia we detect great movements of people. Such as the invasion of China by the Jung tribes and, at a later date, by the Chows. Whenever the clouds have for a moment lifted, we have seen Assyria occupying a more commanding position than before. The time had now come when it was to assume the leading position in the Oriental World.

We fortunately possess quite long inscriptions of Tiglath-Pileser I. At ancient Asshur, there was found an octagonal prism covered with the annals of his reign.[1] We must, however, make some allowance for Oriental vanity. Reading these annals we would conclude that he

[1] A full translation of this is given in "Records of the Past," Vol V.

swept everything before him. But in this account, a victory over a few nomadic tribes is described as a conquest of "kings and people." Their fortified encampments are described as "cities." An unexpected raid, a sudden blow and the quick return march of the Assyrians laden with plunder reads the same as the account of a deliberate campaign.

We conclude from the accounts of his times, that the country he had to rule over at the commencement of his reign was a very small area on the Tigris; but, in the course of his active, vigorous, war-like reign, he did succeed in reducing to tribute a great number of surrounding people, and spread the dread of the Assyrians through a wide extent of country. He crossed the Euphrates with his army, but the extent of his conquests in Asia Minor may be somewhat in doubt,[1] though it is generally supposed that he penetrated quite to the Mediterranean.[2] However, his conquests in this direction were not permanent. He sums up the results of the first five years of his reign as follows: "There fell into my hands altogether between the commencement of my reign and my fifth year 42 countries with their kings, from the river Zab, plain, forest, and mountain, to beyond the river Euphrates, the country of the Khatti, and the upper ocean of the setting sun. I brought them under one government."[3]

In the next cut we have a rock-hewn image of Tiglath-Pileser set up near Karker at one of the sources of the Tigris. These campaigns were not confined to the first five years of his reign. Near the end of his reign, he became involved in war with Babylon, and it seems on the whole to have end-

3 "Records of the Past," Vol. V., p. 20.

ed with the advantage in favor of Babylon, since Sennacherib, over four hundred years later, speaks of recovering the images of the gods which the Babylonians took from Assyria in the wars with Tiglath Pileser I.[1]

Tiglath-Pileser I.

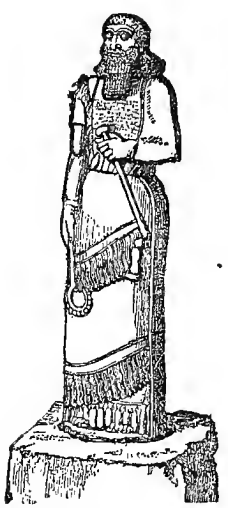
The immediate successors of this king were not able to keep the benefit of his conquests. Two centuries pass by in which but little is known of Assyria, which seems to have shrunken to its former, rather limited, area. Not until near the beginning of the ninth century B. C., did Assyria once more become a formidable power. In the meantime the Israelites had risen to the height of their power under David, and had entered on their decline. These were centuries of progress in the world's history. The fires of Civilization in Europe, after long languishing, were now burning with a clear and steady glow. The great Mazdean system of belief took form and shape and commenced to exert an influence in the Oriental world. At length, Assyria once more rouses from her lethargy and becomes the greatest power in Western Asia.

Asshur-natsir-pal.

Early in the ninth century B. C., we find Assyria ruled by

[1] Smith: "History of Sennacherib," London, 1878, p 134. Prof. Sayce gives a different account of this Babylonian war. "Assyria," p. 28. Compare with Rawlinson: "Seven Great Monarchies," Vol. I., p.

an energetic king, Asshur-natsir-pal. [This name is spelled several different ways.] We have also a long account of his reign.[1] From it we gather that far and wide he carried the Assyrian arms. He took care to leave lasting impressions of the dread of the Assyrians on the people into whose territory he marched: "I overthrew, I demolished, in fire I burned" is the way he says he treated their cities and forests. He then calmly relates how he treated those unfortunates who fell into his hands: "The rebellious nobles who had revolted against me, and whose skins I had stripped off, I made into a trophy." Of another place, he says: "3000 of their captives I consigned to the flames." Of still another, this terrible account is given; "Many soldiers I captured alive; of some, I chopped off the hands and feet; of others, the noses and ears I cut off; of many soldiers I destroyed the eyes; one pile of bodies, while yet alive, and one of heads, I reared up on the heights within their town."



Supposed tatue of Asshur-natsir-pal.

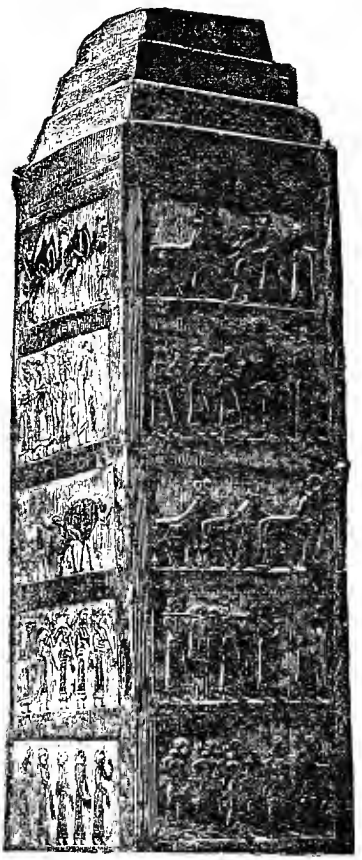
The son and successor of Asshur-natsir-pal was Shalmaneser II., and in his long reign of thirty-five years, the first Assyrian empire reached the height of power.

The records of his reign are quite full, contained on three principal monuments. The first is the Black Obelisk. A square pillar of hard, black stone, about seven feet high. The sides are covered with

393. Duncker: "History of Antiquity," Vol. II, p. 40.

1 A translation of his annals is given in "Records of the Past," Vol. III., p. 37.

sculpture and writing. The second[1] is a monolith from Kurkh. The full-length figure of Shalmaneser is sculptured upon it, and the surface is coverered with inscriptions. The third monument are the plates of bronze (See cut page 778) that formed the covering of two large gates or doors found at Balawat a few miles from Nineveh.



Black Obelisk.

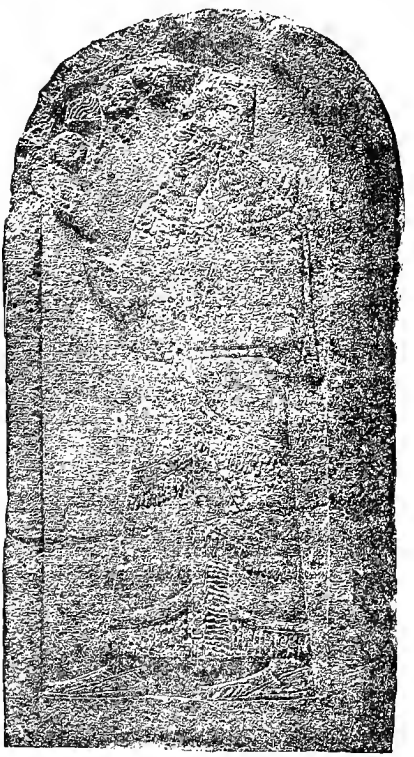
One fact, made apparent by the reading of these inscriptions, is that the various people in South-western Asia were now aroused to the danger threatening them from Assyria. Accordingly, a coalition was formed to oppose Assyria. These people ceased their fighting against each other and ranged themselves under the leadership of Hadad-idri.[2] This probably explained the somewhat sudden patching up of difficulties between Ahab, of Israel, and Hadad-idri.[3] In this league, there were soldiers from Israel under Ahab, Hittites from Hamath, Phoenicians from Arvad, Ammonites and, strange to say, Egyptians.[4]

[1] Full translations of the inscriptions on the Obelisk and Monolith are given in "Records of the Past," Vol. III. and V., by Prof. Sayce.

[2] The Ben-Hadad of I Kings. [3] I Kings xx. [4] Kurkh Inscriptions by Sayce in "Records of the Past," Vol. III., p. 99-100.

If these last were really present, it shows how far the dread of Assyria had then extended.

The most important member of this league was probably Syria; and, under the skillful leadership of Hadad-idri, Syria was no mean opponent of Assyria. In the sixth year of Shalmaneser, a great battle was fought at a place called Karkar. In the following account from the Kurkh Monolith inscriptions, we must make due allowance for Oriental exaggeration. "The city of Karkar, the city of his majesty, I threw down, dug up (and) burned with fire... From the city of Karkar to the city Gilza-u, a destruction of them I made. 14000 men of their troops with weapons I slew. Like the air-god, over them a deluge I poured, (with) their flight the surface of the waters I filled.



Shalmaneser II.
*Monolith from Kurkh.*

"All their hosts with weapons, I laid low..... In the midst of the battle, their chariots, their magazines (and) their horses trained to the yoke, I took away from them." As a matter of fact, this contest was more nearly a drawn battle.

For, though the confederates were defeated, yet the Assyrians were too badly crippled to follow up their victory; and they returned to

Assyria without the tribute they exacted when successful.

Five years now passed by, the principal event marking them being the subjection of Chaldea. Now Chaldea was always regarded by the Assyrians with romantic interest. There was the home of their gods, and from hence their ancestors had come. It was, in fact, their father-land.

In the inscription on the Balawat gates, this conquest of Chaldea is dwelt upon with exultation. "The triumphant entry into Babylon—a city described as the foundation of heaven and earth, and the seat of life—is spoken of as a solemn occasion, upon which sacrifices were made to all the deities whom the king worshiped."[1] In his eleventh year, Shalmaneser again marched against the Syrians, again was he confronted by Hadad-idri and, though the inscriptions claim a victory, by reading between the lines, we are confident he was repulsed. Three years later this experience was repeated. Still all these attacks were weakening to Syria. The various nations who combined to oppose the Assyrians seemed to feel that their case was hopeless, and so presented no united front. They were even at war among themselves.[2]

In the meantime, Hadad-idri (Ben-Hadad) had been assassinated, and Hazael succeeded him.[3] When, four years later, the Assyrians again appeared on the scene, Hazael with the forces of Syria alone confronted him. The Syrians were defeated in a great battle fought near Mount Hermon.[4] Damascus was besieged and the country ravaged, and the various petty nationalities of Asia Minor hastened to make their peace with Shalmaneser. The cut next presented is one from the Black Obelisk and is of

[1] Harkness: "Assyrian Life and History," p. 17.
[2] II. Kings viii. 28-29: x. 32-33: xii. 17-18. [3] II. Kings viii. 15.
[4] Called Senir in the inscriptions, compare, Deut. iii. 9.

considerable interest to us. Among the people who hastened to send tribute to the Assyrians was the kingdom of Israel. It represents the tribute bearers of Jehu. It is accompanied by the following inscription. "The tribute of Yahua (Jehu) son of Khumri (Omri): silver, gold, bowls of gold, vessels of gold, goblets of gold, pitchers of gold, lead, scepters for the kings hand, (and) stones: I received."[1]

Thus, by the middle of the ninth century B. C., the Assyrians had reached the most commanding position in Western Asia. From the Mediterranean on the west, to Persia and Elam on the east; from the country of the Al-

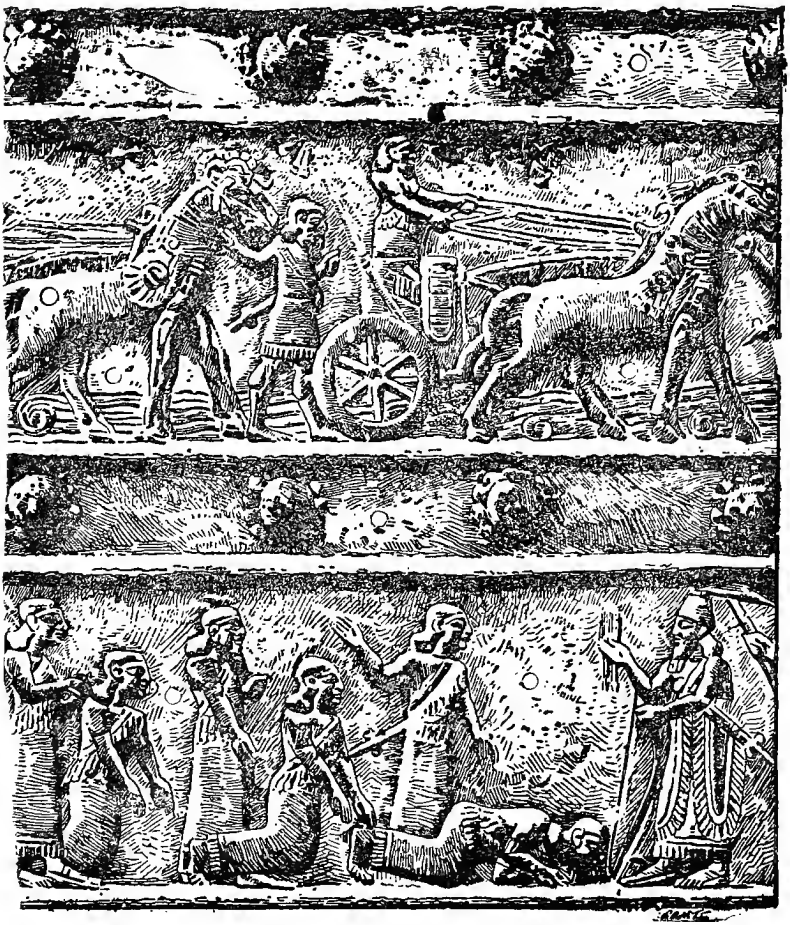
Jewish Tribute Bearers.

arodians around lake Van on the north, to the Persian Gulf on the south, they were masters. We will now hurry along. A hundred years pass by, the events of which we know but little about. It seems to be much such a period as we have noticed on a larger scale in regard to Egypt. On the whole, it seems to have been a prosperous time for Assyria. Its bounds remained about the same. Its power was probably increased by the more thorough subjection of Babylon. In the West, Damascus was occupied and such distant nationalities as Judah and Edom sent tribute.[2]

[1] "Records of the Past," Vol. V., p. 41. It will be observed that though Jehu did not belong to the house of Omri, the Assyrians did not make that distinction.

[2] The payment of tribute by Judah is not generally mentined but

It is somewhat singular that, during such a period as this, when tribute must have poured into Assyria from all quarters, no great advance in arts and Civilization took place. But no such advance is to be noted. The latter



Portion from the Balawat Gates.

half of this obscure century seems to have been a troublous time. The reigns were short. No monuments of any kind are known to survive of this period. The

compare with Sayce: "Fresh Light etc.

more distant provinces resumed their independence. Revolts broke out in the more important cities. In B. C. 746, such an insurrection occurred at Calah, in the course of which the king either died or was put to death. Thus closed what is known as the First Assyrian Empire. Every one must see that we have before us just such a period as terminated each important epoch of Egyptian history. It must point to a common cause; and, in our opinion, the explanation is to be found in the fact that, in both cases, the empires rested on tribal society as a basis.

Tiglath-Pileser I. founded the First Assyrian Empire: the chieftain by the name of Pul, who siezed on the vacant throne and founded the second empire, assumed this ancient name and became known to history as Tiglath-Pileser II. We know nothing with certainty of this personage before he came to the head of affairs, but he must have been a person of no common resources, or he never would have held his high position. Perhaps it was not until some years later, that he assumed the throne-name of Tiglath-Pileser. One or two references to him call him Pul.[1] Tiglath-Pileser II. was an organizer and one of the greatest warriors and statesmen of his times.

It is interesting to trace the course of events in Syria and Palestine. This section of country was coveted by the Assyrians. The first expedition of Tiglath-Pileser was against Northern Syria. Arvad was taken and the kingdom of Hamath destroyed. It was at this time that Menahem, of Israel, deemed it best to make his submission.[2] But he was not alone in this matter. Nearly all

[1] II Kings xv. 19. In the list of Babylonian kings from the year 747 B. C. to the time of Alexander the Great, he is called Pul. Compare Rawlinson's discussion of this in "Seven Great Monarchies," Vol. I., p. 423 *et seq.*, with Smith's discussion: "Assyrian Canon," p. 76.

[2] II Kings xv. 19.

the small nationalities of Palestine did the same, and among this number was Azariah of Judea.[1] All this was by way of preliminary. The real conquest was yet to come. It is interesting to complete the short historical notices in the Bible with the new light from Assyrian sources. Human nature was the same then as now. In all those little states there were two parties. One party, who could see before them nothing but a blotting out of their national existence at the hands of the Assyrians, hoping against hope, endeavored to secure some sort of an alliance to head off Assyria. The other party counselled submission, they believed that the only chance. It was, in truth, a terrible time for these weak provinces, who vainly sought some way to escape from the fatal grasp of Assyria.

From what we can learn from the few notices at our disposal, the majority of the small states of Palestine concluded to unite their forces under the lead of Damascus, and so present a united front. In the kingdom of Israel, Menahem had paid tribute to Assyria. We read that his son, Pekahiah, was murdered and Pekah reigned in his stead.[2] It is, at least, probable that this occurrence points to a contest between the two factions of this kingdom. Judah refused to enter this alliance. The peace party there was in the ascendant. It was probably owing to this refusal to join the league, and for classing themselves as vassals of Assyria, that the various nations of Palestine went to war with Judah. They wished to compel her to join the league.[3]

---

1 This event is not stated in the Bible, but see "Records of the Past," Vol. V., p. 46.

2 II Kings xv. 23-26.

3 II Kings xvi. 5. Compare with II Chronicles xxviii. 17-18, where we notice that the Edomites and Philistines are also at war with Judah.

It is no wonder that the people of Judah were sorely dismayed at this sudden onslaught.[1] They, however, called on Assyria for assistance, to which as faithful vasssals they were entitled. The response of Tiglath-Pileser was prompt and decisive. The Syrians were defeated and Damascus besieged. The cities of the Philistines were ravaged. One of their kings committed suicide to escape falling into their hands, and another fled to Egypt. The Edomites, Moabites and Ammonites were severely punished; Israel was overrun, and Samaria captured. Pekah was put to death, and Hosea given the throne. After a siege of two years, Damascus was taken, Rezon slain and the principal part of the population taken captives to Assyria. Ahaz of Judah went to Damascus to meet his master and renew his fealty.[2]

In a former chapter, we have shown how after some centuries of confusion, the twenty-fifth dynasty of Egypt had once more united the country, and was endeavoring to make it a strong and prosperous power. We have now reached the same period of time from the Asiatic side. It was but natural that the new dynasty in Egypt should carefully study the "Palestine problem." They knew enough of the Assyrians to know that if they remained

---

There is an error of copyists in the number of years given to Jotham. It should be six instead of sixteen. We fail to see any evidence of the view supported by Ragozin: "Story of Assyria," p. 229, that Judah had sought to form an alliance with Edom, Moab and Ammon, and had refused tribute to Assyria in 738 B. C. True, Judah does not appear in the tribute list, but all evidence shows that she had remained true to her obligations as a tributary vassal from the time of Azariah.

[1] It was at this time that Isaiah comforted the king and people of Judah. Isaiah vii. 2-10.

[2] Smith: "Assyrian Discoveries, p. 282 *et seq.* II Kings xvi., 7-10. It is possible that the inhabitants of Samaria put Pekah to death and raised Hosea to the throne, as a sort of peace offering to the Assyrians. [II Kings xv. 30] The inscriptions, however, state the other way.

inactive until Assyria had converted all Palestine into an Assyrian province, their turn would come next. Hence it is, that we begin to detect evidence of Egyptian diplomacy in the relations of Assyria with the petty nations of Palestine. On the other hand, we can see how gladly the party, in all these several states opposed to Assyria, would welcome the help of Egypt. They could not bring themselves to think they were to become but a fractional part of Assyria. They still dreamed of independence and power.

Tiglath-Pileser was succeeded in the year 727 B. C., by Shalmaneser IV., who was probably a successful general. In fact, it would seem as if the first kings of the second empire were elected to the office, which probably accounts for the number of energetic kings that made their appearance.[1]

The death of Tiglath-Pileser was the signal for revolt. In Palestine, the kingdom of Israel took the lead in this matter. The Assyrians took prompt steps to crush this revolt. Israel was overrun, Hosea taken prisoner and Samaria besieged. The city of Tyre, which had joined in this revolt, was also besieged.

Shalmanesar IV. reigned but five years when he was succeeded by Sargon,[2] who was a successful general and probably on that account elected to the throne. He it was that completed the conquest of Israel. Samaria was taken, and the principal people taken captive to Assyria.[3] But now Sargon had to turn his attention to other parts of Assyria. The Elamites were stirring up trouble in the South-

1 Most authorities speak of these kings as siezing on the throne when it was made vacant by death. We believe that the new monarchy was an elective one, though the tendency would be for this office to pass by inheritance.

2 722 B. C.

3 II Kings xvii. 6.

east. In the Eponym Canon, this expedition to Elam occupied the year 721 B. C. This interval of time must have been well employed by Egypt in forming a league of the states of Palestine. We are somewhat surprised to read the names of some of the cities joining this league. Samaria and Damascus appear on the list. This shows how the Orientals are given to exaggeration. We have just read how Samaria was utterly destroyed, and its people carried away captives two years before.

Sargon.

The next year Sargon turned his attention to this confederacy, and, after defeating the confederates in Syria, he pressed on toward Egypt. At Raphia, near the confines of Egypt, was fought the first great battle between Egypt and Assyria, to which we have already referred, and which ended in the defeat of the Egyptians.[1] This campaign quieted matters in Syria, and Sargon turned his attention in other directions. We will only note in passing that, in the campaign of 717 B. C., the Hittites, as an organized

[1] See page 619.

power, disappear from history. Carchemish was taken by assault, and their country was converted into an Assyrian province. We will pass by the war waged with the Alarodian tribes of the Van.

For some years, Babylon had been in open revolt. Merodach-Baladin, who was at the head of affairs there, endeavored to form a new alliance of the little states of Palestine and Syria. Probably Egypt was assisting in this matter. The chances must have seemed good since the kingdom of Judah, which had stood aloof from these leagues heretofore, entered into this alliance. The arrival of the embassy from Babylon at Jerusalem is mentioned in the Bible.[1] We also see what precautions were taken to hide from Sargon the real meaning of this embassy. It was under the pretense of congratulating king Hezekiah for recovery from his sickness. We also notice how strongly Isaiah was opposed to this alliance. He represented the Assyrian party of which we spoke some pages back.[2]

Sargon came down upon the allies in the West, and crushed them before full arrangements could be made. He took Asdod and shattered the confederacy before it was fairly started.[3] Sargon must have moved with unexpected swiftness, he says he crossed the Tigris and Euphrates at their flood. The reinforcements from Egypt

[1] II Kings xx. 12. [2] Isaiah xxxix. 1 *et seq.*

[3] That Judah at least took some steps toward joining this confederacy, see Smith: "Assyrian Discovery," p. 291. Prof. Sayce thinks that at this time Sargon overran Judah and captured Jerusalem, and that Isaiah refers to this siege and conquest [Isaiah x. 28-32 and xxii. 1-15.] In all the inscriptions of Sargon to which we have had access—"Records of the Past," Vol. VII, IX ; "Assyrian Discoveries," Chapter XV.; "Assyrian Eponym Canon," p. 125-131.,— we have failed to find any statement of Sargon to this effect. The majority of writers on Assyrian topics do not mention such a conquest by Sargon. Compare Duncker: "History of Antiquity," Vol. III., p. 91 *et seq.*, with Sayce: "Ancient Empires," p. 129.

did not have time to put in their appearance. After thus disposing of the allies in the West, he crushed out the revolt in Babylon.

Sargon first held his court at Calah, but he built for himself a very noted palace and city called Dur-Sargina, now known as Khorsabad. This is the best preserved Assyrian ruin and has been carefully studied and described. The walls were covered with sculptures, and winged bulls guarded each entrance. It is asserted that considerable advance in the arts took place during his reign.[1]

Sargon was murdered, probably by his soldiers, in his new city, 705 B. C. Sennacherib, his son, was made king in his place. In this case, although the son succeeds the father, we are reasonably sure that Sennacherib was not the oldest son. This is shown by the meaning of his name, which is "the moon-god has increased the brothers." We have quite full details of his reign, and his selection was a wise choice for the people.[2]

Sennacherib had no easy work ahead of him. The death of Sargon was the signal for the tributary states to rebel, and Sennacherib's first years were years of almost continual warfare. We now come to that most interesting invasion of Palestine, a small part of the details of which is given in the Bible.[3] The inscriptions complete this account. We gather from them that Phoenicia and the various small states in and around Palestine entered into an alliance with Egypt to throw off the Assyrian yoke. In this alliance, Judah takes a prominent part. Not until his fourth year (B. C. 701) did Sennacherib march to break

[1] Rawlinson: "Seven Great Monarchies," Vol. I., p. 445.
[2] Prof. Sayce thinks less favorably of him: "Assyria," p. 41.
[3] II Kings xviii. and xix.

this new coalition. From a reading of the inscriptions giving an account of this war and the account in the Bible,[1] we draw the following account of this invasion.

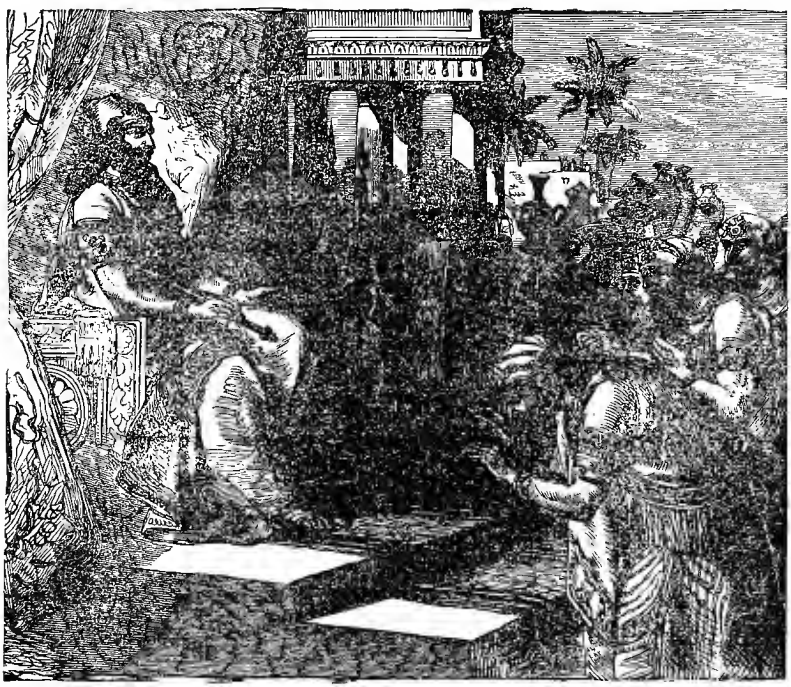
The Assyrian army made its appearance in Phoenicia, and, one after another, the Phoenician cities submitted. He marched south, taking all the coast cities. He then

Winged Bull, Palace of Sargon.

received the submission of most of the allies. The list of those who sent him tribute is–Samaria, Sidon, Arvad, Gebal, Ashdod, Ammon, Moab, Edom and Syria. It is somewhat surprising to meet with Samaria. But Judah still refused tribute and so did Ekron, and a few cities near,

[1] The inscription in the original Cuneiform characters, and a translation of the same into Assyrian and English are arranged in order in "History of Sennacherib," Part IV.

such as Lachish and Libna. A detachment of the Assyrian army overran Judah, taking all the small places, while Sennacherib reduced Ekron and laid siege to Lachish. It was at this critical time that Hezekiah concluded he had made a mistake in entering the confederacy, and so he sent his embassadors to Lachish to sue for peace.[1] A heavy tribute was imposed upon him by Sennacherib, and one ar-



Tribute to an Assyrian King.

ticle, not named in the Bible, was the surrender of Padi, king of Ekron. It seems that Padi wished to keep on good terms with Assyria, but his subjects had revolted against him and sent him in chains to Jerusalem. In the meantime, Sennacherib heard of the approach of the Egyptian

[1] II Kings xviii. 14.

army under Tir-ha-ka (See page 620) and he now demanded the unconditional surrender of Jerusalem, which was refused by Hezekiah and a siege commenced.

Lachish was at length taken by the Assyrians. We have a representation of Sennacherib on his throne and the spoils of Lachish passing before him. Libna was next besieged, and, from this place, Sennacherib sent once more to urge Hezekiah to surrender.[1] He probably wished to withdraw his army from before Jerusalem so as to concentrate it to meet the now rapidly approaching army from Egypt. We read in the Bible how Hezekiah, encouraged by Isaiah, refused. Soon after occurred the decisive battle between the Egyptians and the Assyrians at Eltekeh, about ten miles from Libna. The Assyrian inscriptions claim the victory, but, as has been pointed out,[2] many little incidents connected with the account make it almost certain that the Assyrians were completely defeated.[3]

At any rate, the Assyrians at once abandoned the country, and Sennacherib never cared to invade Syria or Palestine again, though he was king for twenty years longer. A portion of this time, he was waging war in Babylon but most of the time he was at peace. He rebuilt Nineveh and built for himself a magnificent palace there. After a reign of twenty-five years, Sennacherib was assassinated and one of his sons (not the oldest) was made king in his place. We possess a very curious monument of Sen-

---

1 II Kings xix. 9.

2 Duncker: "History of Antiquity," Vol. III., p. 138-9.

3 Probably this battle is referred to in II Kings xix. 35. The "Angel," mentioned in this verse, might have been any instrument of destruction, and an Egyptian army will answer this description as well as anything. It may be, however, that the Assyrians were, as they claimed to be, victorious in this battle, and that the sudden calamity that fell on them was an outbreak of the plague. See Ragozin's ingenuous explanation in "Story of Assyria," p. 311.

JEWS TAKEN CAPTIVE TO BABYLON. 789

nacherib. It is generally spoken of as his will, but it is difficult to believe that the Assyrians had reached the point of allowing property to pass by will. It is an acknowledgment of a gift to his son, Esar-haddon, of "chains of gold, stores of ivory, a cup of gold, crowns and chains, besides all the riches of which there are heaps."[1]

Sennacherib.

It is quite probable that Sennacherib was partial to this son, Esar-haddon, and this led to his asassination by his two older sons.[2] The Assyrian inscriptions, that probably refer to that event, are badly defaced at the point where they become legible. We learn that, at the time of his father's murder, Esar-haddon was in command of an army in Armenia. The army had gone into winter quarters, and everything must have seemed favorable to the conspirators. But Esar-haddon was not the one to sit quietly by and allow his brothers to divide the empire between them.

He says: "From my heart I made a vow ..... Immediately I wrote letters (saying) that I assumed the sovereignty of my father's house." He broke camp, and marched for Nineveh. On the way, he fought a battle, presumably with the troops of his brothers, and was victorious.[3] According to some accounts, on the field of battle itself, the soldiers proclaimed Esar-haddon king.[4]

---

[1] "Records of the Past," Vol. I, p. 136.

[2] II Kings xix. 37. [3] "Records of the Past," Vol. III., p. 103.

[4] Sayce: "Fresh Light, etc.," p. 128.

He himself piously ascribed his success to the great gods to whom he had "lifted up" his hands. He had been assured of their favor before leaving Armenia. An oracle had been sent him saying: "Go, fear not! We march at thy side! We aid thy expedition!"[1]

Esar-haddon proved to be one of the best kings of Assyria, he was not only an excellent soldier, but he had great political tact. It is said of him that he was the only king of Assyria who endeavored to conciliate the nations he had conquered;[2] and, in his inscriptions, when he speaks of conquered kings, he often adds: "I took pity on him." It is not surprising, then that under his reign, Assyria reached the very zenith of her power. He quickly recovered whatever had been lost during the troublous times that followed the death of Sennacherib, and, in most cases, he seems to have retained them by kindness. He gave back lands and provinces to conquered kings, and assisted them in rebuilding their cities and temples. We are not told by what means he conquered Syria and Palestine; but he commanded the obedience of twenty-two kings in that section, and, among the number, we read: "Manasseh king of Judah."

Perhaps the most notable event of this king's reign was the conquest of Egypt. The details of this event and the causes leading to it are lost, but still we can outline the course of events. It had been the policy of Assyria ever since the formation of the second empire, to extend her rule over Western Asia, and she longed to lay Egypt under tribute. Two battles had already been fought between the Egyptians and the Assyrians, but neither had decided the question of supremacy. The battle of Elte-

[1] "Records of the Past," Vol. III., p 102.
[2] Sayce: "Assyria," p. 47.

keh, for the time being, crippled the authority of Assyria in Palestine; but, as we have just seen, early in the reign of Esar-haddon this had been recovered, possibly all this had been regained in the life-time of Sennacherib.

But we gather that Tirhaka was scheming to form a new union of the petty states in Western Asia. Strange to say, he was successful. In the year 673 B. C., Esar-haddon conducted a campaign against Egypt and her allies. The allies' names are not given in the fragment we possess, but Tyre and Judah were probably among the number. The fragment, probable date of which is 672 B. C., reads: "Esar-haddon, king of Assyria, his forces sends against Tarqu, king of Kush, and the men his allies."[1] The Egyptians were defeated and Tirhaka retreated in haste to Egypt. Then came the subjugation of Judah; Manasseh being carried captive to Babylon.[2]

Tyre, owing to its insular position, was able to withstand a siege. The next year, 672 B. C., Esar-haddon built fortresses "over against it" and "cut off" its food and water. Then he marched for Egypt. The difficulties of the march are described. He seems to have penetrated into Nubia in pursuit of Tirhaka, who probably eluded him; but Egypt, from Thebes to the sea, passed under the power of Assyria, and was divided into Satrapies. As far as possible, Esar-haddon recognized the old division of nomes, and the chiefs of the nomes were made the Assyrian viceroys. This shows the kindness and tact of

1 Smith: "Assyrian Eponym Canon," p. 141. Notice that Tirhaka is styled "King of Cush," and recall that his dynasty was Ethiopian. See, also Duncker: "History of Antiquity," Vol. III., p. 155.

2 II Chronicles xxxiii. 11. Esar-haddon had built a palace at Babylon, and resided there a part of the year. This conquest and the woe it brought upon Jerusalem seem indicated in II Kings xxi. 12-17. but, somewhat strangely, the carrying away of Manasseh captive to Babylon is not mentioned by the author of Kings.

Esar-haddon. Tyre probably soon submitted and probably received very easy terms. And we note the further fact that Manasseh was soon released and permitted to return to his kingdom and crown.[1] Esar-haddon could say of Manasseh as of another king: "I had mercy on him. I washed out his rebellion."[2]

We have seen that both the father and grand-father of Esar-haddon had been murdered, and, in one case at least, the result was due to the intrigues of the king's sons. As if to provide against such a deplorable result as this, Esar-haddon associated with him as co-ruler his son Assurbanipal. Assurbanipal was probably regent during his father's absence on his Egyptian campaign.[3] Shortly before death, Esar-haddon resigned almost all the cares of government into Assurbanipal's hands, and retained for himself only the government of Babylon. In 668 B. C., death made Assurbanipal sole king in Assyria. His reign was long and, on the whole, brilliant, but the rapidly setting sun of Assyria had already become obscured in clouds when his reign was brought to a close.

The records of the first period of Assurbanipal's reign are very full and complete. All that we need is an outline, so we will simply remark that it required two expeditions, led by the king in person—besides which his generals quelled one revolt—to thoroughly subdue Egypt. In his second expedition, Thebes, the great city of Upper Egypt, was given up to plunder. The details of this sack are dwelt on to some extent. Among the objects carried away were "two lofty obelisks covered with beautiful carv-

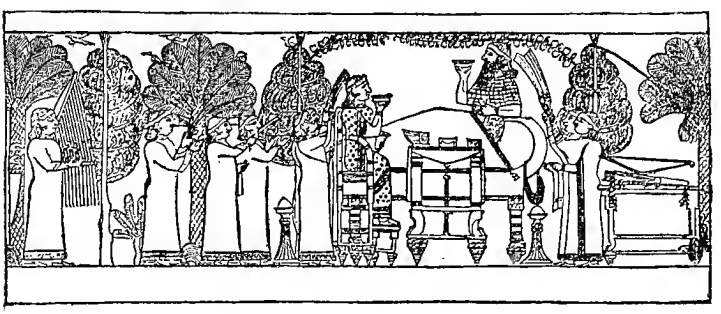
ings, twenty-five hundred talents their weight (over ninety tons), standing before the gate of a temple."[1] During the reign of Assurbanipal, the Assyrians overthrew the ancient kingdom of Elam. We have not space, nor is it necessary, to give the details of this conquest. The Elamites and the Babylonians united their forces; and, at the head of the Babylonians, was the younger brother of Assurbanipal, Saulmugina, whom he had made viceroy of Babylon. It took four years of almost constant warfare to quiet matters in this section. The issue of the conflict was the downfall of Elam and the complete subjugation of Chaldea, but this result was only achieved after great exertion by Assyria.



Assurbanipal's Feast with his Queen.

During the course of this war, Egypt had revolted and the Assyrians made no attempt to renew the conquest of that country. In spite of this loss, Assyria was still the greatest power of Western Asia. Assurbanipal, as if grown weary of wars, contented himself with preserving his empire as it was after the conquest of Elam but loss of Egypt. It is just at this point that our historical light suddenly fails us. We know that quite a number of years now pass by of apparent peace and prosperity for

[1] "Assyrian Discoveries," p. 328.

Assyria. During which, the arts and sciences flourish, and Assyrian literature entered on its most glorious period.

Yet, at this very moment, causes were at work, which were destined, in the course of a few short years, to completely overthrow the Assyrian power. A change was now about to take place; the political power in the Ancient World was about to pass from the hands of the Semites to those of the Aryans, and they were the ones who were destined to carry forward the Civilization of the world. The wisest ruler in Assyria could probably not have long stayed the gathering storm. Assyria suffered no long and lingering death as did Egypt. 650 B. C., Assurbanipal was at the height of his power, and Assyria was probably as formidable as it ever was. Twenty-five years later, it no longer existed as a great power, and, before the beginning of the sixth century B. C., Nineveh had been plundered by a foreign army, and its palaces and public buildings were falling into ruins. In short, the hour had struck, and Assyria was no more.

We have but briefly spoken of the growing belief in the minds of all classes of scholars that the birth-place of the Aryan race was in Europe.[1] We have pointed out that the great upheaval of people in Western Asia, in the twenty-third century B. C., was probably caused by Aryan tribes forcing their way among the Turanian people to the east of the Caspian. We have seen this eastward migration of the Aryans extending even to China. We have also suggested that the Alarodians were Turanian tribes more or less Aryanized by Aryan people coming from Europe through the passes of the Caucasian mountains. We shall, in the future, show that Aryans had

[1] This subject will be fully considered in Vol. III., Chap. i.

early crossed the Bosporus and Aryanized the western portion of Asia Minor. In the meanwhile, a portion of the first Aryan invaders to the east of the Caspian had wandered to the south, and had split up into two divisions, one of which finally penetrated to India. The other, marching west, had forced themselves among the Turanian tribes of the Zagros mountains, and was subjecting them to Aryan influence.

The Assyrian monuments mention Aryan tribes in that somewhat illy defined section of country known as Media, to the south-west of the Caspian sea, as early as the middle of the ninth century. By the middle of the sixth century, there had grown a somewhat close confederacy of tribes in that section of country. The Assyrian kings from Sargon down had held these tribes under tribute, though they were doubtless very restless vassals.

Enlarged View of the Queen.

This confederacy was formed the same among the Medes as among other people. One tribe gradually growing in power and compelling the surrounding tribes to range themselves under their standard. Some indistinct historical figures appear on the scene about the middle of the seventh century B. C. We hear of Phraortes as king, and of his greater son, Cyaxares.

When Assurbanipal devoted himself to a life of ease, after his victory over Chaldea and Elam, this Median tribe, under the lead of Phraortes, was strengthening its power in Media. At length, mistaking quietness for feebleness, they ventured to invade Assyria itself;

they were, however, repulsed, and among the slain was Phraortes himself. The Medes, however, under the lead of Cyaxares, who reorganized his forces and probably secured new allies, made a second attempt and it is supposed that they were in the high tide of success, when they were suddenly recalled to their own country, by a new invasion of half-savage Aryans from Europe, by way of Caucasia, which invasion must have dealt a terrific blow to the already tottering power of Assyria.

To understand this movement, we must study the situation of affairs in Asia Minor. We have seen that, from very early times, Aryan tribes from Europe exerted a pressure in that section of country. Probably great waves of migrating people rolled into the country of which we have no record. We catch sight of one such wave about the middle of the eight century B. C. The Cimmerians, a primitive Aryan people from the great Germanic stock, crossed the Bosporus and ravaged the country to the south of the Black Sea. Sinope, on the coast, was the seat of their power. From this section of country, marauding expeditions were continually starting out to plunder the more settled portions of Asia Minor and Western Asia.

About this same time, the Scyths, a Sarmatian people, must have crowded down into Caucasia, by the Western coast of the Caspian; seating themselves in the mountain fastnesses, they commenced also to send out their marauding expeditions to whatever section of country seemed open to invasion. The terror of these half-savage tribes must have extended far and wide. The prophet Ezekiel, in distant Judah, knew of them, and foresaw the important part they were destined to play.[1] The very word used in the

[1] Ezekiel xxxix and xl.

Bible, Gog, occurs in one of the inscriptions of Assurbanipal under the form of Ga-a-gi.[1] The Assyrian power for a time held back this Aryan torrent. Esar-haddon speaks of defeating a band of Cimmerians, and utterly destroying their army.[2] Assurbanipal boasts of defeating Gog, a chief of the Scythians, capturing his two sons, and taking seventy-five of his cities.[3] Gyges, king of Lydia, when his country was overrun by the Cimmerians, thought to gain the protection of the Assyrians by making voluntary submission.[4] The relief was but temporary. When Assyria was closely pressed by Cyaxares the Mede, the Scythian hordes, no longer dreading Assyria, marched their marauding bands in all directions in Western Asia.

We know almost nothing of these devastating inroads. The monuments are silent. Tradition has it that Cyaxares hurriedly abandoned the siege of Nineveh, and returned to defend his own country. Probably many of the cities of Assyria were plundered, the palaces and the temples destroyed. Palestine, in the west, was overrun. The ancient town of Beth-shan, has since their time been called Scythopolis. According to report, the Egyptian king purchased the safety of his own country by liberal presents. But the fury of the tempest soon passed. The torrent may roll down the mountain, working havoc on its way, but it soon loses itself in the level expanse of the plain. So these Scythic bands, that from the highlands of Caucasia poured down into Western Asia, lost their energies under the more ardent sun of Syria and Palestine, and the luxurious living that attended their too

successful expeditions. They soon disappear from history, either driven back to their mountain home, or lost among the masses of the people they for a time held in terrified submission.

When the storm clears away, we are conscious that old landmarks have been greatly changed. The larger part of the provinces of Assyria are free from her yoke. Egypt not only pays no tribute but is preparing to take the offensive. Judah, at this time under the rule of a young and energetic king, Josiah, is extending its authority over such of the immediate contiguous provinces as seem most desirable, and the ancient kingdom of Israel has already been annexed.[1] The two Aryan powers, Lydia in Asia Minor and Media to the north-east of Assyria, appear with greatly increased power. Babylonia, on the south, is still, nominally, an Assyrian province, but undoubtedly but half-concealed preparations for revolt were under way.

It seldom falls to the lot of a human being to experience such vicissitudes of fortune as Assurbanipal. At the head of his victorious army, he sacked Thebes and firmly held Egypt to tribute. It was his armies that subjugated Elam, yet when he died, probably in the year 626 B. C.,[2] Assyria had ceased to be an object of dread, and was probably contending for its very existence with the Scythians. His successor was probably Bel-zakir-iskun, and his reign was probably very brief.[3] He was succeeded by Assur-ebil-illi-kain. Here we lose sight of history. We do not know how many kings, mere shadows of their

former greatness, succeeded each other in rapid succession. The name of the last king was Esar-haddon II.

We gather that the viceroy of Babylon, Nabopolassar, threw off the yoke of Assyria about 625 B. C.[1] We gather further that the two Aryan states, Lydia and Media, had divided between themselves the various provinces of Armenia and Asia Minor, and had engaged in war themselves to test the question of supremacy. According to tradition, this war was terminated by an eclipse occurring in the midst of a battle. This event is supposed to have happened about 610 B. C.[2] Be this as it may, the Medes and the Babylonians now united their forces. The result of that league was the invasion of Assyria, the siege and capture of Nineveh and the complete disappearance of Assyria as a political power.[3] Here we might bring the historical outline to a close, but, in order to round out the story of the Ancient World, let us briefly outline the course of events in Egypt and Western Asia for a century following the fall of Assyria. As already pointed out, we detect the immense power of Assyria in process of division among several of her strongest vassals, not for the present regarding the Aryan powers, we seek to learn of Egypt and Babylonia.

Egypt at this time was under the rule of the twenty-sixth dynasty; which was a rise to power on the part of the Delta. The Pharaohs of this dynasty were the heads of the Saitic nome, Psammetichus, the founder of this dynasty, was one of the satraps of the Assyrians. When Assurbanipal was engaged in his wars against Elam and

---

[1] Sayce: "Ancient Empires," p. 139. Duncker would place this event later. [2] Duncker, Op. cit., p. 288.

[3] The exact date of this event is not known. It lies between the three years of 606, 607 and 608 B. C.

Babylonia, Psammetichus, with the help of the Greek mercenary troops, drove the Assyrian forces from Egypt, and firmly established his own power. We want to notice the presence of the Aryan Greeks in this war since it shows the rising importance of the Aryans. Egypt was greatly exposed to Greek influence at this time, which influence made itself felt in a great many ways.[1]

As Assyrian influence declined, the rulers of Egypt once more commenced to indulge in pleasing dreams of foreign conquest. With no very positive evidence to guide us, it seems quite probable that they invaded the coast region of Palestine and, perhaps, reduced the cities of Phoenicia to a sort of vassalage.[2] The Scythic invasion probably checked his movements in this direction. The second king of this line, Necho, was an energetic one, and he endeavored to establish Egyptian control over all of Western Asia as far as the Euphrates. He spent some time raising a navy to aid in his undertaking.

At this time, Assyria was in her death struggle and was powerless to oppose his advance. But, as pointed out, Josiah of Judah, was equally bent on enlarging the boundaries of his kingdom, and increasing her power and influence by annexing the contiguous provinces. We have seen that he had already taken possession of the territory of the old kingdom of Israel. It is also supposed that he had reduced the Edomites, Ammonites, Moabites and neighboring tribes to tribute.[3] In short, on the wreck of Assyria, he was endeavoring with rapidity and success to advance Judah to the high position held by the Jewish nation in the days of David and Solomon. A conflict,

---

1 Rawlinson: "Egypt," Vol. II., p. 465.
2 Ibid. Compare with Duncker, Op. cit. p. 305.
3 Ewald: "History of Israel," Vol. IV., p. 241.

then, was bound to come between Egypt and Judah. A brief mention is made of this war and the result of its one decisive battle in the Bible.[1] The rapidly rising hopes of Judah were doomed to a bitter disappointment. They had but exchanged the Assyrian vassalage for the Egyptian. For many years, the people of Judah mourned the death of their brave young king, and the cause he had espoused.[2]

The triumph of Egypt was but short lived. Her dreams of glory and conquest were to be as rudely broken as were those of Judah. When Nineveh fell, Babylon received as her reward, the territory of Assyria lying to the west of the Tigris river.[3] The Babylonians could not look with complacency on the occupation of Syria by the Egyptians. Egypt and Babylonia had to settle by force of arms the question of supremacy. The battle of Carchemish, 605 B. C., was one of the great pivotal battles of the world. Here the forces of Egypt and Babylon contended for the supremacy of Western Asia. The result of that battle was the complete defeat of the Egyptians. Babylon succeeded to all the power of Assyria in Western Asia.

Nabopolassar, viceroy of Assurbanipal, indeed laid the foundation of this new Babylonian kingdom, but his son, Nebuchadnezzar, was the one who succeeded in carrying out his designs. He it was who carried Babylon to the very height of her glory. We need not recite in detail how he overrun Palestine, extinguished the independence of Judah, carried away the inhabitants of Jerusalem as captives to Babylon, crushed the life out of the Phoe-

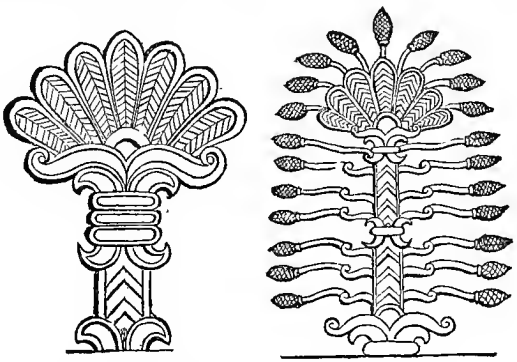
nician cities, and finally overrun Egypt itself, and reduced that proud country once more to a state of vassalage. He it was that beautified and enlarged Babylon, until it became one of the wonders of the Ancient World. Yet the life of the empire he built up outlasted his own but twenty-three years. After a long and glorious reign of over forty-two years, he died in 562 B. C.; the Babylonian empire was brought to an end by the conquest of Cyrus, king of Anzan or Elam, in B. C. 539. The fall of Babylonia was as sudden and complete as that of Assyria. With the fall of Babylon, we have something more to record than the mere extinction of one kingdom by another. Semitic supremacy in Western Asia passed away. But even more is to be said. We are here brought to the end of the Ancient World in culture. From this point we will study the development of Aryan culture, and the scene is no longer laid in Africa or Asia, but in Europe. Let us now study some of the especial points of Assyrian culture, and make a general summary of Semitic Civilization.

In studying the culture of Assyria, we have a most interesting field before us, and one, for the full elucidation of which a volume would scarcely suffice. We can only glance at some of the main points and compare them with Semitic culture in general. They constituted the most important branch of the Semitic people, and were, for centuries, the most powerful. As time passed on, the language of Chaldea became a classical and even a sacred language. The Shamans, magicians, and sorcerers of Chaldea became the priests, seers and prophets of Assyria. The magical formulae, incantations, and songs became inspired writings. They were copied with the greatest of care, the original language was retained; and the priests, to derive the fullest

benefit from them, must repeat or chant them in the original tongue. A similar reverence was felt for the poems and stories of that primitive long ago. And thus the Turanian mythology of Chaldea was adopted *en masse* by the Assyrians.

But the Monotheistic tendencies, inherent in all Semitic belief, arising as we have seen from their consistent Ancestor worship, led to the same result in Assyrian belief as it did among the other branches of Semitic people. It led to a qualified Monotheism. Along with their belief in the



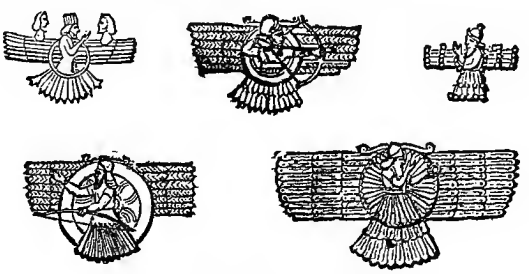
Sacred Tree of the Assyrians.

existence of other gods, they believed in their own local, national god who, as far as they were concerned, was supreme; and national vanity ascribed to him dominion over other gods. This was the god Asshur, and the name probably points back to a time when the sky was regarded as a great fetich, since the word is probably derived from a root "sar" meaning sky.[1] The inscriptions of the Assyrian kings often mention the aid of other gods with reverent gratitude. But Asshur is nearly always the first one mentioned, and always in such a way that we at once detect his superior importance. An inscription of Shalmaneser

[1] Sayce: "Assyria," p. 21.

I. begins: "Asshur, the great Lord, King of all the assembly of the great gods."

Wars are generally asserted to be by his commands. The king, on his expeditions, is "in the service of Asshur." Victory is ascribed to him, some such an expression as this is sure to occur: "Exceeding fear of Asshur, my Lord, overwhelmed them." One king after another complacently excuses his deeds of cruelty, since they were done by commands of Asshur, and for his honor and glory. The other gods, as far as important events are concerned, are supposed to assist in carrying out the commands of Asshur,



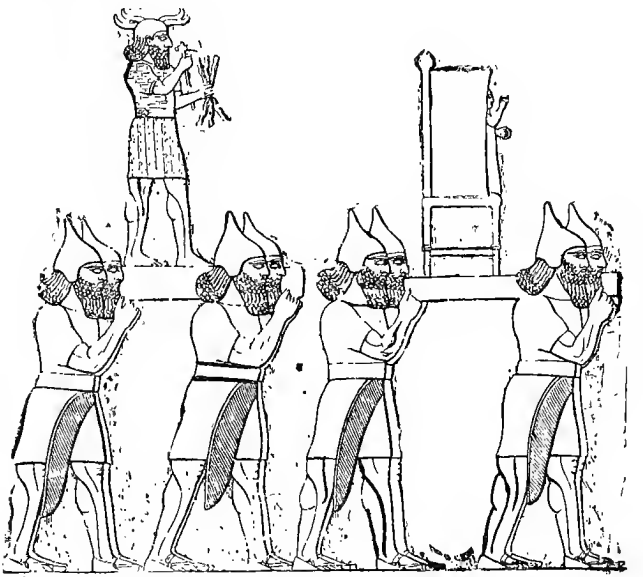
Representation of Asshur.

each in his own particular way, for, as already stated, each of these gods had, so to speak, a special department. These gods, though inferior to Asshur, were still powerful, and, in a certain way, seem to have been nearer to the hearts of the rulers and people than their great national diety.

The goddess Ishtar seems to have been quite a favorite. Her temples were to be found in all of the principal cities. She had a two-fold nature. She was the goddess, not only of love, but of war. As the "Lady of Battles," she was quite a favorite with the Assyrian kings. Esar-haddon, when in trouble about the Elamite war, prayed Ishtar, and received from a prophet the following comforting assurance:

"Fear not, O Esar-haddon,

I am (as) Bel, thy strength,
I will ease the supports of thy heart.
Each of the sixty great gods my strong ones
With his life will guide thee.
The moon god on thy right hand, the sun god at thy left.
Upon mankind trust not, bend thine eyes upon me,
I am Ishtar, of Arbella."



Gods Carried in Procession with their Arks.

The Assyrians built temples to their gods. There are many points of resemblance among Semitic temples wherever built. They had outer and inner courts, as well as an inner sanctuary where the priests only were permitted to go. Before this sanctuary a veil was hung. An inscription of Nebuchadnezzer reads: "Before the curtains of His sanctuary I bowed down my head." In this "holy of holies," there was an altar approached by steps, as well as an ark, regarded as the especial home of the god, in whose honor

the temple was built. We sometimes see this ark carried in a procession by priests, analogous, in this respect, to Egyptian usage. Mr. Rassam discovered in the ruins of the temple at Balawat two inscribed tablets of stone placed in this ark or coffer.[1] In the outer court, there was placed a large basin (called a "sea") filled with water for religious purposes. The gods were worshiped by prayers, songs and sacrifices. Each temple had its corps of priests who were especially devoted to the service of the god of the temple. Minute directions for the guidance of these priests were given.

The priests were provided with a regular prayer book containing prayers suitable for all occasions. The following prayer for the good of a king is really a beautiful one: "Length of days, long lasting years; a strong sword, a long life, extending years of glory, pre-eminence among kings, grant ye to the king, my lord, who has given such gifts to his gods! The bounds, vast and wide, of his empire and his rule, may he enlarge and may he complete! Holding over all kings supremacy, and royalty, and empire, may he attain to gray hairs and old age! And, after the life of these days, in the feasts of the silver mountain, the heavenly courts, the abode of blessedness; and in the light of the happy fields may he dwell a life, eternal holy, in the presence of the gods who inhabit Assyria."

Their collection of sacred writings contained many beautiful examples of psalms, if we may judge of the few fragments we possess. What is finer than the following address to some unknown deity:

"In heaven who is great? Thou alone art great.

---

1 Sayce: "Assyria," p. 74.

On earth who is great? Thou alone art great.

When thy voice resounds in heaven, the gods fall prostrate!

When thy voice resounds on earth, the genii kiss the dust!!

The thought in the following fragment is certainly noble and beautifully expressed: "The god, my creator, may he stand by my side!

Keep thou the door of my lips! Guard thou my hands, O Lord of Light."

While on this subject, let us quote this hymn on the death of a righteous man: "Bind the sick man to Heaven, for from earth he is being torn away.

Of the brave man who was so strong, his strength has departed.

Of the righteous servant, the force does not return,

In his bodily frame, he lies dangerously ill.

But Ishtar, who in her dwelling is grieved concerning him,

Descends from her mountain, unvisited of men.

To the door of the sick man she comes.

The sick man listens!

Who is there? Who comes?

It is Ishtar, daughter of the moon-god, Sin."

Compare with the foregoing the following brief but beautiful prayer for the departing soul: "Like a bird may it fly to a lofty place! To the holy hands of its god may it ascend!"

The influence of the priests extended to acts of daily life. Swine's flesh, among some other unclean animals, was prohibited. They had regular fast days, but, in times of public calamity, other days were appointed for fasting and weeping. They also adopted the Chaldean Sabbath,

they called it Sabattu, in the Assyrian this meant "a day of rest for the heart." We have seen that among the Chaldeans it meant "a day of completion of labor," very strict rules for its observance were instituted. They worshiped the gods with sacrifices, a part of the animal only was used for this purpose, the rest being handed over to the officers of the temple. As yet, no evidence of human sacrifice among the Assyrians has been obtained. We may confidently expect to find this, since, as far as we know, all other Semitic people occasionally offered up human sacrifices.

A sacrificial Scene.

Before treating of their mythology, let us briefly glance at their literature. All the ancient capitals of Assyria were supplied with Royal libraries. The "books" of these libraries were clay tablets: all the tablets treating on one subject were of uniform size, the writing employed was, of course, cuneiform. In some cases, the number of tablets in a series amounted to over one hundred. Each tablet in any series was numbered, and the name of the series was given. This name was the first phrase of the first tablet. For instance, the tablets containing the Creation Poem were twelve in number. The first phrase of the first tablet was "When Above;" this was, therefore, the name of the series. The third tablet, for instance, bore this title "Third Tablet of When Above." When a person

wished to consult a "book," he was requested to hand to the librarian (who was always a highly honored official) a writing of the number and name of the tablet he wished.

It is estimated that the Royal library at Nineveh contained ten thousand tablets. Several thousand fragments of these tablets are now in the British Museum, many thousand more remain in the ruins. Assurbanipal made strenuous efforts to build up this library. His agents were everywhere at work, copying the old Chaldean records, contained in the libraries and temples of Chaldea. Many of these were translated from the old Turanian literature of Accad; occasionally the scribe would come across a word he could not translate, so he would write the word *khibi*, "it is wanting," and go on with the text.

A large part of this literature was of the nature of grammars and dictionaries. No Assyrian could call himself educated who could not read the language of Accad, their classical language, and the language of their sacred books. So we find long lists of Accadian characters drawn up, with their pronunciation in Assyrian given. Also lists of Accadian words and grammatical forms, with their Assyrian equivalents. Other tablets contained phrases and sentences extracted from some particular Accadian work and explained in Assyrian. Reading exercises or primers, for the use of the young Assyrian just learning Accadian, were employed.

All branches of knowledge, known at the time, were treated of in these libraries. Mathemathics, astronomy and medicine were all represented. Tables of squares and cubes have been found, and tablets covered with mathematical figures and calculations are in existence. Astronomy was well represented. Great collections of recorded eclipses are found, and it is generally stated whether the

eclipse happened "according to calculation" or "contrary to calculation." But, of course, at that early day astronomy was simply an aid to astrology. The Zodiacal signs had been marked out. Every great city had its observatory and official astronomer, who reported to the king every two weeks. Tablets of such reports are in existence. Medicine was generally handed over to the priests, for the Assyrians firmly believed in the evil spirit theory of diseases. Still they had other methods. Here, for instance, is a prescription from a book on medicine: "For low spirits slice the root of the Destiny tree, the root of the Susum tree, two or three other vegetable compounds and the tongue of a dog. Drink the mixture either in water or in palm wine."

We have seen that the Assyrians were a commercial people. It is an error to suppose that the Second Empire was wholly a military one. Commerce was active, and, from Nineveh, great caravans often started out for the commercial centers of Western Asia. One of the most interesting series of remains of Assyria are contract tablets, thousands of them are now in the British Museum. It is interesting to note that while Accadian was their classical and sacred language, and the Assyrian the common language of the land, the Syrian was the language of trade and commerce. "Not unfrequently an Aramaic docket accompanies an Assyrian contract tablet, stating briefly what were its contents, and the names of the chief contracting parties."[1] The subject matter of these contract tablets relates to all sorts of commercial dealings. All deeds and contracts were signed and sealed in the presence of witnesses, who affixed their seals to the documents

[1] Sayce: "Assyria," p. 133.

or, if too poor to own seals, they made a mark with their thumb-nail. There flourished at Babylon for many years, a great banking firm, the house of Egibi. The business descended from father to son. They were the Rothschilds of the Assyrian world. The probable modern equivalent of their name is "Jacob and Sons." Here is one of their contract tablets concerning a loan they negotiated:

"Ten shekels of the best silver for the head of Ishtar of Nineveh, which Bil-lubaladh has lent on a loan in the presence of Mannu-ki-Arbella (here follows three seals), the silver is to have interest paid upon it at four per cent. The silver has been given on the third day of the month. (Dated) the third day of Sebat, in the eponymy of Rimmon-lid-aui." Then follow the names of a number of witnesses.

Mythological subjects occupied a large place in their literature. We have already referred to the Creation Poem, which covered twelve tablets; this was a translation from old Accadian sources for the Royal library of Assurbanipal at Nineveh. Of late years, scholars have collected many scattered fragments of a great epic poem, which once consisted of twelve books, narrating the adventures of a hero by the name of Izdubar. Many of the cylinders given on former pages refer to these legends. It is generally agreed that this epic is a description of the course of the sun through the twelve constellations of the Zodiac. The whole conception is very finely worked out. As each book corresponds to some sign of the Zodiac, its contents are descriptive of that sign.

For instance, the sun entered the constellation of the Lion in the fifth month. So appropriately enough, the fifth legend treats of the victory gained by the hero Izdubar over a lion. From the ninth to the twelfth month is the

Winter season of the year. The books corresponding to these months relate the journey of the hero to the under-ground world (the spirit world), the adventures that there befell him, and his final return, purified and invigorated, to the world of light. The series of legends is very transparent all the way through. Our interest in them suddenly increases when we reach the eleventh book. This was the rainy season of the year. The month was called "The month of the curse of rain," then the sun entered the constellation Aquaries. We are prepared, then, to hear of the adventures of Izdubar on the water.

It happens that this is the best preserved tablet of all, or rather we have fortunately discovered more fragments of it. To our astonishment, it turns out to be an account of the flood. Izdubar meets in the under-ground world a renowned ancestor of his, Hasisadra, who had been translated alive into the assembly of the gods. He it is who relates to Izdubar all about the flood. Making allowance for the vein of Polytheism in this account, the agreement between it and that given in Genesis is most striking. The copy we have was made for the Nineveh library. There is no reason to doubt that this is a correct copy of an extremely ancient poem, one in the possession of the Accadians long before the Semites entered Chaldea.[1]

We have now completed our review of what we might call the Semitic period in the culture history of the

---

[1] We have extracted our account of the culture of the Assyrians from the following: Budge: "Babylonian Life and History," London, 1885; Sayce: "Assyria," London, 1885; Smith: "Assyrian Discoveries," London, 1883; Smith: "Chaldean Genesis," London, 1876; Harkness: "Assyrian Life and History," London, 1883; "Records of the Past," Vols. I., III., V., VII. and IX.; Lenormant: "Chaldean Magic," London, 1877; Sayce: "Ancient Empires," New York, 1884.

world. Broadly speaking, it is seen to cover the period of five thousand years preceding the Christian epoch. They are seen to be the ones who build, from the foundation laid by the Yellow Races, the superstructure of Ancient Civilization. During that extended period of time, the Aryans had been slowly advancing through the several stages of Barbarism. Those situated on the northern shores of the Mediterranean had entered into the light of Civilization, and there was growing up the Civilization which was destined to take a commanding position in the world. We have now arrived at that epoch in the world's history and so here we bid farewell to the Ancient World.

As we close the lids of this volume and glance away from the busy present adown the long vistas of the past, what strange scenes throng the troubled field of vision! The genial sun of early Tertiary times lights up the scene; and, from the distant East, we see bands of savage men dispersing over the earth. Long ages come and go before the snows of the advancing Glacial Age commence to fall. Then that strange and but poorly understood period of time passes on and off the stage of vision.

During all this prolonged period, doubtless exceeding in duration the subsequent ages, we learn of nothing but tribes belonging to the Black Races in the Paleolithic stage of culture. But the scene now changes, the Yellow Races appear in Northern Asia and spread over the world, carrying with them improved tools and weapons, and possessing a much more highly organized governmental and social system. Every element of our present culture is seen to start from the foundation laid by them.

As in a dream, there passes before us the splendors of that early Civilization in the valley of the Nile; and, more

shadowy and evanescent still, unrolls the history and culture of ancient Chaldea. The petty Semitic states of Western Asia pass in review; and there looms up before us the overpowering greatness fo Assyria, followed by the rocket like rise and fall of Babylonia.

In the midst of these confused and shifting scenes of the past, can we not extract some cheering truths in regard to the growth of Civilization in general? Though nations rise and fall, and races come and go, has not human development ever been upward and onward? We can, then, look forward to the dawning of a better day. We can hope that the Civilization of the future will as greatly surpass that of the present, as the light of day exceeds in brilliancy that of moonlit nights.

# PREFACE.

THIS VOLUME treats of the Medieval World in culture, and is the third of the series entitled "THE HISTORY OF CIVILIZATION." As explained in the preceding volume, the Medieval and Modern Worlds, as far as the history of culture is concerned, are entirely taken up with the consideration of Aryan civilization. Strictly speaking, there are no broad, well marked divisions of Aryan history and culture. The Aryans were the last great people to emerge into the light of history. Their growth in political power and culture has been slow but ever onward, until, at present, their ranks include all the most powerful and progressive nations of the world.

We will, in this volume, treat of that period of Aryan development which culminated in the Discovery of America, the Invention of Printing and the Protestant Reformation. In Part I., we treat of the Political Development of the Aryans during the period of

time just mentioned. We have tried to present a connected account of this development in the five chapters devoted to this part of the work. Although we must let this part speak for itself, yet we can not refrain from speaking of the main assertion sought to be supported in these chapters.

It has been very generally asserted that the Ayrans were Asiatic people; but of late years an opposite theory has sprung up, and is supported by some of the best scholars of the day. In brief, this theory teaches that Europe is, and always has been, the home of the Aryans; that in Europe, owing to the co-working of many causes, was first evolved the Aryan people. The literature on this subject, though rapidly growing, is at present mostly confined to foreign writers, and we have, unfortunately, been unable to examine it very extensively; yet but a very brief examination is required to show that this theory possesses many elements of strength, and we have little doubt that before many years it will be one of the accepted conclusions of science.

After having thus outlined the political development of the Aryans, we turn to consider their development in culture. In this part, we strive to make apparent the fact, that Aryan development has flowed on in an ever-widening and deepening stream. We aim to show that the general idea in regard to the so-called "Dark Ages" is not correct. There has been no retrograde movement in Aryan culture. The freshness and vivacity of Grecian culture may have disappeared, but just so does the charm of morning disappear before the pressure of mid-day. The concluding chapter of this part—Aryan Religion—is a continuation of Primitive Religion of Volume II. Regarding religion as one of the principal factors of civilization, it is incumbent upon us to trace the development of Aryan religion. It will be seen in the sequel that here, as elsewhere, the Aryans played a most important part in the world's history.

Regarding Europe as the home of the Aryan people gives us a new insight into the nature of Aryan civilization. There is being

evolved in America to-day a new type of people, possessing distinct racial characteristics, and they will probably some day evolve a distinctive civilization. Just so we are to regard the Aryans of Europe. Probably centuries of time elapsed before this race type was fully developed, and many other centuries passed over before they had assimilated the culture of Asia, and had fairly started forward in their own career. Prolonging our mental vision back some thousand of years before the Christian Era, we can dimly make out the same succession of events in Western Asia, which resulted in the Semitic civilization.

Considering Egypt as really part of Asia, the civilization of Asia, Europe, and America will correspond, in a general way, to the Ancient, Medieval, and Modern Worlds in culture. This last division has not yet become distinct; we still call ourselves Aryans, and our culture is not materially different from that of Europe. Some centuries hence this distinction will probably become fully apparent. It is only by thus taking broad, general views that we begin to form adequate ideas as to the march of events in the world's history. Compared with these great movements—the slow rise of races of men to a commanding position in the culture history of the world, their culmination and decline—how utterly insignificant is the life of the individual!

In reference to the preparation of this volume, the same general plan was pursued as in the preceding one. Mr. ALLEN was assisted by the two gentlemen already named, viz.: WILLIS BOUGHTON, B. A., University of Michigan, and EMIL REICH, D. C. L., University of Vienna. While we have to thank them for many valuable suggestions as to the work in general, we wish to make a special acknowledgment to Mr. BOUGHTON for his services in Part I, and a similar acknowledgment is due Dr. REICH in reference to Chapters VI, VII and VIII. The author and his assistants have aimed in all cases to present the latest and best sustained views of scholars in the various fields they have touched upon. Where we have differed from the

conclusions generally given, we have only done so after a full consideration of all the facts of the cases; and in all such instances, we have aimed to give in foot notes the authorities and reasoning followed.

We take occasion once more to return our sincere thanks to Mr. A. W. WHELPLEY, Librarian of the Cincinnati Public Library, and his corps of assistants. The same kind assistance mentioned in the preceding volume was continued in this. It is not too much to say that much of the value of this work is owing to the voluminous material to be found in this library. We trust, that all who read this volume will find much to commend, little to disprove, and that such of our readers as never gave much thought to the origin and development of the Aryan people will be tempted to pursue the subject further. We assure them that they will never regret such a course.

E. A. Allen.

CINCINNATI, *June* 1, 1888.

# TABLE OF CONTENTS.

## PART I.

### CHAPTER I.

**THE PRIMITIVE ARYANS.**

INTRODUCTION—Aryan Linguistic Family—Geographical Location of the Aryans—The Evidence of Language—Aryan Migration—Celtic—Cimmerian—Dorian—Thracian—The Phrygians—The Slavonians—Aryan Influence in Eastern Asia—Ainos—Coreans—Polynesians—Hindoos—Iranians—Asiatic—Asiatic Origin of the Aryans—Difficulties of this Theory—European Origin—The Evidence of Ethnology—Of Language—Advantage of the European Theory—Conclusion. . . . . Page 19

### CHAPTER II.

**THE ASIATIC ARYANS.**

INTRODUCTION—Oriental Peculiarities—Geographical Distribution—The Afghans—The Galchas—The Iranians—Zoroaster—Mazdeism—The Rise of the Persians—Cyrus—Cambyses—Darius—Reorganization of the Empire—Mt. Behistun—Xerxes—Traits of the Persians—Disposal of the Dead—Art Among the Persians—Description of Ruins—Conquest of Alexander—The Parthian Empire—The Neo-Persian Empire—Religious Reform—The Indians—Description of the Country—Early History of the Country—Asoca—The Vedic Literature—The Caste System in India—Science in Ancient India—Philosophy in Ancient India—Buddhism—Ruins in India—Conclusion. . . . . 88

### CHAPTER III.

**THE HELLENIC ARYANS.**

PELASGIANS—The Hellenes—Aryans of Asia Minor—The Phrygians—Explorations at Hissarlik—Ancient Troy—Relics from Hissarlik—Cyclopean Walls—Phœnician Influence—Early German Influence—Ancient Hellas—The Heroic Age—The Argonautic Expedition—The Poems of Homer—Beginning of History in Greece—Political Life in Ancient Greece—Religion in Ancient Greece—The

Amphictyonic League—Early Settlements—The Dorian Migration —The Rise of the Spartans—The Period of Argolic Supremacy—Spartan Supremacy—Development of Athens—Stories of Solon—Important Cities of Ancient Greece—Greek Colonies—Other Aryan People—The Cimmerians—The Persian Invasion—Age of Pericles —Triumph of Sparta Over Athens—Rise of Thebes—Rise of Philip of Macedon—Alexander the Great—Conclusion. . Page 185

## CHAPTER IV.

### THE ROMAN ARYANS.

FIRST GLIMPSES OF ITALY—Geographical Description—Phœnicians in Italy—First Aryans in Italy—Greek Colonies in Italy—Celtic Influence in Italy—The Latin Tribes—The Confederacy of Alba Longa—Physical Surroundings of Ancient Rome—The Etruscans—Legends of Ancient Rome—Gallic Invasion of Rome—Architecture of Ancient Rome—Rise of Roman Power—War with Carthage—Extension of Roman Territory—Capture of Carthage—Internal Troubles at Rome—Marius and Sulla—War with Mithridates—Gladiatorial Contests—Spartacus—First Triumvirate—Rise of Cæsar to Power—Second Triumvirate—Antony and Cleopatra—The Formation of the Empire—The Beginning of the Decline—The Division of the Empire—Review of the Growth of Rome in Territory—Conclusion. . . . . 259

## CHAPTER V.

### THE RISE OF MODERN NATIONS.

INTRODUCTION—The First Appearance of the Huns—The Migration of the Goths—Invasion of the Western Empire by the Teutons —Fall of Gaul—Atilla—Gothic Conquest of the Western Empire—Rise of the Franks—The Saracens—Charles Martel—Charlemagne—The Final Separation of the Two Empires—The Basilian Dynasty in the East—Fall of the Eastern Empire—The Triple Division of Charlemagne's Empire—Italy under the Karlings—Change of the Western Empire to the German Empire—Rise of the Italian Cities —Outline Sketch of Germany—The Hohenstaufen Dynasty—Frederic Barbarossa—Rise of Austria—Outline Sketch of France—The Norsemen—Rise of Normandy—The Capets—Appearance of Modern France—Sketch of Spanish History—Castile and Aragon—Charles V.—The Small States of Switzerland, Belgium, and Holland Explained—Sketch of Russian History—The Muscovites—Peter the Great—Hungary, Litnuania, and Poland—Sweden and Norway—

Denmark—Outline of English History—Aelfred— The Norman Conquest—The Plantagenets—The Magna Charta—Henry VIII.—General Conclusions. . . . . Page 330

## PART II.

## CHAPTER VI.

### GREEK CIVILIZATION.

INTRODUCTION—Importance of Grecian Culture—Factors of Grecian Culture—Influence of Tribal Society—City Life—Family Life in Ancient Greece—In Classical Greece—Condition of Women at Athens—In Sparta—Explanations of the Same—Daily Life of an Athenian—The Value of Athenian Citizenship—Consequences of the Condition of Women in Athens—Education in Athens—Theaters of Athens—Greek Games—Greek Public Meals—Music and Dancing—Public Official Life—The Ecclesia—The Court of Areopagus—The Senate—Greek Philosophy—Thales—The Pythagoreans—Xenophanes—Parmenides—Heraclitus—Empedocles—Democritus—The Skeptics—Sophists—Socrates—Plato—Aristotle—The Epicureans—The Stoics—Grecian Science—Astronomy—Mathematics—Greek Art—Temple Architecture—Painting—Phidias. . 433

## CHAPTER VII.

### ROMAN CIVILIZATION.

INFLUENCE OF THE CITY OF ROME—First History of Rome—Description of Rome—The Houses—The Fora—Slavery in Ancient Rome—Different Classes of Slaves—Treatment of Slaves—Manumission of Slaves—The House Sons—House Daughters—Marriage in Ancient Rome—The Status of Married Women—Ceremonies of Marriage—Education in Rome—Compared with Greek Education—Public Life in Rome—Public Games—Races—Gladiatorial Games—The Coliseum—The Gladiators—Influence of these Games on the People—The "Ludi Magni"—Public Baths—Meals and Foods of the Romans—Use of Wine in Rome—The Dress of Romans—The Toga—The Tunica—Special Articles of Dress—Female Dress—Roman Literature—Cicero—Tacitus—Finances in Rome—Taxes—Commerce—The Government in Ancient Rome—Normal Development of Tribal Government—Roman Civil Law—The Vast Influence on Our Civilization—Conclusion. . . . . 520

## CHAPTER VIII.

### CULTURE OF THE MIDDLE AGES.

INTRODUCTION—Right Ideas as to the Middle Ages—Feudalism —Its Origin—Feudal Tenure—Ceremonies Attending the Transference of a Fief—Duties of the Vassal—Military Service—Feudal Incidents—Reliefs—Fines—Forfeitures—Aids—Feudal Nobility—Origin of Classes—Freemen—Villeins—Medieval Slavery—Feudalism a Development of Tribal Society—Feudal Jurisdiction—Wager of Battle—Origin of this Custom—Rise of Free Cities—Chivalry—Its Origin—Influence of the Church in this Matter—The Page and His Duties—Squires and their Duties—Modes of Conferring Knighthood —The Ancient Ceremony—The Shortened Ceremony of Later Times —Classes of Knights—The Tournament—Knight Errantry—Estimation of Feudalism—Picture of the Middle Ages—The Crusades and their Influence—Powers of the Church—Estimation of Church Influence—Church Influence in the Matter of Advancing Knowledge —Trade in the Middle Ages—Social Life, etc.—Conclusion. Page 606

## CHAPTER IX.

### ARYAN RELIGION.

INTRODUCTION—Mythology—Origin of Myths—Eclipse Myths—Nature Myths—The Myth of the Dawn—Aryan Mythology—The Sky God—Aryans of Asia—The Vedic Age—Brahmanism—Rise of Philosophy—The Sankhya System—The Yoga Branch—The Vedanta School—The Doctrine of Illusion—Iswara—Mazdeism, Origin of—Mazdean Literature—Dualism—Ahura Mazda—The Ameshospands —Development of Mazdeism—Zrvan Akarana—Peculiarity of Greek Development—The Ionic School of Philosophy—Pythagoras—Socrates—Plato—The "World of Ideas"—Comparison with Hindoo Thought—World-Soul—Contact between Aryan Thought and Judaism—Angels—Satan—Primitive Feast—Greek Mysteries—The Eleusinian Myth—Nationality of Buddha—Initiation into Brahmanism —Organization of his Order—The Laymen—Sayings of Buddha—Initiation into the Order—Political Development of Buddhism—Esoteric Buddhism—The "Tathagatha," The "Great Vehicle" Movement—Baddhaghosa—The Legendary Buddha—Spread of Buddhism —General Conclusions. . . . . 707

# Part I.

## History of the Political Development of the Aryan People.

I. Primitive Aryans.

II. Asiatic Aryans.

III. Hellenic Aryans.

IV. Roman Aryans.

V. Rise of Modern Nations.

The hand upon thy dial, Time, now marks
The hour of change. The Orient, effete
With opulence, is crumbling fast to dust.
Lo from its ruins, Phenix like, appears
A new born race.
A heritage is theirs.
O'er-reaching all the earth. The East gives up
Its hoarded wealth. The West invites them come
And occupy its boundless fields. The Earth
Unbosoms mines of jewels rare, while at
The touch of their deft hands fair beauteous forms,
Almost divine, spring from the senseless rock.
With keen and searching minds, they penetrate
The realms of endless thought. In search of truth,
They enter quiet Nature's holy walks
And study God's most subtle laws.
Behold
When Iran comes, a Universe bursts forth
In welcome strains, and rich profusion crowns
The ardent zeal of that aspiring race.

WILLIS BOUGHTON.

# CHAPTER I.

## THE PRIMITIVE ARYANS.

INTRODUCTION—Aryan Linguistic Family—Geographical Location of the Aryans—The Evidence of Language—Aryan Migrations—Celtic—Cimmerian—Dorian—Thracian—The Phrygians — The Slavonians—Aryan Influence in Eastern Asia—Ainos—Coreans—Polynesians—Hindoos—Iranians—Asiatic—Asiatic Origin of the Aryans—Difficulties of this Theory—European Origin—The Evidence of Ethnology—Of Language—Advantage of the European Theory—Conclusion.

IN MANY ways, Nature teaches us that time is long, and that she can not be hurried to her final results. In the fullness of time, the results of her methods of work are revealed, and the time taken to produce a given result is, in a sense, commensurate with its importance. This is to be seen when we consider some of the theories of modern science. They tell us of countless ages

during which our earth swung in space, a glowing orb of light. They speak of eras, exceeding in time the ability of the human mind to conceive, during which our planet was fitting as an abode for sentient beings. They have to say of the long infancy of the human race, of its slow advance in culture, of its triumph over many obstacles, and of the final appearance of that better day, when ideas of truth and justice and such an advanced stage of justice and enlightenment had been reached that we speak of man as civilized. But all this took many millenniums of years to accomplish.

Since then, many centuries have been tolled off in rapidly passing years. From a distance, taking a mental survey of the entire field, making reasonable allowance for that which is yet obscured by darkness, we can detect certain great planes of culture with clear traces of advance from one to the other. Closer inspection shows us that, explain it how we will, the people in these successive stages of advance are also separated by racial differences. We have the culture of the Turanian races, followed in time by the strangely tropical growth of the Valley of the Nile, which was in turn succeeded by the Semitic culture of Western Asia.

It further appears that different portions of the earth's surface have been at different times the seats of the most advanced culture. In this respect, both Asia and Africa hold an important position in the culture history of the world. There was the early home of Civilization, there first the light of history broke through the clouds of prehistoric times. The time was now at hand when the seat of learning and culture was to depart forever from the countries of its birth, to reappear with added lustre in a country beyond the blue billows of the Mediterranean, the

narrow strait of the Bosporus, the tossing waves of the Euxine. That country was Europe. There, for some thousands of years, a sturdy people had been passing through the various stages of Barbarism.

That long period was now past. The hills and vales of classic Greece had now caught and focussed the light of Oriental culture. And sunny Italy, too, had seen the daylight in the East, and was laying the foundation of its world-wide culture. These countries, however, formed but the most advanced outpost of the Aryan people. The grassy steppes of Russia, the vast forests of Germany, the fiord valleys of Norway, were likewise the homes of numerous kindred tribes, though some centuries were to elapse before they were to come to their full inheritance. Let us now take up this country; study its people in their collective sense; and learn of their condition in that primitive long-ago, before they commenced to move out of their common home; trace some of these migrations to distant portions of Asia; and, in short, study the development and scope of the Aryan, or, as we might call it, European Civilization. We have to inquire first, who were the Aryans, where were they when history dawns upon them, and where did they come from?

It has long been a matter of common understanding that the various languages of Europe are all more or less connected. There are many points of resemblance in the grammar, and even many of the words are the same. Interest in this matter was aroused to a still greater pitch when India passed into the hands of the English. The English officials, scattered in various capacities throughout the country, quickly became aware of the fact, that, not only was this language spoken in India to-day in some respects an European language; but they make the further

discovery, that, in the hands of the priestly caste, there were many volumes written in a tongue that but few could understand, though the books themselves were the sacred books of the Hindoos.

When a few scholars ventured to study this language, they found to their surprise that it, in many respects, resembled the modern languages of Europe. That language was the Sanskrit, and scholars at once set about its study. And, from that study, have come many theories concerning the Hindoos and the Europeans, and their connection with this ancient language. In short, a new science was given to the world, the science of Philology, or the comparative study of language. As a result of that study, we put into one class by themselves, as forming a closely related linguistic group, all the people of Europe, with but few exceptions,[1] and some of the people of Asia—such as the Persians, Afghans, and Hindoos and some of the but half-civilized tribes of the Hindoo Koosh mountains. We can say of the language of all these people, that their grammars are substantially the same, and that they possess great stores of common words. These words occur with a slightly different dress according to the general peculiarities of the individual language. That is to say, the common word appears in a slightly different dress according as it is used by English speaking people or Germans or Russians or Indian Brahmins. But, in all these cases, the real part of the word, the root—the nucleus—can be quite easily traced from language to language.

In another place, we have made the Aryans a principal division of the White Race.[2] All understand that this classification is one of convenience only. Of course, as the various bands separated from their common home,

[1] See This Series, Vol. II. p. 33, note 2. [2] Ibid. p. 82.

they must have become intermixed with other people. Keane asserts: "The Aryan stock itself, whatever its original constitution, has everywhere become so intermixed with non-Aryan people already in possession of the land that the very expression, 'Aryan,' has almost lost its ethnical value.[1]"

This collected group of people has not always been called Aryans. Some scholars have called them "Indo-Germans." Others have used the name "Indo-Europeans." The term, *Aryan*, is a comparatively late name for the great family of nations. It is derived from the Sanskrit word, *arya*, which means, literally, noble.[2] It is also the name of a small country near where the Asiatic Aryans (The Indians and Iranians) first made their home upon reaching Central Asia. Darius, the first great Persian king, has rendered the name immortal by announcing to the world in his funeral inscription at Naksh-i-Rustan: "I am Darius, the great king, the king of kings.....Aryan of Aryan ofispring."[3] We shall adopt it throughout, for it is the most convenient term, if not the most appropriate.

In wondering at the marvelous works of the past, and the more marvelous legends that cluster around everything that is ancient—myths that have been palmed off upon the world as historical facts—we are apt to overlook the fact that we are living in the midst of a far more enlightened world than the ancients ever dreamed of. We incredulously wonder at the ancient splendor of Assyria and Babylonia; we marvel at the architectural remains of

---

3 Dr. Oppert in "Records of the Past," Vol. IX. p. 75.

Egypt. We forget, that the Aryans began where all the rest left off, and that Aryan Civilization is far more worthy of our admiration. The Aryans have never yet been given full credit for the work which they have accomplished. Let us turn for a time from a slavish worship of antiquity, let us consider, that, if we wish to study art we visit Greece and Rome; if we wish to view the philosophy of the past, we must study Aryan classics; or, if we wish to gain a knowledge of any of the important or vital questions of the present, we turn to the Aryan scholars of to-day. Even in religion, the Aryans have furnished the world with the three most admirable systems of religion that have ever stirred the hearts of men. These are Zoroasterism, Buddhism and Christianity. As for the last, we shall see that it is and always has been pre-eminently an Aryan religion. Though of Semitic origin, it was discarded by the Hebrews. In short, all we can say of ancient culture is that it was the foundation on which Aryans built the massive superstructure of our present Civilization. The Aryans to-day include the progressive race of the world. The science and religion of the world to-day are Aryan. Let us then endeavor to come to a full understanding of the Aryan people and their culture.

The various Aryan people have not always been known by the particular names which they now bear. In ancient times, one important branch was the Celts. Though there is now no separate nationality known by that name, it was once applied to a great people who roamed over a large part of Western Europe. There were two groups of Celts, Gallic (spelled also Gaedhelic) and Cimric. The Irish are the descendants of the former, and the Welsh of the latter.[1] Historians have so often applied the name Gauls to the

1 Keane, Op. cit. p. 559.

Celts that the names may be interchanged freely, remembering that Gauls are always Celts but that the reverse need not be the case. Among the first German tribes to come into contact with civilized people, were the Teutons. Teutonic is a word that has ever since been preserved and may be applied to all German people. The name "Germans" had just come into use in the time of Tacitus, as he tells us in his Germania,[1] and it has ever since clung to the Teutons who have lived beyond the Rhine. From the third to the fifth century A. D., when the Western Roman Empire was about to fall to pieces, a number of entirely new German tribes came into prominent notice. These were the Saxons, Goths, Franks, Vandals, Burgundians, Suevi, Lombards, Angles, and others less prominent.[2]

The Slavonic Aryans, represented by the modern Russians, are a later people and form a distinct branch of the Aryan family. Along the shores of the Baltic, there exists to-day a peculiar people. They are called Lithuanians or Letts. Though not a numerous people, they have a language that is nearer the typical Aryan than any other existing form of speech. We know almost nothing about them, historically, and so can only guess alike at the date when they came thither and of the road by which they came. The most illustrious of the early Aryans were, of course, the Greeks and Latins. Thus far, we have mentioned those Aryans who dwelt in Europe. Europe has ever been pre-eminently the Aryan continent, but the Persians and the Indians may be mentioned as the most striking examples of Asiatic Aryans. A convenient grouping of the Aryans would be the Greco-Latins, the Celts, the Teutons, and the Slaves.

---

1 Chap. II.

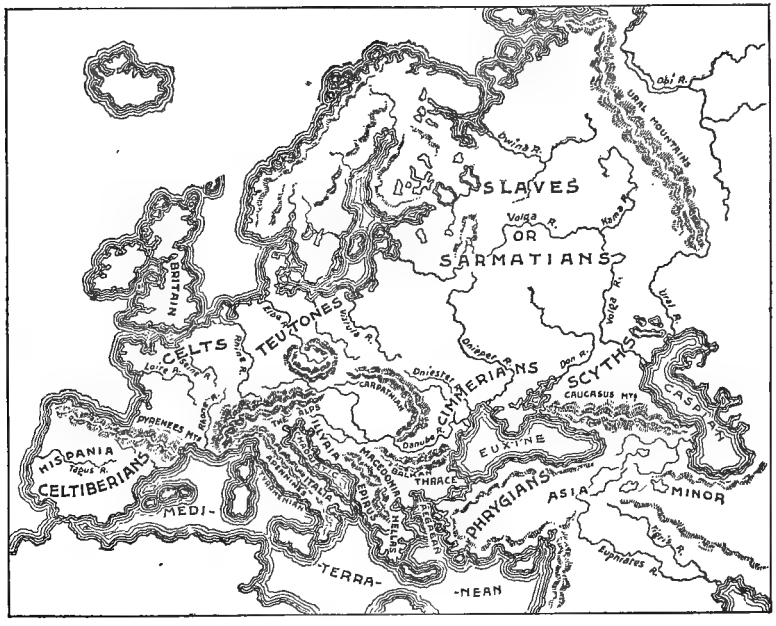
2 Freeman: "Historical Geography," p. 85, 87 and 97.

Now it must not, for an instant, be supposed that the various branches of the Aryan family have grown and developed side by side, each keeping pace with all the rest, and, finally, all together growing into our present Civilization. Such an idea would be far from the true one. Each one of the great nations, that have arisen from the primitive Aryan stock, has had its own period of growth and its own peculiar form of development. The so-called youngest, or Slave, family is still in its infancy and no one can prophesy what its future may be. The very first of what we may call Aryan civilization that appears to us in history was that of the Trojans, who were nearly related to the Greeks and Germans as we shall see later.[1] It was some six centuries after Troy had met her fate before the Persians arose to a commanding position among the nations of the world. Greece and Rome and the Neo-Persian civilization followed in quick succession, only to be superseded by the Romance and Germanic (including English) civilizations of our own time, upon which the sun in its daily course never sets. The light of Aryan civilization first dawned on the East, and there it first attained its meridian height. From that time until this, it has gone steadily forward toward the West, journeying backward for one brief period only, when the Persians arose to a commanding place among the nations of the world in the time of Darius the Great. It crossed the Atlantic, illumined the New World, and the waves of the Pacific, that break on the shores of Asia, will soon, let us hope, glow refulgent with its light.

Before endeavoring to locate the historical homes of

[1] The reader will find this fully treated in Schliemann's "Illios" and "Troja." We will speak of it in detail when we come to speak of the Greeks.

the several families of the Aryan race, we must familiarize ourselves with the geography of Europe, for we shall find that the stage of Aryan life and civilization has been principally upon European soil. From the accompanying map, we will see that Southern Europe is a series of peninsulas, projecting southward into the Mediterranean. Three of these peninsulas are more prominent than the rest. They are Greece, Italy, and Spain. The first was known to the



Map of Aryan Europe.

ancients as Hellas, the second as Italia, and the third as Hispania, or sometimes Iberia. The Black Sea was known as the Euxine. Between Hellas and the coast of Asia Minor, was the Aegæan Sea. The Hadriatic (or Adriatic) was the same as at present, while the western coast of Italy bore the name of Tyrrhenian sea from the Greek name for the Etruscans.

North of Hellas were Macedonia and Epiros, Thrace

and Illyria, ranging in pairs. The latter pair was separated from the northern land by the Balkan mountains. The Alps formed, then as now, the northern semi-circular boundary of the head of the Italian penisula. North of these two mountain ranges was the home land of the numerous German tribes, and north of Hispania was the country which Caesar called Gaul. Roman Britain corresponded pretty well to modern England. Wherever we have occasion to mention the great rivers of Europe, such as the Rhine, Rhone, Danube, Elbe, Vistula, Volga, Don, Dneiper, and Ural, we will use the modern names for them.

In a general sense, we may describe the location of the principal Aryan groups at the dawn of history as follows: The Mediterranean basin, including its great lake, the Black Sea, was the theater of action for the Greco-Latins. The Rhine and Vistula rivers naturally divide Central Europe into three great regions, roughly corresponding to the other three great divisions of the Aryans. The Rhine, in ancient times, formed the dividing line between the Celt and the Teuton, while the Vistula, in more modern times, separated the Teuton from his Slavic kinsman. In very ancient times, however, it is supposed that the Germans were confined to the territory between the Rhine and the Elbe, but they afterwards crowded farther east.

Of course there must have been a time once, when there were no well marked divisions among the Aryans. We have also seen that there was once a time when Europe was in the firm posession of Turanian people. If, then, we were permitted to glance down the long vistas of time, we finally come to a period when the Aryans, as such, can first be distinguished. That time was long before historic

eras. The glaciers had come and gone; the Neolithic Age, had come with its unnumbered hosts of Turanian people, who, after populating these fair lands for unknown ages, were now passing away before the superior culture of the advancing Aryans. The Bronze Age was fast approaching

Lithuanian Forest.

its culmination. The physical features of the country were much the same as now, but nature was permitted to hold wild and universal dominion over almost the entire land.

Man had not yet learned to hew down the forest trees and to drain the marsh tracts. The steppes of Russia were the pasture lands for innumerable flocks and herds. The forests of the north, and the marshes of the lake regions were the homes of the buffalo, the bear, and the boar, and were still inhabited by fierce Turanian tribes. We know but little about the Aryan population there until long after historic times.

As time passed and migrations went forward, the primitive Aryans split up into the great divisions we have roughly outlined. In the forest or marshy region, just described, were located the Slaves or Sarmatian people. Ancient Germania, with its great Hercynian forest and Teutoberger wald, so fatal to Varus and his legions, was the home of all Teutonic nations. It was a country generally bristling with forests, or reeking with swamps.[1] There were river valleys, however, that yielded rich harvests of grain, and every tribe had its flocks and herds. The men were hunters and warriors. Their homes were the forests where they concealed their straw-thached huts, or in whose secret depths they waited the approach of their foes.

The Rhine formed a natural barrier between the Teutons and the Celts, and its shores were their common fighting ground. The latter floated their small crafts down the Rhone, and occupied the valleys and passes of the Pyrenees. They pastured their flocks and galloped their horses through the valleys of France. They snatched the forests of Britian and the bogs of Ireland from the aborigines, and they swept down the valley of the Po on their plundering expeditions. Though they had fixed habita-

1 Tacitus: "Germania," Chap. v.

tions, they were the most unsettled and warlike of the ancient Aryans, and would desert their homes on the slightest provocation to wander about in search of new ones.[1]

Celtic Warriors.

As we propose in this chapter to learn all we can about the primitive Aryans, it will be well to understand that historians are wont to imagine a time when the ancestors of these varied and widely separated peoples all dwelt together in some peculiarly favored land. Pictures of this primeval Aryan home have been painted in the

[1] Caesar: "Gallic War," Book viii. chapter 26.

most glowing colors that language can furnish, and one needs wonder why some of the ruder tribes of antiquity should have so fallen from the state of culture that the primitive Aryans are represented as attaining. Let us remember, therefore, that, when we study of the primitive Aryans, we are but passing through the shadowy lands of legend and myth, and that many of the pen pictures that we find are almost purely imaginary. Linguistic history tells us all that we know of the primitive Aryans in their primeval home. We can rely upon it, and upon it only. It tells us that all these nations had a common origin and, therefore, a common ancestry. This would necessitate their coming from a common country; but, as to where that country was, language tells us nothing.[1]

Now, in a word or two, we can explain how we gain our information of the life, habits, and degree of culture that the primitive Aryans had attained before any of their descendants had left their home-land. By comparing the Aryan dialects, we find that they have identical words (observing the vowel and consonant changes according to Grimm's law) for father, mother, brother, and sister; and, in fact, they had the same endearing terms to express almost all of our family relations. So we are sure that the Aryan home in all its purity existed in those prehistoric times. So, likewise, we learn that they had their household gods, the spirits of departed ancestors. They must have had all the beliefs accompanying such a worship. They had advanced to the stage of worshiping the great nature fetiches. The clouds, the lightning, the sun, moon and stars, in fact, anything in nature phenomenal, startling, or inexplainable, may have been personified and worshiped.

---

[1] Whitney: Am. Cyclopedia.

A similar system of tribal government was common to all of them. They had their herds of domestic animals, and understood the cultivation of some of the cereals. They dwelt in villages and in thatched huts. These villages are said to have been joined by roads, probably similar to the Indian trails so common among the aboriginal Americans. Over these paths, the primitive peddler may have borne his pack of foreign wares to exchange for native produce. The common word for sea would tend to locate the primitive home near some large body of water on which they rowed their skiffs. Words for the oyster and pearl were common to them all. So, likewise, we know that they dwelt in a land where snow and ice were common, and where the birch and fir trees grew; but we find no indications of Oriental luxury and enervating climate. As the primitive Aryans were but slightly acquainted with metals, they could have possessed only the rude weapons common to the closing stages of the Neolithic Age.

Thus much does language teach us of a primitive Aryan people, before they commenced their migrations. If we try to penetrate further into the past, language refuses to be our guide. It will tell us nothing by which we can locate their primeval home on the map. When we try to follow the route of any Aryan people back to the land from which they came, language is silent and will not cast a ray of light upon these long forgotten paths. If we attempt to approximate a date at which the dispersion took place, we find that language furnishes us no reliable data to build upon, after we ascend into the realms of prehistoric times. We can only conclude, then, that all the highly colored pictures of primitive Aryan life owe more to the imagination of the artist than to the information drawn from language.

Some of these pictures are falsely drawn by allowing some of the historical Aryan people to sit as models, though they must be clothed in their most primitive historical garments. One will describe the primitive Greek, another the Latin, and a third the Hindoo, as a typical primitive Aryan. This is wrong and gives us erroneous ideas of that primeval land and people. We shall, therefore, not follow this method. We shall take each of the more primitive of the Aryan families and try to form an idea of their mode of life when they first appear in history. In doing so, we shall use only legitimate sources of information such as language, ethnology, archaeology, and, perhaps here and there, draw some imformation from legends wherever there appears to be a thread of historical light to guide us.

But, first of all, let us institute a search for the primitive home land of the Aryans of which so much has been written. None of the Aryan traditions afford us any light. Our scholars are not agreed on this point, and, as a consequence, we have several hypotheses to choose from. As an aid in this matter, let us study the historical migrations of the various branches. The general directions, in which the movements have taken place, may give us some useful hints; if we can trace two or more lines back to an intersection, we may come upon this much sought for country. We will, therefore, begin with the purely historical movements of these people, and journey backward into the labyrinth of their past wanderings as far as we can find a thread of light to guide us.

For our purpose, it is not necessary to notice all the modern or historical movements of the Aryans. There are two kinds of migrating movements. Ordinarily the migration of races is a very slow process. It may be

likened to a gradual spread of species from some center of dispersion. It results in a mixture of races. The stronger race will predominate and, almost always, give its language and culture to the weaker people, who become, in fact, serfs or slaves. This will account for the mixed ethnical character of all the people of Europe. In fact, there are no pure races anywhere. Another form of migration was, however, quite common among people in tribal life. When a territory became so densely populated that the land was unable to support its population, it was not uncommon for a vast horde, perhaps several tribes, to start on a long journey in search of new homes. In this case, they took with them their wives and children, their flocks and herds, and all their movables. It took the form of a great military expedition, and sometimes they journeyed a long distance before they reached a land enticing enough to hold them. If they found a desirable locality, before effecting a permanent settlement, they had to conquer the tribes already in possession of the country. Such a result was as sure to lead to a mixture of people as the first one.

Shortly after the Christian Era we find the legions of Rome strongly guarding that portion of their empire bordering on Germania. For some centuries, they thus held back the ever swelling flood of Germanic people. But the time at length came when Imperial Rome could no longer protect her frontiers, and the great streams of Gothic people forded the rivers and poured over the mountains upon the lands of the Roman, Greek, and Celt.[1] This great migration of Teutonic people occurred during the fourth and fifth centuries, and resulted, as we shall see later, in the destruction of the Western Empire of Rome.

---

[1] Freeman, Op. cit. p. 87 *et seq.*

It was also the first step toward the origin of modern nations. At present, however, we are concerned only with the general direction of this great movement of Aryan people. The Germans crossed the Danube, the Alps, and the Rhine, and, journeying to the south and west, secured there new homes. It required less than two centuries for them to establish their power over all of Western Europe and even to conquer the opposite coast of Africa.

Passing rapidly along toward ancient times, we find the Celts at the height of their power during the third and fourth centuries B. C. During those two centuries, we find that they are continually pouring through the passes of the Alps, down into the valley of the Po, and threatening to deluge Rome herself. Near the beginning of the third century,[1] we detect a great movement of Celts to the south and east. Stopping on their journey for a season or two, they gathered the wealth and plundered the inhabitants of Thrace and Macedonia. Then they moved onward, crossed the Hellespont, and, finally, were induced to settle in Asia Minor. There they have dwelt ever since, having founded the province of Galatia. They were preceded by another army of Celts who burned Rome in 390 B. C., and thence turned toward the east, settling in Thrace.

This is about as far as we have historic light for the movements of Aryan people in Western Europe. But, as we shall see in a following chapter, the probabilities are, that the ancestors of the Aryan population of Central Italy were Celts. Let us notice that all the movements of the ancient population of Italy were toward the south.

---

[1] Some identify these Gauls with the army that burned Rome in 390 B. C. Others claim that it was a later movement, 280 B. C.

As if yielding to an irresistable pressure of Celtic tribes from the north, the Sicles entered Sicily; the Iapygians passed down the Adriatic coast, and the Latins also came from the north. Let us now consider Aryan movements in South-eastern Europe and Asia Minor. It is distinctly stated by Herodotus[1] that Darius, the great Persian king, planned his expedition into Europe to avenge the Medes and Persians for the wrongs that they had suffered from the invasion of certain Cimmerians during the seventh or eighth century B. C. Some historians claim that these Cimmerians were Celts, and some think that they were Teutons. The latter are, no doubt, right.[2] These Teutonic tribes are said to have crossed into Asia through the passes of the Caucasian mountains,[3] and, in fact, Cimmerian invasions from Europe into Asia, by way of both the Bosporus and the Caucasus, were not uncommon occurrences. Many of the Scythic tribes of Herodotus are now known to have been Aryans,[4] though the particular group to which they belong has long since become extinct.[5] Sometimes the Cimmerians alone poured over the mountains; sometimes they allied themselves with their near kinsmen, the Thracians, and invaded Asia, both by land and by water, all along the line between the Aegæan and Caspian Seas.[6] We have all evidence that these Germanic tribes, the Cimmerians and the Thracians, but especially the former, formed a numerous and warlike

[6] Strabo, Book i. Chap. 3, section 21.

people. Strabo says that they "were once sovereigns of the Bosporus,"[1] and, again,[2] that, after Trojan times, their invasions, together with other people mentioned, "threw everything into confusion." To some of these invasions, a much higher antiquity is given. Eusebius mentions one as occurring as early as the eleventh century B. C.[3] Though Herodotus does not mention this particular incursion, he does regard the Cimmerians of sufficient importance to give their name to a portion of the Bosporus. He mentions, besides, Cimmerian castles and a Cimmerian ferry.[4]

If we can at all depend upon the accounts of these ancient historians, Cimmerian and Thracian Aryans were for several centuries a terror to the most enlightened portions of Asia Minor.[5] Right here, it may not be inappropriate to remark, that, were we to seek for the origin of those Aryan characteristics and racial qualities, peculiar to the Alarodians of Caucasia,[6] we would find that these various incursions of Thracians and Cimmerians could point to the source of this Aryan influence, and explain the origin of this branch of the White Race. Then, if the Hittites were akin to the Alarodians, as some authors believe, we at once detect a possible source of that more than Turanian energy with which they ruled Asia Minor. Here, notice in particular, that for many centuries preceding the fourth century B. C., Germanic tribes were constantly threatening Asia Minor from the north by way of Caucasia and the Hellespont. No doubt from time to time, they effected a lodgment in that country. We have had occasion to mention the fact, that, as early as the

middle of the eighth century B. C., they had established themselves at Sinope, on the southern shore of the Black Sea.[1]

Group of Caucasians.

At an earlier date still, there was the Dorian migration into the Peloponnesus, when great tribes of Dorians, a Grecian people, came down from the north (Twelfth Century B. C.) and drove large numbers of Ionians, and Aeolians across the Aegaean into the coasts of Asia and the

[1] Ibid. p. 728.

Isles of the sea, only to follow them at a later date. As we shall see in a following chapter, this movement was caused by the pressure of tribes from the north; the Epirots encroaching upon the Thessalians, and these in turn pressing upon the Bœotians, and there is no doubt, but the Teutons were at the same time coming down the Danube and crossing the Balkan mountains to take the place of the people whom they crowded forward.

Greek Brigands.

If the storied siege of Troy by the allied Greeks bear any meaning to the historian, it is, that there was an ever southward pressure of Grecian tribes that finally poured an enormous migration upon the coasts of Asia Minor. The result of this migration was the destruction of Ilios and

the ravaging of all the towns along the northern coast. The conquerors of Troy probably took immediate possession of the adjoining territory where the most of them settled. The wanderers that may have turned back toward their fatherland were but few compared with the hosts that first set out upon these adventures. The poet makes Achilles boast of having stormed and conquered a number of cities before force enough had assembled upon the plains of Troy to attack the principal Trojan stronghold. Here, too, we must note the constant tendency of the Aryans to spread toward the south and east.

At an extremely early date, the Thracians were a great and widespread people. Herodotus[1] says that they were the most numerous of all people except the Indians. In fact, their importance was so noticeable that some ancient writers "divide the world into Asia, Libya (Africa), Europe, and Thrace".[2] They were blue-eyed and red-haired—"a most martial and highly musical people, much given to Bacchic habits, but also to philosophical speculation."[3] All historical evidence points to the fact, that they were the ancestors of the Mysians and the Phrygians, the latter of whom were the acknowledged ancestors of the Trojans.[4] The Thracians are themselves said to be of Germanic origin.[5] All these people, then, were Aryans. The ancestors of the Phrygians must have migrated from Europe into Asia, for it is an admitted fact that none of the Aryans west of the Halys river could have entered Asia Minor in any other way.[6]

When we come to assign a date to the migrations that

brought the ancestors of the Phrygians across the Hellespont, the "research of the spade" at Troy has enabled us to "penetrate into a past, of which German tradition had forgotten the very existence".[1] At the beginning of the twelfth century B. C., [2] the great city of Troy was flourishing in all the splendor of Oriental grandeur. For ages before this time, the Babylonian caravan had made its way across the country and brought wares to the Mediterranean sea-board. The Hittite merchant was, no doubt, a common sight on the streets of Ilios. In the thirteenth century, the historical inscriptions of Rameses III. tell us of Greek and Trojan allies among the foes of Egypt.[3] When the Libyans made war upon Menephthah,[4] in the fourteenth century, the Trojans united their forces with the enemy of their old Egyptian foe. When the Hittites made war upon the great Pharioh, Rameses II. in the fourteenth century, the Dardanian Trojans had already identified themselves with the enemies of Egypt and joined the Hittite expedition.[5] This foreign Greek and Trojan element among the enemies of Egypt is mentioned on the monuments even before the epoch of the eighteenth dynasty or about the close of the eighteenth century B. C.[6]

Thus in our search for the first appearance of the Phrygian Aryans in Asia Minor, we must go back of the siege of Troy. We must pass over the reigns of the nineteenth and eighteenth Egyptian dynasties. Still we find that the Aryans are sought as allies by Asiatic powers. The sun of the Neolithic Age had not set on the shores of the Mediterranean, when the Aryans first erected a citadel on His-

sarlik, the site of Troy.[1] Do we try to go back farther, we are lost in the gloom of antiquity. Still the Phrygian, ancestors of the Trojans, must have crossed the Hellespont at a much earlier date. To what a remote age does this point, and yet, how plainly are we told, that even then the German tribes were pressing down upon the Thracians who in turn were forced to cross into Asia and there find homes. Of a truth, these Aryans must have been in Southern Europe at a very early date in the history of mankind.

It will be noticed that none of the movements we have been considering are those of the Slavonian Aryans. Where were they during this long period of time? While the Celts, the Grecians, and various Germanic people were making these great migrations, apparently radiating from Central Europe, were the Slaves living in contented quietness? Or were they also sending out great immigrating bands, and winning for themselves new homes by foreign conquests? Let us see what the probabilities are.

The first historical appearance of the Slaves was not until the sixth century of our era. They were at that time situated in Central Russia. The increasing pressure of Turanian tribes, sallying out of the wilds of Siberia, impelled the Slaves toward the west and south. They crossed the Danube river and the Balkan mountains, and settled in Thrace and Macedonia. How long a time, now, before the sixth century, had the Slaves been living in Central Russia? The probabilities are, from that same primitive long-ago, when the Phrygian Aryans crossed the Hellespont and intrenched themselves on Hissarlik, at Troy.

---

1 Sayce, Op. cit. p. xii.

Scholars who have studied this question assure us that, from the very earliest times, the Slaves were confronting the Germans on the east, and, in fact, were slowly pressed east by them. Sayce calls our attention to the significant fact, that both the capitals of modern Germany, Berlin and Vienna, stand on ground that was once Slavonic.[1] Latham declares there was once a time when Slavic dialects were common everywhere between the Elbe and the Dnieper rivers.[2] Quatrefages tells us that the Germanic race clashed with the Slaves in the basin of the Oder. His conclusion is: "The Slaves settled on the Vistula at a pre-historic period and possessed its entire basin."[3] In fact, everything seems to point to the conclusion that, at the same early date at which the first great divisions of the Aryans appeared in Europe, the Slaves were located in Russia, and for unknown centuries they wandered back and forth on its grassy steppes. Unless they differed from the other Aryans, they must have also sent forth from time to time great bands of migrating people. Where could these bands go? To the west and south-west were numerous Germanic people, of all Aryans the most energetic, who as just stated, instead of yielding before the Slaves, gradually forced them east from the Elbe. To the south, were the numerous and warlike Thracians, Cimmerians, and Scythians, preventing any movements in that direction. One course only was open to them. Passing to the north of the Caspian Sea they could easily invade Asia, and possess themselves of the territory contiguous to the Caspian. Let us, then, turn to Asia and see what traces we can find of Aryan people in that

1 "Science of Language," Vol. II. p. 94.
2 "Man and his Migrations," p. 180.
3 "Prussian Race," London, 1872, p. 12.

great continent, and the directions of their movments.

Asia has always been preeminently the home of the Yellow Races, as Europe has been of the Aryans. We have seen in Western Asia, that the Semites gained possession of the country and have seen that supremacy passing into the hands of the Aryans; yet time has brought around the first conditions again, and once more a Turanian people are rulers in that section. Comparatively speaking, but a small part of Asia was ever in the hands of the Aryans. In historical times, we find them in possession of Northern India, Persia, Armenia, the Bactrian country, and the adjacent mountains. It is further true that we find traces of Aryan blood in Southeastern Asia where we had least expected to find them. Only in very recent times are conditions changing, and Aryan culture and influence are on the increase.

Let us refer first of all to traces of Aryan influence in Eastern and Southeastern Asia. In Treating of China, we made mention of the Chows, as an invading and conquering people, who appeared on the confines of China about the twelfth century B. C. It is stated, on excellent authority, that these Chows were, in part, Aryans.[1] But at a far earlier time, other invading people had passed east through the Gates of Kashgar and overrun portions of China. It is supposed that these people, the Jungs, were also, in part, of Aryan blood.[2] It is further supposed that the so-called aboriginal tribes of China are quite largely descendants of these partially Aryanized people.[3]

We have also learned of the wide extension of white blood in South-eastern Asia. We can not say that the source of this element in the ethnology of this far away people was Aryan, and yet, to our mind, this presents the

The Ainos.

easiest solution. These Aryan tribes, who thus wandered far to the Orient, became, in time, so hoplessly mixed with the surrounding people that they lost their distinctive race qualities. It is, for instance, only of late years, that we

have recognized in the Ainos of Japan a white people.[1] They probably come the nearest to proving an exception to the remark, that there are no "White Savages." We are only acquainted with them in modern times, when they have long been ground under the cruel dominion of the Japanese. They are now rapidly approaching extinction. Once the sole inhabitants of the chain of islands extending south of Kamtchatka and including the Japanese islands, they have been compelled to retire before a more civilized people, coming, some from the mainland, others, perhaps, from the islands of Polynesia.

It seems, also, that the aboriginal inhabitants of Corea belonged to the white stock.[2] They were gradually outnumbered and absorbed by the yellow stock, owing to the constant migration from the Chinese province of Pechilli. The typical features of the whites—oval features, light complexion, blue eyes, etc.—are plainly discernible in some instances. It is said: "But for the speech and costume one might often fancy one self surrounded by Europeans."[3]

In regard to the further extension of this eastern branch of the White Race, it is well to bear in mind that we are speaking of a subject which is as yet far from being a settled one. However, modern research seems to establish the fact, that, within comparatively recent times, they spread themselves very extensively over the Islands of Polynesia—in fact, that the present inhabitants of Polynesia are, at the base, a White Race. Where the older writers speak of the *Malayo-Polynesian* people, we have to change

Isles of the sea, only to follow them at a later date. As we shall see in a following chapter, this movement was caused by the pressure of tribes from the north; the Epirots encroaching upon the Thessalians, and these in turn pressing upon the Bœotians, and there is no doubt, but the Teutons were at the same time coming down the Danube and crossing the Balkan mountains to take the place of the people whom they crowded forward.

Greek Brigands.

If the storied siege of Troy by the allied Greeks bear any meaning to the historian, it is, that there was an ever southward pressure of Grecian tribes that finally poured an enormous migration upon the coasts of Asia Minor. The result of this migration was the destruction of Ilios and

the ravaging of all the towns along the northern coast. The conquerors of Troy probably took immediate possession of the adjoining territory where the most of them settled. The wanderers that may have turned back toward their fatherland were but few compared with the hosts that first set out upon these adventures. The poet makes Achilles boast of having stormed and conquered a number of cities before force enough had assembled upon the plains of Troy to attack the principal Trojan stronghold. Here, too, we must note the constant tendency of the Aryans to spread toward the south and east.

At an extremely early date, the Thracians were a great and widespread people. Herodotus[1] says that they were the most numerous of all people except the Indians. In fact, their importance was so noticeable that some ancient writers "divide the world into Asia, Libya (Africa), Europe, and Thrace".[2] They were blue-eyed and red-haired—"a most martial and highly musical people, much given to Bacchic habits, but also to philosophical speculation."[3] All historical evidence points to the fact, that they were the ancestors of the Mysians and the Phrygians, the latter of whom were the acknowledged ancestors of the Trojans.[4] The Thracians are themselves said to be of Germanic origin.[5] All these people, then, were Aryans. The ancestors of the Phrygians must have migrated from Europe into Asia, for it is an admitted fact that none of the Aryans west of the Halys river could have entered Asia Minor in any other way.[6]

When we come to assign a date to the migrations that

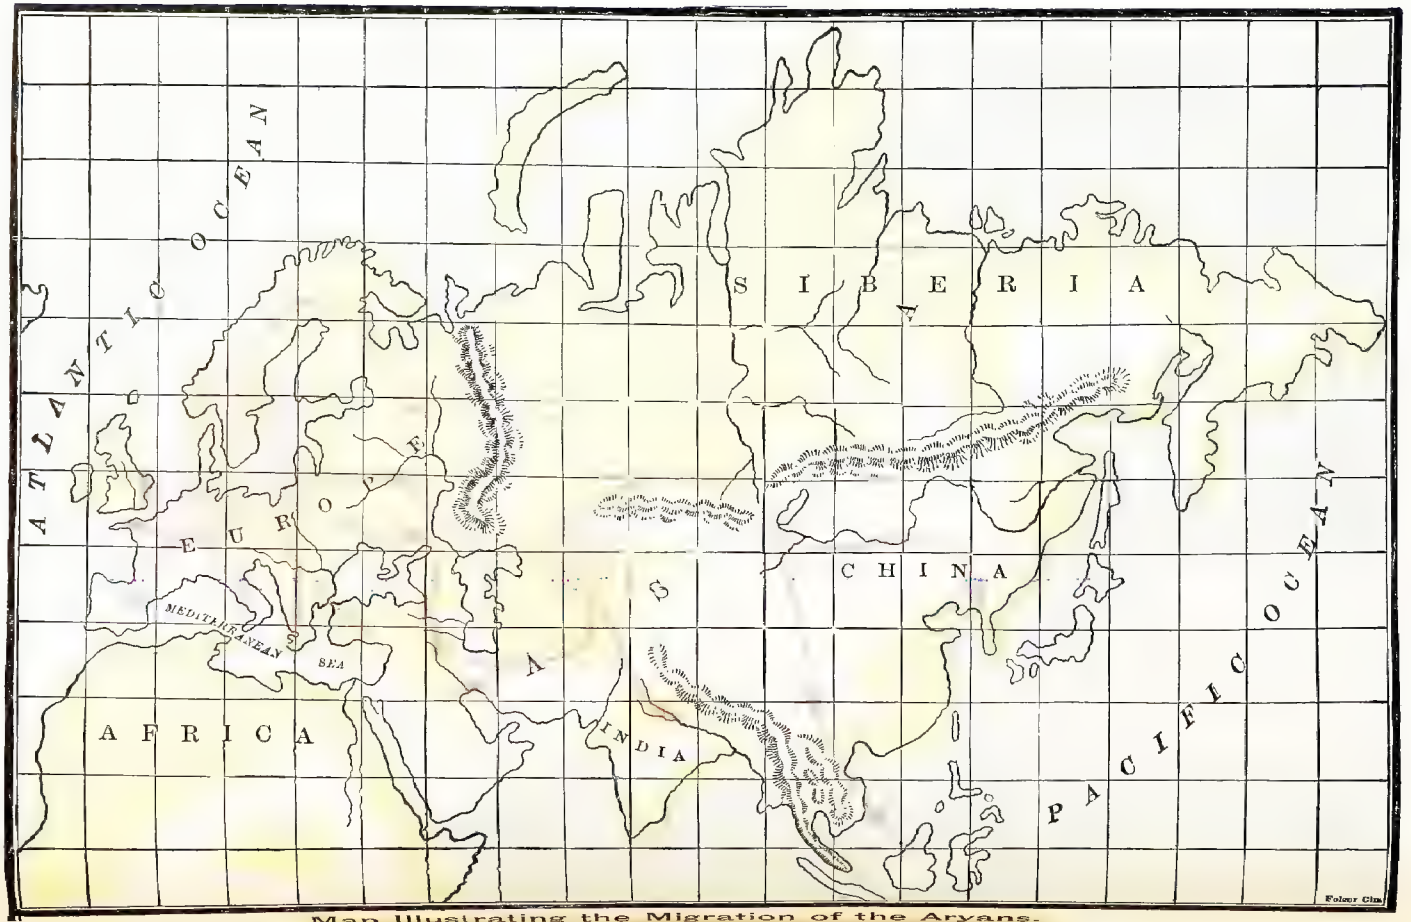
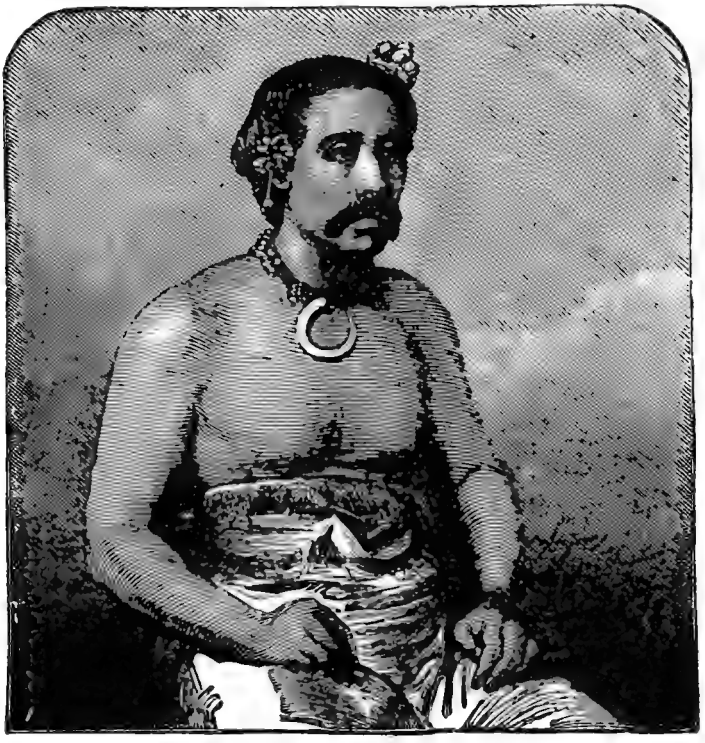


Map Illustrating the Migration of the Aryans.

languages have been compared, and all points bearing on the ethnology of the people have been examined. The Island of Boeroe, between Celebes and Ceram, is usually considered the starting point. In fact, all recent authorities are agreed on this point. It remains only to point out how all explorers have praised the fine personal appear-



Polynesian Chief.

ance of the true Polynesian Islanders. They are invariably described as being possessed of fine symmetrical proportions, tall in stature, and with handsome, regular features. Their hair is smooth but not lank, often curly and wavy, and the beard is naturally full, though often artifically removed. They are furthermore declared to be of a cheerful and joyous temperament, of a frank and truthful disposition,

and of a kindly nature. All this forms a type distinct from the typical Yellow Races of Asia.

As we have remarked, we have no assurance that the Aryans were the source of this white element. Yet we must notice that, from an extremely early time, we have evidence of Aryan tribes marching east through the Gates

Cambodian.

of Kashgar to debouch on the plains of China. We have seen these tribes steadily pressed to the south by fresh migrations of Mongolian people in China. It is almost impossible to escape the conclusion that the white element in Cambodia was derived from that source. At a later time, we see the Polynesians starting from the islands near

the coast of Farther India, setting out on their great migrations that finally peopled the Islands of the Pacific. This migration being so recent in time that we can gather the details of it from native songs and traditions.

Turning to the movements of the Aryans in Western Asia, we find that they played quite an important role in history. They fall mostly into two great divisions, the Indians and the Iranians, and of the latter the Persians from the greater part. We know that, at an early date, the Persians branched off from the Indians who were then dwelling in and about the Hindoo Koosh mountains somewhat to the north and east of historical Persia. The Aryan ancestors of the Indians first journeyed through the passes of the Hindoo Koosh mountains,[1] and took possession of the Punjab, or the north-western portion of modern India. Thence, they followed the river courses to the south and east. While Aryan blood does not form a marked characteristic of the southern Hindoo, the northern part of modern Hindoostan is decidedly Aryan; and Aryan culture, language, and influence have penetrated to the remotest shores of the peninsula. The date at which the first Indian tribes entered India will, perhaps, never be known. This much is true, however, that they were a people separated from their kindred before their literature, known as the Vedic literature, began to crystallize into its historical shape. The Persians had a literature of their own, but it was a later formation. As some of the Vedic hymns relate to about the fifteenth century B. C., we are safe in inferring that the Vedic Age extended back at least as early as that date.[2]

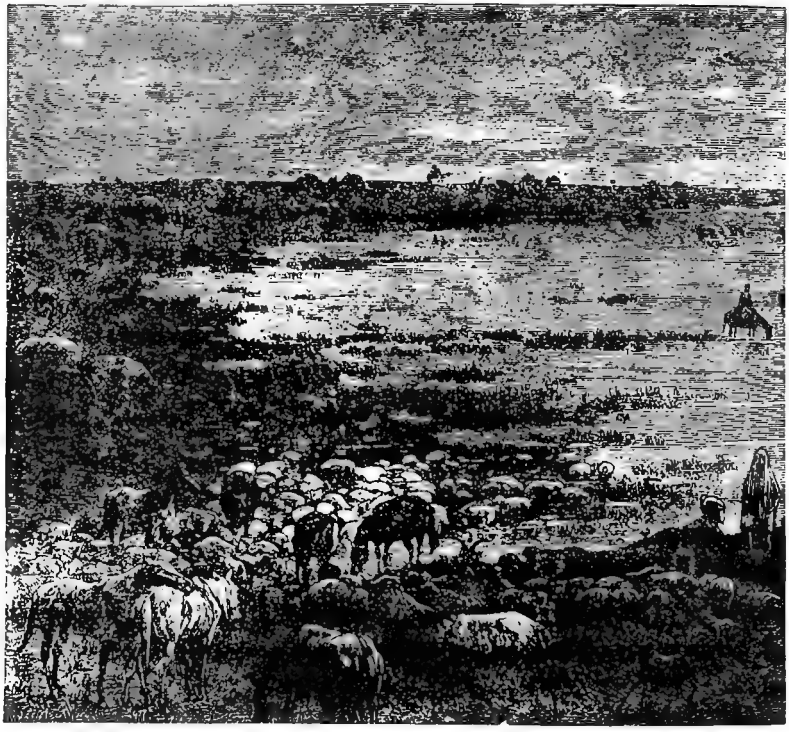
[1] Thomas in J. R. A. S., 1883, p. 378-86.

[2] Muller: "Science of Language," Vol. I. p. 210, 147, New York, 1881. There is also good authority for saying, that the Indians separated

Now the Persians or Iranians were a colony of Indians that separated from the latter, while they were encamped at the foot of the Hindoo Koosh.[1] This separation must necessarily have taken place at an earlier date. The Persians, turning toward the south and west, must have driven out and occupied the homes of a more primitive



Aryan Encampment on the Shores of the Caspian.

people. The earliest traditions of the Indians and Iranians point to a home on the source of the Oxus and Jax-

themselves from the Iranians in the Bactrian land, the former journeying toward the Punjab. The period of the separation is often placed at 2000 B. C., or some time previous to that date. See Whitney: "American Cyclopedia," Vol I. p. 800, also Duncker: "History of Antiquity," Vol. IV. p. 27, (English Edition).

[1] Muller, Op. cit. p. 248.

artes.[1] Here they dwelt before they crossed the Hindoo Koosh.[2] This takes us back to a very remote period, many centuries before our era. For Muller tells us that "along the Caspian, and in the country washed by the Oxus and Jaxartes, Aryan and non-Aryan tribes were mingled together for centuries."[3] It will thus be seen, that, as far as the movements of the Aryans in Asia can be traced back, they seem to converge toward the territory to the east of the Caspian. Can it possibly be, that there is any connection between these Aryans and the Slavonians? To-day we know it to be a fact, that Russian influence is spreading far and wide in Asia. Can it be, that such has been the course of history ever since the Slaves found themselves cramped for room in Russia? When the German tribes pressed the Slaves to the east of the Elbe, did they discharge themselves upon Asia? Can it be, that, whereas we find the Russian and the English (a Slavic and a Germanic people) confronting each other in almost hostile array in Asia, we are but witnessing the final moves in that great inter-racial game begun ages before the dawn of history, in the valley of the Elbe in Germany, from which narrow field the Germans moved to the West, the Slaves to the East, and are now met for the final test of strength in mid-Asia?

This would, indeed, be a reasonable theory if we could find any satisfactory ground for concluding that the Iranians and Indians were more closely related to the Slavonians than to the other members of the Aryan family. Language certainly seems to afford some help in this matter. We have already mentioned, that Sanskrit was the original tongue of the Indians and Iranians. Now,

1 Ibid. p. 239. 2 J. R. A. S. 1883.
3 "Science of Language," Vol. I. p. 243.

almost all scholars unite in establishing the close relationship between the Letto-Slavic dialects of the Letts, on the shores of the Baltic, and the Sanskrit. They almost universally claim for the former a nearer relationship than can be ascribed to any other of the Aryan languages.[1] It is further pointed out, that the Scyths and Sarmatians, who dwelt on the plains of Russia in ancient times, used a dialect that had many points in common with the Iranian dialect.[2] One curious bit of proof is pointed out by Mr. Morgan. It seems that the Slavonian people in Europe have certain peculiarities in their system of relationship not met with in any other of the European Aryans, but they do re-appear in the tribes of India.[3] Thus we find considerable to induce us to believe that the Iranians and Indians of Asia are more closely connected with the Slavic Aryans of Europe than with the remaining Aryans. In fact, this is admitted by all scholars of note.

Now Asia, from the earliest times, was the home of the Yellow Races. If the Slaves were confined in Russia until they gathered strength to sweep all before them, their invasion of Asia must have resulted in a great disturbance. Now we have seen, that, about the twenty third century B. C., there was a very great disturbance among the people in Western Asia, and, strange to say, the lines of these movements seem to diverge from the Caspian basin. Then it was, that Turanian tribes, marching east through the Gates of Kashgar, followed the course of the Hoangho and laid the foundation of Chinese culture.[4] It was at this time,

---

[1] Sayce: "Science of Language," Vol. II. p. 94. Whitney: "Study of Language," p. 215. Latham: "Comparative Philology," p. 610. Freeman: "Historical Geography of Europe," p. 15, London, 1881.

[2] Sayce: "Comparative Philology," p. 396.

[3] "Systems of Consanguinity and Affinity," p. 43.

[4] This Series Vol. II. p. 424 *et seq.*

also, that the Elamite tribes suddenly invaded Mesopotamia and conquered Chaldea.[1] Then it was, that Asshur went out from Accad and laid the foundation of Assyria, and at that time, also, the Hebrew people took up their line of march from the head of the Persian Gulf to the West. And, as already pointed out, the waves of migration carried the Hyksos kings into Egypt.

When we reflect, that the date of these movements corresponds remarkably well with the presumed first appearance of the Aryans in Asia, and when we observe further, that these movements are just such as we would expect to follow from the sudden appearance of a great host of Aryans forcing their way among thickly settled Turanian tribes: it seems difficult to avoid the conclusion, that it was at this time (2300 B. C.) that the Slavonian Aryans bore all before them, and marched, a resistless host, from Russia, by way of the northern shore of the Caspian, into Asia.

As a result of our examination into the movements of Aryan people, as far as known in history, we conclude that the lines of these movements converge in the territory around the Baltic in Europe. Here seems to have been the point from which they marched, some to the west, others to the south, still others to the east; and, as we have seen, Europe was not the only field of their activity. Indeed this seems to have always been their center of dispersion, not only of prehistoric times, but of historic times, and is true of today. We are therefore prepared to believe that the original home of the Aryan Race was that portion of Europe immediately adjacent to the Baltic sea.

Yet, when we turn to examine the writings of our

---

[1] Ibid.

scholars on this point, we are surprised to find that this is not the generally accepted view. They speak and write of the Aryans as originating in Asia. They picture forth a series of migrations by which they came into the possession of Europe. Our surprise is somewhat abated when we discover that it is only the older writers who are nearly unanimous in favor of the Asiatic Origin. Of late years, the tide seems to be setting just as strongly the other way. As this question is, for our purpose, a very important one, let us see what our scholars have to say on this point. Many suppose that Philology has fully settled this question. Let us first examine this point. The classical or literary language of the Indians is called Sanskrit. This, together with Latin, Greek, Teutonic, Celtic, and Letto-Slavic, forms a great sisterhood of languages that was, at some time in the past, derived from a single more primitive form of speech, that was probably used by our primitive forefathers in their primeval home. This lost and forgotten tongue is spoken of as the primitive Aryan language, and many attempts have been made to reconstruct it.

Scholars are divided as to which known dialect comes nearest to this primitive tongue. Some regard the Letto-Slavic dialects as the nearest co-geners of the typical language, while others claim that place of honor for the Sanskritic. On this claim alone, some philologists wish to locate the home of the primeval Aryan tribe as near as they can to the region where the Sanskrit was first found to be in use. But as further study proves that all the people who use Sanskrit dialects have moved from some unknown place to their present abodes, they have further to decide on some suitable place for the common starting point. They have, therefore, settled upon an indefinite point in Central Asia, somewhere near the the shores of

the Caspian Sea. The only ground for this choice being, that such a location is near the Sanskrit speaking people. The claims of the Letto-Slavic dialects to a closer relationship to the primitive tongue than any other[1] being utterly ignored.

In regard to physical surroundings, the choice is not a very happy one. This region has been, from the very dawn of history, totally unsuitable for the production and support of such a hardy, energetic, and vigorous race as the Aryans. If the Trans-Caspian territory and the lands along the Oxus and Jaxartes were the primitive home of the Aryans, we must needs transform it from a barren table land and sandy desert waste to fertile fields, and cover it with cereals and meadows, suitable for the maintenance of men and animals indigenous to temperate lands.[2]

But let us inquire more particularly into this argument of language. All must admit that the results of comparative philology, if rightly understood and applied, are a great help in tracing the early history and culture of a people. Yet it is not an infallible guide, and we must take into consideration other sciences, such as Anthropology and Ethnology. Of late years, there is a tendency to question some of the conclusions so confidently urged by philologists.[3] But those who appeal to Caesar must stand by Caesar's judgment. We have seen that good grounds exist for claiming that the Letto-Slaves are nearer the original Aryans in speech than any other, why not, then, seek

for the home in their neighborhood? But this is not all. Such an eminent philologist as Professor Whitney shows that "language does not at all prove that the Indo-Persian common abode is nearest to the original abode of the family."[1]

Closely examined, the Asiatic theory comes to some startling conclusions. It is universally admitted that the Asiatic Aryans (we include under this term all the Aryans in Asia east of the Halys river) are only immigrants in the regions which they have occupied since historical times began. It is supposed that the primeval tribe of Aryans, from whose loins the entire race has sprung, dwelt close by the side of the modern homes of these Asiatic Aryans. From this small band, we are told that all the various European families hived off, swarm after swarm, and, as by a bee-line, journeyed toward their European homes. Should we sound the roll-call, and pass in review the innumerable tribes of Aryans who have been known to history—the hosts of Celts that covered the mountains and plains of the Southwest; the armies of the Teutons of the central lands; the hordes of untrained Scythians and Thracians; the more cultivated Greeks and Romans; and the Slaves of later times—the whole of Europe would not be a field of sufficient size for us to muster this enormous army upon.

When, therefore, we are asked to believe, that all of these people are the descendants of a small primitive band that resided near the southern shores of the Caspian Sea, and that one great army after another of emigrants left this primitive home and journeyed toward the shores of the Atlantic; when we consider, besides, that each and

[1] Am Cyclopedia.

every one of the various and several branches of this great family must have journeyed at least two thousand miles before coming to a halt; when we further consider, that not one of these many armies along this whole distance dropped one single memento by which modern researchers have been able to point out the way by which they reached the continent of Europe: when we consider these and many other obstacles that oppose themselves to the Asiatic theory, we can readily believe that it is not even probable, that such great armies of people could have left Central Asia since the close of the Neolithic Age, and penetrated to the heart of Europe without causing such a commotion in the affairs of ancient people that some slight murmur of their distant tread would be wafted from the wings of time to the listening ears of modern historians.

If we consider the relative importance of the Aryans in the two countries, equally striking results are before us. The Asiatic Aryans play no part in the affairs of that continent until centuries after the European Aryans had begun to make their power felt in the Mediterranean district. In fact, it is doubtful whether they were ever known among Oriental people until the appearance of Zoroaster. This means, then, that the primitive band of Asiatic Aryans that settled at the foot of the Hindoo Koosh mountains, dwelt there in peace and comparative isolation for a long time before they could muster warriors enough to spread out and command the notice of the neighboring people.[1] It was not until the times of Cyrus and Darius,[2] that the Asiatic Aryans gain a place in history. Now, if these were the primitive Aryans, the Aryans *per excellence*, from whose loins had sprung even

1 Madam Clemence Royer in "Anthropologia," 1873-5, p. 593.
2 Sixth Century B. C.

in that age, the bone and sinew and muscle of Europe–it is not probable that they would have so soon sunken to a position of such utter insignificance unknown and unheard of. In numbers, the Asiatic Aryans have ever been but as a handful compared with the Europeans. And further, in regard to the former having come from Europe, we can but see the logic of Dr. Latham, who says: "A mile is a mile, and a league is a league, from whichever end it is measured, and it is no farther from the Danube to the Indus than it is from the Indus to the Danube. In Zoology and Botany, the species is always deduced from the area of the genus, rather than the genus from the area of the species."[1] It is much more probable, that the handful

Slavonian Man.

[1] "Comparative Philology," p. 612.

of Asiatic Aryans should have migrated from Europe, than that almost the entire population of Europe should have come from this one small and historically unknown portion of Asia.

It is a fact worth pondering over, that those who accept the Asiatic theory are by no means agreed as to the routes by which the Europeans entered their present homes. Some would have them journey by the way of the Caucasus and the Hellespont.[1] There are those who select two routes of migration; one by the way of Asia Minor, and the other around the northern shore of the Caspian.[2] There are still others, who, recognizing the fact, that there are absolutely no indications to prove that any of them came by the way of Asia Minor, and being unable to find a convenient time since history began to rush these great migrating bands across the Hellespont, make them all travel around the Caspian, and enter Europe through the plains of Russia.[3] Keane meets this point with the statement, that the journey through Asia Minor occurred in the Neolithic Age, prior to the rise of the Babylonian and Assyrian Empires.[4] Schliemann[5] has shown that the first Aryan dwellers at Hissarlik were still in the Neolithic stage of culture, and, as they were members of an Eastern wave of Aryan migrations from Europe into Asia, we consider the point strained more than it will bear.

Those who support the Asiatic theory are forced to manufacture explanations for certain migrations of Aryan

---

4 Op. cit. and "Anthropological review," 1863, p. 159. 5 "Illios."

tribes, that their theory forces them to admit. In their attempts to set forth the motives for the stupendous migrations that must have occurred, they mention almost every phenomenon of nature, from earthquakes to the sinking of the level of the Caspian Sea.[1] They have given to Bactriana a climate, temperature, and fertility of soil that it does not possess. They have made it the great "center of communications between internal Asia and western countries,"[2] and such it has never been. They have transformed the Trans-Caspian region into another garden spot like the flowery vale of Cashmere. Neither has the snow line of the Hindoo Koosh been a barrier to these primitive people, nor has the sandy desert in which the Oxus loses itself failed to furnish abundant pasturage for their flocks during these peculiar journeys.

The Asiatic theory fails to account for many of the circumstances connected with the primitive Aryan home, and the migrations that we know that the Aryans made. There is not a tribe of Aryans in Asia of whom we can not say, that they, or their ancestors, were immigrants in the region which they now inhabit. No scholar or historian has yet been able to point to a place on the map of Asia and say, that there the Aryans were dwelling when their history, real or legendary, began. All are but pilgrims or usurpers in the land that they call their own. This cannot be asserted of the German and Lettish tribes of the Baltic region. This has always been their home, so far as legend, language, or history tell us.[3] Now the astronomer proves, from lingering superstitions, common to

---

the Aryans, relating to the movements of the heavenly bodies, that this race of people must have dwelt at one time no further south than 49° 20′ north latitude.[1] As this is a considerable distance north of the Caspian Sea, and has always been the home of the Yellow Races, it seems difficult to believe that there could also have been the home of the Aryans.

Slavonian Woman.

Prof. Sayce, who holds to the Asiatic origin of the Aryans, thinks the European Aryans were all living together in a common home in Europe.[2] He goes even further than that, and restricts the center of their final dispersion to some point "westward of a line drawn from Konigsburg to Crimea." If this be the case, some strange conclusions

[1] "Vendidad," i. 4-27; "Bundahish," xxv. 4; also consult Conder: "Heth and Moab," London, 1885, p. 223.

[2] "Comparative Philology," p. 369.

follow. We would have an example of an enormous host of emigrants, issuing in a body from the heart of Asia, journeying in a body for nearly three thousand miles, showing no cause for their departure from their primeval homes, and leaving no mementoes to mark the routes that they took; or, here would be the solitary and phenominal example among rude tribes, of a long series of migrations, all starting from about the same point, covering centuries of time, and all converging toward the same region, the last ones destroying all vestiges of their movements. If such proves to be the correct theory, it stands as a solitary example among the movements of mankind, while in a tribal state of society, and will need strong evidence to establish its truth and make it acceptible to the historian.

At the risk of wearying our readers, let us push the investigation a little further. As we have already stated, migrations generally are of two kinds. It may occasionally happen, that a restless band of warriors will take their wives, flocks, and possessions, and make quite a long military expedition, and, finally conquering some people, take possession of their homes. Ordinarily, however, the migrations of a people take the form of a gradual spread outward from some center of dispersion, lasting through centuries of time. Caesar, for example, found German tribes crossing the Rhine and occupying lands in the Gallic territory; but we must observe, that only a tribe or two crossed each season. So Grecian and Thracian tribes took gradual possession of the coast of Asia Minor. It was many generations before they had Aryanized the country. The Indians have not yet Aryanized the peninsula of Hindoostan, although they must have entered the Punjab many centuries ago.

Let us go backward in time many ages, to the time

when the Turanian tribes called the European continent their own, and wandered at will from the steppes of Russia to the shores of the Atlantic. Of course, as the continent of Europe filled up, there was intermingling and confusion of these tribes; there was, in short, in process of formation, a distinct people; just as there is being evolved in America to-day the American type. Finally there arose near the Baltic the first Aryan tribes, flaxen-haired and blue eyed.

Nourished by the products of a fruitful soil and hardened by the winter of a cold temperate climate, they began to increase and multiply. As they grew in numbers, the weaker tribes were forced outward from the old home to the borders of the Aryan world. In all their migrations, they met only Turanian people. Intermixture everywhere occurred. Usually the Aryan influence was strong enough to change or Aryanize the people with whom they mingled. Occasionally, however, the Aryans must have been swallowed up by the Turanians whom they went out to conquer. All history indicates that this spread was gradual in all southerly directions and toward the east. If our supposition, here stated, be correct, we ought to find the purest Aryan types near the old homeland, and as we journey away from this center it should grow weaker. This conclusion is supported by the best ethnologists of to-day. In a table we give the ethnical description of various European people. An examination of the same shows us how true it is, that, as we journey away from the shores of the Baltic Sea, Aryan blood becomes weaker. Thus Ethnology will support us in the belief that the Baltic region is the primeval home of the Aryans.

Now, as the first tribes spread out and, at last, covered

# TABLE.

| PEOPLE. | ETHNIC DESCRIPTION. | RACE FACTORS. | | REMARKS. |
|---|---|---|---|---|
| | | ARYAN | TURANIAN | |
| East Germans | Slavo-Teutonic | Slaves Teutons | | These are the Germanic people, and form the purest Aryans in Europe. No appreciable Turanian element. |
| South Germans | Celto-Teutonic | Celts Teutons | | |
| East Russians | Letto-Teuto-Slavic | Letts Teutons Slaves | | |
| English | Celto-Teutonic | Celts Teutons | | |
| South Scandinavians | Teuto-Nord | Teutons Norse | | |
| Great Russians | Finno-Slavic | Slaves | Finns | Observe as we pass out from the Baltic region we at once come on people who are more or less mixed with Turanians. |
| Bulgarians | Ugro-Slavic | Slaves | Uigers. | |
| Hungarians | Ugro-Teuto-Slavic | Slaves Teutons | Uigers | |
| North Italians | Liguro-Celtic-Italic | Celts Italics | Ligures | |
| Spanish | Celt-Iberian | Celts | Iberians | |
| South French | Ibero-Celtic | Celts | Iberians | |
| North Scandinavians | Norse-Finno-Lapp | Norse | Finns Lapps | |

the central part of Europe, they met nothing but Turanians. These Turanians were of various types. Those of the South were small, dark, and round-headed; while those of the North seem to have been long-headed, and slightly inclined toward the blonde type.[1] The point that we wish particularly to notice is, that the farther the vanguard of Aryan migration spread from the home land, the more

Celtiberian.

marked becomes the Turanian influence, for intermixture occurred all along the line. We would look, then, on the borders of the Aryan world for a people whose blood was very weakly tinged with the Aryan. Such do we find to have been the case when history dawns upon Europe. We

---

1 Elton: "Origins of English History," London, 1882, p. 151 *et seq.* Sir. G. Campbell, B. A. A. S. for 1886, p. 842. Flowers in "Nature," Feb. 5, 1885, p. 330.

observe that many of the far-away tribes of Celts are strongly Turanian; as, for example, the Celtiberians of Spain, the Welsh, and the Irish; in fact, the unsettled character of the whole people shows a marked Turanian element. In the South, were the mysterious Pelasgians, who were a peculiar people, that have left many indications of their Aryan descent, though strongly Turanized. When we enter the Slavic territory, we find there, at the dawn of history, Scythians and Sarmatians, who were so strongly Turanian that they are almost always regarded as such, but their language has been found to have been of the Aryan type.[1]

We have here probably an explanation of the origin of the various Aryan families. A certain degree of mixture with certain Turanian tribes would change the primitive Aryans into Celts. So a mixture with other Turanian tribes gave rise to the Pelasgians and Sarmatians. But as the purer Aryan tribes continued to advance in all directions, they continually recruited those that had preceded them. So we find that there were all shades of Aryans, from Celt to Teuton, from Pelasgian to Teuton, from Sarmatian to Teuton. But as the first baptism of Teuto-Aryan tribes over the Turanians was succeeded by another and another —we know not how many—the Celt became Aryanized to the Latin, the Pelasgian to Greek and Thracian, the Sarmatian to Salvonian. It is now known[2] that the Scythians and Sarmatians of Herodotus' time used a language closely allied to that of the Asiatic Aryans, thus pointing directly to the route that the latter took to reach the sources of the Oxus and Jaxartes, the Gates of Kashgar, and

[1] Sayce: "Comparative Philology," 395-6. Keane in Standford's "Europe," p. 572.

[2] Ibid.

the Punjab. The Indians, Iranians, and Chinese Aryans are not as pure in blood even as the Galchan tribes of the Hindoo Koosh; but, as their ancestors were all cut off from the fatherland by the same inroad of Turanians from the Siberian plains, they show many marks of likeness.

The change in language to form the various dialects is, of course, easily explained. Any tribe that becomes somewhat separated from its parent tribe will soon develop a dialect of its own. The Celts had more than one dialect, so did the Latins, the Greeks, the Teutons, and, in fact, almost every one of the great divisions of the Aryan race. None of them at present speak or use the primitive tongue. It has died out, just as has the Old Prussian, and just as Lettish is now doing. Still we can trace the origin of the various members of the race by a similarity of dialects; and, as we would expect, they all rise from a Teutonic base: thus, the Latin is said to be closely related to the Celtic,[1] the Celtic to German;[2] the Phrygian to Thracian, the Thracian to German;[3] the Pelasgian to Geek, the Greek to German;[4] the Indian and Iranian (or Sanskritic) to the Slavic, the Slavic to German and Lettish.[5] The Lettish, Slavic, and Sanskritic dialects rank nearest of all to the typical Aryan. This is just as we would suppose, as their ancestors took less part in the racial warfare of early times, and roamed freely across the plains of Russia for many centuries before they became separated, and the Sanskritic family became isolated from its kindred.

We are now better able to understand a number of scientific and linguistic points that have puzzled the an-

thropologist and the ethnologist. We can see why "the primitive Slaves differ from the Germans and Celts, their brethren by origin, only by very slight shades,"[1] for all were so slightly separated from the fatherland. We can understand why it is that the gulf is widest between the Celtic and Sanskritic dialects,[2] for they represent the breadth of Aryan migration in either direction. We can see why it was so easy for the Celts to almost universally adopt the language of their children, the Romans, and why the Romance languages, are almost universally built upon an ethnically Celtic foundation.[3] We can see how such a mixture of Aryans and Turanians could arise as to produce the Celto-Slavonic-Lithunians.[4]

If this theory of the rise and spread of the Aryan tribes be correct, we can easily solve one of the ethnological problems. We are told that the Galchans of the Hindoo Koosh have typical Aryan skulls, and from this it is argued, that all the Aryans must have come from thence.[5] Such a result does not follow. Quatrefages tells us that the ancient Slaves had also a typical Aryan skull.[6] Wherever their descendants have led an isolated life, we would expect to find this type of skull. The Galchans have lived just such a life in the passes of the Hindoo Koosh. Turning to Europe, we learn that the great passes of the Alps in Savoy have been in the possession of a people probably descended from the Slaves,[7] and here, again, we meet with this typical skull.

After having thus minutely reviewed all the facts and evidence that we can find, that relate to the primitive home or the early wanderings of the Aryans, we are forced to the conclusion, that it all testifies against the Asiatic theory. While eminent philologists still hold to that theory, we have the authority of others just as eminent for claiming, that philology does not even require the home of the Aryans to be located in Asia, much less does it prove that it was there. We find, that, as early as the Neolithic Age, the Celts were wandering over the plains

Germans crossing the Rhine.

of Southern and Northern Europe, and Aryans of Teutonic origin had even reached the plains of Troy by the close of that Age. All the evidence that we have been able to gather in regard to the migrations of Aryan people, does not go back of a time when they were not moving in southerly and easterly directions from Central Europe. We can find no westerly movements until we pass the imaginary line drawn from Konigsburg to Crimea, for the movements of the Celts have, as a general thing, been

from northeast to southwest over the plains of Europe. The earliest Aryan migrations that were recorded relate to European Aryans who, appearing along the shores of Asia Minor, had begun to interfere with Egyptian affairs. Next, we catch a glimpse of Aryans passing through Kashgar into China; and soon the Persians and Indians appear upon the scene, spreading their authority, influence, and peculiar characteristics southward from the base of the Hindoo Koosh. We find in all this not one single iota of evidence in favor of the Asiatic theory.

Looking at it, then, from every direction and going back beyond the earliest pre-historic times, the picture is the same—great bands of Teutonic people are crowding outward from the German and Lettish fatherland.[1] When we consider that the Teutonic nations are to-day the Aryans *par excellence* the world over; when we consider that they furnish not only the bone and sinew and muscle of the civilized world, but the men of thought and learning as well; then, when we are forced to admit that they are the known ancestors of the great mass of modern Aryan nations, we ought no longer to hesitate to give the Teuton his place in history. The Lettish and Old Prussian dialects are pointed out to us as more closely related to the typical primitive Aryan than any others that exist. Keane[2] says of it, that, "although betraying more numerous points of contact with Slavonic than with any other Aryan language, it also exhibits some marked affinities with the Hellenic, Teutonic, Iranic, and Indic bran-

---

[1] Quatrefages claims that the Letts are Aryans in language only, but have become so intermixed with Turanian people that they are physically Turanized. ["The Prussian Race," London, 1872, p. 20.] Prof. Keane, speaking of them ethnically, calls them Celto-Slavonic, and we judge that he is nearer right. (Ramsay's "Europe," p. 556).

[2] Ramsay's "Europe," p. 575-6.

ches." We must, then, be drawing pretty close to the primeval homeland. If the Lithuanians be Aryans in language only, they must live close to the border line of the fatherland of the race.

Max Muller says, that, before their separation, the Aryans led "a life such as Tacitus describes that of the ancient Germans;"[1] and Tacitus' description of the German people will correspond almost exactly with a great proportion of the philologists' imaginary descriptions of the primitive Aryans. Their land was the land of the birch, the fir, and the beech.[2] The climate, the soil, and the productions of the land are just what were necessary for the production and maintenance of such a hardy race as the Aryans. Then why should we look to Asia for the primeval home of the Aryans, when all evidence points toward the German fatherland and the shores of the Baltic Sea?

In fact, look at the matter as we will, we can come to no other conclusion than, that the Aryans commenced their migrations from the vicinity of the Baltic Sea in Europe. The Asiatic theory seems to us to be largely a "taken-for-granted" theory. It was *assumed* that Western Asia was the home of the human family, and especially of the White Races. It was *assumed* that from that point the Hamites and Semites went west, and the Aryans moved into Europe. At present, we ought to have no hesitation in demanding proof instead of assumptions. When we reflect that the science of language is utterly silent on this point; when we reflect, further, that

---

1 "Science of Language," Vol. I. p. 234.

2 Sayce: "Comparative Philology," p. 395-6. As we shall see later the Asiatic Aryans, being descendants of the Slaves, probably never heard of the Beech.

the probabilities are, that the Semites and Aryans were never co-dwellers in some common home, and that the Semites probably took their rise in Abyssinia;[1] when we read, that the traditions of the Aryans point back to a time when they were living to the north of 49° 20′ N. L., which in Asia would carry them into the Altai Mountain region, and that this has always been the home of the Yellow Races; when we perceive that not one argument can be given for the Asiatic orgin, which can not be at once applied just as strongly in favor of Europe; when an examination discloses that our later writers, with the results of modern research before them, are rapidly coming in favor of the European origin; when we recall that all the movements of Aryan people as far as known, appear to diverge from the Baltic section of Europe—when we take all the forgoing into consideration, we need have no hesitancy in deciding, for the present at least, and until better informed, that Europe not only is, but always has been, the home of the Aryan people.

In coming to this conclusion, it is satisfactory to learn that this has all evidence of being the "coming theory." The belief of the European origin of the Aryans is fast gaining favor. Among the first who dared to champion this theory was Dr. Latham, to whose works we shall make occasional reference. He has never been without followers, and of late years there has arisen a strong belief in the truth of his theory. Professor Hommel declares, that this theory is fast becoming a dogma,[2] although he does not yet feel inclined to support it. Other eminent scholars[3] recognize the fact that this European theory is

[1] This Series, Vol. II. p. 644.
[2] "Archiv für Anthropologie," Band xv. supplement, 1885, p. 167-8.
[3] "American Antiquarian," July, 1887.

fast gaining popularity, and in regard to it say that "the claims of Europe are becoming as great and appear to be as well defended as Asia."[1]

Now that we have chosen, at least for the present, the European theory, we are at liberty to turn our attention to the civilization of these primitive Aryans. We are told that philology gives us much information about the degree of culture that they had attained; but writers have indulged in such fanciful sketches of the life of these early people, that we can accept none of them as based upon a sufficiently sure foundation. The most that we can say is, that they were a hardy race, inured to rigorous winters. They were already far past Savagery, having all the principal domestic animals that we have, practicing the arts of weaving and agriculture, being acquainted with one or two metals (whether iron is not certain), and possessing some of the cereals; "it was rather pastoral-agricultural than nomadic in its way of life."[2] Accepting these statements, then, as proved by linguistic history, our most satisfactory way of further studying the life of the primitive Aryans is to pass each great group in review and learn what we can of their civilization when history dawns upon them. Even here, we will often find ourselves in the shadowy lands of tradition and myth, but we will try to glean all the knowledge that we can about these early people.

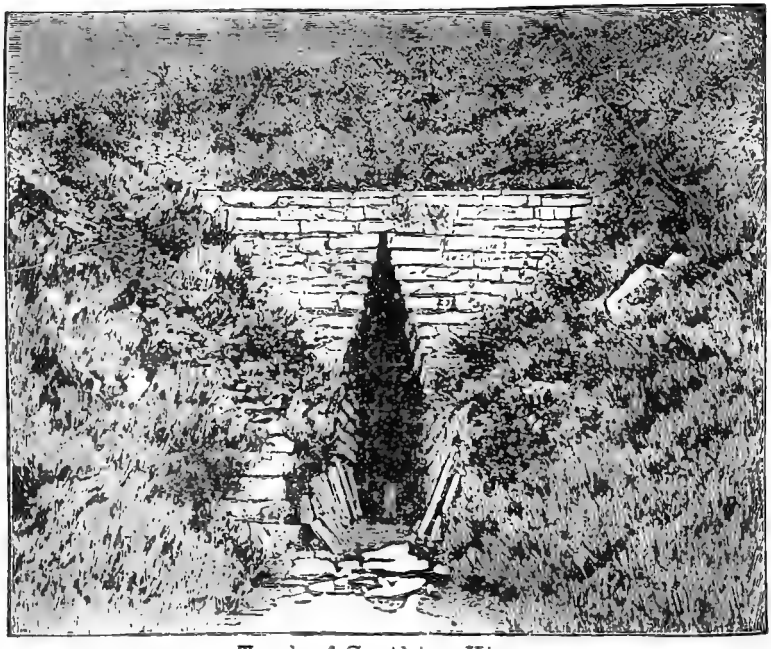
As the Latins and Greeks, with their descendants,

---

1 See an article by E. P. Evans, in "Atlantic Monthly" for 1886, p. 632, who adopts the European origin. We might remark that, when we commenced to prepare "This Series," we supposed it was settled that the Aryans came from Asia. The first two volumes were written with that in view. Yet when we sit down to investigate this theory, we find ourselves obliged to abandon it, and accept the more recent theory.

2 Whitney, Op. cit.

are later and historical members of the great Aryan race, they will be treated in separate chapters. There remains, then, three great primitive members of this group, the Celts, the Slaves, and the Teutons. To them we must look for our information of the character and culture of the primitive Aryan people. The Slaves, the youngest member of the Aryan race, according to the Asiatic theory, becomes a very important family when studied from the



Tomb of Scythian Kings.

standpoint of the European theory. They then become the ancestors instead of the children of the Asiatic Aryans. They belong to the blonde division of the race, are tall, lithe, and well proportioned. The Western Slavic tribes were undoubtedly among the purest of Aryans, because of a continuous baptism of Teutonic people to which they were subjected. This is proved by the shape of their skulls,[1]

[1] Quatrefages, "Prussian Race," p. 14.

as well as by the almost typical character of their language.

Among the earliest historical Slaves, were some of the tribes whom Herodotus describes as Scythians. This, however, must have been many centuries after the Asiatic Aryans had become cut off by the hordes of Turanians that came into the Caspian basin from the North and East, between the seventeenth and twentieth centuries B. C., and whose movements probably forced the Jung tribes eastward to the confines of China.[1] We find that those tribes of Scythians furthest removed from the fatherland, by constant intermixture with Turanians, became very much corrupted. Not so with a few tribes who had been forced to seek protection in the mountain fastnesses of the Hindoo Koosh. There they remain to the present day. These were the Galchan tribes, who, by living in isolation, have retained the blonde features, blue eyes, fair complexion, and light hair,[2] which they inherited from their Slavic ancestors. They, too, have preserved some of the purest ethnical features peculiar to the Aryan race, as they have an almost typical Aryan skull.[3] Their language shows a similarity to the Iranian dialect, and is thus proved to be closely allied to that used by Scyths and Sarmatians.

The Indians and Iranians were crowded down among the darker Turanian people of the South, and show marked indications of intermixture with them. They belong, therefore, to the southern, or dark-featured group of Aryans;[4] ethnologically they can not be very purely

---

2 Keane, in Stanford's "Asia," p. 706.

3 Keane, in Stanford's "Europe," p. 558.

4 Campbell, B. A. A. S., 1886, p. 842.

Aryan, for the Turanian people with whom they have mingled, have always been in great preponderance over the Aryan. Caste in India may have, however, preserved the Aryan features in the higher grades, but even this argument is open to serious objections, as we shall see in another chapter. The modern dialects of India and Persia are by no means typical Aryan dialects; but each people have developed a distinct religious system, the sacred teachings of which have been faithfully treasured up in the language which their ancestors used, when they dwelt together at the southern base of the Hindoo Koosh. This is the Sanskrit, and it alone tells us of the Aryan origin of the Indians and Iranians. It is understood by only a few of the more highly educated priests, who, previous to the entrance of the English into India, jealously guarded this knowledge.

The Sanskrit has, thus, been preserved as one of the purest Aryan dialects, but we can not claim so much for the racial peculiarities of the people. We have no historical records of the Iranians before the time of Darius I. of Persia, although Zoroaster must have preached his great religious reform many centuries before that time. Of the Indians, we know only that Darius and afterward Alexander the Great made military expeditions into the Punjab and along the Indus. Their own political history, however, begins with the reign of Asoca about 250 B. C. In the religious world, they were widely known through the spread of Buddhism, the first missionary religion. Previous to the time of Buddha (about 500 B. C.), they lived in seclusion; the Brahmins conversing about "life and death,"[1] Kshatriyas fighting their tribal battles, the

[1] Müller: "Early Sanskrit Literature," p. 25.

Vaisyas attending to their commercial and other pursuits, and the Sudras servants to all the others. The Slaves, known as such, did not come into historical prominence until the seventh century A. D.; and, from that time, we must look to history for a record of their growth into the modern Russian nation.

The Celts and Teutons play quite an important part in the affairs of early Europe. Rome had not yet become mistress of the Latin colonies when she was burned by invading Celts. It was the pressure of the Thracian and German tribes from the north that started the Dorian migration into the Peloponnesus, and entirely changed the nature of the population of Hellas. The Celts, as we have seen, spread away to the west and south, and had so filled up this territory as to make it appear crowded to their restless natures. They had already begun to push toward the east, and one large band had cut its way into Asia Minor, before Rome became a power in the world. At the beginning of the fourth century B. C., the Celts were in the height of their power as history knows them. They were spread over England, Wales, and Ireland when these lands became first known to the eastern world.

When we undertake to describe the Celts and the Teutons separately, as they appeared at the dawn of their history, many difficulties arise. Those Celts that were farthest separated from the German lands were, of course, strongly tainted with Turanian blood. As we approach the border line of the purer Teutonic tribes, ancient authorities either failed to distinguish as to which were Teuton and which were Celt, or else they did not know. It is also a fact, that some of the Celtic tribes were so nearly like the Germans in physical appearance as to

compel even those who believe in the Asiatic origin of the Aryans to admit, that they were "descended from the German stock."[1] This all shows how firmly the primitive Aryan features, passing through the Teutonic people, shaded into the Celt and thence into the Turanian.

On the whole, however, the Celts were physically less powerful than the Teutons, and were strongly mixed with the dark races of the south. But wherever they had reached the north far enough to mingle with the fair Turanians, the resulting people were fair with flaxen hair.[2] This happened both in Europe and in the British Isles.[3] Then, too, we are apt to gain from ancient authorities many erroneous ideas in regard to both Celts and Teutons. We are told that, in Britain, naked, painted savages came out to battle in scythed chariots drawn by four horses. We are also expected to believe that naked savages came out of the forests to successfully contend with the powerful Roman legions. This is far from the truth, and is no more worthy of belief than the statement of Tacitus in regard to a battle between the Romans and Britons: "About ten thousand of the enemy were slain; on our side there fell three hundred and sixty men."[4] If we will bear in mind that our first knowledge of these people comes through their sworn enemies, the Romans, we can account for many statements that bear upon their faces the marks of falsehood.

The Celts, though less powerful, were more restless than the Teutons. They have been called the nervous race. They were ready to move at all times, though they

2 Ibid.
3 Elton: "Origins," p. 152 *et seq.*
4 "Agricola," chapter 37. Church's translation.

preferred to dwell in towns. They seemed to delight in war and fought mounted on horses. In all this, we see the Turanian influence. The Teuton, on the other hand, often migrated, but nearly always in search of new homes. The Celts were by no means savages, however. They

Steppes of Russia.

"were tall, pale, and light-haired." "The women were singularly tall and handsome." They wore the same dress as the men, which consisted of "a blouse with sleeves, confined in some cases by a belt, of trousers fitting close at the ankle, and a tartan plaid fastened up at the shoulder with a brooch. The Gauls were experts at

making cloth and linen. They wove their stuffs for summer, and rough felts or druggets for winter wear."[1] They had also learned to weave in diverse colors and make the cloth appear "as if it had been sprinkled with flowers." "The favorite color was red or a pretty crimson." They were fond of every kind of ornament and wore necklaces, collars, bracelets, and beads. "The chieftain's clothes were a flaming and fantastic hue; his hair hung down like a horse's mane .... and both hair and moustaches were dyed red."[2] They had almost all of our domestic animals. They were very hospitable, entertaining their guests with feasts, at which the bard was always present. Though they sometimes dwelt in rudely thatched houses, they had learned to build cities with walls and streets and market-places." They even fought with iron broad-swords at the battle of Amo, in the fourth century B. C.[3] Surely these were not rude and uncultivated savages.

The Teutons have always dwelt in the land between the Rhine and the Elbe. But, in ancient times, when we crossed the Rhine, we passed through a region whose population was of a Teuto-Celtic nature, and finally came among a people that might be called pure Celts. When we crossed the Elbe, we found a similar mixture of Teuto-Slavonic people before we come upon the purer Slaves.[4] But as the Celtic population on the southwest, the Slavic on the east, and the Pelasgic on the south, became baptized again and again with a population direct from the German fatherland, we are told that the ancient Germans spread so as to cover the whole of Central Europe with Teutonic people. This plainly indicates that the people who dwelt on the borders of ancient Germania became

[1] Elton: "Origins," p. 113 *et seq.*
[2] Ibid. [3] Ibid. [4] Latham: "Comparative Philology," p. 663.

more Aryanized as they became more Teutonized. Toward the west, however, there seems to have been an earlier and a stronger stream of Teutonic migration, which crowded the Finns toward the north into Scandinavia, and, pressing onward even into Scotland, may have Teutonized the Picts to some extent.[1]

The ancient Teutons were distinguished by their "lofty stature, their robust limbs, their fair complexion, and their flaxen, flowing hair."[2] They have never yet received their place in history. Their civilization has been under-estimated. We have contemplated them too much through Roman and monkish spectacles. "We have talked of his (the Teuton's) forests, till we have forgotten his cornfields; and spoken of his feats as a hunter, till we have overlooked his labors as a herdsman. We have believed that all well equipped and disciplined armies, with all their weapons, clothing, and commissariat, could come out of the wilderness, or what is yet more incredible, that naked barbarism could defeat the legions and storm the cities of a well organized civilization..... He (the Teuton) is the muscular and material man of Europe.... He is pre-eminently the strong man of the world.... He is nature's resource, when her nervous races, Celtic and Classic, have become effete, that is wire drawn and overbred, used up. Then she resorts to him for a fresh supply of strength and stature, bone and muscle... But the Teuton is not all bone and muscle. He has also a goodly brain, well arched, and of the largest volume. He far transcends the classic man, both in elevation of principles and warmth of affection. He regenerated the South morally as well as physically.[3]"

---

1 Keith: "History of Scotland," Edinburg, 1886, Vol. I. p. 34 *et seq.*
2 Quatrefages, Op. cit. 3 "Anthropological Review," 1868, p. 26-7.

Although the writer, from whom we have just quoted, has done partial justice to the Teuton, he has failed to understand the real origin of this Teutonic pre-eminence. He has failed to perceive in the Teuton the Aryan *par excellence*, by whom the whole civilized world has been regenerated. It is very strange that, in the light of all this evidence, so many of our scholars are even yet trying to make for the Aryans a home land in the scorched and effeminating regions of Central Asia. While in the heart of Europe, in a region almost surrounded by the Rhine, the Maine, and the Elbe, have dwelt, since European history began, this hardy German people, whose warriors taught the Roman legions lessons in the arts of war, whose women taught the Roman matrons lessons in virtue and industry. They were not an ignorant and uncultivated people, for they had their Runic form of writing for six centuries before our era.[1] Thus they were keeping pace with the civilizations of the South and East. Let us then forget the pictures that the prejudiced and misinformed classic writers have left us of the ancient Teutons, and gain, if we can, truer impressions of these strong and worthy people—the ancestor of our own English speaking race.

In treating of these primitive Aryan people and their primeval home, we have, perhaps, wandered somewhat from the old, beaten track, which the historian is wont to follow; and we only hope that we have escaped some of the ruts into which he has invariably fallen. We have studied faithfully the two theories of the origin of the Aryans, and have found all evidence pointing to the European theory. Seeing no other way open to us, we

1 Keane in Stanford's "Europe," p. 572. Taylor: "Greek and Goth," p. 41 *et seq.*

have adopted that theory; and we have found it sufficient to explain every question that puzzles the writer from the Asiatic standpoint. We must now hasten on to consider some of the more prominent members of the race separately. It is, indeed, a satisfaction to believe that the portion of the world, that to-day sees the Aryan race at the very summit of modern Civilization, watched over the cradle of the Aryan people in their infancy, and gave them nourishment as they grew into perfect manhood. We will turn first to follow the footsteps of those that wandered farthest from this primeval home into the mountains, deserts, and jungles of the Orient, and then will return to consider those people who have always dwelt nearest their fatherland.[1]

---

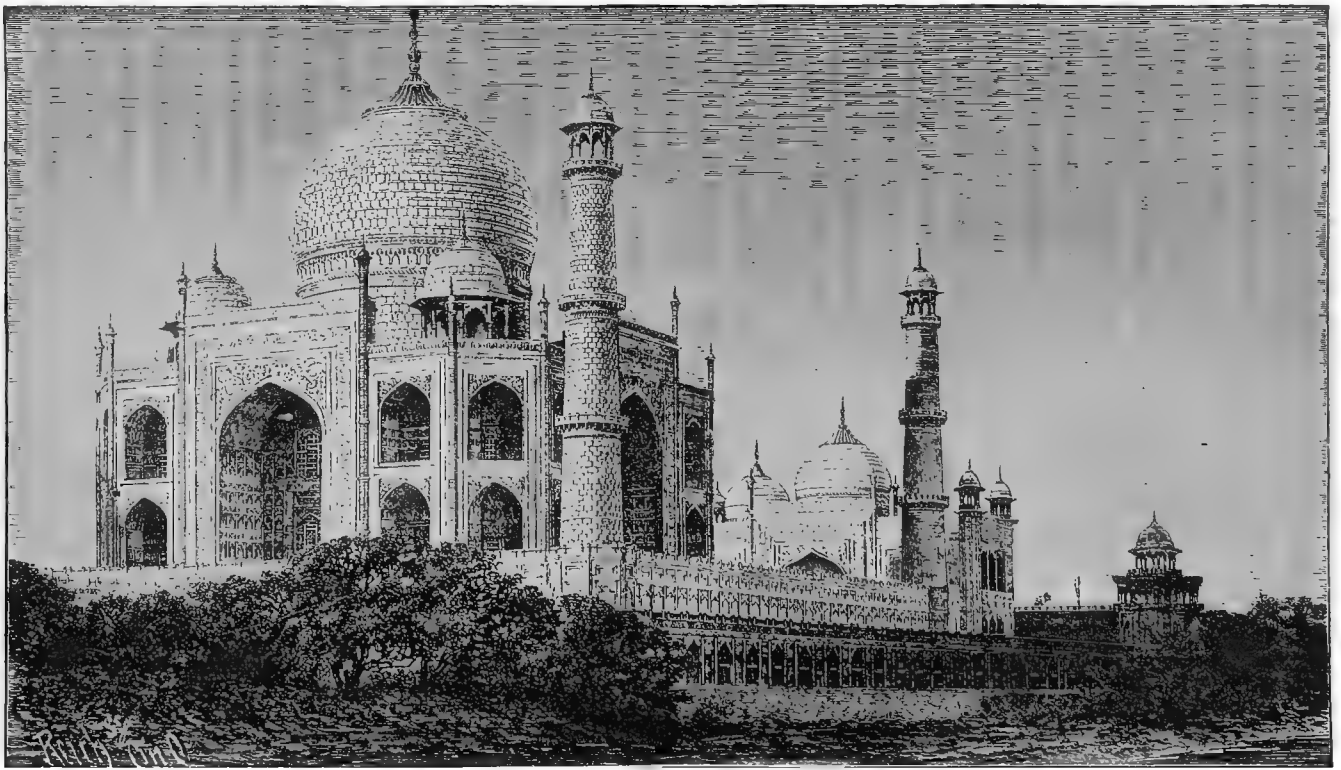
1 As these pages are passing through the press, our attention has been called to Biddulph's "Tribes of the Hindoo Koosh," Calcutta, 1880, and we are interested in noticing that Russian officers boldly claim a Slavic origin for the Aryan tribes in that section; thus confirming the conclusions set forth in this chapter.

## CHAPTER IV.

### THE ASIATIC ARYANS

INTRODUCTION — Oriental Peculiarities — Geographical Distribution — The Afghans—The Galchas—The Iranians—Zoroaster—Mazdeism—The Rise of the Persians—Cyrus—Cambyses—Darius—Re-organization of the Empire—Mt. Behistun—Xerxes—Traits of the Persians—Disposal of the Dead—Art among the Persians—Description of Ruins—Conquest of Alexander—The Parthian Empire—The Neo-Persian Empire—Religious Reform—The Indians—Description of the Country—Early History of the Country—Asoca—The Vedic Literature—The Caste System in India—Science in Ancient India—Philosophy in Ancient India—Buddhism—Ruins in India—Conclusion.

TRAVELER in Central Asia is struck by the Oriental peculiarity of his surroundings. The people are mostly dark in hue, and treacherous in character, dressing in a manner peculiar to the Orient. The beast of burden is the camel, and the caravan takes the place of our railroad train. The desert is as familiar to the Asiatic as the prairie is to the American, while bitter, brackish pools take the place of the refreshing lakes. The rivers start from the mountains on a joyous, rapid course, but are soon choked and strangled by the burning, drifting sands of the constantly changing deserts. Only now and then, is the current strong enough to plow its way in an ever shifting channel to some lake or sea; the most of them losing themselves in the sands of the desert. The great Oxus river is one of the few



THE TADJ MAHAL, INDIA.

that is able to keep an outlet clear, but even it is constantly changing its channel; and the pittiless desert approaches to within two miles of its banks, as if by stealth to snatch the vital spark from every living thing.

But among the mountains, within sight of the snow line, are some happy valleys, that, drinking the waters from the mountain streams, blossom forth with a luxurious herbage during the few months of summer that these regions enjoy. Such is the rose covered "Vale of Casmere," the haven for the tourist during the hot and blasting months of the Indian summer. And, as we follow the Oxus down toward its mouth, we find that many districts have been reclaimed from the desert by a system of artificial irrigation by means of canals. Such regions are remarkable for the fertility of soil, and stand out in the surrounding deserts as veritable garden spots where "the white houses are like bowers buried in foliage and flowers; the nightingale warbles in every rose-bush."[1] Such regions are, however, but few miles in extent, and are liable at any time to be restored to the desert should the fickle river change its channel.

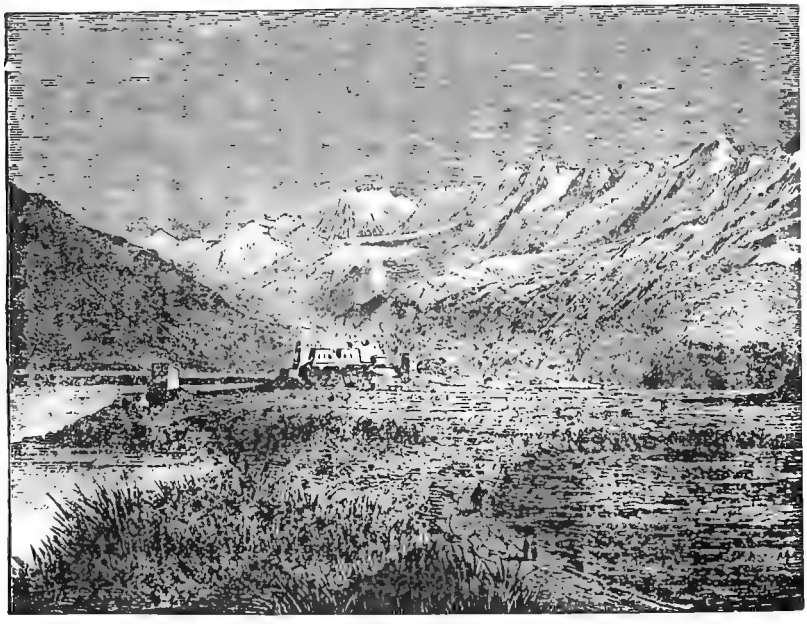
But such oases in the desert continent of Asia are only rare exceptions to the great barren regions of the central table lands. When the rivers loose their courses in the sands of the deserts, they often give rise to brackish malaria breeding marshes. So well known are these characteristics that many proverbs are current descriptive of these features. "If you want to die go to Kunduz;"[2] "Salt water, burning sands, venomous flies, and scorpions, such is Andkhoi, and such is hell," are common expres-

---

1 Recluse: "The Earth and its Inhabitants," New York, 1884, Vol. I. p. 265.

2 A river in Northern Afghanistan.

sions in that country. Nor are the mountain valleys always pleasant. On the contrary, we often come to great stretches of country that are cold and bleak, and can hardly be said to possess even a temperate climate. So marked is this feature that the Afghan language is said to be "hard and gutteral, as if the cold winds blowing from the Hindoo Koosh compelled the people to speak with half-closed lips."[1] Still, this is the very region that some think was the cradle of the Aryan race, from whence issued the great migrating bands that finally filled all Europe.



Scene on the Upper Oxus.

However that may be, there is no doubt that in this territory, for some centuries, tribes of Aryans and Turanians wandered to and fro contending for supremacy, gradually mingling their blood to form one united people. We have suggested that the first appearance of the Aryans

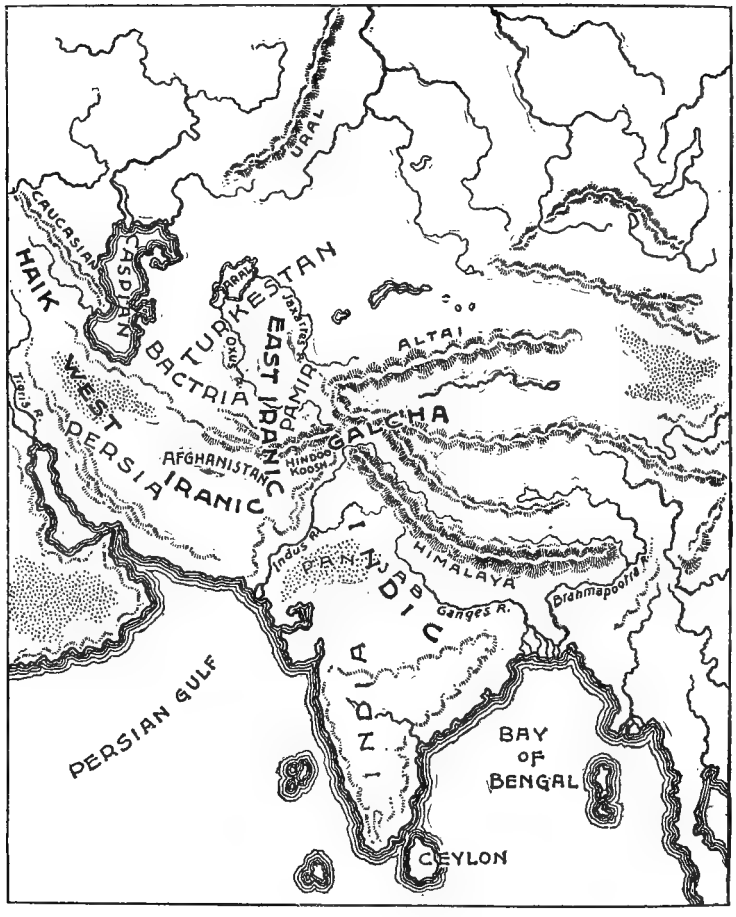
1 Recluse, Op. cit. Vol. IV p. 84.

in that vicinity was the inciting cause of that sudden outpouring of Turanian tribes, the troubled movements of which we catch sight of in the uncertain light of the twenty-third century B. C. Probably some centuries elapsed during which the Aryans were largely the masters. All history, however, teaches that, from time to time, great swarms of Mongolic people issued from the inhospitable regions of Northern Asia, driving all before them. And so the time finally came when the Aryan and Semi-Aryan tribes of the Oxus and Jaxartes basins were forced in turn to give way before advancing hordes of Turanian people, who, pressing westward toward the northern shores of the Caspian, cut the Slavic people into two parts; forcing one back toward the Aryan homeland, and driving the other upon the table land of Pamir, and into the mountain fastnesses of the Hindoo Koosh region, where they have since dwelt in security and independence.

As we shall devote this chapter exclusively to the Asiatic Aryans, it may be of advantage to us to first understand just what people may be included under that head and indicate the lands which they inhabit. There appear to be five independent branches of the Aryan family in the Asiatic division of the race. These, taken in the order of their importance, are the West Iranic, Indic, East Iranic, Galcha, and Haik branches.[1] The Indic comprises the many tribes of Aryans who dwell in the peninsula of Hindoostan and who speak dialects of the ancient Sanskrit language. The West Iranic branch, also called Achæmenian, includes the Parsi and Neo-Persian, Baluch, Kurdish and Ossetian. To the East Iranic branch, belong the Bactrians and Afghans, or Pushtu, people. Among the

[1] Keane in Stanford's "Asia," p. 706.

Galchas, may be mentioned the Karateghin, Darwazi, Wakhi, Siah-Posh, Kafir, and Chignangi. The ancient and modern Armenian are called Haik,[1] and will need but occasional mention in this work.



Ethnic Map of Asia.

The Afghans are an extremely interesting people and have become of great political importance of late on account of the region that they occupy. In their midst, lies the

[1] Ibid.

disputed border line between Russian and English dominion in Central Asia; and thus, these poor people are placed between two great fires, that, in meeting, may finally sweep them, as a separate people, out of existence. In ancient times, the Afghans occupied only the Kabul valley,[1] through which the Indic tribes may have passed on their way to the Punjab.[2] They have been indentified with the Paktyes whom Herodotus[3] mentions as dwelling here in 509 B. C.[4] Their language is of the Iranic type. Thus, it connects them with the ancient Slaves, and fully identifies them with the Aryan race, though in physical appearance they show many Turanian characteristics. They belong to the dark type, and thus again indicate their mixture with the Turanians.

In many ways, however, the Afghans show their Aryan descent. They have "robust frames and muscular energy." They are as bold as they are strong, and have ever gloried in their independence. "Let our blood flow, if needs be, but we will have no master," is their motto. "They are skillful artisans, hospitable, generous, and even truthful. ..... The man who shuts his door to the stranger is no Afghan," says the national proverb.[5] They still retain the tribal form of government, and all the usual tribal divisions exist in full vigor. The joint-family is a still existing institution, and the house-father is a much respected person of considerable power.[6] "Their women are much respected, and manage the household with in-

telligence and firmness." "Go to India for wealth, to Kashmir for pleasure, but to the Afghans for a wife," is an Oriental proverb that illustrates this point. But there is another side to their character. They regard "everything as fair in war," and so show no mercy to their enemies. "God shield you from the vengeance of the elephant, cobra, and Afghan," is a prayer that the Mussleman has long since learned to repeat.

There is another type of people in Afghanistan perhaps more interesting to us, in an ethnic sense, than the dark Aryans of the Southwest. These are known as Galchas, and dwell in the immediate Hindoo Koosh region and to the northward. They may have dwelt in these wild and mountainous regions since the Turanians first cut them off from their Slavic fatherland. They are the purest physical type of Aryans to be found in Asia. Their skulls are identical with those of the Savoyards.[1] As to their language equally significant remarks are made. Professor Keane[2] tells us that the language of the Galchas "may possibly prove to be *pre*, rather than *Neo*-Sanskritic." In which case we have here an Aryan people who are ethnically connected with the Slaves, and who use an Aryan language of a more ancient type than the Sanskritic, though inclined toward the Iranic.[3] They, too, dwell in the very region toward which all the Vedic and Avestic traditions point, as the land through which the ancestors of the Indians and Iranians journeyed before they reached their present homes. When we further remember that

the ancient Slaves, or Sarmatians, used an Iranian dialect connected with that of the Persians and Afghans,[1] it seems evident that in the remote past, the territory of the Slavic tribes reached from the Vistula to the Kindoo Koosh. In the Galchas, then, we have the ancestors, and not the children, of the Indians and Iranians. We are here building, not upon theory, but the proof lies before us like the pages of an open book.

These Galchas are typical Slavic Aryans in many other respects than language and shape of the skull. Here we find also the blonde type so peculiar to the ancient Slaves.[2] "The fair or chestnut type is found almost exclusively amid the Kafiristan highlanders."[3] Professor Keane[4] says of the same people that they have "reg-

ular features, blue and black eyes, hair varying from brown to black, broad, open forehead, tall and well made." The Kafir women are beautiful and the men handsome; and the English report that the Kafirs look like kinsmen and allies.[1]

In the Hindoo Koosh region itself, we meet with Galchan tribes whose complexion is still lighter and fairer. They have blue eyes and light hair. They are considered superior to all the people about them and "have preserved their old customs, recalling those of Zoroastrian times."[2] They are by no means ignorant, for many of the schoolmasters of Turkestan are from Karateghin. Naturally industrious, they are engaged in salt mining, weaving, metal-working, and gold-washing. They trade with many of the cities in this region, principally Kokan, Bokhara, and Kashgaria. They have always retained their independence, preferring, like the race in general, to live in their cold mountain homes rather than submit to the commands of any master. Between the English and the Russians, however, it is impossible to say how long they will retain their independence, or even their purity of race and language.

The Indians and Western Iranians are usually supposed to have wandered away together from the slopes of the Hindoo Koosh. Then a separation took place, some of the tribes journeying to the Southeast into Hindostan, and some to the Southwest into Persia. Max Muller believes that it was the reform of Zoroaster that caused the separation of these people into two branches.[3] But, so long as the Kabul valley lay open to them, as soon as the

Aryans took possession of the Hindoo Koosh, there is no reason why some tribes should not have early wandered into the Punjab, and why the migrations of the Indic tribes should not have been slow and continued through

Armenian Women—Haik Aryans.

many generations. At the same time, some of the primitive tribes may have pushed off toward the west and south across Afghanistan and, finally, into Persia and Media. Such movements would be in accordance with what we know of the migration of primitive people. The

language of the Afghans is also classed as intermediate between the Indic and Iranic dialects,[1] while the Iranic are more closely allied to the Galchan dialects than are the Indic.[2] Thus is revealed the fact, that the general direction of the tribes of Aryans that reached Irania was down through Afghanistan, and that they separated from the Galchas at a later date than did the Indians.

The Iranians and Indians have each an ancient literature, in which have been preserved their legends and religious myths since they left the slopes of the Hindoo Koosh. They are recorded in ancient dialects that are of great importance in the study of philology, though they are now classed with the dead languages. From the East Iranic branch, the Bactrians furnish us with the Zend dialect; from the West Iranic branch, the Persians furnish us with the Parsi and Pehlevi dialects; while the Sanskrit is the ancient dialect of the Indic branch. The Vedic, or classical literature of the Indic branch, is written in Sanskrit; while, of the Avestic or Iranian classic literature, the oldest parts are written in Zend, the more recent additions or explanations in Pehlevi, and the latest additions or explanations in Parsi;[3] but all of these dialects have long since become antiquated. We must, from the start, understand that the Vedas form the Bible of the Indians, and the Avesta, that of the ancient Iranians.

In tracing the history of the Iranians, it is necessary to speak to some extent of their religion, since their first history is gathered from their religious books. Only an outline of this religion is required at this point, we will analyze and compare it later. In the dim light of a

---

distant past, a personage by the name of Zarathushtra, commonly known as Zoroaster, appears as a great religious reformer. We will, for the present, not question whether he be an historical personage or not, though his origin and life are veiled in mystery, and no historian can fix the date of his birth, or that of his death. In fact, ancient historians mention as many as six philosophers, by the name of Zoroaster, assigning to each a separate nationality.[1] The particular Zoroaster, to whom reference is probably made, was designated by the family name of Spitama, and the land of Bactria was the probable scene of his life and teachings. The age in which he flourished is also a mooted point and ranges all the way between 2400 and 600 B. C. While a number of our best linguistic scholars assert that he could not have lived at a later date than 1200 or 1000 B. C.;[2] other authorities claim to be very liberal in admitting the composition of the Avesta to have been as early as 700 B. C. Passing by all these questions for the present, we must be content to ascertain, as best we can, the effect of the teachings going by his name upon the later civilization of the Iranians.

It must have taken a long period of time for the tribes of Aryans to grow and spread themselves over the ancient countries of Bactria, Parthia, Media, and Persia, until they had completely Aryanized the Turanian population of those regions. But such seems to have been accomplished by the time of Zoroaster. Probably the ideas which Zoroaster formulated and preached had been

---

slowly developing for ages, and had even entered into the lives and practices of the priestly class. Then, even as now, the principles of a reform seem to have grown until the minds of the people were ready for it. At an opportune date, Zoroaster is supposed to have appeared; and, as the result of his labors, the religion that he preached became the principal religion of the Iranians. It is now known as Mazdeism. As was but natural, it became much changed and corrupted before it assumed the form of the religion of the present Parsi community of Bombay. As it spread westward from tribe to tribe, it seems to have absorbed many foreign elements from the native religions which it supplanted. And so it grew until, in a later day, it became the ruling religion of one of the greatest nations of ancient times.

Kurdish Hunter--West Iranic Aryan.

The religion of Zoroaster has been preserved to us in the sacred writings of the Parsis under the title of

the Zend-Avesta. Sanskrit scholars recognize in it, as in all cases of ancient sacred literature, a growth of literature extending over many generations. The first part only, known as the Gathas, is attributed to Zoroaster; and the language in which it is written appears to be two or three centuries older than the ordinary Avesta language.[1] It claims to be a record of the revelations made to that prophet, and the doctrines which he taught.[2] The other parts of the Avesta were added, from time to time, by priests and by teachers, claiming to be aided by inspiration. When the disciples of Zoroaster arrived in Media, they were confronted by the Magi, the priestly body, formed by the coalescing of the numerous Shamans of an earlier age. The result was a union of these two religions. When the Sassanian dynasty arose in Persia,[3] the Zoroastrian religion, after having been neglected for ages, was for the last time made the state religion, and, under the careful protection of the Persian rulers, continued to flourish until the Mahommedan conquerers forced it from its native soil at the point of the sword. The most earnest and loyal Mazdean worshipers either died for freedom of conscience, or fled to the mountains, or to foreign lands, where they could worship their own gods in peace. And in our own day, respected by all nations for their habits of industry and honesty, they constitute one of the most flourishing commercial communities on the coast of India.

Very briefly expressed, we may say that, in theology, Mazdeism taught that there was only one god, and that his name was Ahura Mazda. He was the creator, ruler, and preserver of the universe. Thus at its foundation the

---

1 "History of the Parsis," Vol. II. p. 155.
2 Whitney, Op. cit. p. 167.
3 A. D. 226.

religion was monotheistic. But it recognized two all-powerful controlling spirits, one good and one bad, that were forever warring with each other for supremacy. This gave rise to a dualistic form of worship.[1] In practical ethics, Mazdeism taught that truthfulness, honesty, and virtue were commendable. It condemned idolatry. It recommended a settled mode of life and the cultivation of the land. It taught immortality, and that the future life of the virtuous was to be much more happy and desirable than that of the vicious. No doubt, this religion was in advance of the time, and the standard of right and wrong was but seldom attained by its followers; but we find in these writings the words of those inspired with a desire to advance and better the condition of mankind.

With such a system of belief, the tribes of Iranians encroached upon the territory of the Turanians. Their most earnest prayers were for the help of their god against the Turanians. It was a continued struggle between Iran and Turan. There were many tribes of each roaming at will over a vast stretch of country. Whenever a tribe of Aryans became powerful through the conquest of its Turanian neighbors, its chieftain did not hesitate to extend his authority over his weaker Aryan brothers also. Thus in early times, in Western Asia, was waged a continued tribal warfare, in which the Aryans, as a whole, seemed to finally gain the ascendency.

In another place,[1] we have shown that the great Semitic power of Assyria had become aware of the growing power of the Aryans to the north and east of it. We have now reached the same period from the Aryan side. The Median empire of Cyaxares, that divided with Nabo-

[1] "History of the Parsis," Vol. II. p. 184-5. Darmestet: "Sacred Books of the East," Vol. IV. p. lvii.

polassar the Assyrian power, was, in name, Aryan, though the people were probably not very pure in blood. But the pure Persians were pressing on from the rear. We must not forget that Assurbanipal had conquered and ravaged the old kingdom of Elam, or Anzan.[1] When Assyria disappeared as a political power, a tribe of Aryan Persians, under the lead of Achemenian chiefs, entered Anzan and speedily became the ruling power in that section. During the entire period of the second Babylonian empire, we know but little of Aryan movements; but they seem to have been gradually extending their power and influence over all that section.

During all this period of migration and conquest, these Aryan tribes seem to have continued their simple, pastoral lives. It was only the overflowing of the parent hive, that led to these migrations at first, and each migrating tribe often stopped on their way to refresh their flocks on some good pasture land or, in its season, to raise a crop of grain before proceeding upon their journey. Thus was passed time enough to conquer and Aryanize all the tribes of people with whom they came in contact. But it must not be forgotten that, wherever the Aryan tribes were weaker than the Turanians, the former were the ones that became absorbed. Thus mixture and intermixture continued until the historian finds himself in doubt as to who were Iranians and who Turanians. But wherever the Aryans prevailed they introduced the principles of Mazdeism; and, wherever they went, they instituted a more settled mode of life than was common among the Turanians. This, in itself, tended to a more stable growth in social condition and strength; and, at a time

[1] Vol. II. p. 795 *et seq.*

when the various empires of Western Asia were decaying, we find in Persia the germ of new empires destined to rule the world.

Cyrus the Great.

We have now, in this hurried review, arrived at the formation of the Persian Empire. "The Persians" is a general name given to a union of ten Aryan tribes, of which the Parsagadae tribe was the ruling one.[1] In this tribe

[1] This Series, Vol. II. p. 165.

the Achemenian gens was the principal one. There seems to be historical evidence for the statement, that Teispes was the first ruling chief, who extended Aryan influence westward to the Persian Gulf. Later kings proudly claim the honor of descent from him. But Cyrus appears as the real founder of Persia. It is claimed for him that he was a grandson of Teispes. There was probably considerable Turanian blood , not only in the veins of Cyrus, but in those of his people as well. But he was now at the head of the old kingdom of Elam, one that vied in antiquity with that of Babylon itself, and one of the last to succumb to the power of Assyria. It is not strange, then, that Cyrus should indulge in pleasing thoughts of conquest and glory, of once more raising Anzan to the height of power. But around the first years of Cyrus, myths have so clustered that it is difficult to decide what is history and what is myth.[1]

It seems to have been his first aim to extend his rule over all the various Aryan people in Western Asia. This involved the overthrow of the Median kingdom founded by Cyaxares, at that time ruled by Astyages. Here again myth has been busy. But it seems that about 549 B. C. Cyrus overthrew this Median power.[2] Some years were spent in consolidating his conquests in this section of Asia. But as a final result, we know that not only the Median kingdom of Cyaxares, but the Aryan states in Asia Minor were all brought under tribute to this new Persian power.

---

[1] See Sayce: "Ancient Empires." New material for the history of this formative time is so recent that Justi: "Geschichte des Alten Persiens"in Onken's " Algemeine Geschichte," still gives credence to the old stories, p. 16 *et seq.*

[2] The defeat of the Medes is referred to in a Babylonian inscription, see "Ancient Empires."

Of course, any power, that aspired to a very extended sway, must sooner or later, come in contact with Babylon. The glorious reign of Nebuchadnezzar had passed into history before Cyrus had commenced to extend the boundaries of his empire. The successors of Nebuchadnezzar were not by any means his equal; and it was probably apparent that the star of Babylonia was as rapidly sinking to final extinction, as it had risen to its meridian height. When such a state of affairs exists, there is always a discontented party; and when Cyrus was planning the downfall of Babylonian power, he seems to have intrigued with the discontented party in Babylon. His intrigues were successful; and when, after his conquests over the various Aryan powers in Asia Minor, his forces appeared before Babylon, the city gates were open to him, and, almost without opposition, his soldiers entered the city. And thus Persian supremacy supervened in Western Asia. They now wielded the power once held by Assyria. The whole history of the conquest of Babylon is recorded on a terra cotta cylinder only recently discovered, so that we have historical evidence of this period in Persian history.[1]

From this, we learn that there was no long siege of Babylon. Cyrus appears as the ally of a disaffected element. His success is claimed as an evidence of favor from the gods of Babylon. Cyrus acknowledges himself, as the servant of Bel and Merodach. He showed a great deal of tact in not antagonizing the religious culture in Babylon. This kindness was even extended to the Jewish captives. With his consent, a portion of them, as an organized church, went back to their ruined city, Jerusalem, and there established Judaism.[2] Cyrus ruled until

The result was, that they determined to rid themselves of the usurper, and to exercise the right of electing one of their number to the office of king.[1] Their choice fell upon Darius, son of Hystaspes, who was young and energetic and, above all, a member of the Achemenian gens, in which the office of ruling chieftain seems to have been hereditary. Darius proudly publishes in one of his inscriptions: "There are eight of my race who have been kings before me. I am the ninth; for a very long time we have been kings."[2] This right of the council, to unseat a ruler and select a chief to his place, is a relic of a purely tribal state of society, and seems to have been recognized and exercised even down to the last days of the Neo-Persian empire.

Darius Hystaspes.

The oldest son generally succeeded the father as chief; but, in case of doubt or dispute, and sometimes of the unpopularity of the heir, this council of chiefs of the various gentes of a tribe would come forward and assert this ancient right. Sapor II. was thus elected chieftain, even before his birth, to the exclusion of an older brother. Kobad was deposed by this council and Zamasp was given the crown.[3] Chosroes I. assumed the office of emperor, when this council claimed that it was a "constitutional axiom that no one had the right of taking the Persian crown until it was assigned to him by the assembled

nobles."[1] Even the last ruler of the Neo-Persian empire received his crown by right of election after a period of internal disaffection.[2] In many other ways, do we find the customs of tribal life clinging to the government of early nations, proving that it was rarely possible for them to establish a purely artificial form of government, without retaining or introducing many of their earlier customs.

The Persian Empire, as founded by Cyrus and extended by Cambyses, was simply one of those huge conglomerations of tribes and people built up on the shaky foundation of tribal society. We have pointed out what plain traces all Aryan people still possess of a former tribal state.[3] It has been impossible for any government to entirely break up the system of tribal life among the Asiatic Aryans. The occupation of many tribes as herdsmen is entirely opposed to any other system of living, and the mountainous nature of their country has always tended to the same result. At the first appearance of an invading army, the weaker tribes could flee to mountain fastnesses, where they could defend themselves against enormous odds of invaders and could find abundant pasturage for their flocks. So in both Persia and India to-day, we find these still uncultivated tribes of Aryans leading a wandering and adventurous life within a few miles of populous and thrifty cities and villages, neither accepting the adopted religion of their brethren nor submitting to be ruled by them. They still worship the old nature gods or fetiches of their forefathers and live in freedom and independence.[4]

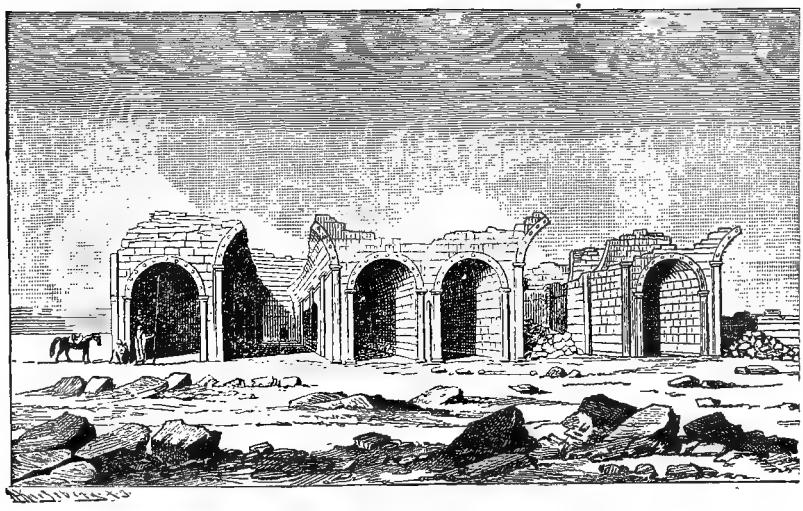
[4] To illustrate this point, we quote from Recluse, who describes the wild Afghan tribes as follows: "Whether swayed by Ameer, Khan, or Jirga, the Afghan still fancies himself free. 'We are all equal,' they are constantly assuring the English traveler, and on his boasting his mon-

Darius effected a complete reorganization of the Persian Empire. He made Susa the capital city, and divided the empire into about twenty satrapies each ruled by a satrap appointed by the emperor. Sometimes this satrap was a native prince, but, more often, he was sent out by the emperor to rule the province. Communication between these provinces was maintained by means of roads that all met at Susa. A royal scribe was stationed with



Ruins of Palace of Darius at Susa.

every satrap whose duty it was to occasionally report the condition of affairs to the emperor, and, to render his authority more secure, the emperor, from time to time, sent an inspector with an armed force to visit each satrapy. Thus, was his authority maintained throughout the empire

---

archial institutions, 'we prefer our dissensions' they reply. 'Let our blood flow, if need be, but we will have no master.' And if local feuds are frequent, the tribes at a distance from the large cities escape, on the one hand, not only from a system of unlimited oppression, but also from the general revolutions which decimate the inhabitants of some other Asiatic lands subject to capricious autocrats." "Earth and its Inhabitants," Vol. IV. p. 35.

and a heavy tribute exacted from every satrapy. The government thus became "a highly centralized bureaucracy, the members of which owed their offices to an irresponsible despot." The emperor was this despot and the fountain of all law.[1] Even that constant element of tribal society, the council—consisting, in the case of the Persians, of the seven chiefs of the seven gentes of the Parsagadaę tribe—for the time being, largely disappeared, seemingly tolerated only out of respect for ancient customs.[2]

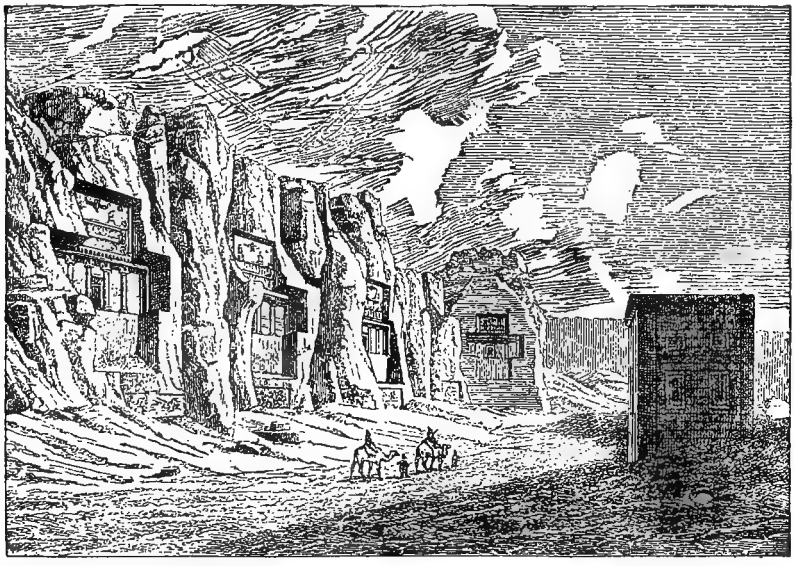
With such a government, and a revenue amounting to at least twenty-one millions of dollars in silver and gold, Darius was able to organize and maintain enormous armies, so it is not strange that his reign was one of great military success. It lasted from 521 B. C. to 486 B. C., a period of thirty-five years. During that time, he conquered nearly every tribe of people west of the Indus river, and south of the Hindoo Koosh mountains. He did not stop with the conquest of Asia Minor and Egypt merely, but crossed over into Europe, and added Thrace to the Persian Empire. Though twice defeated in his attempt to conquer Greece, he was in the midst of much vaster preparations for a new invasion of that country, when the vital force gave out and he was buried in a magnificent tomb at Naksh-i-Rustam.

The Magian revolt being suppressed by Darius, as we would expect, Mazdeism was made the religion of the empire. Darius is said to have ordered a collection of the writings of Zoroaster to be made. But the relig-

1 "Ancient Empires," p. 247-50.

2 Sayce says: "A council consisting of the seven leading families and a hereditary sub-nobility sat without the will of the king, but this relic of a period when Persia had not yet become an empire had neither power nor influence against the bureaucracy that managed the government." "Ancient Empires," p. 248.

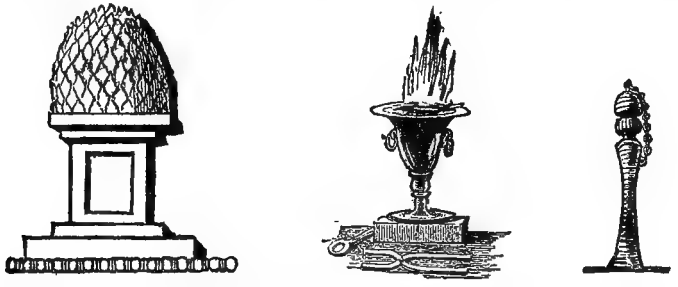
ion that was instituted as the state religion was not the pure Mazdeism as taught by the great Iranian prophet. It was a corrupt religion formed by the amalgamation of Magism (the worship of the elements, such as fire, earth, water, and air) with Mazdeism. Nor did the influence of the old Magian priests disappear. After their unsuccessful attempt to gain governmental authority under Gomates, they seemed to have changed their policy, and led the way



Tomb of Darius at Naksh-i-Rustam.

to a blending of the Mazdean spiritualistic and dualistic worship with their own cult. In this way they succeeded in forming a combination of the two religions under the name of Zoroastrianism. But having secured the office of priest as the peculiar right of their own particular sect, these priests of the new religion then proceeded to erect their fire altars on the tops of the highest mountains; and, calling down fire from heaven through the lightning, they kept it constantly burning and sacredly guarded, lest it be corrupted even by the human breath.

Perhaps one of the most striking natural objects to be found in the whole length and breadth of the Persian land is the imposing, precipitous face of Mount Behistun, situated in the western part of Persia twenty-seven miles east of Kirmanshah. Rising above the surrounding plain to a height of fifteen hundred feet, it presents its precipitous face to the approaching traveler, and stands out, like a great natural monument, to proclaim to passing generations the life, conquest, and the deeds of prowess accomplish by Darius the Great, by the grace of the Zoroastrian god, Ahura Mazda. The center of the face of this



Various Forms of Fire Altars.

rock, at the height of four hundred feet above its base, was polished into a smooth tablet, one hundred feet high by one hundred and fifty feet long. All cracks and crevices were filled with lead, and the whole covered with a silicious varnish. Upon the face of this rock, was sculptured in bas-relief a representaton of Darius attended by the nine conquered chieftains, upon the neck of one of whom he is resting his foot. These are mentioned in the inscription as the Asiatic rulers who revolted against Darius, and were conquered by him.[1]

---

[1] There were Gomates, the Magian: Atrines, the Susian; Nebochodrossor, the Babylonian; Martes, a Persian; Phraortes, a Median; Sitratachmes, the Sagartian; Phraates, the Margian; Veisdates, the Persian; and Aracus, the Armenian. "Records of the Past," Vol. I. p. 124.

On the remainder of this tablet is recorded the history of the reign of Darius, setting forth his conquests and his power, in three languages—the Persian, Median, and Assyrian—in all of which the cuneiform alphabet was used. There are several hundred lines of these inscriptions, written under the directions of Darius himself, and calling down imprecations upon the head of him who dared to deface or to add thereto. For twenty-three centuries, has this rock stood, like an open book, inviting the inquisitive to come and read. But the historian blundered on from age to age, trying to build up a history from fragments of mythological lore, ignorant or regardless of these records. In the middle of our own century, Sir Henry Rawlinson scaled the cliff, and reclaimed to the world this valuable contemporaneous record of the history of Persia's great conqueror. From this record, Persian history has been reconstructed, and placed on a sure and safe foundation.

Xerxes, son and successor of Darius, reigned twenty-one years, and also vainly endeavor to conquer Greece. He, however, succeeded in maintaining intact the vast empire organized by his father, and he ruled with considerable energy and ability. His death occurred in 466 B. C. The seven emperors, who in succession followed Xerxes, did very little to enhance the glory, or, to increase the territory of the empire. Their combined reigns covered a period of about one hundred and thirty-five years from 466 to 321 B. C.[1]

Even in the time of Xerxes I., germs of decay began to take root and grow. The ornamentation of the palace

[1] These kings were Artaxerxes I., who reigned 41 years; Xerxes II., 45 days; Sogdianos, six months; Darius II., 19 years; Artaxerxes II., 46 years; Okhos, 21 years; Arses, 2 years; and Darius III., 5 years.

of Darius represent the king as hunting the lion, and as fighting with and killing fabulous monsters; while, in the palace of Xerxes, attendants are represented as bringing towels and delicate dishes to satisfy the whims of an effeminate prince.[1] This early sign of effeminacy increased until, when Alexander arrived with his conquering army, he met with little or no resistance. The Macedonian conqueror brought with him scarcely thirty-five thousand soldiers; yet, when he met the Persians on the battlefield of Arbela, where Darius Codomanus mustered an army claimed to number one million soldiers, he is said to have slain three hundred thousand men.[2] Although the Greek authors, who have recorded the history of Alexander's conquests, may have falsely stated the number of soldiers that opposed him in these various engagements; it is evident, that the empire had become disorganized, and that the Persians had no such leader as Darius Hystaspes, who dared to carry Persian arms into Greece itself. This conquest by Alexander put an end to what is known as the first Persian Empire, which had lasted, as we see, about two centuries.

Darius Codomanus.

As united under Darius and his immediate succes-

[1] Rawlinson, Vol. IV. p. 265.

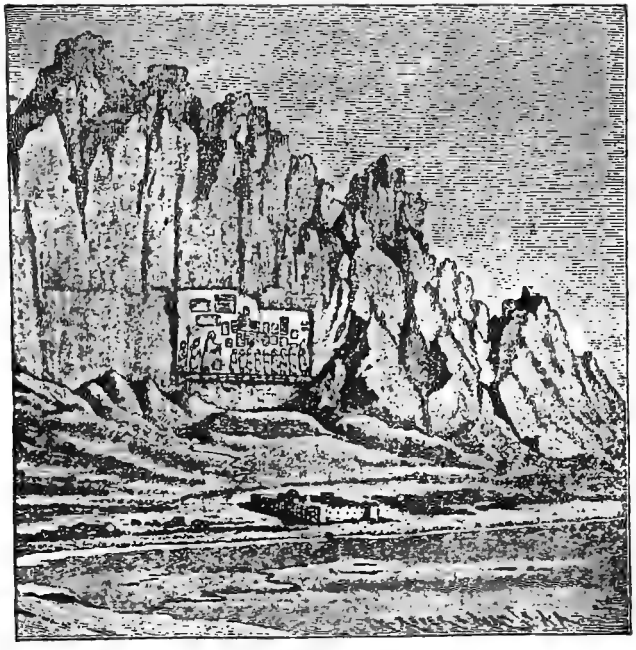
sors, the Persian Empire was still a country of long distances and occupied by tribes of people, who waited only for a favorable opportunity to rise and declare their independence. This state of affairs was made manifest in a marked degree, by the successful retreat of the ten thousand Greek mercenary troops, who accompanied Cyrus the younger in his unsuccessful expedition against his

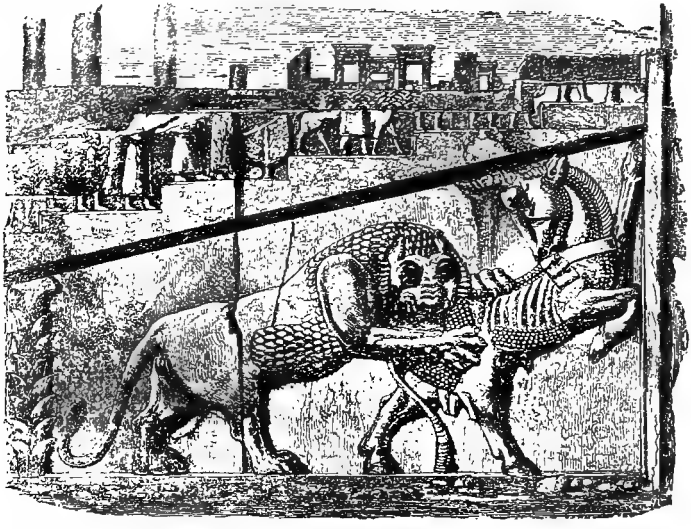


Mount Behistun.

brother, the Emperor Xerxes. On the death of Cyrus at the battle of Cunaxa, they found themselves hundreds of miles away from home, their leaders murdered, and themselves surrounded by enemies.[1] Electing Xenophon as their leader, they began their memorable retreat and succeeded in reaching their native Greece. Had the country through which they passed been inhabited by people thor-

1 Xenophon: "Anabasis."

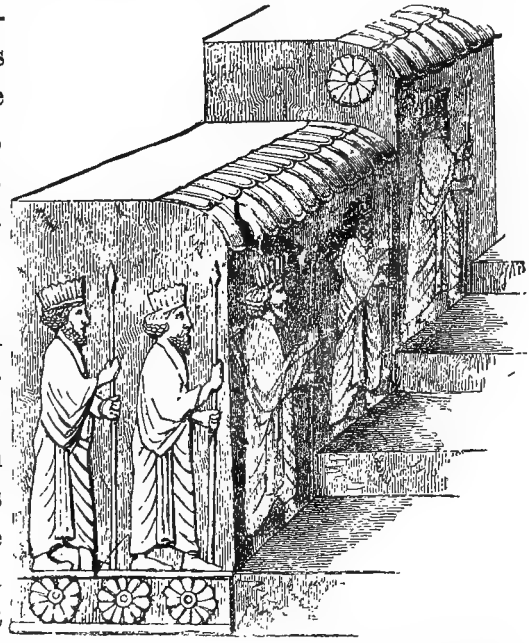
oughly in sympathy with the Persian government, a body of ten thousand hostile men could never have passed through the heart of this country, which seems to have been able to raise army after army of hundreds of thousands of men with comparative ease. While living in fear of the power of the Persian monarch, the various tribes inhabiting the empire were in a state of constant uneasiness, and the ruling monarch had to be constantly on the watch to suppress incipient revolts.



Stairway at Persepolis, Lion Devouring a Bull.

In regard to the personal traits of character of the Persians, we have to admit that they were not only cruel but apparently set very little value on human life. This is at least true of the ruling house. The majority of the emperors reached the throne and maintained the same, only by a series of bloody deeds. Darius himself gained supremacy by the murder of Gomates, and the massacre of the Magi; whenever a chieftain displayed uncommon energy in maintaining a revolt, the great "King of many

Kings" caused to be recorded that he, after mutilating the body of his prisoner, caused the miserable captive to be chained to his palace door and, finally, to be crucified.[1] Xerxes was murdered by two courtiers at the instigation of his wife. Artaxerxes, his third son and successor, secured possession of the throne by the murder of two brothers. His successor, Xerxes II., was assassinated by a half-brother, forty-five days after his accession to the throne, who, in turn, ruled six months, and was murdered by another brother. Then Cyrus the younger was killed in battle, while attempting to supplant his brother on the throne.[2] This chapter of crime could be extended indefinitely, but enough has been said to show that the state of society was certainly very crude.



Stairway at Persepolis, Persian Guardsmen.

The religion of the old empire, formed, as we have

---

[1] Darius says of Phraortes: "I cut off both his nose, and ears, and his tongue and scourged him. He was held chained at my door, all the kingdom beheld him. Afterward at Ecbatana, there I crucified him; and the men who were his chief followers at Ecbatana within the citadel, I executed them." "Records of the Past," Vol. I. p. 119. The same punishment awaited another of his captives also.

[2] "Ancient Empires," p. 252-3.

seen, by the union of Magism and Mazdeism, had many ceremonies calculated to impress the masses of the people. The priestly body was very numerous and influential. Clothed in long white robes and tall felt hats, with lofty air and stately bearing, carrying their divining rods in their hands, processions of these Magi were wont to wind through the streets of the Persian capital and up the mountain sides, there to practice their weird incantations around the never dying fires on the sacred mountain altars. These altar fires also reminded the Iranian peasant of his own sacred vestal fires; and, under the influence of superstitious dread of the priestly magic, no laws strong enough to prevent the union of these two religions could be made and enforced.

Worshiping the elements, fire, earth, air, and water were regarded as sacred. It was a problem to them how to dispose of the human body after death, until they struck upon the plan of erecting lofty "towers of silence" on the mountain tops. There, between the heavens and the earth, they placed their dead that the flesh might be devoured by the vultures of the air and thus be prevented from defiling the elements. This custom of disposing of the dead, however, had not become incorporated into the Mazdean religion at the time of Darius,[1] or of his successor, Xerxes; for both of these emperors, though champions of that faith, were buried in costly and elaborate rock-tombs, ruins of which can be seen by the modern traveler in Persian lands.[2] In another place, we have shown how Fetichism gives rise to idolatry. Inasmuch as Fetichism was common to all people, it has been almost impossible

[1] See Mills: "Zend-Avesta," Part III. in "Sacred Books of the East," Vol. XXXI. p. xxxi.

[2] "Sacred Books of the East," Vol IV. p. xlv.

to supplant idolatry. This has been the experience of all systems of belief. So we are not surprised to find that, although idolatry was forbidden by Zoroaster, still at the time of Darius images had been already made to represent peculiar Mazdean divinities and angels. On the face of his tomb, Darius is represented as worshiping Ormazd, or Ahura Mazda. The only image of this god that we find is the winged circle surmounted by an incomplete human figure like the accompanying cut. This idea seems to have been adopted from Assyria.[1] There is, however, also found, on one of the square pillars erected by Cyrus at Pasargadae,

Representation of Ahura-Mazda.

the figure of a colossal man with four wings issuing from his shoulders, and is supposed to represent the angel, "Serosh," who in the Mazdean religion meets the pious soul and escorts it across the Bridge of Death to the Paradise beyond.[2] This also represents a hybrid style of art, as the figure is clothed in a purely Egyptian style.[3] Neither the Iranian nor the Magian at this time had temples for their gods, but believed rather in paying reverence to their

deities in the pure open air, where the horizon was their temple walls, the mountains were their altar foundations, and the vault of heaven, the star-bespangled dome of Nature's beautiful and sublime cathedral.[1]

The Angel Serosh.

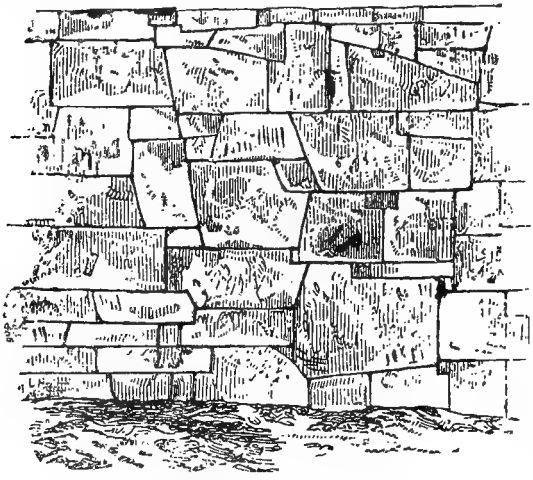
The ancient Persians never reached any great degree

[1] Sayce remarks on the winged figure as follows: "Egyptian influence may perhaps be detected in the propylae through which the royal palaces were approached, as well as in the headdress of the man who has the attributes of the winged Asiatic goddess on one of the pillars of the tomb falsely ascribed to Kyros (Cyrus) at Murghab," ("Ancient Empires," p. 272.)

of merit in art and architecture. They were, in the main, copyists and thus originated a mixed style of architecture, showing very little skill or originality. Their religion, as stated, forbade idolatry, and, in that way, was removed the greatest source of inspiration to the artist; for, under the inspired chisel of the ancient sculptor, the rough marble block gave form to the ideal conceptions of divine grace and virtue, and transformed itself into images of surpassing beauty and loveliness. The poetical muse of both the Iranians and the Indians seems to have guarded her dominion with jealous care, and, while giving them a rich and reasonably pure form of worship, in the same breath, seems to have forbidden the entrance of her sister divinities into the fields of Iranian nature worship. It is true, that the ravages of war and of the elements have left very few remains of ancient Persian architecture; but those remains prove the costliness and magnificence of Persian palaces, and, at the same time, display, to a certain degree, a coarseness and a lack of polish in their finish.

The richest field of ruins that can be found in Persia is near the site of the ancient city of Persepolis. Here were built in succession the three great palaces of three great Persian emperors, Darius I., Xerxes I., and Artaxerxes III., the Sassanian. Here also may be found the ruins of the "Hall of One Hundred Columns" and the "Great Hall of Audience," all of which buildings are said to have been destroyed by Alexander the Great, in a drunken revelry, in order to please Thais, a beautiful follower of his court. These ruins are grouped on an enormous platform, rising in terraces to a height of forty-five feet above the plain. The surface of the third terrace is seven hundred and seventy feet long, by four hundred broad, and on this were erected the three palaces and

two large halls just referred to.[1] This whole platform is built of solid masses of hewn stone, often of enormous size, though irregular in shape, these blocks were closely fitted to each other so as to present the appearance of the accompanying cut. The top of the platform on which the buildings were erected, was reached by a series of flights of broad stairs, sloping so gradually that they could be ascended and descended by a traveler on horseback. The parapet walls of the staircase were elaborately covered with ornamentation and sculptures, representing Persian guardsmen, a lion devouring a bull (see cuts pages 120-1), or some mythological event.

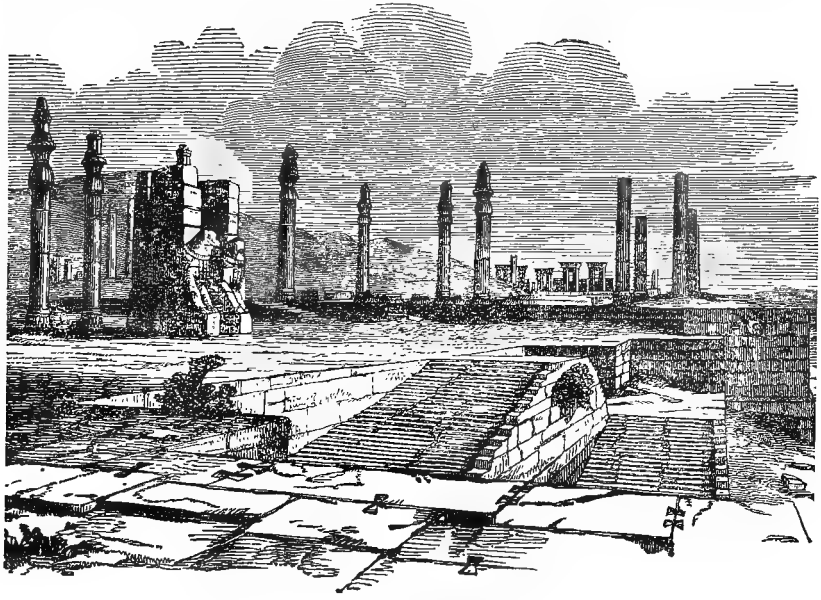


Masonry at Persepolis.

The palace of Darius seems to have occupied the most exalted position of any of the buildings on the platform. It was built on a separate terrace of its own, about fourteen feet above the general level of the third main terrace, the western edge of which it occupied, facing the south. It covered a space of one hundred and thirty-five by one hundred feet, and seems to have been a one-storied edifice about twenty-five feet high. The kingly guest, passing up a double flight of stairs, would enter the palace through a deep portico, adorned with enormous columns surmounted by "dou-

1 For further details of this field of ruins, see Rawlinson: "Five Great Monarchies," Vol. IV.

ble griffin" and "double bull" capitals of elegant design and execution. On either side, a guard-room opened into the portico, and the Persian soldiers stationed here furnished a protection against intruders. Next, he would be ushered into a square hall, the roof of which was supported by sixteen pillars arranged in four rows. On the three remaing sides of this hall, were suites of compartments, the doors of which bear the only specimens of sculptures that

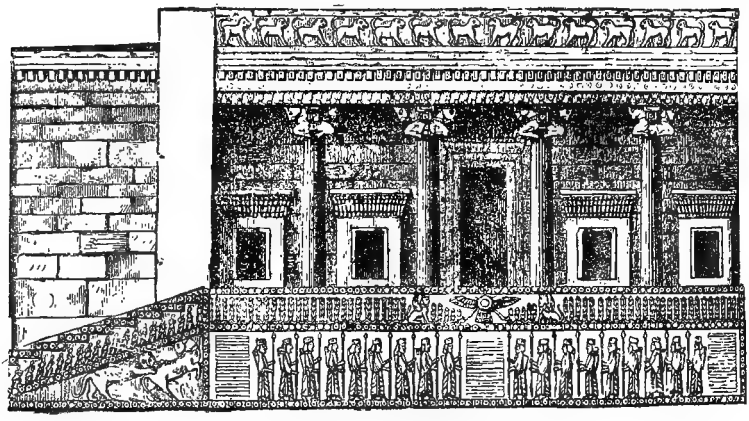


General View-Ruins of Persepolis.

adorn the room. This was the great hall of Darius, "the great king, the king of many kings, the king of the nations."[1] The ordinary Asiatic monarch was content to live in no such close quarters as these. If, however, the grand central hall, though only fifty feet square, were bedecked in true Oriental style, it would have presented no mean appearance. And it probably was so adorned.

[1] Inscription at Nakhsh-i-Rustam.

The columns were, no doubt, slender and graceful, and plated with gold and silver. The beams and rafters of the ceiling were regularly arranged at right angles, and likewise coated with precious metals. The cold stone walls, broken here or there by window or door, were similarly decked and further bespangled with jewels, curtains of brilliant hues hung across the entrances. The floors were paved with many colored stones, and in places covered with magnificent carpets. An elevated golden throne, under a canopy of purple, adorned the upper end of the

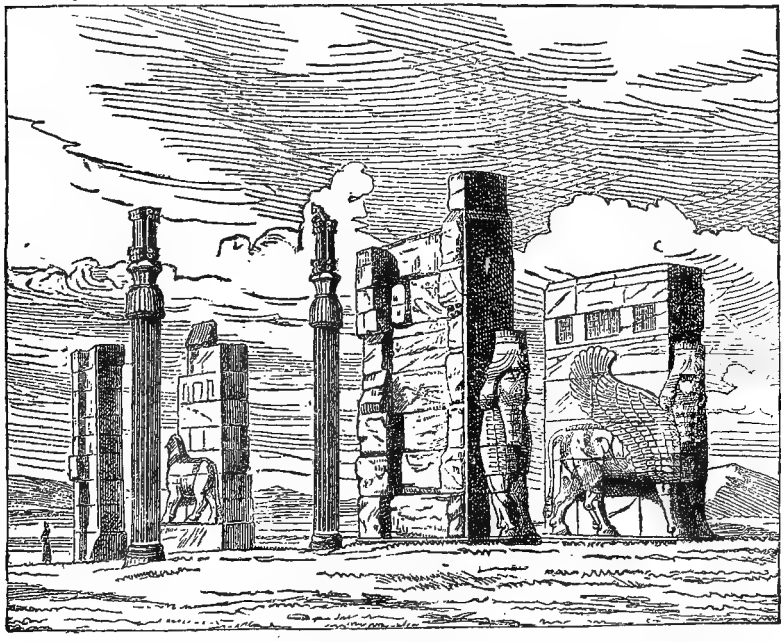


Palace of Darius—Restored.

hall. We can thus see how elegance of form and richness of adornment may have more than compensated for the want of that grandeur which results from mere size.

The palace of Xerxes stands on the same main platform, and is built after the plan of that of Darius, though double the size; but there are a number of gateways guarding the various entrances to the platform, or palace, that are remarkable for their size and ornamentation. They were halls of great size and may have been "throne rooms where the monarch held his court on grand occasions." The largest of these was eighty-two feet square, surrounded

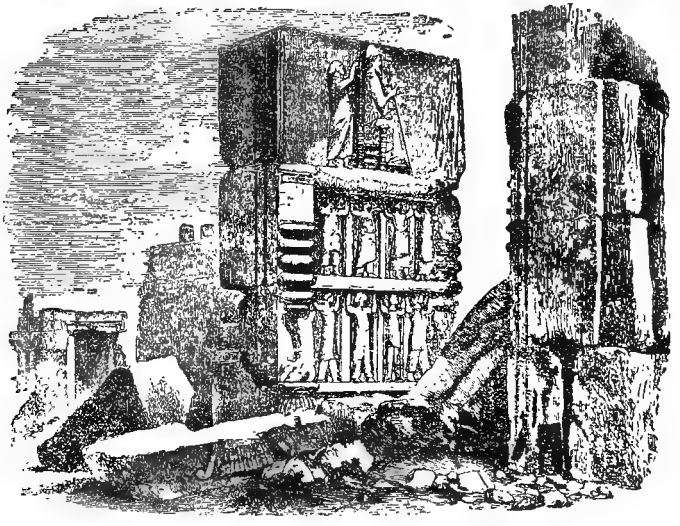
by walls sixteen feet thick, the roof being supported by four massive pillars nearly sixty feet high. The apartment was entered through two portals thirty-six feet high, and twelve feet wide, and these were flanked with figures of colossal bulls, some of which were winged and human headed, similar to those of Assyrian workmanship.



Ruins of Palace of Xerxes.

The ruins of two structures of enormous dimensions may also be found on this same platform. These were two pillared halls, probably used for public gatherings, where the emperor presided before great assemblies of people. Both were similar in shape and construction to the gateways. One is called, by the archaeologist, the "Hall of One Hundred Columns," because the roof of the main audience room was supported by that number of lofty marble pillars, arranged in ten rows in an enclosure two hundred and twenty-seven feet square. The portico was

one hundred and eighty-three feet deep, and also supported by columns. The "Great Hall of Audience," though similar in design, was even grander in proportions. The ruins of this enormous building cover an area three hundred and fifty feet long by two hundred and forty-six broad. The central square alone covered over twenty thousand square feet. The roof of this part was supported by thirty-six pillars, arranged in six rows. But the

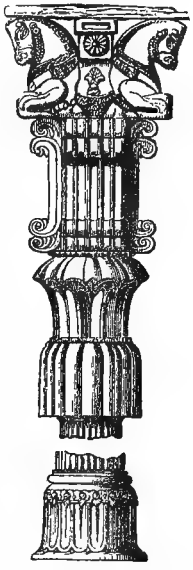


Gateway to "Hall of One Hundred Columns."

most remarkable feature of the building was the height of its columns. These all towered above the platform to the uniform altitude of sixty-four feet and were, besides, of a much more ornamental and complex style of architecture than any that we have previously examined, as will be seen from the accompanying cut.

We have taken a hasty glance at the most remarkable relics of ancient Persian grandeur. It is humiliating to record, also, that it was Aryan against Aryan that finally led to the downfall of these proud cities and lofty halls.

No amount of labor or wealth can repair the ruin of a single night of revelry on the part of the Macedonian conqueror. Much of the grandeur of these proud old emperors has disappeared, but enough remains for us to dimly realize what must have been their power and resources, to enable them to send forth their vast armies to new victories and further conquests, and, at the same time, to cultivate the arts of peace. They were able to quarry blocks of marble so massive that it would baffle our own enlightened age, with all its arts and mechanical skill, to remove them from their native beds.



Column from "Hall of One Hundred Columns."

The first Persian Empire was, as stated, brought to an end by the conquest of Alexander the Great. The career of the great Macedonian is one of the most wonderful in the annals of the world, and exerted a very great influence on the culture of Western Asia. We are here not concerned with giving even an outline of his conquests. We want only to sketch the fortunes of the Persians. It suffices to say, that more than five hundred years pass away before we come to the New Persian Empire. Alexander himself soon passed off the stage of action. The Syrian kingdom of Seleucus Nicator, which at first included the greater part of Alexander's kingdom, in fact, all of the Asiatic conquests except Lower Syria and Western Asia Minor, for the time being, ruled over most of the territory of ancient Persia.

But this kingdom lost power and territory almost from the first. As it declined, there grew up the Parthian King-

dom. Parthia was properly the country to the south-east of the Caspian Sea, and was formerly one of the satrapies of Persia. Its inhabitants were, probably, never very pure Aryans; and probably, in the course of time, new arrivals of Turanian people came from the north. At any rate, the ruling people in Parthia were Turanian as is shown by their customs, language, features, and other traits. Parthia became independent[1] about fifty years after the fall of Persia; a century later, it was at the height of its power; and for four centuries, all the territory of ancient Persia, east of the Euphrates, was a part of her territory.

We can say in a few lines all that we deem necessary of the Persians during these five centuries of vassalage. Under Greek rule, we do not find the Persians greatly oppressed. They were not forbidden to worship according to their own religion. But Mazdeism was neglected; and, had it not been for the devotion of the people, and the zeal of the Magi and priests, it must have lost much of its hold upon the nation. Neither was the Parthian yoke, seemingly, a hard one. Persia was made a satrapy and was ruled by its own prince who was possibly a descendant of the royal Achemenian line of chiefs. The Parthian emperors do not seem to have interfered with Mazdeism. In fact, Mazdeism seems to have been promoted and even to have been the favored religion of the empire, at least under several of the early Parthian rulers.[2] But during the later days of Turanian rule, Mazdeism fell into disrepute. The Magi were neglected; idolatry was introduced; the sacred fires were allowed to go out; the fire-temples themselves were destroyed; the rulers demanded to be worshiped as gods; and many other rites were instituted, that seemed extremely sacrilegious to the true fol-

1 249 B. C.

2 "Sacred Books of the East," Vol. IV. p. xxxv.

lowers of Zoroaster.[1] Such a state of affairs alone has been sufficient to cause many a great uprising and rebellion against emperors and kings, as all past history will prove. For mankind will sacrifice more for liberty of conscience than for any other right or advantage; and it was largely under the banner of a religious reformer, that the Neo-Persian empire arose upon the ruins of the great throne of Cyrus and Darius.

The individual who was destined to raise Persia from her long subject state, and to re-establish the ancient religion of the land is generally called Artaxerxes though also named Ardeshir. He was appointed satrap of Persia by the Parthian emperor, Artabanus. While claiming to be a descendant of the royal Achemenian family, the probabilities are that he was not of such descent, but the son of a Persian soldier bearing the name, Sassan. However that may be, he was certainly an able and ambitious man. Just such a person as would be apt to quietly gather the forces of Persia, and test the question of strength with the ruling power, Parthia. In this contest, he of course made use of every advantage he could; and not the least in importance would be the aid of the still numerous and influential priesthood, the Magi. In his efforts, he was successful; and, in the year 227 A. D., the Parthian power was overthrown, and the Neo-Persian empire appeared on the scene. Speaking generally, it included the territory of ancient Persia, east of the Euphrates.

Artaxerxes.

As this revolt was so largely a religious one, it is

1 Rawlinson: "Seven Great Monarchies," Vol. III. p. 223.

not strange that we hear of a reformation taking place as regards Mazdeism. At this time, "Western Asia was a seething pot, in which were mixed up a score of contradictory creeds, old and new, rational and irrational, Sabeism, Magism, Zoroastrianism, Grecian Polytheism, Teraphim-worship, Judaism, Chaldean Mysticism, Christianity."[1] Artaxerxes began at once a system of religious persecution. Temples of worship, not Mazdean, were ordered closed; idols were destroyed; and the Magi were assigned lands that placed them in positions of pecuniary independence. It was seemingly his intention to unite all these various and conflicting beliefs into one common form of worship, that of Mazdeism.

In order to best accomplish his purpose, Artaxerxes caused a council of priests to be assembled at his court for the double purpose of reviving pure Mazdeism, and collecting into one volume whatever of former writings and collections had been preserved through the vicissitudes of wars and the enmity of hostile rulers, as well as to gather and add thereto all that could be gleaned from the memories of the priesthood of the entire land. It is said, that more than forty thousand priests assembled in answer to his call.[2] This grand concourse of sacred teachers, clad in their long robes, as pure and white as the historical ermine of the judge's gown, flocking toward the Persian court, must have filled the common tribesmen with superstitious awe and reverence for their sacred teachings, and must have crowned their pious ruler with praise and almost adoration. This enormous assembly of the priesthood seems to have been governed by a like desire to formulate a pure and perfect form of religion. They proceeded to

[1] Rawlinson: "Seven Great Monarchies," Vol. III. p. 271.
[2] "History of the Parsis," Vol. II. p. 125.

select from their number first a committee of four thousand, then of four hundred, from these forty, and finally from these seven, each time striving to choose those especially distinguished for learning and piety. To these seven, was given the task of compiling a revised edition of the Zoroastrian creed, and this edition stands to-day as authority in all Parsi communities, although there seems to be springing up a more liberal school of interpreters, who are discarding many of the old superstitious practices of their forefathers.

This final committee of seven met and chose as their leader a young and pious priest named Arda Viraf, who was instructed to prepare a collection of all the teachings of the Mazdean faith, and to blot out all practices that were evil, impious, and harmful. It is claimed for him that he spent seven days in a trance, during which all these religious precepts were revealed to him. This may mean that he, with the aid of six assistants, managed to collect from the assembled thousands all the then existing writings, traditions, and scraps of wisdom that clustered around the name of Zoroaster, and these, combined with the teachings of the Magi, he condensed into a useful volume of valuable precepts. The result of this work did by no means give to the people the pure Zoroastrian doctrines, but the book of Arda Viraf seems to have furnished a good, united system of religious worship and moral precepts, which then became the religion of the empire. This, no doubt, contained all that was good in Mazdeism, Magism, and the many other beliefs that had crept into the Persian territory. The blended religions were accepted by the people in general; and, from that time until the appearance of Mohammedanism, the new faith was not only preached by the priests, but also enforced by the

government. We have given a short historical outline of the growth of Mazdeism, but a discussion of the principles of this system, and its place in the ranks of comparative religions, we will reserve for another chapter.

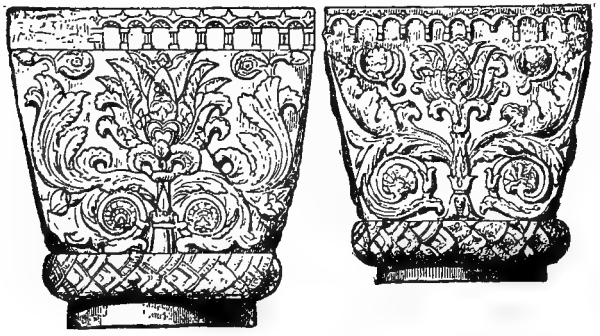
The Neo-Persian empire existed for about four hundred and twenty-five years, and during that time, twenty-eight monarchs of the Sassanian dynasty sat on the throne. But few of them, however, ruled with any great degree of energy or distinction. The first of them was Sapor I., Artaxerxes' immediate successor. He is known in history as the only Persian that succeeded in bringing a Roman emperor (Valerian) to his court as captive. He held the reins of government with a strong hand, and proved himself one of the most able of the Persian rulers. His mother is said to have been the daughter of Artabanes, the last Parthian emperor.[1] Emperor Chosroes I., however, who began his reign A. D. 521,[2] not only was able to maintain the Persian empire unbroken, but extended his conquests into neighboring provinces and caused the Roman emperors to fear him and respect his rights. Above all his predecessors, did he succeed in enshrining his memory in the hearts of the Persians by his endeavors to rule with mildness and to better the condition of his subjects. He built and populated cities; and loving traditions relate that he was followed from one end of his empire to the other by armies of architects and builders, who were instructed to repair the humble cottage of the peasant as well as the walls of stately royal halls.

Sapor I.

[1] Rawlinson, Vol. III. p. 279.

[2] "History of the Parsis," p. 8, 9, 70.

He instituted a number of reforms, that placed Persia in advance of contemporary nations. He willingly formed a treaty with Rome, that guaranteed protection to all Christians residing in Persia, allowed commercial intercourse between the two empires, and provided that all future disputes arising between the two empires were to be settled by courts of arbitration. Finding that his empire was broken up into too many satrapies, he divided it into four districts, each presided over by a viceroy, who was to receive reports from the satraps and, in his turn, report to the emperor. He regulated the land tax

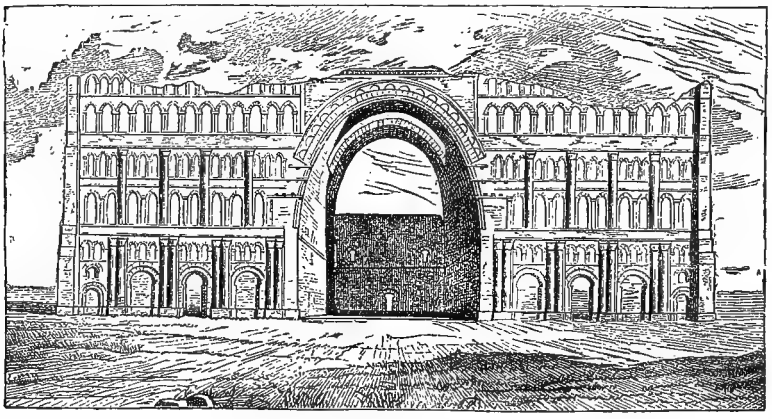


Architectural Columns, Sassanian Period.

so as to encourage agriculture. A reform in the administration of the Persian army is also ascribed to Chosroes. Every soldier and officer was encouraged by a payment according to the rank to which he belonged. The treasury could no longer be robbed, neither could any soldier, private or officer, draw more than his rightful pay by misrepresentation. There was likewise a reform made in the administration of justice, whereby the rights of every subject were considered as sacred as those of the emperor himself. Though very jealous in regard to his own rights as emperor, we find this wise monarch so careful of the

rights of his subjects as to in no way trespass against them to gratify his own desires.

During this reign, we also notice a great step in advance for Persia. Although the emperor, himself, was a believer in Zoroastrianism he was very tolerant toward believers in other religions. One restriction only seems to have been placed upon the followers of other gods and that was forbidding proselytism. He invited travelers, sages, philosophers, and the learned of all nationalities to his court, and has the credit of founding the first Persian university



Palace of Chosroes I.

at Shapoor, where medicine, philosophy, rhetoric, and poetry were studied. Thus we see the Iranians passing through their period of highest development and enlightement during the reign of one who was cruel toward his enemies, relentless in his punishment of offenders of the law, and severe in the penalties attached to the violations of his laws. On the whole, however, it was only such a strong and fearless mind combined with a firm hand, that could hope to institute and maintain such reforms at such a time in this greatest of Oriental Empires.[1]

[1] Rawlinson's Vol. III. p. 448, *et seq.* "History of the Parsis," Vol. I. p. 10.

During the latter part of the Neo-Persian period, art and architecture received a great deal of attention throughout the entire empire. A refinement and a degree of ornamentation never before known seem to have been introduced. The remains of four palaces are found. These were situated at Serbistan, Firuzabad, Ctesiphon, and Mashita, the third of which was the palace of Chosroes I. and the last that of Chosroes II. Only a small portion of the palace of the first Chosroes remains standing, but this proves it to have been a massive erection, filled with apartments arranged and furnished on the grandest scale. All that remain of the walls may be seen from the accompanying cut about one-fourth of the original enclosure. The exterior ornamentation of all the Sassanian palaces was by pilasters, arched recesses, and cornices. "The interior ornamentation was probably, in a great measure, by stucco, painting, and, perhaps, gilding. All this, however, if it existed, has disappeared."

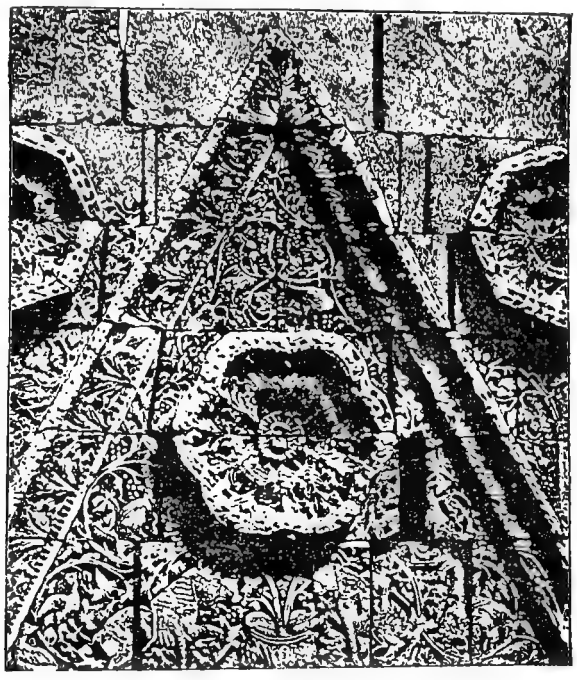
The Mashita palace, of Chosroes II., though somewhat smaller than that at Ctesiphon, is said to far exceed the others in beauty of ornamentation. The face of this building presents specimens of the most elaborate ornamentation known to the ancients. Figures of peacocks and parrots are mingled with those of the lion and the wild boar in the greatest profusion; and, midst the whole, are intertwined branches and vines bearing rich clusters of fruits and nearly concealing the groups of smaller birds and animals. It is indeed a delicate piece of workmanship, and modern times can scarcely produce anything so elaborate. North-east of Kirmanshah, there are the ruins of an arch known as Takht-i-Bostan, or "Roof of the Gardens," that need especial mention on account of its bas reliefs, said to be little inferior to the best Roman art. The court of the later Sassan-

ian emperors rivaled in grandeur and magnificence anything ever known. The robes of the emperor were "beautifully embroidered and covered with gems and pearls," which in some cases could be counted by hundreds. The royal crown, too large to be worn, said to have been ornamented by one "thousand pearls each as large as an egg," was suspended by a golden chain above a golden throne. The whole court was likewise adorned with jewels and precious metals, causing it to vie in splendor with the dazzling Taj Mahal, the jeweled pride of India.

Flowered Panel from Takht-i-Bostan.

Though the goverment of Persia under Chosroes I. had reached a stage of strength and magnificence hardly ever attained among the ancients, it required only a half a century of civil wars and misrule to completely overthrow and ruin the empire. About the middle of the seventh century of our own era, the armies of Mohammed swept across the borders of the Persian empire, and found the Iranians so divided or weakened by civil wars that they were illy fitted for checking the invading hosts. The last Persian emperor was captured in 651 A. D., and the followers of Zoroaster were given the choice of accepting the faith of their conquerors or of dying by the sword. A few succeeded in escaping to the mountains and, finally, making terms with their conquerors whereby they could occupy certain lands, and worship according to their own faith; but they were, from the first, branded as outcasts. Those of the Iranians who could reach the shores of India were

kindly received by their more fortunate brethren, and given lands on which to rear their fire altars. They now form a wealthy and respected community, in which are to be found the merchant princes of Bombay. Thus fell one of the greatest of Oriental empires; but the records of its deeds and the proud name that it will ever bear in history will endure until the mountains, that alone have witnessed



Ornamentation of Mashita Palace

the struggles that occurred in their fastnesses, shall have ceased to exist, and all history be buried in oblivion.

We have now given a very brief account of the ancient Persians. Before passing on to the Aryans of India, let us note the strongest point in the culture of the Persians. It is in the field of religion. Zoroaster, or the reform going by his name, exerted a very great influence

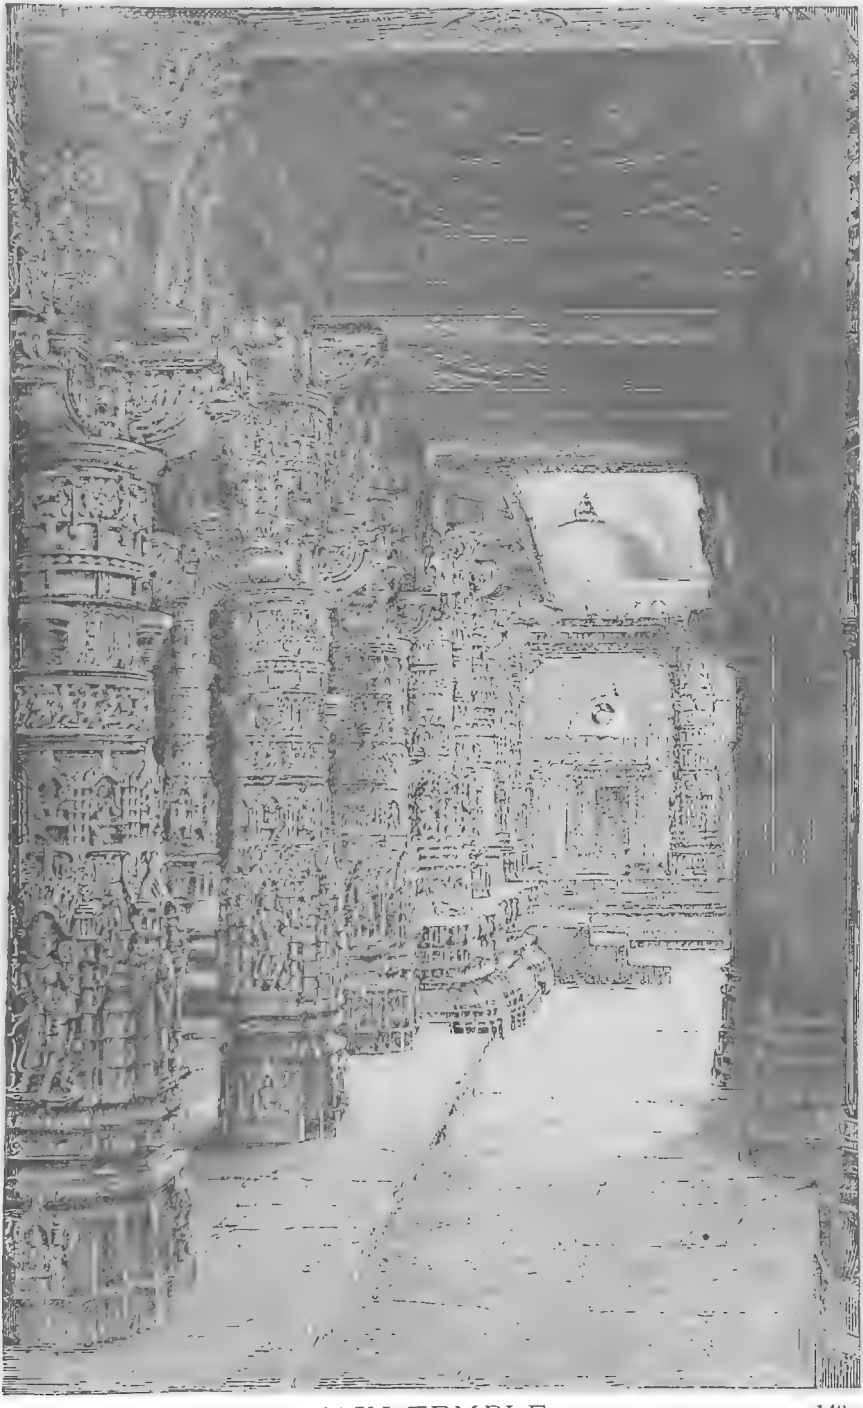
throughout Western Asia. Nor was its influence confined to Asia. Zoroaster was known among the Greeks as a great eastern sage and philosopher, and a number of Greek writers left treatises on his doctrines.[1] Indeed it is not too much to say, that even to the present day Mazdean doctrines color the prevailing religious beliefs of the world.

When we turn to consider the Aryans of India, we have before us a very interesting field, and one that is not yet fully understood. There are not wanting those who think we have in India relics of the oldest civilization in the world, that here was the real cradle of the Aryan race. And yet we fail to find any satisfactory foundation for such an hypothesis. From India as a center, very great influences have gone out in the field of religion, as will be shown. But the probabilities are that the Aryans are comparatively late arrivals in India, and it seems unsafe to assign any very high value to the Dravidian civilization which they superceded.[2]

We have seen that the pressure of Turanian tribes, advancing from the north, probably forced the Slavic Aryan tribes, that had wandered into the regions east of the Caspian Sea, over the table lands of Pamir into the Hindoo Koosh region. But sooner or later, the ancestors of the Indo-Aryans discovered the head-waters of the great rivers of India and followed them down into fertile plains, spending no doubt many seasons on their journey, during which they grew their crops of grain and

[1] "Sacred Books of the East," Vol. IV. p. xlvii.

[2] In apparent contradiction to the above, we must state that there are not wanting many evidences of a very ancient civilization in India. We recall that it is only within the last few years that we have learned of a period of Turanian culture in Mesopotamia. It may sometime be shown, that the Dravidian culture in India was considerably advanced,



JAIN TEMPLE.

refreshed themselves with long seasons of rest. Winding through the Kurman and Gomal passes,[1] or exploring for the first time, the great thoroughfare of the Kabul river valley, through which the great armies of Oriental conquerors have from time immemorial entered the plains of India, we find the forefathers of the Indo-Aryans at last encamped on the banks of the great river, Indus, and singing their songs of praise and thanksgiving to its waters.

"Flashing, sparkling, gleaming, in her majesty, the inconquerable, the most abundant of streams, beautiful as a handsome, spotted mare, the Sindhu (Indus) rolls her waters over the levels. Mistress of a chariot, with noble horses, she traverses a land yielding sweetness."[2] Thus they sang of this noble stream, as they took possession of the land which it drains, and made war upon the people who had previously, in their turn, entered and taken possession of these rich and coveted plains.

The tribes of Aryans who first entered India were an energetic and hardy race of people, in this respect, superior to the older inhabitants, whom they either supplanted or swallowed up. Still, we are not to picture them as very much in advance of the primitive Aryans.

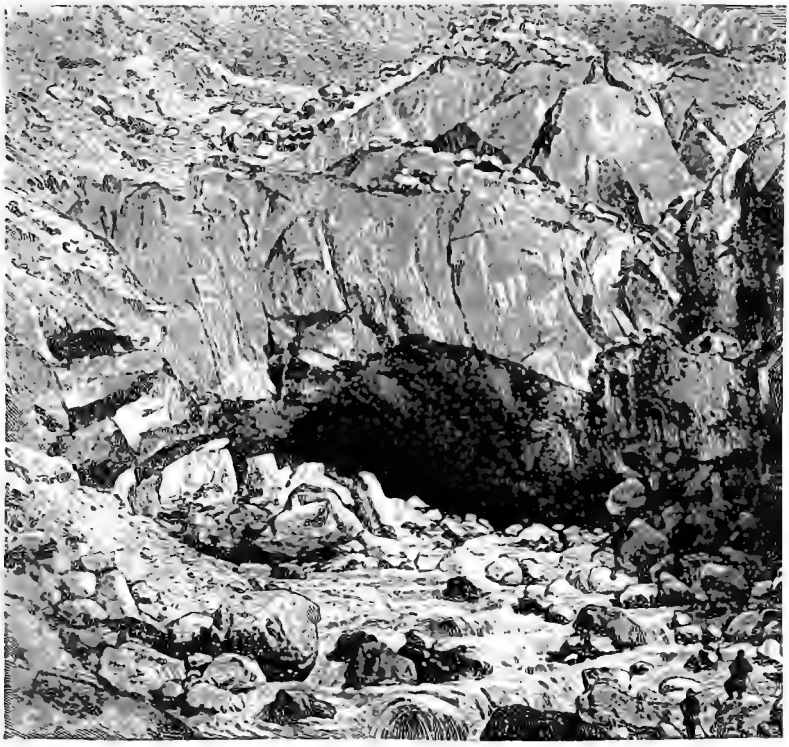
The area of India is about one million five hundred thousand square miles. It is divided by Dr. Hunter into three sections. There is first the northern or Himalaya section, an elevated mountainous tract whence rise the great rivers of India. This is followed by the "river

---

and undoubtedly very ancient, that the Aryans played the same part in India that the Semites did in Mesopotamia and absorbed the culture of the Dravidians. This would explain many otherwise dark points. We look for the Turanians in India to exert their greatest influence in the field of religious culture.

[1] Journal R. A. S. 1883, p. 359. [2] Ibid. p. 61.

plain," the section watered by the Himalaya rivers. Extending from the Indian ocean on the west, to the Bay of Bengal on the east, it comprises one of the most densely populated regions in the world. Every square mile has to feed about two hundred and fifty people, or one-fifth more than England with all her manufactories.[1] The great rivers of India (the Indus, the Brahmapootra, and



Source of the Ganges.

the sacred Ganges, whose source is in the southern slope of the Himalayas) with their tributaries, cover the whole country with a veritable network of streams with fickle changing channels. This great Bengal region, though

1 Hunter, p. 3.

densely populated, is very fertile and capable of producing two and even three crops a year.[1]

Sloping upward from these river plains, the third region of India succeeds the second, forming an extensive triangular table land populated with non-Aryan races of men. It is a land of mountain peaks and dense forests; its black soil is very fertile. The inhabitants have reclaimed some portions of it from the forests; and so we find occasional villages and cultivated fields interspersed between forest tracts, so dense that Sanskrit poets were wont to speak of this table land "as buried under forests."[2]

India has been called "a great museum of races, in which we can study man from his lowest to his highest stages of culture."[3] We have briefly referred to the most important of these races, and have spoken of their arrival in India and their gradual extension over the country, absorbing, or driving, still farther south those still lower tribes who preceded them.[4] Following in the wake of these Dravidians, the Aryans finally appeared at the headwaters of the great Indian rivers and conquering, absorbing, or dispossessing in their turn, gradually spread toward the south. When the English conquerors entered India, they occupied the northern part of Hindoostan and were gradually spreading toward Farther India. We find also that the southern half of Ceylon was inhabited by Aryans.

We have almost no date from which to reckon the the antiquity of the Aryans in India. Back of the first historical date (connected with the religious reform of Buddha in the fifth century B. C.), is a period of unknown duration. We must calculate how long it would require

[1] Ibid. p. 22. [2] Ibid. p. 25. [3] Ibid. p. 35.
[4] This Series Vol. II. p. 364.

for them to develop a system of religion into such a degree of perfection as Brahmanism had attained. We must allow time for the composition of the Vedic and contemporary literature. All this must have been accomplished in that period of Indo-Aryan history that elapsed between the time of their separation from their Iranian brethren and the first date that appears in their history. Professor Muller[1] allows eight centuries of time for this period of growth; and we believe, with many others, that if he has erred at all in his figures, it has been in allowing too short, rather than too long, a time for this period of growth.[2]

The whole era is devoid of historical records. There are, however, two great epic poems that apply to these times; but they are about as valuable as historical evidence, as the poems of Homer are in the history of Greece. They are the Mahabharata and the Ramayana, and only preserve the legends of two great Aryan tribes,[3] that had settled in the northern part of India at an early day. But these show traces of having been collected, arranged, and even remodeled at a comparatively recent date[4] by Brahman priests. Consequently we have no history of the Indo-Aryans before the fifth century B. C., when the effects of the teachings of Buddha began to manifest themselves. There are very few remaining dates in their history for the following ten centuries, except those immediately dependent upon the date of Buddha's death.[5]

The reform of Buddha was a religious reform and went on quietly, exerting no political influence until the

time of Asoca, about the middle of the third century B. C. We know, however, that Darius Hystaspes, in the meantime, pushed his conquests into India,[1] but can not tell how far he advanced, nor the effect of his conquest. Alexander the Great also invaded India. He found, as we would suppose, the whole country occupied by a host of independent tribes, each governed by a Raja, or chief, of its own. But in the Punjab, the most of these tribes had become united into three powerful confederacies,[2] under three chieftains named Taxiles, Porus the elder, and Porus the younger. Taxiles immediately went over to Alexander, the forces of the other two were defeated, and the Macedonian remained ruler of the whole of northern India. This was about 327 B. C. Passing down the Indus to the sea, the Greeks turned backward toward Asia Minor, leaving India under the government of one of Alexander's tools. He was soon murdered, and his successor was driven out of the country as soon as the news of Alexander's death reached the banks of the Indus.[3]

About this time, we hear of Chandra Gupta, who succeeded in forming a confederacy of such power that he was acknowledged ruler of the whole Punjab. He established himself so strongly that Seleucus, Alexander's successor in Eastern Central Asia, thought best to leave him undisturbed, and even to make a treaty with him.[4] This

[1] Williams: "Hinduism," p. 4.

[2] "Rajendralala Mitra," Vol. II. p. 3.

[3] Wheeler: "A Short History of India," London, 1883. p. 47-9 In regard to the conquest of India by Alexander, consider the following: "The story of the conquering army of Alexander penetrating into Northern India, itself becomes more and more doubtful every day. No Hindoo national record, not the slightest historical memento throughout the length and breadth of India offers the slightest trace of such an invasion." Madame Blavatsky: "Isis Unveiled," Vol. II. p. 429. [4] Wheeler, Op cit.

Chandra Gupta was known to the Greeks as Sandrocottus and was the grandfather of Asoca,[1] the champion of Buddhism. Asoca leaves the first inscriptions that are known to Indian antiquarians. He extended his conquests even across the Indus into what is now Afghanistan. He did

Scene at Benares.

more for religion, art, and culture than any of his predecessors. He called the third council for the purpose of systematising the Buddhistic beliefs, and appears to have been an earnest follower of that faith.

In the latter part of the second century B. C., Tu-

[1] "Ancient Sanskrit Literature," p. 262.

ranian tribes began to work down from the northern countries through the mountain passes into the Punjab, and just before the commencement of the Christian era, they succeeded in subjecting all northern India. They adopted the Buddhistic religion, and their most famous chieftain summoned the fourth Buddhist council. His capital was in Cashmere, and the form of Buddhism that his council adopted had mixed with it many features of the old Turanian beliefs, so that there arose two forms of Buddhism, one practiced in the north of India and one further south.[1]

There seems to have been continual warfare for supremacy between the Aryan and Turanian races for the next five hundred years. There was no Aryan chieftain able to form a confederacy of tribes powerful enough to drive out the Turanian, though a number made strong attempts to do so. Among the most prominent of these, were the Vikramaditya and Salavahana, the former of whom was a great patron of literature and the arts. In Bombay, the Sak dynasty of chieftains ruled from 60 to 235 A. D. In Oude and Northern India, the Gupta dynasty ruled from 319 to 470 A. D. The Valabhi dynasty is mentioned as ruling in Cutch, Malwa, and the northwestern districts of Bombay from 480 to 722 A. D. The Huns are known to have been in Northern India about 500 A. D. And so we have about all that is known of Indian history down to the time when the Iranians were conquered by the Islamites. As we glance over these few records of the past, how plainly it appears that "India has no place in the political history of the world."[2]

We are not for a moment to suppose, however, that the Indo-Aryans mildly submitted to every foreign yoke that was placed upon them. No matter who the inva-

[1] Hunter, p. 82.

[2] "Early Sanskrit Literature," p. 51.

ders were, we find that the Brahmans still remained the priests of the land, the Rajas were still rulers over their own tribes, and the Vaisyas still cultivated their fields, usually unmolested even in times of war. When at last the Mohammedan ruler appeared with his armies, he

Raja and his Court.

found it no easy task to gain a lasting foothold in India; and, at no time, did he succeed in forcing his religion upon these people. Mohammedan expeditions against India began A. D. 636, and the "Hindoo power in Southern India

was not completely broken till the battle of Talikot in 1565."[1] Akbar the Great succeeded in organizing and maintaining a strong government only by incorporating some of the Hindoo chieftains into it. The Hindoo spirit of revolt, manifested in what is called the Marhatta confederacy, began at once to undermine the government; and, "in less than two centuries, the successor of Akbar was a puppet and a prisoner in the hands of the Hindoo Marhattas of Delhi."[2]

In the time of Alexander the Great, we notice that the government of India was divided between a number of tribal chieftains who, in the Punjab, had united into three great confederacies. When the Turanians descended the mountains on their marches of pillage and conquest, they were met by no organized resistance, but were forced to conquer one tribe after another, until they had literally engulfed a portion of the country. When the Mohammedans attempted to supplant the religion of the Vedas by Islamism, they found themselves opposed by a host of independent tribal chieftains; and, no sooner was one conquered, than another was formed and appeared in a state of open rebellion. Thus was the government of the Mohammedans undermined and weakened. Though a large number of religious converts were made, the government was never able to boast supremacy over the whole of Aryan India, except it be in the time of Akbar the Great. When, in the latter part of the last century, the English army appeared on the scene, the people of India were found still organized in tribes, and governed by tribal chieftains. The English have pursued a wise policy. They have allowed such chieftains as were able and willing to govern wisely to still remain independent, and have given the

1 Hunter, p. 100. 2 Ibid.

conquered a chance to assist in the government of the British provinces. But from the earliest times to the present day, the government of the Indo-Aryans has never arisen beyond the typical tribal form of government.

In a country that has been peopled from time immemorial by so many independent tribes as we have found in India, it is almost impossible to trace the lineage of the various tribes back to any distinct line of ancestors. We find that the Aryans who forced their way into India first became thoroughly mixed with the aborigines, probably Dravidians. Then came in their Aryan brethren from Greece and Iran and an intermixture of eastern and western Aryan blood occurred. Later the Turanians came in from the north and there was a third amalgation formed. But over the whole of these barbaric traits of character, customs, and race conditions, Aryan energy, culture, and superior intelligence have predominated. Thus was produced the Aryan Hindoo. The early Aryan stock had such vitality and superior force of character and mind that the whole of Central and Northern Hindoostan became so completely Aryanized that the invading Turanians were swallowed up and lost in this Aryan population.

The ancient Indians developed a vast body of literature, of which we must now attempt to gain an understanding. We have seen how India has always been peopled by a large number of independent tribes, and that these tribes spoke a large number of languages and dialects, so we need not be surprised to learn that, when writing came into vogue, a large number of alphabets were adopted by these various tribes, in fact outnumbering "all the other alphabets used in the remainder of the world."[1] These al-

[1] Taylor: "The Alphabet," Vol. II. p. 285, London, 1883.

phabets are said to "furnish a sort of epitome of Indian history, their development being intimately connected with the religious and political fortunes of the country during the last two thousand years."[1] All of these scripts, however, may be traced back to a single source, and this source may be found in the inscriptions of the Buddhist

An Indian Princess.

king, Asoca.[2] One learned Hindoo writer, Dr. Rajendralala, maintains that the Indo-Aryans originated their own alphabet; but there are a host of others, who assert that it was introduced from Semitic sources and adapted to the various Aryan dialects spoken in India.[3]

---

2 Ibid. p. 288.

3 "Indo-Aryans," Vol. II.; Taylor: "The Alphabet," p. 256; "Ancient Sanskrit Literature," p. 427-524. Keane claims that it is "the

The dates of the inscriptions of Asoca have been fixed with accuracy; but how long previous to his time the Indians had a system of writing, we can not tell. These inscriptions of which we speak, were transcribed into two different primitive alphabets. The inscription, known as the "Kapur-di-gire" inscription, is made with an Indo-Bactrian character, reading from right to left, while the remaining inscriptions employ an entirely different character. These two, as we have said, are at present the acknowledged source of the alphabets of India. Both are of Semitic origin, and "underwent a gradual evolution. Finally a systematic redaction and arrangement was affected by scientific grammarians, who were acquainted with both alphabets."[1]

The composition of a portion of the literature of the Indo-Aryans dates away back into prehistoric times, long before the invention of an alphabet, when the hymns of the Rig-veda were chanted by the Rishis (bards), and when the prayers of the suppliant housefather were as effectual with the gods as those of the priest. This was before the Brahman priesthood had appeared, and before the blasting system of caste had become fully developed. In their belief, great importance was attached to the idea of sacrifice and the greatest care was given to all its details, which required the services of those especially educated in this matter. It is plainly evident that, at a very early date, the religious ceremonies for each tribe had to be conducted by some rishi or priest. Then it became customary for each tribal chieftain to support a priest.[2] A

most perfect system of alphabetical notation in existence," and believes that further inquiry will show that the Indian alphabet is a local invention. Stanford's "Asia," p. 707.

[1] Taylor, p. 304-5.

[2] Each modern Hindoo family, not Brahman, has its priest, who

time finally came when this priesthood became powerful enough to demand as theirs the sole right to conduct religious services.

When the rishis had thus gained this right, they seemed to have waived the right of political rule in favor of the tribal chiefs. They made themselves, however, necessary to every head of a family as well as every tribal chieftain by taking absolute control of the religion. They collected all of the hymns then in use by the prominent tribes and families, and arranged them into four classes; thus were formed the Vedas, "the oldest literary work of the Aryan race."[1] Now right here we must understand that all scholars admit that the body of literature known as the Vedas was transmitted orally from one generation to another for several centuries before the priesthood would allow it to be placed in a written form. So that when we speak of this literature as having been composed we do not wish to intimate that it was also at the same time placed in the form of manuscript.[2]

These early hymns were called Mantras and the four collections above referred to are known as the Rig-veda, Yajur-veda, Sama-veda, and Atharva-veda. The Rig-veda is the oldest Sanhita, or collection of Aryan literature, and contains songs of praise, many of which were sung by the primitive tribes before entering India. The Yajur-veda was a collection of such hymns as were especially adapted to ordinary sacrificial ceremonies. The Sama-veda was an arrangement of hymns that were chanted at

comes every day and bathes the household idol, and offers it the sacrifices furnished by the members of the family, who may or may not be present at the worship as they choose. Wilkins: "Modern Hinduism," p. 27

[1] Ibid. p. 65.

the special Soma sacrifices. Both the Yajur and Sama-vedas contained hymns also found in the Rig-veda, and manifested the handiwork of an organized priesthood in their arrangement for special religious ceremonies. The Atharva-veda is a later production, and has been called the spell, or charm veda, because many texts of it were used as spells or charms. It is hard for us to conceive how this great mass of literature, consisting of several thousand verses of poetry, could have been composed, collected, and arranged in so exact and definite a shape. Such nevertheless was the fact.

It was a self imposed duty for every rishi to commit all this to memory before his education was completed, and every such priest was, as Muller says, an individual copy of the great unwritten Veda book,[1] and could be read only by repeating what he had learned to another.[2] The Vedas were composed in the ancient Sanskrit language, which at that time had reached a stage of perfection that has never since been attained by an inflected language. In time, this form of speech became virtually a dead language, and the Vedas were understood only by the priests whose business it was to learn them. Later there arose schools of priests, who devoted themselves to a life long study of this literature, and who had nothing to do but to think and meditate upon its teachings.[3]

[1] "Ancient Sanskrit Literature," p. 377.

[2] Monier Williams: "Religious Thought and Life in India," London, 1883, p. 8; Barth: "Religion of India," p. 2. The above gives us the probable *relative* order in which the various *Sanhitas* or collections were made. We want to caution the reader on two points, 1. We must not suppose that the oldest *Sanhita* contains the primitive stage of Aryan religious thought. The ideas it contains are the results of many centuries of growth. 2. Some of the later collections may embody much nearer the popular ideas of the Aryan people. See this subject discussed in Lang: "Myth, Ritual, and Religion," London, 1887, Chapter vii.

[3] Müller, Op. cit.

The Hindoo is characteristically the meditative Aryan.[1]

The descendants of these old rishis became very numerous. They had established their power. They had nothing to do but to study and meditate. Their studies were the religion of their fathers, and their meditations were confined to the natural yearnings of the soul after the divine, or else to the superstitious dread of the mind for the unknown. Their simple nature gods were not sufficient. There was "a perpetual feeling after one Supreme Being, if haply he might be found in sky or air."[2] This subject, no doubt, was frequently discussed in their schools, and the rishis philosophized upon it when they were instructing their pupils. At last it became a settled opinion among them that a spirit breathed through all material things. This spirit "vivifying their own bodies" was antecedent to all the gods and supreme above all. They called this spirit Brahman, which comes from a root meaning to expand, and this new religion was called Brahmanism.[3] Traces of this philosophical conception and the use of the word Brahma are observed even in the Rig-Veda.[4]

In order to adapt it to this new order of things, we find a second stage in the growth of this Vedic literature. We have seen how the language had changed so that it was not understood by the ordinary tribesmen; and, with the rise and growth of Brahmanism, we find that additions, explanatory of the old Vedic hymns, were made from time to time, but were composed in prose. These were called Brahmanas. Then there came a time when it was found necessary to make a collection of these Brahmanas and arrange them with reference to the different Vedas, for it

---

3 A comparative study of Brahmanism will be made later.

4 Lang, Op. cit. p. 224.

was found that the now numerous tribes of priests had almost as many rituals of worship as there were tribes.[1]

This collection when completed and arranged showed a growth of at least two centuries in the history of the Indian people.[2] Nor did this growth stop here, but, after another period of about the same length of time, the results of later meditations of these Brahman priests were collected and arranged with reference to the four Vedas. This collection forms what is known as the Upanishad.[3] The Brahmanas seem to contain the ritualism, and the Upanishads, the philosophy of Brahmanism. The whole forms a vast collection of very ancient literature, that even modern Hindoos believe to be inspired or revealed.

Right here, it is well for us to understand that the literature of the Indo-Aryans is divided into two great classes. The first comprises such compositions as were directly revealed by Brahman himself to the old and sacred rishis—that is what they heard—and by them transmitted orally, word for word, down through a line of priests until finally it was allowed to be placed in writing. The second class consists of various and extensive works composed at a later date by Brahmans, but claiming mere tradition for their only authority. They had, however, to be based on revealed truth, with which they must harmonize. The first class comprised the Mantras, Brahmanas, and Upanishads of Vedic literature already described. They are called Sruta or "that which is directly heard or revealed." The other authorized writings are termed Smriti or "recollection."[4] The most important work in the last class is

---

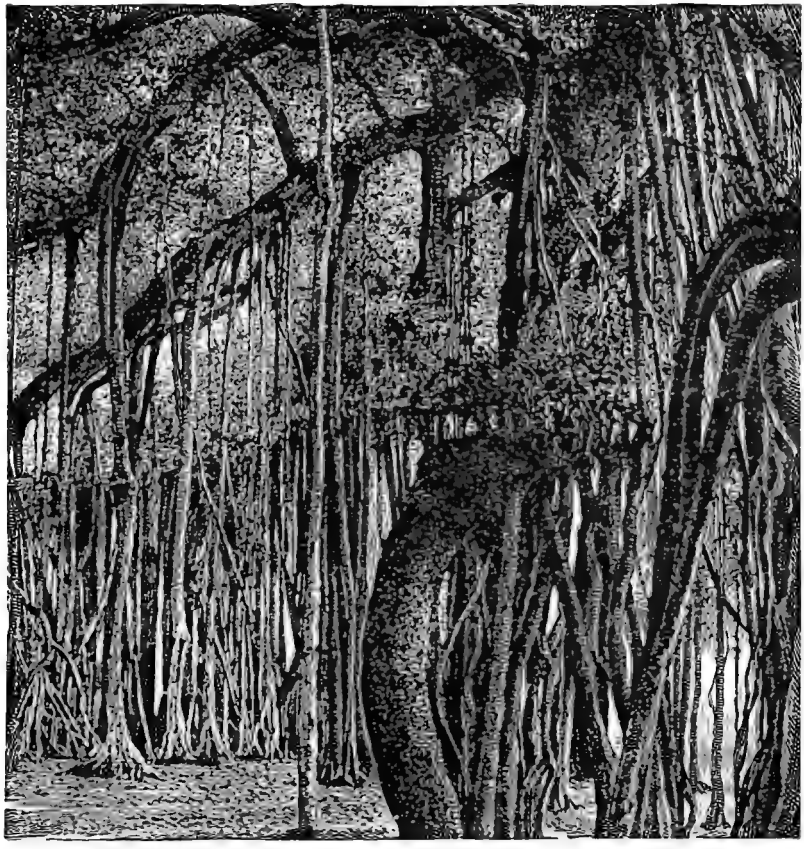
entitled the "Laws of Manu." We can point to no one person as the compiler of these laws, nor can we fix any definite period when they were completed. Parts of the collection may have been composed as early as the fifth century B. C. This code of laws, belonged to a certain school



Banyan or Sacred Fig-tree.

or family of Brahmans, called Manavas, and tradition ascribed its authorship to one Manu, who is mentioned in the Vedas as the first man. It is regarded as one of the most remarkable literary productions of all ages. Though originally a local code, it finally became the law of all

Brahmans. There were two other authorized codes of law, but they never reached the celebrity of the code of Manu, which regulated the domestic life of the Indo-Aryans and made it comform to their religion. "The root of all law," says Manu, "is the Veda and the traditions of those who know the Veda." Thus can we see how intimately the religious and the social life of the Indo-Aryans were connected.[1]

When we come to the study of the religions of India, we shall see how Buddhism sprang rapidly into popularity and drew thousands away from the schools of the Brahmans. Like true philosophers, the Brahmans sought out the peculiar principles of Buddhism that made it a religion of the people, and then endeavored to supplant it with their own belief adapted to the popular mind. The minds of the people who had not the time to commit the Vedas could not comprehend the abstract and the ideal god, Brahman, and so they continually reverted to their earlier conceptions.

In order to satisfy this longing after a more simple constellation of gods, the Brahmans caused all the old poems of the heroic age, when the Aryans were fighting their way into the Punjab, to be collected, adapted to Brahmanism, and arranged in two grand heroic poems called the Mahabharata and the Ramayana. The heroes, of whom the ancient bards sang, were deified and made the descendants of the god, Brahman, himself. The people were thus given many gods, and gods that they could come

[1] "Religious Thought," p. 52. If we recall that among many people the name of the first law-giver bears a close resemblance to this name—*e. g.* Menes, among the Egyptians; Men, in India; Minos, in Crete; and that from it are derived many words meaning Wisdom; *e. g.* Minerva, goddess of wisdom, Mens in Latin; Mind in English—we will probably agree with Higgins that Menu meant simply Divine Wisdom. "Anacalypsis." p. 319,

near unto and worship, while the thoughtful and learned Brahman continued to meditate upon, and strive to lose himself in that essence of being, the Divine Self or Spirit.[1]

One of the most singular features in the civilization of the Indian Aryans is the system of caste. Nothing quite like this has ever been found elsewhere. The origin of caste probably goes back to the very beginning of Vedic times, though we do not find it developed into a rigid system before the close of the Vedic Age. The word which the Indo-Aryans used to denote caste meant color, and gives us the probable key to the system. The Aryans did not exterminate the tribes of aborigines, whom they found in possession of the Punjab when they came down from the mountains of Central Asia. They conquered these swarthy Turanian tribes and made them slaves. But they no more thought of mingling socially with these slaves than did the old southern planters with their black servants in the days of American slavery. In fact, they despised them and hated them, called them Dasyus, "the black skins," "the raw eaters," and all the vilest epithets that their language could frame and their tongues utter.[2]

This was the first indication of caste; and, at that time, the people were divided into two casts only, the Aryans and non-Aryans. We have now to consider the formation of caste within the Aryan tribes themselves. Let us begin with the priestly class the Brahmans. We have dwelt with sufficient fullness on the savage priesthood. We have seen that such priests are found among all people. As civilization advances, these Shamans of rude tribes tend always to form a closely connected body.

---

1 Ibid. 41-5.

2 Hunter: "Annals of Rural Bengal," p. 112-13.

Among all people, they are a much respected and generally feared body. They are respected because they are always a learned body, and, as a general rule, use their power to advance the interests of their tribe. They are feared because they are generally supposed to possess magical powers, and able to bless or curse. Such a body of priests always tends to usurp, more and more, the rights of the various orders of chiefs to conduct worship. Generally speaking, we have seen that any one holding a position of authority within the tribe was, ex-officio, a priest. The housefather offered sacrifices for his household, the gens-chief for the gens and so on.

In the course of development, then, there was sure to come a time when the priestly body, of whom we have just spoken, would try to usurp this authority. In almost all cases they succeeded. Almost all the European Aryans were ruled in religious matters by Druids or similar bodies. The Magi among the Medes was an equally strong body. The priesthood among all Semitic people has possessed great power and influence. The Israelites formed no exception to this rule. It is not singular, then, that the Aryans who entered India should come under the workings of this same law. The more so when we reflect that the tribes they subjugated undoubtedly had numerous influential Shamans.

The Vedas show the presence and guiding hand of such a priesthood. The very collection of hymns, betraying a spirit no doubt far above that of the mass of the people, could only have been made by such a learned body. To get the full benefit of the sacrifices, they must be performed by an adept.[1] We find, even in the Vedas,

[1] "The Vedic sacrifices are but ceremonial magic," Blavatsky: "Isis Unveiled," Vol. I. xxxii.

that principal families were expected to support a family priest. It is not singular, then, that, in process of time, we find this priestly class drawing to themselves all religious functions; they called themselves *Brahmans*, from *Brahma*, he who pronounced *Brahm*, or prayers. We may admit that there was opposition on the part of some officials to this course, still the change was doubtless of very slow growth extending over many generations.

But, as stated some pages back, these Brahmans contented themselves with the field of religion. They did not care to interfere in the political field. But another principle was at work, which was to evolve the warrior class, and the laboring class. It was the same cause that gave rise, in early Roman history, to the Patricians and Plebeians, and to the two classes in early Greece, that was conquest, conquest of one Aryan tribe by another. Such must have occurred, and, among the invading Aryans, there must have been some more or less dependent and inferior tribes. Still further, it is self evident, that the conquest of the Punjab was not achieved at once, probably successive waves of invading tribes arrived on the scene who would gain supremacy over their predecessors. It is further evident, that these conquered tribes would not be allowed the full measure of rights and privileges assumed by the conquerors. And, just as in the case of the Patricians at Rome and the Eupatrides in Greece, the master tribes of the Aryans would claim and exercise the rights of government and of warfare, while the conquered tribes would become the laborers. This would give us two more castes, the Kshatriyas, or warriors, and the Vaisyas, or laborers.

But in order to give to these various divisions the peculiarities of caste as known in India, it was necessary

to forbid marriages between the classes, and to give the whole system the sanction of religion. All this took, of course, many years to accomplish. Minute rules were adopted, the violation of which involved the loss of caste. The priesthood were active in this matter, and though arrogating to themselves the most favored position, arranged the various divisions in an unyielding system, forbid as far as possible intercourse between them, and assigned to each division a peculiar religious standing. We only need to add that the final result was due to causes at work long before and during the entire Vedic period.

If the Aryans of India have not been able to exercise any very great influence in the political history of the world, they have certainly exercised a most tremendous influence in the culture history. Only in modern times are we beginning to understand this, and to give these "Meditative Aryans" their share of honor. The modern Aryan world is separated from this ancient world by such a prolonged interval of time; and the clamors of wars and conquests, and the rise and fall of nations have so blinded those historians who record only passing political events, that we have almost forgotten where to look for the origin of various systems of philosophical thought, both religious and scientific. We are of the opinion, that future discoveries will tend to show more and more that to the Aryans of India belongs this honor. The time has not yet come for a full demonstration of this, yet enough is known to render it probable.

In the field of science, for instance, it is now known that they invented the decimal system of notation[1] and Algebra.[2] The Arabic writer on Algebra, who has been

[1] Draper: "Religion and Science," p. 115.
[2] "Encyclopedia Britannica," art. "Algebra."

given the credit of originating it, is known to have traveled in India to gain his knowledge.[1] In addition to the foregoing, they are known to have made considerable progress in Geometry. The famous theorem of the square of the hypothenuse etc. is found engraved on the *Goparama* of the majority of the great pagodas.[2] Euclid, the great geometer, arranged in his work many theorems first worked out by the Brahmans of India. In Astronomy, although many people professed to have had very good ideas of Astronomy in early times, yet the claims of the Hindoos apparently rest on a solid foundation.[3]

It is claimed for them that they fixed the Calendar, invented the Zodiac, calculated the equinoxes, and predicted the eclipes.[4] The French astronomer, Legentil, who visited India in 1767, was given a set of tables going back to 3100 B. C.[5] Let it not be forgotten that the theory of the revolution of the earth around the sun, as taught by Pythagoras, was an Indian theory.[6] Even some of the theories of modern science seem to have been first enunciated in India. The modern doctrine of evolution is clearly stated in the following from the "Bhagavata:" "When this world had issued out of darkness, the subtle elementary principles produced the vegetal seed which animated first the plants; from the plants, life passed into fantastical bodies, which were born in the *illus* of the

5 Yet in Chaldea, Astronomy had made considerable advance, probably before the Aryans had arrived in India. Nothing is to prevent the supposition, that the Indians greatly advanced the theoretical parts of this science.

6 Draper: "Religion and Science," p. 156.

waters, then through a series of forms and various animals, it reached man.[1]

When we enter the field of Philosophy, it is certainly true that all forms of philosophical creeds converge to India. This is such a broad field, that to give it anywhere near justice, we must reserve it for a separate chapter. We will here simply give an historical outline of the development of religious thought in India. We must take into account the probable culture of the Dravidian tribes of India. There is probably danger of giving the Aryan invaders of India too high a standing as regards religious culture. But it is undoubtedly true, that they would be influenced by the religious culture of the Dravidians. At the present day, these aborigines in India furnish a good illustration of savage philosophy. They believe in spirits swarming everywhere about them, and the usual accompaniments of such beliefs, that is a belief in magic and sorcery.[2]

The Aryans, themselves, must once have been on this same level of thought. Indeed the Vedas show the plainest traces of it all the way through.[3] It is evident that, as they spread over the Punjab, this stage of feeling will tend to revive. When the priestly caste was once fairly formed, there would likely grow up a system of forms and ceremonies suitable for the mass of the people, abounding in magic rites, symbols, and many gods. But this religion we must understand, had an exoteric and an esoteric side, according as we look at the public belief, or the secret doctrines

[1] "Isis Unveiled," Vol. II. p. 260. It is scarcely necessary to caution the reader that some mythological conceptions may in form come near modern theories with a scientific basis. It is well to receive with caution such statements as the foregoing.

[2] This Series, Vol. II. p. 307. See Hunter: "Annals of Rural Bengal." He calls this system of philosophy "Demon worship." It is the same philosophy that we have already discussed.

[3] Lang: "Myth, Ritual, and Religion."

taught by the priests. This system is known as Brahmanism, and will be fully studied in its proper place. Briefly expressed, we may say, that Brahmanism professes to have for its foundation the religion of the Vedas. But the Vedas, at the time when Manu's code of laws was compiled and adopted, consisted of a growth of literature through at least eight centuries.[1]

We must distinguish between ancient Brahmanism and the Hindoo religion after the Brahmanical revival of the eighth century A. D. The one is pure Brahmanism and the other modern Hindooism. They are very different. We are considering the former only at present. Ancient Brahmanism, then, as set forth in the laws of Manu, established the existence of a divine, supreme spirit god, called Brahman. The four-fold system of caste was the basis of all social and religious organization. The Brahman, as priest, was infinitely superior to all other beings, and alone could perform sacrifices or teach the Vedas. The Kshatriyas ranked next, and the Vaisyas were still lower. Members of these three castes were called the twice-born, and they alone could share the benefits of religion.

The only duty of the Sudra, or fourth caste, was to "serve meekly these other three castes."[2] "The very birth of a Brahman is an eternal incarnation of the sacred law, for he is born to fulfill the sacred law, and becomes one with Brahman," the god.[3] "The whole Veda is the first source of the sacred law, next the traditions and the virtuous conduct of those who know the Veda further, also the customs of holy men, and, finally, self-satisfaction. For that man who obeys the law prescribed in the revealed

[1] "Ancient Sanskrit Literature," p. 572.
[2] *Vide* "Bhagavad Gita," ;. 261. [3] "Laws of Manu," p. 250.

texts, and in the sacred tradition, gains fame in this world and after death unsurpassable bliss."[1] The bliss of the departed referred to in the text was attained through transmigration of the soul. The good Brahman priest would thus attain union with his god Brahman, while every good man of the twice born race would, according to the acts of this life, attain birth in a better or worse state of life, thus could he finally attain a blissful state.[2]

Such a cold, rigid form of religion was not suited to the wants of an uncultured people; and its spirituality was beyond the conceptions of any save the Brahman, who could spend a lifetime in meditation in order to attain the desired union with the divine "Self." The priests alone were the mild-eyed philosophers whom Megasthenes[3] found conversing upon life and death under the beautiful groves of the Punjab, while the mass of the people were suffering under a grinding yoke of religious oppression. During all these centuries of ancient history of the Indo-Aryans, not only did occasional tribes rebel, and prefer freedom of conscience at the price of ostracism from society rather than Brahmanical oppression and a surety of future bliss; but numerous reformers arose at various times, flourished, and died, the most of them leaving scarcely more than their names to mark the period of their lives. Traditional history mentions six such re-

1 "Laws of Manu," Vol. ii. p. 6 and 9.

2 Manu, xii. 39, 85. No system of philosophy has been able to entirely clear away the animistic ideas of an earlier state of society. The complicated polytheism of Greece cut very little figure in the popular religion of the people. The same remarks doubtless apply to Brahmanism in India. The priestly system cut very little figure in the worship of the common people.

3 "History of Indian People," p. 77. It is probable that the "Brahmans" of Megasthenes, were a Buddhist sect; King: "Gnostics and their Remains," p. 54, London, 1887.

formers, and most of them were of the Kshatriya caste.[1] But of these six, there was one who has left a name prominent above all Indo-Aryan names; and who founded a religion, that has more followers to-day than any other system of belief.[2] We refer to Gautama, who afterward received the name of Buddha or "the Enlightened."[3]

Buddha flourished during the fifth century B. C. He was the son of a ruling chief, and would have been next in line of succession. At the age of twenty-nine, he chose rather to sever himself from home and kindred, and to assume the robe of an ascetic than to himself submit to Brahmanical oppression, and see the great mass of people burdened by oppressive, tyrannical laws. The great mission of Buddha seems to have been to try to elevate the condition of all mankind, and to preach the doctrine of free salvation, (peace of soul) to all, no matter what their social condition; no matter whether male or female. He was born in the very heart of Brahmanism, but there seems to have been a rising sentiment of free thought throughout the Brahman territory, and Buddha seems to have been the prophet arising at the right time to champion this sentiment. Gautama first spent six years of austerities and penance wandering in the forests and jungles. Then, after passing through a season of temptation, sitting serene under the sheltering branches of the sacred fig-tree, while according to tradition, demons beset him with all manner of temptations, a sweet and peaceful calm came over his mind. He felt himself no longer subject to temptation. He was thereafter Buddha, the "enlightened," and saw clearly that henceforth he was to leave the jungle and the hermit's

[1] "Indian Wisdom," p. 50.

[2] "Brief History of India," p. 64.

[3] A full discussion of Buddhism will follow in its proper place.

cell, and go forth to preach reform. The remaining years of his long life were spent in wandering up and down the banks of the Ganges, preaching his good tidings, occasionally spending a few months in some bamboo grove, where he taught the multitudes who thronged to hear his words.

The Brahmans declared that it was sacrilegious for any except a member of his own caste to teach, and that all knowledge must be based on the Vedas. Buddha belonged to the Kshatriya caste, and utterly ignored the the Vedas,[1] so he was ostracised from the start by the ruling caste. First of all, he did away with all manner of sacrifices, and set aside the claims of the Brahman priesthood. He taught that happiness hereafter depended upon the good acts of our own lives, so that virtue, morality, kindness, charity, patience, fortitude, meditation, and knowledge, all bore their fruits, and tended toward the perfection of the soul. The three great duties of Buddhism were, "control over self, kindness to other men, and reverence for the lives of all sentient creatures."[2]

The reward of a good life was alike open to all mankind, no matter what the caste or what the race. This reward was the attainment of "Nirvana" which has been translated as "eternal rest," "cessation," union with the the universal "Spirit" of Brahman. We see that this opened a great fountain of hope for all people, and all manner of men, from the Brahman to the slave, flocked around the great teacher to hear his wonderful words. The anathemas of the Brahmans could not affect the teachings of the Buddha. He seemed to be inspired with a

[1] This statement is rather strong, as will be shown in its proper place. Buddhism was a reform on Brahmanism, and Buddha simply rejected this binding authority and the conclusions of the Vedas.

[2] Hunter: "History of Indian People," p. 67.

sort of magnetism that drew all men to him, and his life was so consistent that none could fail to be impressed with the doctrines he taught. At the age of four score years, he died, and passed into peaceful possession of the Nirvana that he had so patiently longed for.

Buddhism was free to all castes, and to all nations. Early in his life as preacher, Buddha sent forth chosen disciples to preach his religion. About two centuries after his death, we find that Buddhism had spread to such a degree, that it was championed by some of the most powerful chieftains, and among others Asoca. He extended his authority over the best portion of Hindoostan, and caused edicts, proclaiming Buddhism as the national religion and setting forth its peculiar tenets, to be inscribed on rocks and pillars all over India. He called a council to draft a settled faith. He founded monasteries and supported thousands of Buddhist priests. He has been called the "Constantine" of Buddhism. This religion itself was the first missionary religion. As early as the year of Buddha's death, it is claimed that missionaries planted his religion upon the island of Ceylon.[1]

Many parts of India that knew nothing of the Brahmans were penetrated by Buddhist priests and this religion was proclaimed. In Orissa, there are remains of several monk caverns that must have been occupied by Buddhist priests at an early date. This new religion spread to the south and carried a great Aryan influence among the Dravidians of the lower table land region. Missionaries went into Thibet and China, and wherever they went, they were received gladly by all people who, in all cases, readily accepted their teachings.[2]

---

[1] "Ancient Sanskrit Literature," p. 269.

[2] It is now satisfactorily proved that by the time of Asoca, Buddhist

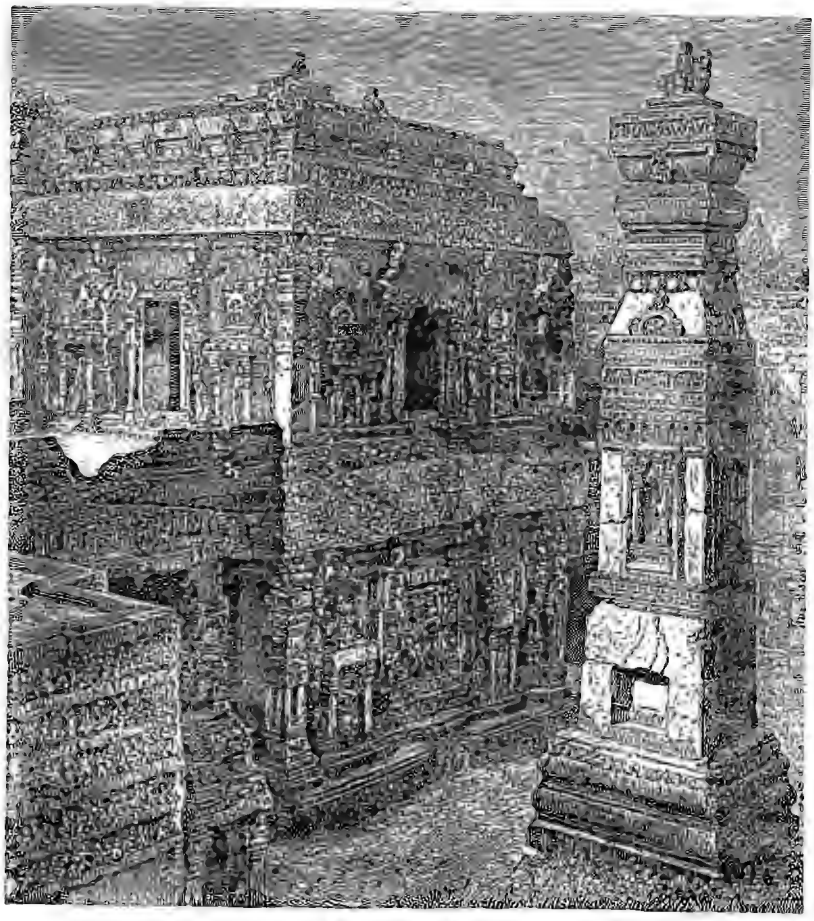
The Turananian ruler, Kanish, also did much to spread the doctrines of Buddhism far and wide, so that we find remains of Buddhist temples scattered all over India; but many of these were erected at a later date when Buddhism had become corrupted by outside influence. At Katmandu in Nepal, we find temples as represented by an accompanying illustration. The most ancient relics of Buddhism however are to be found in the cave temples in the vicinity of Ellora. "They are excavated on the west face of a plateau of tufa formation, terminating in a steep cliff, here and there furrowed by ravines and flanked by isolated mounds. To execute such works needed as many hands as were employed upon the pyramids of Egypt." They stretch in succession to the north and south for a distance of four thousand yards, and are so numerous that it would take several days to inspect them all. They range in age from the time of Buddha until the age of later Brahmanism. Those built in later times are the most elaborate. Among these, is the Palace of Kailas, which is called an architectural marvel cut in live rock and entirely detached from the hills. Its columns are carved elephants and other enormous animals. They support a vast monolithic roof two-hundred and fifty feet long, one-hundred and fifty feet wide, and one-hundred feet thick.

The east gate of the Sanchi Tope also is worthy of particular mention. Its date is an unsettled question, but Mr. Ferguson thinks that it belongs to the earlier stage of Buddhist architecture.[1] It is remarkable for the figures of men and animals sculptured upon it, the most natural of which are the elephants and peacocks. A better idea

missionaries had spread the doctrines throughout all of Western Asia, Syria, Palestine, and Egypt. This influence will be traced in its proper place.

[1] "Ancient Architecture in Hindoostan," p. 27.

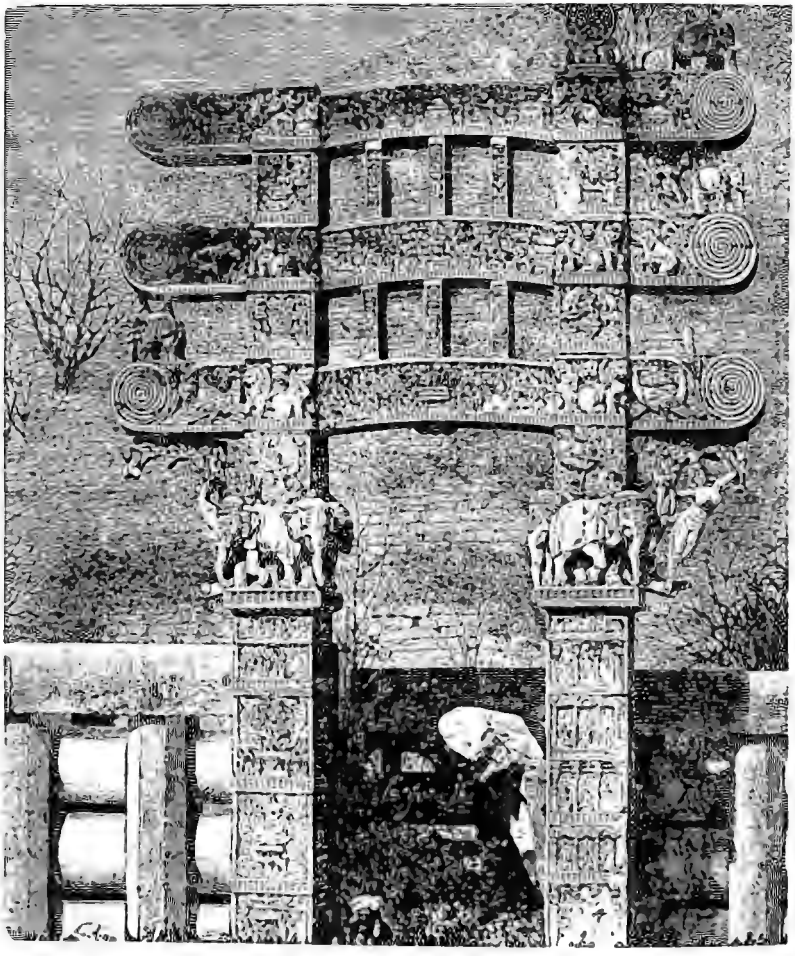
can be gained from the accompanying illustration than from any description. Indian architecture begins about the time of Asoca, while the more elaborate temples belong to the Hindoo period, or to the revival of Brahmanism.



Palace of Kailas

Buddism continued to flourish in India until about 1000 A. D. It at no time completely supplanted Brahmanism, but the two flourished side by side and finally merged into Hindooism. Even then, however, Buddhism was represented by a sect of worshipers called Jains who have many

temples scattered all over India. Among the localities most noted for these temples, are Mount Abu and Sunagarh. It must be remembered that they belong to a later stage of architecture than that of the Buddhist rock cut caves mentioned above.



Great Sanchi Gate.

The two great religions of India, Brahmanism and Buddhism, each for a season seemed to satisfy the people. The latter was much the more popular for twelve centuries,

between the time of Gautama and the seventh century A. D., and it threatened to completely destroy the former. It had the advantage of the support of the chieftains ruling during almost the whole of this period. "The vast monastery of Nalanda formed a seat of learning which recalls the Christian abbeys and universities of medieval Europe.[1] This was supported from the royal purse and sent out large numbers of missionaries into other fields of labor. Thus did Indo-Aryan thought, culture, and religious belief penetrate the surrounding world; and cells of early Buddhist monks may be found in all of the mountain ranges that surround India on its northern sides. But Buddhism was not proof against the influences of earlier superstitions and became greatly corrupted as the pure life and example of their great teacher grew gradually fainter and fainter, receding in the mists of time. Then, too, the Brahmans did not lose patience nor did they recede one jot nor one tittle from their demands. They demanded that a man should acknowledge the inspiration and supremacy of the Vedas and also recognize the laws of caste. They cared not what else he believed.[2] Therefore they adopted into their religion all popular features of every other religion. Theirs was not a proselyting creed, but all manner of policy was resorted to in order to keep their own believers true to their religion. In this endeavor at popularizing Brahmanism the old Vedic gods are almost forgotten.[3] We perceive that there is a decided change in the gods that are worshiped. The old Vedic gods Indra, Agni, and Varuna give place to Brahman, Vishnu, and Siva. Under various names, these three gods form the Hindoo pantheon, and

[1] Hunter: "Indian People," p. 72.

[2] Williams: "Religious Thought," p. 53.

[3] Wilkins: "Modern Hinduism," p. 43-5.

numerous images of the trinity may be seen in the various temples of India; the most remarkable is in the caves of Elephanta on an island off the coast near Bombay.

In the modern Hindoo, we detect an ethnical mixture of Aryan, non-Aryan, and later Turanian.[1] Modern Hin-

Buddhist Priests from Ceylon.

dooism, as a state of society, is based upon caste. Its religion is a union of many creeds and beliefs, associated in the various attributes of their trinity of gods, Brahman, Vishnu, and Siva. The god Brahman is the peculiar god

1 "Early Indian People," p. 81.

of the highest, or Brahman caste. Vishnu, the second member of the trinity, is a purely Vedic god, while Siva appears to be as purely an aboriginal deity, and is worshiped by the great majority of Indian people.[1]

"The Hindoo religion is a reflection of the composite character of the Hindoos, who are not one people, but many. It has held out the right hand of brotherhood to the fetich worshiping aborigines of India, it has permitted a descent to the most degrading cults of the Dravidian races; while at the same time, it has ventured to rise from the most groveling practices to the loftiest heights of philosophical speculation; it has not hesitated to drink in thoughts from the very fountain of Truth; and owes not a little to Christianity itself."[2] The Hindoo religion represents a growth through many centuries, and throghout all this time we notice the controlling influence of the great masters of thought, the Aryan Brahmans. From the time that the priesthood became first established, these Brahman priests watched the growth of the Hindoo religion with jealous care. They rejected what would tend to limit the power of the priest; they utilized everything that would tend to make their religion popular. They were patient, yet aggressively persevering when in political disfavor.

They moulded not only the religion of modern Hindooism, but also its entire social fabric. With a resident of India, not to be a Hindoo is to be a social outcast. The most degraded Sudra, considers his social condition far superior to the most enlightened foreigner, and will

---

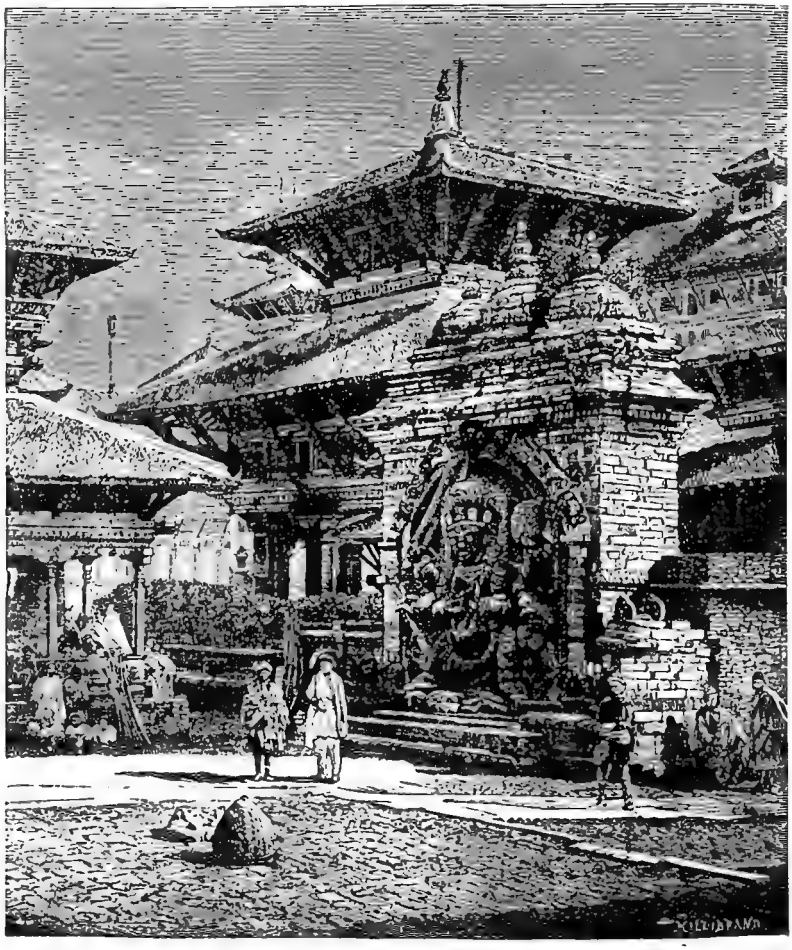
2 Williams: "Religious Thought," p. 58-9. In many respects this is too strong a statement. The fetich worship and degrading cults are, in many cases, survivals of early Aryan stages. It is not believed they have borrowed from Christianity. Higging: "Anaclypsis,"

avoid associating with him as much as possible. Hindooism has furnished the inspiration for the greatest specimens of Indo-Aryan art. Upon the revival of Brahman power, Buddhist shrines were converted into Hindoo tem-



Buddhist Temple, Himalaya Mountains.

ples; and to satisfy the desire of the Hindoos for the grand and the beautiful, still more magnificent structures were erected to cover the shrines of the various gods. In Orissa we find Bhuvaneswar, the temple city of Siva, and the

wagon shaped temple of Jagganath. Indeed Orissa is the Holy Land of the Hindoo, and thousands of pilgrims journey hither every year to be present at the various festivals and celebrations.

In reviewing then the growth of civilization in India, we see how a small handful of Aryan emigrants went down into the Punjab and became completely cut off from their brethren to the northwest and from all other outside influences. They found the country peopled by tribes whose civilization is yet in doubt. The gods of these people, they elevated to a place in the Vedic pantheon. In this contact, the civilization of the Aryan conquerors and that of the people already settled there, of course, mutually influenced each other. By Aryan thrift and industry, flourishing villages and walled cities sprang up all over the fertile river valleys. Although in numbers these Aryan tribes were not strong enough to spread their settlements all over Hindoostan, their superior intelligence and culture have, like the mite of leaven, leavened the whole lump. The savage hill tribes are no longer the degraded beings that the ancients knew. Dravidian India is no longer the home of the barbarian. All have felt the influence of the Aryan mind. It has made for the heathen of India a religion. It has built magnificent temples for the Dravidians. It has crowned the loftiest mountains of the world with temples and shrines. It has given five hundred millions of people a religion. Its influence has been felt from the lofty Himalayan summits to the "pearl drop on the brow of Ind," Ceylon, the Ophir of King Solomon of old. It has given the Indian world a social system that has defied the power of monarchs and the superstition of religion to break its bands.

Despite the grinding oppresssion of caste the Hin-

doo is not unhappy. No matter what his social condition he glories in it, for there are always others inferior to him in rank. He can not attain membership to a higher caste, but he is content. So ages passed in India. Finally the fanatic followers of Islam arrived, and the Hindoos saw neither freedom nor peace until the western Aryans came to their rescue, and the Indo-Aryan was restored to his much prized freedom of life and conscience.

---

Prof. Sayce, in his Greek edition of Herodotus, with English notes, London 1883, has brought out some new material in regard to Cambyses. It seems that Cambyses was king of Babylon before the death of his father, Cyrus. There is considerable uncertainty as to the length of Cambyses' reign. We have contract tablets dated the eleventh year of his reign. Other writers make his reign eighteen and even nineteen years.

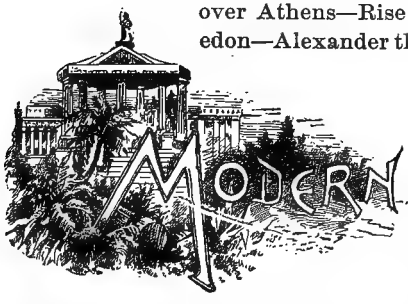
# CHAPTER III.

## THE HELLENIC ARYANS

PELASGIANS — The Hellenes—Aryans of Asia Minor—The Phrygians —Explorations at Hissarlik—Ancient Troy—Relics from Hissarlik—Cyclopean Walls—Phœnician Influence—Early German Influence—Ancient Hellas—The Heroic Age—The Argonautic Expedition—The Poems of Homer—Beginning of History in Greece—Political Life in Ancient Greece—Religion in Ancient Greece—The Amphictyonic League—Early Settlements—The Dorian Migration—The Rise of the Spartans—The Period of Argolic Supremacy—Spartan Supremacy—Development of Athens—Stories of Solon—Important Cities of Ancient Greece—Greek Colonies—Other Aryan People—The Cimmerians—The Persian Invasion—Age of Pericles—Triumph of Sparta over Athens—Rise of Thebes—Rise of Phlip of Macedon—Alexander the Great—Conclusion.



RESEARCH is fast reconstructing ancient and medieval history. The reading of inscriptions, the comparison of languages, and the spade of the archaeologist are so focusing upon the pages of history the rays of light that fall to us from the dim past of myth and tradition that new negatives are forming, some of which produce only fancy pictures of the fruitful imaginations of nations in their childhood, while others portray, in life-like colors, truthful ideas of olden times. But many mysteries yet remain, the unknown is still more vast than the known, and, in the dim light of far away times, we catch uncertain glimpses of many people and races of which not yet much is known. Such a people are the

Pelasgians, of whom historians were wont to draw only a fancy picture. They were said to be indigenous "the children of the black earth."[1] Future discoveries may tell us more about them; but should we, with our present light, assign them a place in history, we can only conclude that they were the offspring of those Aryan tribes that were the first to penetrate into Greece, Thrace, and even reached the shores of Asia Minor. The conquered Turanian population, that previously occupied these lands, would, in many instances, furnish the mothers of a new race. The mingled Aryan and Turanian blood would produce a mysterious people to whom it would be difficult, in our day at least, to assign a racial place. Such appear to have been the Pelasgians. They constituted those mysterious tribes of people that inhabited the shores of Europe and the isles of the Mediterranean, and were wont, from time, to sweep down with their armaments upon the coasts of Egypt and the Valley of the Nile, to the fear and dismay of the Pharaohs. Aryan and yet Turanian, indigenous and yet foreigners, thus, probably, arose these people who have so seriously puzzled historians.[2]

Historians of half a century ago readily granted the mysterious Pelasgians a place among the early people of Southern Europe. They have been repeatedly made the ancestors of the Greeks and Latins. They are mentioned among the defenders of Asia Minor against the Egyptians by both Rameses II. and Rameses III.[3] In the first Homeric Epic[4] they are mentioned as inhabiting the coast of Asia Minor. Herodotus[5] refers to them in a number of places. He regards the Hellenic speech as a branch of

1 Curtius: "History of Greece," New York, 1871, Vol. I. p. 45.
2 See This Series, Vol. II. p. 597, note 1.
3 Brugsch in "Ilios," p. 755-8. 4 "Iliad," book ii. l. 840. 5 Bk. i. ch. 58.

the Pelasgic, thus giving the latter priority over the former, though he seems to have had little positive knowledge of the Pelasgians. Keane[1] says that "the Greek tribe itself, whose name was adopted by the Latins as the collective designation of the whole race, appears to have been Pelasgian." He further classes all the Aeolian, Dorian, and Ionian dialects under the title of "Pelasgo-Hellenic." Canon Rawlinson[2] ranks the Pelasgic language with the Aryan family, and gives it as his opinion, that the Greek and Latin sprang from it to some extent.[3] Prof. Sayce[4] regards the Pelasgians as simply tribes of Aryan people, but refuses to class them as a particular family. He further detects a double meaning in the word. At first it may have applied to some particular tribes, but later Greek writers used it in a sense almost synonymous with our word "prehistoric."

Curtius[5] seems to have gained a clear idea of these mysterious people. According to him, they were husbandmen and herdsmen, who everywhere preceded the purer Greek stock as it spread throughout Hellas, the isles of the Aegaean, and Asia Minor. They formed the dark background from which the Hellenes arose. Curtius says distinctly, that the Ionians (the Hellenes of Attica) developed from this Pelasgic stock. Future research will probably sustain this view.[6] As Aryan tribes pushed

---

1 Stanford's "Europe," London, 1885, p. 566.

2 "Herodotus," New York, 1881, Vol. I. p. 541.

3 It must be remembered that Rawlinson maintains the Asiatic origin theory, and holds that the route of migration from Asia to Europe was by the way of Asia Minor. ["Herodotus," Vol. II. p. 541.] Those who hold the Asiatic theory, however, no longer trace the route of migration through Asia Minor, for they are obliged to admit that *all the Aryans in Asia west of the Halys river are of European origin.* Sayce: "Elements of Comparative Philology," p. 389 *et seq.*

4 In "Ilios," p. 127.

5 "Griechische Geschichte," Berlin, 186[illegible] Band I. s. 26 *et seq.*

6 This Series, Vol. II. p. 798.

southward from their Baltic homeland, the first mixture with the Turanians would produce a people whose Aryan blood would be very weak. Such were the Pelasgians. As Aryan tribes spread to the west and southwest from the Baltic region, a similar mixture produced the Celts. On the east, the ancient Sarmatians represent just such a weak mixture of Aryan with a super-abundance of Turanian blood.

Ancient people were always on the move; and, as we shall see, the pressure of migration in Central Europe was always toward the south. As the population of Hellas was mixed again and again with purer Aryan blood from the north, a new and decidedly Aryan people appeared. These were the Hellenes, who derived their name from a mythical ancestor called Hellen. They early developed into three types, or confederacies of kindred tribes, known as Ionians, Dorians, and Aeolians. The Ionians appear to have preceded the others in point of time. Curtius, as just stated, makes them descendants of the Pelasgians,[1] whom they followed from isle to isle across the Aegaean even to the southwestern shore of Asia Minor, where they had established themselves long before the time of the Trojan war. Thus was Hellenic or Greek influence established over the islands of the Aegaean, and the coast of Asia Minor, as well as in the Hellenic peninsula, at a very remote period.[2] The Ionians receive frequent mention in the earliest parts of the Hebrew Scriptures under the name of Javan.[3] Professor Brugsch-Bey interprets the word *Hauneb*, that appears on the monuments of Egypt, at a time previous to the eighteenth dynasty (about 1700 B.C.), as "foreigners who chose their chiefs

[1] Curtius, Op. cit. s. 26. [2] Sayce: "Ancient Empires," p. 212.
[3] Genesis x. 2, 4; I Chronicles i. 5-7; Isaiah lxxvi. 19.

in order to accompany them on warlike expeditions . . . the inhabitants of the islands and coasts of the sea." Thus pointing directly to the early Greeks, probably the Ionians whose name has the significant meaning of "emigrants."

There was another route open for the descending Aryans to crowd over into Asia. This was by the way of the Hellespont. A Pelasgian[1] population was, no doubt, first developed over Thrace and the region between the Carpathian mountains and the Danube river. But, as wave after wave of Aryan tribes came pouring down from the Baltic homeland, the resident population in this region became pretty thoroughly Aryanized. The Thracians were, no doubt, more purely Aryan than the Hellenes.

The Aryans pressed onward across the Hellespont into Asia Minor, and there also arose a Pelasgic population. But the great Semitic empires toward the east and southeast, and Egypt on the south, were powerful enough to check this continual stream of Aryan migration, although the Aryans of Asia Minor and Europe receive mention among the prominent enemies of Egypt. The farther advance of Aryan migration in these directions being thus checked, there was developed a strongly Aryanized population in Western Asia Minor by frequent intermixtures with tribes coming later from the Aryan homeland. Indeed there seem to have been certain tribes of Germanized Thracians, known as Briges,[2] who crossed the Hellespont in such numbers that they formed in Asia Minor a powerful confederacy, or state, that has been called Phyrgia, that

[1] We use this term as indicating the vanguard of Aryan migration toward the south, and the population resulting from the first intermixture of Aryan and Turanian blood.

[2] Karl Blind (appendix 4, "Troja," p. 355) says: "The Macedonians who said 'Aprodite' and 'Bilippos,' for 'Aphrodite' and 'Philippos,' called the Phrygians, Brig, Bryg, or Brykai, but there is no doubt as to this name, Bryges, Bryk, or Fryk, having meant a freeman a

embraced a large portion of Asia Minor within its borders.[1]

That the Phrygians were descendants of Thracians who had crossed the Hellespont from Europe is now admitted by the majority of recent students in this field. Strabo[2] long ago declared this to be a fact. Recent study of their language confirms his statement, and their name shows their relationship to the old Germans, though it had been subjected to Thracian influence.[3] After settling the central portion of Asia Minor, the Phrygians began to spread toward the western coast. A portion of Northwestern Asia Minor about eight miles long by four miles broad possesses peculiar interest to the historian. This was the famous plain of Troy, that has witnessed so many changes in the history of the past. The northern part of the Troad is washed by the waters of the Hellespont. Across this strait, lies the Thracian Chersonese, a long, narrow peninsula stretching toward the southwest into the Mediterranean, as if to form an easy highway for migrating bands to enter Asia from the west, or to welcome Asiatic invaders into Europe.

The shores of the Aegaean on the west rise to an average height of one hundred and thirty feet above the sea level.[4] The various rivers of the Troad rise from the slopes of Mount Ida, whose various branches extend throughout that portion of Asia Minor known as Mysia.[5] The largest of these rivers is the Scamander, which in

4 Schliemann: "Troy and its Remains," p. 69.

5 Schliemann: "Ilios." New York, 1881, p. 68.

ancient times flowed directly past the walls of "sacred Ilios." The region of the Troad was once fertile, fruitful, and populous. Even in classical antiquity it supported at one time eleven cities and two villages. One of these cities whose acropolis stood on the hill of Hissarlik contained, according to estimate, over seventy thousand inhabitants. Were we to penetrate into the dim past of prehistoric times, we would discover that comparatively modern cities were built upon the ruins of seven prehistoric cities, a Lydian city, and three towns of the ninth century B. C.[1] The ruthless hand of time, however, has covered this once fruitful region with ruins and miserable villages, and, in places, has converted it into marshy, malarial breeding tracts.[2]

What scenes this region must have witnessed. The poets tell us that in olden times Jupiter sat on the highest peak of Mount Ida and witnessed the battles between the Greeks and the Trojans. The historian of to-day can see not only the strife between the Greeks and Trojans, but can also picture in his mind innumerable hosts of strange and restless people as they tramped in never ending armies across this highway between two continents. He will see vaster armies and witness fiercer battles than were witnessed by the gods of old, a never ending panorama of wealthy cities, invading hosts, slaughtered armies, smouldering ruins, and new and stronger walls successively rising upon the ruins of past grandeur. Sacred Ilios has been reclaimed and such is the story that she has to tell.

The Phrygians were the founders of ancient Ilios, whose acropolis stood on Hissarlik and whose territory spread away down upon the plain of Troy.[3] The most an-

[1] Schliemann: "Troja," New York, 1884, p. 345-6. [2] "Troy and its Remains," p. 71. [3] Sayce: "Troja," p. xi. Blind "Troja," p. 357-8.

cient records that we have referring to the ruin of that city are the Homeric poems—the Iliad and the Odyssey—attributed to the authorship of an ancient, blind poet who bore the name of Homer. But ours is an extremely skeptical age. The vague and highly improbably myths and stories, that formed the basis of all ancient history, have been questioned and cross questioned and sifted down in order to find facts upon which to base a reliable record of events. Much that was once accepted as history has been discarded as wholly unreliable.

In regard to these Homeric poems, Professor Sayce[1] says: "Herodotus must have understood by Homer all that mass of epic literature which in after times was called Cyclic, and distributed among various authors, together with the Homeric hymns . . . . . In their present form, the Iliad and Odyssey bear traces of the age of Pericles; and the mass of epic and didactic literature, which went under the names of Homer and Hesiod, must have been of slow growth. Homer is a name rather than a person, and '*homeros*,' 'the fitted together,' is applied by Euripides to the marriage-bond." Thus can we see only darkly through the mist that time has thrown around the name and labors of one whom the later Greeks held as almost sacred.

A decade and a half ago, the skeptical had condemned these Homeric poems as utterly unfounded, and some had come to regard the story of the ill-fated city of Ilios as the wild picture of the disordered imagination of the poet.

[1] "Herodotus," London, 1883, Book ii. chapter 53, note 5.

But, in later years, there came the archaeologist with his spade and cleared away the rubbish that had gathered around these old and storied cities. Behold the mythical clouds began to clear away, and there was revealed to the astonished world treasures and cities and records of forgotten times. Thus have "Blind Homer's" songs been proved to contain rich treasures of traditional lore, descriptive of real events of historical importance.[1] The Archaeologist was Dr. Henry Sehliemann, whose name will ever hold a prominent place among those of distinguished investigators. Being a faithful student of the Homeric poems, he located the site of ancient Ilios upon the hill of Hissarlik, in the center of the Troad. He began his excavations in 1871. At a depth of fifty-two and one-half feet, native rock was uncovered. As the excavators sank their shafts, and cleared away the rubbish, they penetrated stratum after stratum of ruins, each varying from the previous one in the date and character of the remains found. The acropolis of seven cities, that had successively crowned the sumit of the hill and as often fallen beneath the hand of the destroyer, were there unearthed. Each of these settlements must have preceded the following by quite a period of time. The five lowest were entirely prehistoric, for we have records of the existence of none of them except Ilios of the Homeric poems, the sixth was a Lydian settlement, and the seventh was "Classical Ilium.[2]

Of the seven settlements, that have at various times occupied the hill of Hisarlik and spread over the plain of Troy to the west, south, south-east, the second above native rock has the greatest interest for the historian, for it has

---

[1] Contemporary Review, Dec. 1878.

[2] The Ilios of Homer is entirely distinct from "Classical Ilium," four cities intervened.

been proved that it was the sacred Ilios of the Homeric poems. The more recent settlements were mere villages when compared to it, and do not interest us. But around Ilios—the stories of whose destruction, as recited by the ancient bards, were wont to stir the assembled Greeks to the highest pitch of excitement—there will ever linger memories of ancient times most enchanting to the student of history. And now—just as historians were about to cast aside the traditions of these heroic times—"the light has broken over the peaks of Ida, and the long-forgotten ages of prehistoric Hellas and Asia Minor are lying bathed in it before us."[1] We are now able to glean some historical truths from what it was feared was only myth.

As we have said, it is now known and generally admitted that these Trojans were colonists, or at least descendants of the Phrygians;[2] and the Phrygians trace their lineage back, through the Thracians, to the great Teutonic family of the Aryan race.[3] But when the Phrygians sent their first colonists to settle at Hissarlik, they found it already occupied by a people whom they must have conquered. Then who were these first people who dwelt in the Troad and built the first acropolis at Hissarlik? The discoveries of Schliemann have proved that this first settlement must have existed for "a great number of centuries."[4] They had erected only two buildings, however, upon the hill, but the settlement must have extended over a large area to the west, south, and south-east of the plain of Troy.

By a comparison of the pottery found in this first settlement with what has been found in "the so-called tumulus of Protesilaos" on the European side of the Hel-

[1] Sayce: "Troja," ix.
[2] Above page 43. [3] Above page 71. [4] "Troja," p. 39.

lespont, it has been proved that "the first inhabitants of Hissarlik, the builders of its first city, must have come across the Hellespont."[1] This means a great deal to us, for it tells us that the builders of this first settlement were more or less Aryanized, and we have little hesitancy in classing them with the great, but mysterious, Pelasgic people that so early spread over Southern Europe.

Polished Axes from Hissarlik.

But the remains of this first settlement teach us many things. They carry us back to a time when the inhabitants of Asia Minor were battling with one another with rude stone impliments.[2] They were still in the Neolithic Age, but just merging into the Bronze Age, for there were found a few ornaments of copper or bronze, such as brooches, knives, etc., showing that they had a slight knowledge of metals.[3] Their weapons, however, were of stone, the most interesting of which were two polished stone axes as represented in the accompanying cut. Exactly similar

[1] Sayce, "Troja," p. x. [2] Sayce, Op. cit. p. xii.

[3] See Lenormant "Les Antiquities de la Troad," p. 11, quoted in "Ilios," p. 481.

axes have been found in Denmark, England, Germany, Livonia, Courland, Hungary, and many other localities in Europe. We are thus introduced to a time prior to the existence of the great empires of Asia Minor, perhaps even before the empire of the Hittites had risen.[1]

To what remote antiquity this all points! Pelasgians had become Aryanized to Phrygians; Phrygians had become Aryanized to Thracians. And this must have been the state of affairs at the close of the Neolithic Age. For we know that the Neolithic Age was just drawing to its close when the Phrygian tribes of Trojans descended upon the first Aryan (or Pelasgian) settlement of Hissarlik, conquered, and destoyed it, laying the foundation of the Homeric Ilios. Now the Thracians and, in their turn, the Phrygians must have developed into quite a powerful people before the first Phrygian colonists appeared in the Troad; and that means that the Aryans had already gained the ascendency throughout the greater portion of Southern Europe long before the close of the Neolithic Age.

Although at the beginning of the Neolithic Age, we are to suppose that the greater part of Europe was peopled by a Non-Aryan race, of which the Basques, Etruscans, and Finns are the remnants,[2] the ethnologist tells us that, during the Neolithic Age, the Celts spread over much of the territory that they occupied at the dawn of history.[3] They probably occupied Gaul and Britain during the ages of Polished Stone, Bronze, and Iron. Those tribes that were compelled to remain nearest the Baltic homeland became, from the beginning, more and more Aryanized by the constant encroachment upon their territory

[1] Above page 42. Sayce, Op. cit. p. ix.
[2] This Series, Vol. I. p. 209 *et seq.*
[3] Ibid. p. 214.

of the Germans. Thus, while most of the broad-headed skulls found in Neolithic caves are undoubtedly Celtic, there is a probability that some are Belgic Germans,[1] so that there were, no doubt, also Germans in Western Europe at the close of the Neolithic Age.

It is, of course, impossible to give dates at this period in Aryan history. It was at the close of the Neolithic Age.[2] With our present enlightenment on this subject, we can not point to a single region in Central Asia and say that we know that the ancestors of the Asiatic Aryans dwelt there in the Neolithic Age. We have no evidence whatever, that they were there when the other great Oriental empires arose. But in Europe, on the other hand, we know that Aryan migration toward the west and southwest had developed the great Celtic branch; that the southward course of migration had given rise to the mysterious Pelasgic branch, extending even to the confines of the Oriental world; and, if we had any records whatever of the movements of the Sarmatian tribes during this Age, we would find them pressing forward toward the shores of the Caspian Sea. Thus at the close of the Neolithic Age, the Celts, the Pelasgians, and the Sarmatians, as the vanguard of Aryan migration outward from the Baltic center of dispersion, shared among themselves the border-lands of the extent of Aryan possessions even as they did at the dawn of history.

Centuries then rolled away, during which time we have no information of the events that transpired among the various Aryan people. From the close of the Neolithic Age to the Heroic Age, they are almost lost to history. During all this time, the Germans must have

1 See description of the Belgae in Bohn's "Caesar," p. 545.

2 *Vide* This Series, Vol. I. p. 257 *et seq.*

kept pouring down into Thrace, and the Thracians into Greece and Phrygia. Tribes of Phrygians migrated into the Troad and laid the foundation of the Homeric Ilios. The Ionian Greeks spread over the isles of the Aegaean and founded many settlements on the coasts of Asia Minor. These foreigners took an active part in the affairs of the older world. They united their forces with the Hittites against Egypt;[1] and, for several dynasties, a number of Aryan tribes are powerful enough to receive distinct mention in Egyptian inscriptions among the powers that allied themselves against the rulers of the Nile region.

The Trojan children of the Phrygians played a more brilliant part in the history of that portion of the world than did the parent tribes. They founded their capital city upon the ruins of the Neolithic settlement, and there it stood for we know not how long. As restored by Dr. Schliemann, it has a wonderful tale to tell. It tells us of a former sacking many ages before its final ruin, for the Ilios that the Greeks burned was built on a partially ruined Ilios of an earlier date. Thus are we given an inkling to the foundation of the ancient myth, that the angry Hercules, on account of the deceit of Laomedon, had once captured and partially destroyed the city.[2] It is acknowledged to be the Homeric Ilios, for all the landmarks are there. The acropolis with its six palaces, surrounded by their Poseidonian walls of defense and filled with their treasures of gold, could have been none other than the home of the aged Priam. Thus does it prove true, that the "recent discoveries in the Troad show that Ilium was as real a place as Thebes."[3]

[1] This Series, Vol. II. p. 394.

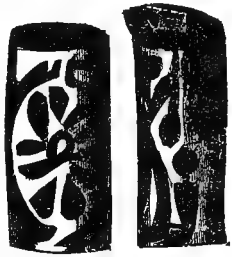
[3] Sayce: "Comparative Philology," p. 319.

Among the souvenirs of ancient Troy so carefully preserved in the ruins of Ilios, as if for the enlightenment of our own favored nineteenth century, are some rare relics that tell us strange stories of past ages, long forgotten by historian and bard. When the spade of the archaeologist threw up from the deep trenches on Hissarlik, certain cylinders and whorls and images, they, falling at the feet of the discoverer, seemed to cast brilliant and penetrating rays of light upon the migrations and deeds of the past, rendered dim and even forgotten by the ages of time under which they had been buried. The first of these objects that interests us is a cylinder of blue feldspar, found by Dr. Schliemann at a depth of about thirty feet which, under the searching eye and keen mind of Professor Sayce,[1] has been made to reveal its story of the past. Some native artist has preserved for us his primitive skill by cutting on its surface "rude representations of a flower and a cartouche. The flower is of the old Babylonian type, but the cartouche reminds us of Egypt, and may possibly contain the name of the owner, symbolized by a flower tied with a string."[2] The tied string may represent a Cypriote character. But the main point for us to notice is that we have here "manifest indications of Babylonian influence."[3]



Cylinder of Felspar.

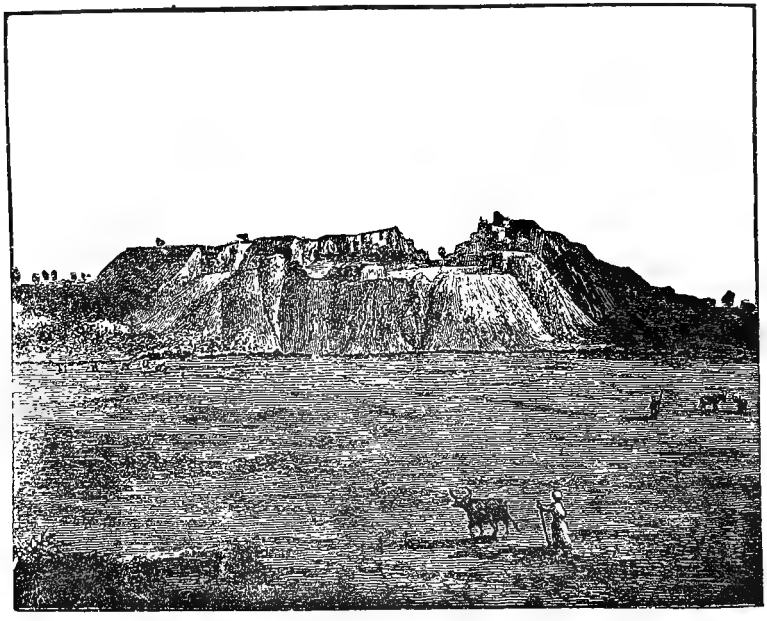
The next objects that attract our attention are a large number of whorls, seals, and pieces of pottery bearing inscriptions. Although we know next to nothing about the language of the Trojans,[4] still the inscriptions have inter-

1 "Ilios," p. 693. 2 Ibid.

3 Compare this with cut on page 383, Vol. II.

4 Sayce, Ibid. 374.

esting stories to tell us, for they carry us back to a time long prior to that when the Phoenician trader roamed over the seas at will, and visited every known portion of the world. We are thus told that, even at that time, the Aryans of Asia Minor had a written language, though it may have been but a rude forecast of the more perfect



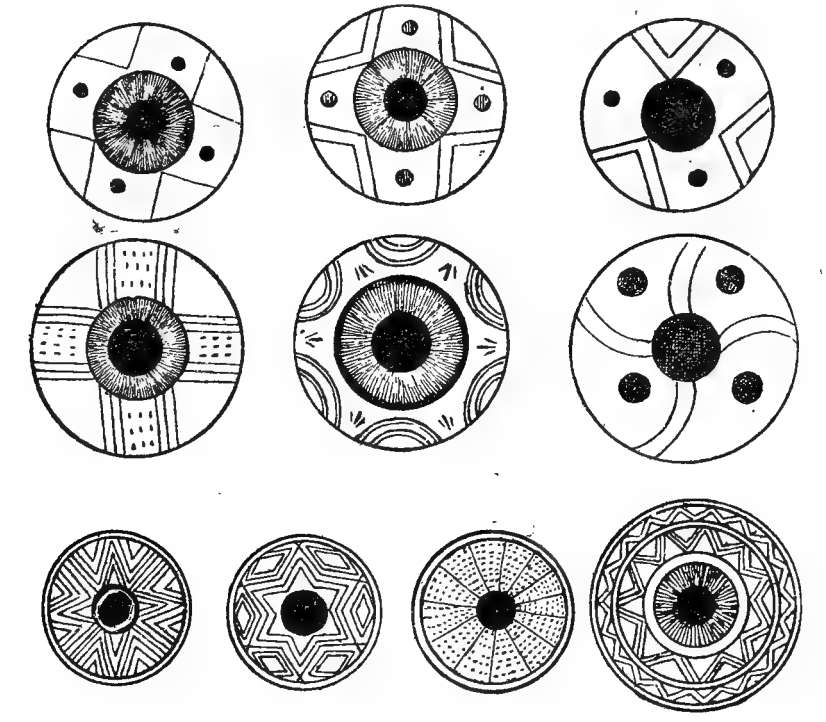
Hissarlik.

form that the Phoenicians themselves were destined to introduce.[1] It was a sort of syllabic form of writing, and goes by the name of Asianic syllabary, given it by Prof. Sayce. This form of writing was widely spread over Asia Minor and the isles of the Aegaean.[2]

Archaeologists are still trying to interpret these Trojan inscriptions, and we can not tell how soon they will

1 Taylor: "The Alphabet," p. 115-6.
2 *Vide* Inscription given Vol. II. p. 403.

read from them pages of history from the long forgotten past. For their interpretation, we are referred back to the time when the Hittite empire was in the height of its glory, and spread its influence over a vast region in Asia Minor between Babylonia and the smaller tribal districts along the western coast. They were the great tra-

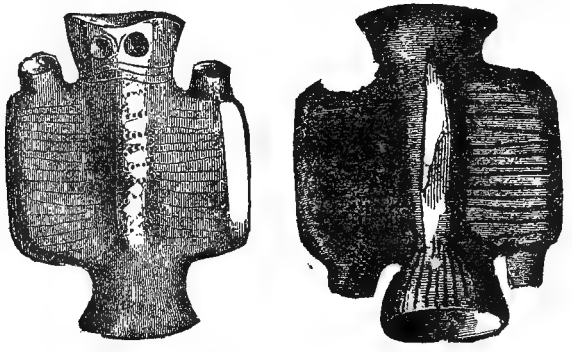


Whorls from Troy.

ders of the age; and it is due to them, that the culture of the East was transmitted to the less enlightened people of the West. The Trojans may not, then, have had direct intercourse with Babylonia, but may have received a knowledge of eastern culture as it came to them tinged with Hittite influence.

A few rude attempts at art were found in the burnt

city of Hissarlik. The most of the specimens that might be classed under that head consist of a rude draft of a pair of eyes, appearing on the pottery. The general appearance of these objects led Dr. Schliemann to class them all under the head of "Owl-headed" pottery. But there was also found a rude leaden image of some goddess that the Trojans worshiped. The discoverer of Ilios was inclined to identify it with the Greek goddess, Athene.[1] Prof. Sayce, after having pointed out the Babylonian and Hittite influence that had so much to do in molding the civili-



Owl-Headed Goddess.

zation of the Trojans, recognized, at once, the resemblance between this Ilian image and the representations of the great goddess of Carchemish, the Hittite capital.[2] The Trojans called her Ate, and the Hittites Athi. We are told that the "Owl-headed" vases also represented this same goddess. Her images occur all over Asia Minor and even appear at Mycenæ. Such was the modified Babylonian art, that spread over Western Asia, and along with it came the worship of the Babylonians as instituted at Carchemish. Thus should we notice the influence of the Turanian Hittites upon the culture, and especially upon

1 "Ilios," p. 153-6.

2 "Troja," p. xvii. and xviii.

the religion, of these primitive Aryan people. Though the former may have received their ideas from Semitic Babylonia, the entire religious belief of the Trojans was deeply colored by this Turanian religion.[1]

Such is our knowledge of the ancient Trojans. Though we may feel gratified by the remarkable strides that historians have made in the past few years in unraveling the mystery—that mystery that has ever veiled this storied land—yet it is humiliating to contemplate how little we, even now, know of the fleeting past, and the momentous events that have transpired. We begin to see through the veil darkly, and can indulge the hope, that it will not be many generations, before our scholars can read us a continuous history of these early times, from the many cylinders and tablets that are being unearthed in this interesting region, the cradle of Aryan civilization.

Now if we turn again to Europe, we will find that the more thoroughly Aryanized people of that continent were not entirely inactive. During the period of Trojan grandeur, the Aryans of Southern Europe were slowly, but surely, gathering ideas from the more advanced regions of the South and East. About the earliest evidence of an advance in culture that we have, is manifested in the great walls of defense, with which these herdsmen and husbandmen seem to have been forced to surround their tribal headquarters. So immense were the blocks of stone used for this purpose, that the ancients were wont to attribute the building of their walls to a race of giants, whom they called Cyclopes, hence we have the term "Cyclopean Walls." It is supposed that the oldest of these

[1] The above would seem to indicate that the tutelary goddess of Athens was of Turanian origin. Consult Lang: "Myth, Ritual and Religion," *cf.* Keary: "Primitive Belief." We have sought altogether too high a source for the gods of ancient Greece.

walls was built around the citadel at Tiryns in Argolis. Mycenæ had one, and Cyclopean walls formed a marked feature of Hellenic architecture of this period.

Writers do not as yet agree as to who the builders of the Cyclopean walls were. Many argue that the architects were brought from Asia. Professor Adler[1] argues that they were of Phrygian origin. Dr. Schliemann thinks that they were a "great Asiatic people, which about the middle of the second millenium before Christ covered the whole of the mainland of Greece, as well as the islands of the Ionian and Aegacan seas, with settlements, and which had already attained a high level of culture."[2] And again he says: "We may therefore assume, with great probability, that the gigantic walls of Tiryns were built by Phoenician colonists, and the same is probably the case with the great prehistoric walls in many other parts of Greece."[3] Here we are introduced to a new people who are taking part in European affairs; namely, the Phoenicians."[4]

In the ruins of Ilios, everything points to pre-Phoenician times.[5] The Hittites were the traders of its day, and we are to suppose that this later nation of merchants had not yet found their way to the shores of the Troad. But in Europe, there have nowhere been found any ruins that can be classed as pre-Phoenician.[6] The Phoenicians, then, must have appeared in numbers on the Mediterranean about the period of the fall of Troy, although single Phoe-

4 The Right Hon. W. E. Gladstone regards these builders of the Cyclopean walls of Greece as a Poseidon worshiping race [*i.e.* Phoenician] related to the builders of the walls of Troy, thus connecting Greece and Troy. See preface to "Mycenae and Tiryns," p. viii.

5 Sayce: "Troja," p. xvi. and xvii.

6 Sayce: "Contemporary Review," December, 1878, p. 69.

nician traders had, no doubt, penetrated these regions long before that time. As private traders and daring navigators, their ships could have been no uncommon sight in Grecian harbors while yet the walls of Troy were standing. The pottery unearthed at Mycenae, though plainly of Babylonian origin, shows also a Phoenician influence. Yet Hittite traders may have early found their way across the Hellespont and down into Grecian lands,[1] and borne thence a knowledge of Oriental arts and manufacturers. We thus catch a glimpse of the wide spread traffic and the long and dangerous journeys of these harbingers of civilization in the very childhood of European nations. The dates of this period are indefinite, but they have been limited by the best authorities to between the eighteenth and fourteenth centuries B. C.,[2] and that is just the period when Assyria and Babylonia were at the head of the civilized world.

Prof. Sayce[3] recognizes two distinct periods in the development of Grecian art and culture. The first of these he calls Phrygian, and defines it as the period when Phoenician and Oriental influence was felt only indirectly, by intercourse with a few traders who periodically visited the cities of Greece. The second was a period when teachers and artisans were invited across the Aegaean to manage the construction of buildings and works of art. As early as the sixteenth century B. C., the Phoenicians had distinguished themselves as a great commercial people, trading between Assyria and Babylonia; and we can not believe that they were ignorant of the very localities where the purple-giving murex, cuttle-fish, and

---

3 Op. cit.

slaves were most easily attainable.[1] But the wide extent and wonderful influence of the Phoenicians on the culture of early Europe has already been sufficiently discussed.[2]

The Phoenicians, accepting the Assyrians and Babylonians as their masters, brought to the people of Europe new ideas, and opened their eyes to a better mode of life. The Aryan mind grasped the new ideas at once. "They entered into other men's labors, and made the most of them." Their small village communities assumed the airs of cities; walls of defense were erected; elegant vases, fine linen, Oriental fabrics, and, indeed, all manner of foreign articles were eagerly purchased, with the produce of the land, or with captives procured in their tribal warfare. Finally, they began to import workmen, who, under the guidance of the Aryan master mind, soon improved upon their models. They built ships, and sought to compete with the Phoenicians upon the sea. Their own works of art came into demand in foreign markets, and Greece soon entered upon a career that was destined to place her at the head of the culture of the Medieval world.

In our haste to give Oriental civilizations credit for all they may have done to advance Aryan culture, we must not overlook the influence that was constantly exerted over these regions from the Baltic homeland. In their love for classical literature and art, scholars are wont to overlook the barbarous and inhuman practices of their particular favorites, the Greeks and Romans. As touched by the poet's art, the act of the great Agamemnon, in slaying his beautiful daughter, Iphigenia, to appease the anger of some goddess, has received plaudits from the literary world from that day to this; but the Druid priest, who, in the midst of the solitary forest, offered up his sac-

[1] Sayce, Ibid. p. 94. [2] See This Series, Vol. II. p. 733.

THE ACROPOLIS OF ATHENS—RECONSTRUCTION.

rifices to gain the favor of some angry deity for his suffering people, has been ranked as a murderer from the beginning. Let us not forget that, until their contact with Oriental civilizations had wrought wonderful changes in

Lions Gate at Mycenae.

classical people, they were as inhuman and barbarous as any other Aryan people. The Spartans can boast of neither humanity nor refinement.[1]

[1] Consult Lang: "Myth, Ritual and Religion," Vol. I. p. 265, *et seq.* where it will be seen that human sacrifice in Greece existed in *reality* to a late date, perhaps, even, to the time of the Roman conquest.

In the royal tombs at Mycenæ were found a number of amber beads.[1] A quantity of these were placed in the hands of a distinguished chemist, and were thus proved to be from the Baltic.[2] Among the specimens of pottery discoverd in the ruins of the first settlement at Tiryns[3] were found vases with "vertically bored excrescences on both sides," which are regarded as very rare and ancient specimens. Still similarly marked vases are found along the Upper Danube, and in many parts of the Baltic region.

Now, the German graves which contain pottery of this class are referred to the Neolithic Age.[4] We must admit, then, that these ancient Germans either manufactured this pottery or else had communication with parts of Greece during the period between the Neolithic Age and the second millennium B. C., back of which time Dr. Schliemann does not carry the date of the founding of Tiryns or Mycenæ. We can not, therefore, believe that these Germans had completely buried themselves in the forests of the north. They were, no doubt, as steadily, though perhaps not as rapidly, advancing in culture as their more favored kindred to the south.

As regards Europe proper, the first gleams of historic light seem to dawn on the shores of ancient Hellas, which has been called "a mountain region in the midst of the

---

2 This Series, Vol. I. p. 237; Vol II. p. 730.

3 There is a dispute about the date of this first settlement, but those who maintain that it is of recent date are in the minority. See Goodwin: "Nineteenth Century," 1886, p. 914 *et seq.* Also Stillman: "Nature," May 20, 1886.

4 Given as Prof. Virchow's opinion in "Tiryns," p. 63. See also same work p. 57 *et seq.*

sea."[1] Hellas proper is the southern portion of a great peninsula, the northern and eastern parts of which were possessed by the Thracians, Macedonians, and kindred tribes. Hellas was cut almost in two parts by an arm of the sea running in from the west. The southern, almost insular portion, was known as the Peloponnesus, and the narrow neck joining it to the mainland was the isthmus of Corinth. To the south of this isthmus, the peninsula of Argolis pushed off to the southeast into the Aegaean sea; to the north was the peninsula of Attica taking a like trend into the sea.

In ancient Hellas, were "Alpine landscapes in the neighborhood of the sea.... in Olympus, Parnassus and Taygetus.... Here steep rocky summits towered in peaceful splendor above groves of olive and laurel, there stately forests inclosed green land spaces,"[2] So varied is the climate that the land produces both temperate and tropical vegetation. "The beautiful pastures on the upland slopes sufficed for the breeding of cattle, the numerous, well-situated mountain terraces were favorable to the culture of the vine."[3] The streams varied from trickling rivulets in the summer to mountain torrents in the spring. Such was Hellas, and the hardy race she produced was not daunted by all the hosts of the Persian Emperor, but returned only defiance to threats of invasion. The country gave them fortifications, and an industrious and rigorous life gave the people the hardihood for which they were famous.

We are now approaching the borderland of history, though we have to deal with myths and legends. We

---

1 Duncker: "History of Greece," Eng. ed. 1883, p. 2.

2 Duncker, Op. cit. 3 Ibid. p. 95.

must remember that thus far we have depended upon language, researches of the archaeologist, and Oriental inscriptions for our information. Though some of our best Egyptologists believe that the names of many Greek tribes are mentioned in the inscriptions of the Pharaohs, others doubt the accuracy of their interpretation.[1] We have now to deal with records even more uncertain. We have reached the period of myths and traditions which center around certain legendary heroes who, if they lived at all, lived so long ago that the ancients supposed that they were the children of the gods. This has been called the "Heroic Age."

Strange and ridiculous as it may appear to us, the heroic age was a time honored reality to the ancient Greeks and Romans. Even down to a very recent time, the mass of the people were firm believers in the genuineness of the mythical history that clusters around their ancestral gods and forms a part of their vestal worship. We must constantly bear in mind that every illustrious hero of this strangely unreal age thought it no sacrilege to claim relationship to some god or goddess of the Grecian pantheon. It was not considered as at all opposed to the ideal character of divinity for their revered gods to visit the earth and deflower the daughters of men. Neither did their goddesses, whose beauty, purity, and divinity inspired the sculptor's chisel, lose anything in the reverence, of the people by meeting earth-born heroes and bearing them children destined to accomplish deeds of renown. Thus the fertile minds of the ancients peopled the earth with a race of demi-gods, in whom they firmly believed and whom they devoutly worshiped.

---

[1] See Sayce: "Contemporary Review," Dec. 1878, p. 74-5.

We must look to the bards of Hellas for the legends of this remote age. Since blind Homer has become such a visionary personage, we can not mention him as an historical character; but the great mass of poetry known as the Homeric poems is as interesting and valuable as ever as a treasure-house of this ancient folk-lore. One of the most ancient legends that interest us is that of the voyage of the ship Argo in search of the "golden fleece." Their vessel was constructed under the supervision of the goddess, Athene, tutelary goddess of Athens.

Argonautic Expedition.

It was manned by fifty heroes and demi-gods, among whom were Hercules, Theseus, Castor and Pollux, with Jason, heir to the chieftainship of Thessaly, in command. Perhaps we can conclude from this legend, that long voyages of discovery were of early occurrence among the Greeks,

and that they journeyed toward the east in quest of gold and precious metals.[1]

So in regard to the sacking of Troy or Ilios, we have no satisfactory records, for this event has ever been a most fruitful source of legends and myths. The spade of the archaeologist has proved that Ilios once was. That she had been twice conquered, once she was but partially destroyed, but at last she met the same sad fate of so many ancient cities. Thus far, we are in no doubt and so we admit that there is an historical foundation for the Homeric poems. We need not dwell upon the myths that cluster around the history of the rise and fall of this ill-fated city. The walls built by Poseidon; the sacking by the angry Hercules; Paris, the unfortunate castaway; the envious contest of the beautiful goddesses, Aphrodite, Here, and Athene; the rape of Helen, the "fairest of living women;" the vengeful Greeks, bent on rescuing the fair Helen and punishing her seducer; the Olympian gods in angry council over the affair; the returning heroes doomed to endless wanderings:[2] all savor too much of the unreal to claim space for detailed mention here; and these legends are, no doubt, familiar to all readers of the older school of historians. We must conclude with Dr. Webb,[3] that "the tale of Troy, as we have it in Homer, is essentially a poetic creation."

---

1 This legend is given in full in Grote: "History of Greece," Vol. I. p. 231 *et seq.*; also "History of Ancient Geography," Vol. I. p. 19. See Richard Payne Knight: "Symbolical Language of Ancient Art," p. 168. Possibly in the legend of the Argonautic Expedition we have a myth to account for a survival from ancient Phallic worship. The ark plays an important part in all religions of the Orient, it probably represents the womb from whence all living things proceed. See Inman: "Ancient Faiths," Vol. I. p. 383 *et seq.*; Knight, Op. cit. p. 133; Higgins: "Anacalypsis," p. 128; Blavatsky: "Isis Unveiled," Vol. II. p. 444.

2 See Homer's "Odyssey" and Virgil's "Aenaeid."

3 "An Introduction to Homer," Boston, 1877, p. 147.

It may be of interest to us, however, to note how faithfully the poet portrays the life and culture of the

Return from Troy.

the times. His characters are all heroes and demi-gods. There were Menelaus, husband of the fair Helen, the great Agamemnon, the wise Nestor, the wily Odysseus,

and the powerful warriors, Ajax and Achilles. Agamemnon was the chosen leader, yet he dared not act before he had called a council of the chieftains. In this council, all the chieftains spoke with as much freedom as the commander, and they did not hesitate to denounce him in the boldest manner. His authority was only nominal, for he seems to have had no power to compel obedience. Pouting Achilles could lie unmolested in his ships, regardless of his superior's commands, as well as the peril of the Grecian cause, just on account of a quarrel between himself and Agamemnon.[1] This all points to a loosely organized tribal state of government, where every chieftain ruled his own tribe independent of any superior authority.[2]

Herodotus but echoed the sentiments of his day, when he makes the Persians say: "To steal women is the deed of knaves, but to hastily seek vengeance for those who have been carried off is foolish."[3] So that it is improbable that the earlier Greeks should raise such a stir about a single woman, even were she the fairest of the sex. The poet's story is, probably, but the solar myth of the strife between light and darkness retold, with perhaps a slight historical foundation. "Some memorable capture of a town in the Troad had probably been made by Greek warriors."[4] We would go even further, and surmise, that it was one of those great periodical migrations of the Hellenes into Asia Minor, when the pent up forces of Aryan migration burst forth with renewed vigor, and the waves flooded the entire eastern shores of the Mediterranean and even laved the feet of the Pyramids of

1 "Iliad," Book i.
2 This Series, Vol. II. p. 179 *et seq.*
3 Book i. chapter 4.
4 Webb, Op. cit.

Egypt, retreating before the armies of Rameses III. Some of the chieftains, after years of wandering, may have found their way back to their homelands only to find that they had sold their birthright for a mess of pottage, and to sink beneath the hands of the assassin.

Historians allow us only four centuries of time between the destruction of the second city of Hissarlik, the fated Ilios,[1] and the first date that appears in Grecian

Trojan War Heroes.

history.[2] In that comparatively brief period of time, are crowded events momentous indeed to the population of Greece. There occurred the building of temples and the establishment of councils. There occurred wars and vast migrations. The populations of Epirus and Thessaly were displaced by invading tribes from the north. The early Dorian territory was also depopulated, and all of Upper Hellas was given a new population that flocked downward

[1] 1200 B. C.; above p. 42, note 2.

[2] The first Olympiad, 776 B. C.

from that ever swarming Aryan hive in northern Central Europe. The Dorians entered the Peloponnesus, and the earlier dwellers there were either Dorianized, enslaved, or driven out upon the islands of the sea. The western coast of Asia Minor was finally repopulated by tribes of Aeolians, Ionians, and Dorians from the opposite coast of Hellas. The Phoenicians planted their colonies along the Mediterranean shores, and even built commercial towns in Greece itself. But, as far as Greece was concerned, they came, performed their mission as harbingers and messengers of a greater civilization, and passed away[1]—all within this period.

The Homeric poems grew during this era. The great epics—the Iliad and Odyssey—have ever since furnished models for the poets of all nationalities. This period also witnessed the introduction of the Greek alphabet, and thus the foundation of a literature, in the scope and perfection of which Greece for many centuries led the world. We seek in vain for more than traces of all these changes. History is all but silent regarding them. A few legends and their stories are told; the growth of language adds its mite; and the spade of the archaeologist brings its tribute. Thus do we glean the seeming facts and shape the records of a great nation through four centuries of its childhood. The rest is buried in a long forgotten past, which may, perhaps, never be recalled. "Our clock strikes when there is a change from hour to hour; but no hammer in the horologue of Time peals through the universe, when there is a change from Era to Era. Men understand not what is in their hands; as a calmness is a characteristic of strength, so the weightiest causes may be most silent."[2]

Should we attempt to compare ancient Hellas with

[1] Grote, Vol. III. p. 270. [2] Carlyle.

modern nations, we would be surprised at its almost insignificant territory. Being about two hundred and fifty miles long and with the average breadth of less than one hundred and eighty miles, it covered an area about the size of Portugal. Still how great an influence it has exerted in the world's history! Many volumes have been written, relating in the minutest detail the myths and legends and songs of the childhood of this great people. But all this is worthless when we seek facts upon which to build history.

The Greeks were the first European Aryans (if we exclude the Phrygians and Trojans) who came into prominence. They were the first to mingle with the civilized nations of the East; and, being ready imitators and remarkably ingenious, they not only adopted the civilization of the East, but finally carried it to a remarkable degree of perfection. Much of the art and culture that has been called Hellenic is, as we have seen, only modeled after foreign masters. This is true also in religion. Some of the gods and many of the practices that the Phoenicians had adopted in their intercourse with Egypt and Persia, were transmitted by them to the ever receptive Greeks. We must not set too high a value on Aryan religion. Human sacrifices, polygamy, and mutilation of the bodies of captives and criminals were practiced by the Greeks as well as other people. Only by slow degrees and after a long time were such practices discarded.[1] Through all ages it seems to have been characteristic of the Aryan mind to glean new ideas from all sources. Of knowledge, habits, and culture, they rejected what was offensive or

[1] See Lang: "Myth, Ritual, and Religion," London, 1887, Vol. I. chapter vi.

corrupting, and carried forward to perfection what was enlightening, ennobling or refining.

When history finally dawns upon Greece, we find that land peopled by tribes who claimed descent from one common ancestor,[1] and recognized "fellowship of blood; fellowship of language; fixed domiciles of gods and sacrifices, common to all; and like manners and customs."[2] The majority of ancient historians, including Herodotus[3] and Thucydides,[4] believed that there was a time when different languages were spoken in the various parts of Greece; but, during historical times, the Greek language has been universally used throughout Hellas. As we would suppose, however, in a tribal state of society, there were many dialects, principal among which were the Doric, Aeolic, and Ionic. Each tribe had its peculiar dialect, though the divergences were not such as to prevent every Greek from understanding every other Greek. This points to a time when a common mother language was spoken by the Hellenic tribes. This language was different, though cognate with the primitive Latin tongue.

Politically the Hellenic tribes were universally independent of one another. Athens was only one of a number of Ionic cities, each of which regarded itself as free from all manner of political servility. As regards dialect,[5] the various political communities of Attica were closely allied. So likewise all Greece was united in the worship of certain deities. But politically there was no unity in ancient

---

2 Grote, Op. cit. p. 237.

3 Herodotus, i. 57-8.

4 Thucydides, i. 3.

5 Grote says: "There was no such thing as one Ionic dialect... The Ionic dialect of grammarians was an extract from Homer, Hekataeus, Herodotus, Hippocrates, etc.; to what living speech it made the nearest approach amidst these divergencies, which the historian has made known to us, we can not tell."

Greece. More recent research in the field of ancient society, enables us to clearly understand society in ancient Greece. It was simply tribal society. A brief study of it has already been made.[1] We need simply recall, that each tribe was independent, and that the several divisions of a tribe allowed no interference in their internal affairs. As each important city in ancient Greece was the headquarters of a tribe, we understand why there was no connecting bond between them, and why it was so difficult for a resident of one city to acquire rights in another; it could only be done by tribal adoption. Only at a later date were confederacies formed. At an extremely early date, however, both at Athens and at Sparta, some tribes, probably Pelasgic, had been reduced to tribute.

The Greeks were further, to a great extent, religiously united. Were we to seek a date commemorated by the founding of the Delphian temple to Apollo, we would loose ourselves amidst the shadows of antiquity. It stood on the slopes of Parnassus before Homer sang of the wrath of Achilles.[2] Even before the return of the Heracleids, the Amphictyonic council was wont to assemble and deliberate for the protection of this sacred temple and the rich gifts, that had at that time, even, been brought from the ends of the world[3] and dedicated to that all-wise god.

Long before the first date appears in Grecian history, the priestess of Apollo was wont to enter the caves of Parnassus and listen to the will of the gods in regard to the affairs of men. Even at the dawn of legendary history, no great enterprise was undertaken without first

3 Smith: "Dictionary of Greek and Roman Antiquities."

consulting the Delphian oracle in regard to the success of the undertaking. In later times, the Greeks founded colonies only under the approval of Apollo, as manifested through the priestess at Delphi. Lycurgus sought the aid of the Delphian oracle before he prepared his laws for Sparta.[1] In still later times, rulers and statesmen from Rome, Egypt, and Asia, sought advice from Delphi,

The Priestess of Apollo at Delphi.
[*Vide* Vol II. p. 328.]

and acted accordingly. Here was the spot in all the world most favored by the gods. This, according to the ancient legend, was the spot chosen by Apollo himself, as his favorite resort. Here, the ancients thought the ear of that god could be reached with least effort and their petitions

[1] Grote, Vol. II. p. 253.

meet with greatest favor, and so, from the earliest times, they flocked hither to listen to the will of the gods.

Now, there was, no doubt, a time when this place of worship was a simple, local shrine,[1] and it must have taken a long time to bring it into national prominence. But finally it came to be known all over Hellas. The rich gifts, that were brought as propitiatory offerings to the gods, accumulated to such an extent, that fears were entertained for the safety of these treasures. So we find, even at the very beginning of Grecian history, that certain twelve of the numerous Hellenic tribes had formed a league for the protection of the temple and treasures of the Delphian Apollo.[2] This league was called the *Amphictyonic Council.* Its origin extends so far back in time, that the legend making Grecians were wont to attribute its organization to a mythical personage, Amphictyon, whom they made a brother of Hellen, the so-called ancestor of the Hellenes.

The word "Amphictyon" means a gathering of friends, or neighbors.[3] It is a noteworthy fact, that only such Hellenic tribes as dwelt in the neighborhood of Delphi and Thermopylæ before the Dorian conquest of Peloponnesus, were represented in this league. Representation was also according to tribes, and not according to cities. Athens was placed on an equality with all other Ionian towns. So, likewise, Thebes was one of several Bœotian towns. Each tribe had two votes in the deliberations of the council, and the small towns were entitled to an equal voice with those that were known in historic times only as large cities. Some of the tribes that were co-powerful with the

---

3 For a deeper meaning of the first syllable, *Am*, see Higgins: "Anacalypsis.

Ionians and Bœotians are only known to us as subordinate to the rule of others that were also members of this league.[1]

In the council, however, the subordinate Perrhæbians had two votes that proved as weighty as the two votes cast by the ruling Thessalians. Thus we see that all this evidence points to a very early period in the history of Greece. It leads us back to a time prior to the return of the Heracleids; to a time, in fact, when Athens, Sparta, and Thebes were not so much more powerful than their neighboring towns as to be deemed worthy of special notice; also to a time when the five dependent tribes represented in the league were equal in strength and liberty to their later masters, the Thessalians.

This much, then, does the Delphian oracle reveal to us in regard to the history of Hellas in the past. We are taught that even before the dawn of history, neighboring tribes were accustomed to hold councils to deliberate upon their common interests. These associations were not confined to this particular league, but there were a number of less prominent Amphictyons, that had their special places of assemblage throughout Greece and her colonies. The Dorian, Ionian, and Aeolian settlements of Asia Minor, each had their league that assembled at stated intervals, at a certain place, in honor of some god. There were others in Hellas itself.[2] The great Amphictyonic council, however, met twice a year; in the spring, at Delphi, in honor of Apollo, and, in the autumn, near Ther-

1 The twelve mentioned as members of the Amphictyonic council are "Thessalians, Boeotians, Dorians, Ionians, Perrhaebians, Magnetes, Locrians, Oetaeans, Achaeans, Phocians, Dolopes, and Malians. Perrhaebians, Magnetes, Achaeans of Phthiotes, Malians and Dolopes were in the state of irregular dependence upon the Thessalians.

2 Grote, Vol. II.

mopylæ, in the "second precinct of Demeter Amphictyonis."

At first, the assembly consisted of little more than delegates from the separate tribes; but later, these representatives were followed to the place of assemblage by large concourses of people who came together for purposes of trade and sacrifice, or to witness the games that were made a part of each festival from very early times. When, in historic times, the Pythian games came to be celebrated at Delphi, the roads and by-ways leading from the remotest corners of Greece were crowded with pilgrims, both on foot and in their magnificent chariots drawn by their finely caparisoned steeds, destined to contend in the races for the honor-bearing prize, a wreath of wild olive.[1]

We must remember that the Greeks, in common with all early people, were still in a tribal state of society when their really historical period begins. While we can speak of them, as we have above, as Dorians, Ionians, and Aeolians, we must not forget that these were only the ruling confederacies. There were many, and different, tribes still dwelling in the Peloponnesus, but so much weaker and inferior to their Dorian masters as to have remained buried in oblivion. The tribes that occupied Hellas had, like all European Aryans, already reached a social development, in which the family was recognized, and the village community was the center of governmental life. They already had their walled towns, but Athens and Sparta had not yet attained the power and grandeur that characterized them later[2].

The majority of their towns were without walls and

[1] These games will be more fully described later.

[2] Grote, Op. cit. p. 247.

scatteringly inhabited; and, according to Thucydides, they regarded it as contributing to their glory to plunder their weaker neighbors.[1] Through fear of being assaulted by pirates, who swarmed the seas, the most of the early villages were located at a distance from the coast.[2] But when the people became more wealthy, through their commercial relations with other countries, they built walled towns on the sea-coast and easily defended isthmuses. In the summer, the mountain slopes were covered with flocks and herds, and all tillable lands were cultivated like gardens. Their products were wheat, barley, flax, wine, and oil.[3]

Although the year 776 B. C. furnishes us a starting point in Grecian chronology, for two centuries more we are left to grope about in the darkness of Grecian history, with only here and there a stray ray of light to guide our uncertain steps. Some events, that ripened into historical facts of greatest moment, sprang into life during the uncertain century preceding the first Olympiad. During three centuries,[4] we are constantly introduced to past scenes, where the historical and legendary meet on nearly equal grounds. It was during the early part of this period, that the semi-mythical character, Lycurgus, existed and gave to Sparta laws remarkable for their originality and severeness.[5]

It was during this period, that the Dorian invasion

1 Book i. 5. 2 Ibid. chapter vii.

3 Grote, Op. cit. 230.

4 One preceding and two following the first Olympiad.

5 Plutarch says concerning Lycurgus [ch. 1] that there is so much uncertainty about him that scarcely anything is said by one historian which is not contradicted by the rest. The conflicting authorities are Aristotle, Eratosthenes, Apollodorus, Timaeus, Herodotus, and Xenophon. O. Müller sums the whole account we have of him in the statement that "we have absolutely no account of him as an individual person." "Dorians," Vol. I. p. 152. This Series, Vol. II. p. 220.

of Peloponnesus was brought to a close by the conquest of Messena by Sparta. It was during this period, that the tribal villages of ancient Greece first grew into importance as cities. It was a period of tyrannies, when ambitious men usurped the ruling power in nearly all the tribes of Hellas. Thus tribal life was largely broken up, and subject tribes came forward to demand some share in the government. This period was also distinguished by the extension of the circumference of Grecian territory to its greatest limit under Hellenic rule, by extensive colonization along the shores and upon the islands of the Mediterranean.[1] The onward march of Aryan migrations had not yet ceased, and the crowded cities of Hellas planted colonies on foreign shores; and, they, in turn, became independent Hellenic cities

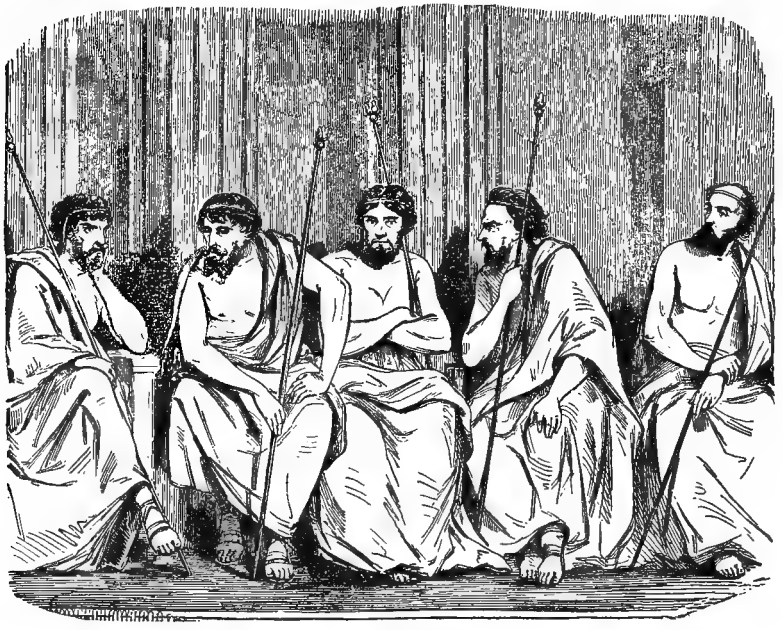
These three centuries witnessed the gradual rise of the Spartans. Sparta was situated among the mountains, in the heart of Peloponnesus. This was one of the points early occupied by the Dorians when they made their appearance in Peloponnesus. It is now generally supposed, that the Dorians united with the Aetolians crossed the Corinthian Gulf. The Artolians took possession of the fertile plains of Elis, but the Spartans passed on to the plains of Poloponnesus proper. They could not have been very numerous or powerful, and seem to have consisted of two bands, the Spartans proper and the Messenians. We have seen reasons in a former chapter to conclude that the Spartans consisted of five tribes.[2] When they reached the location of ancient Sparta, they built each their tribal city, five in all, unwalled and unadorned, at a distance from the sea

[1] It must be remembered that Philip of Macedon and his son, Alexander the Great, were not Hellenic Greeks.

[2] Vol. II. p. 184.

coast, shut off from all risk of invasion by almost impracticable mountain roads. The band of Messenians pushed on further southwest, and established themselves not far from the border line of Arcadia, with whom they lived in peace.

On the eastern side of the Peloponnesus, another, though independent, invasion was in progress. Certain tribes of Dorians were advancing upon the native villages of Corinth



The Five Ephors

and Argos. There is every reason to believe, that these attacks were made from the sea. But we know that the Dorians finally gained possession of both towns and formed settlements there. Corinth was located on the narrow isthmus that joined Upper Hellas to the Peloponnesus. Argos was situated at the head of the gulf that separated the peninsula of Argolis from the mainland. This all happened during the first century after the fall of Troy. The

 CROESUS ON THE FUNERAL PYRE.

Spartans and Messenians were for several centuries close friends and allies. They were alike powerful at the Olympic festival, and had even erected a common shrine to Artemis Limnatis.

Though the Spartans entered their land as conquerors, and the Messenians forced the natives to an alliance, they found life among a strange people full of risk and contention. They, therefore, grew into power very slowly. Messena never attained the strength of her neighbor and after

Hoplites.

rival and conqueror. Though they reached their homes very early in the twelfth century B. C., it was not until the close of the ninth century, that Sparta became powerful enough to extend its conquests beyond a very limited area. About fifty years before the first Olympiad, there was said to rule at Sparta a chieftain by the name of Teleclus who claimed to trace his descent from Hercules. This was about the time that Sparta was given the laws of Lycurgus, and, no doubt, had begun to feel the benefits of these stringent enactments.

The result of Sparta's laws was the formation of a powerful army. Every man was physically perfect and trained to endure all manner of hardships. A military training began at the age of seven, and no man was exempt until he had reached his three score years. Now, as an indication of Sparta's weakness up to this time, we are told[1] that during the three and one-half centuries that the Dorians had occupied the five villages at Sparta, there had existed a number of independent native tribes to the south, one of which, Amyclae, was only two and one-half miles from the Spartan headquarters. It was not until the time of Teleclus that these towns were conquered and made a part of Spartan territory! Not until this occurrence did Messena and the balance of the Peloponnesus begin to be fearful of Spartan supremacy.

For the ruling power in the Peloponnesus during the entire period of three centuries,[2] we are to look to Dorian Argos. This was her period of conquest and glory. As soon as her city became filled with inhabitants, an expedition was sent out to conquer and possess some neighboring villages. Thus did Argos establish colonies at Kloenae, Phlius, Sicyon, Epidaurus, Troezen, and Aegina, and make herself mistress of all the neighboring towns. Herodotus claims for her the sovereignty of the whole of the eastern Peloponnesus, Cythera, and other islands. Argos was the metropolis of Greece, and so continued until the Spartan armies, by mere physical superiority, gained supremacy in Hellas.

Argos seems to have reached the height of glory and power under the reign of the tyrant, Pheidon, who seized the government soon after the first Olympiad.[3] He

[1] Grote: "Greece," Vol. II. p. 329.

[2] Herodotus, i. 82.

[3] 770-730 B. C.

even had the effrontery to claim, as right of descent from Hercules, the privilege of presiding at the Olympian games; so at their eighth celebration, he appeared with an army, and took charge of the festival.[1] The insult was afterward punished by the combined armies of Elis and Sparta.[2] This may have been the prime cause of the enmity between Sparta and Argos. The most memorable act of Pheidon is yet to be mentioned. He caused the first coins to be struck at Aegina, and established a system of weights and measures, called the Aeginaean scale,[3] that came into general use throughout the greater part of Hellas. The Ionian Greeks modified this system and introduced the Euboeic scale which finally came into more universal use. Pheidon was the last ruler of prominence at Argos.

While Argos was enjoying her supremacy, the Spartans and the Messenians had become open enemies. About 743 B. C., they came to open hostilities; and, for the following three-fourths of a century, an almost continual warfare existed between them. The cause of this hostile state of affairs is attributed to a dispute in the neighborhood of the common shrine that stood on the borders of the two countries. The Peloponnesus, in the latitude of these two cities, is about eighty miles across from sea to sea. The border line between the two could not have been more than twenty miles from either.[4] During the seventy-five years of contention, Sparta was on the whole the stronger, and, finally, about 668 B. C., she succeeded in re-

1 Strabo, viii. 358.

2 The Elians had for a long period been given the honor of presiding at this festival, as it was celebrated on their territory.

3 Grote, Op. cit. p. 318.

4 It is evident, then, that this famous war, seventy-five years in duration, must have been a sort of tempest in a tea-pot.

ducing the Messenians to complete subjection. Her way was now clear for the conquest of the balance of the Peloponnesus, and her armies did not rest until this object was accomplished.

It was not until after the conquest of the Messenians by Sparta that Athens came into prominence. About 624

Solon Dictating his Laws.

B. C., there was introduced the Draconian code of laws, which were so severe that they were said to have been written in blood.[1] Almost every crime was made punishable by death. Thirty years later, Solon was elected Archon[2] and distinguished himself by the capture of Sal-

[1] But as to the meaning of this tradition, see Vol. II. p. 219.
[2] Ibid. p. 192.

amis, which was at that time under the control of Megara. That placed him in a position to have made himself tyrant of Athens. He was urged by his friends to do so, but chose rather to uphold the existing form of government.

During the season of his popularity, he was urged to draft a code of laws for Athens. The government promised to adopt and uphold for ten years his laws should he do so. The result of his efforts was the great Solonian code,[1] written on tablets,[2] which were ordered to be placed in the market place where all could read them. Then, so runs the tradition, in order to avoid being annoyed by clamors for changes and requests to repeal these laws, Solon absented himself from his country for ten years. It was during this time, that, traveling from country to country, he was invited to visit Crœsus, then ruling Sardis. Tradition asserts that he viewed the treasures of this richest of living men, but gave great offense by claiming that no one could be sure of happiness before the end of life.

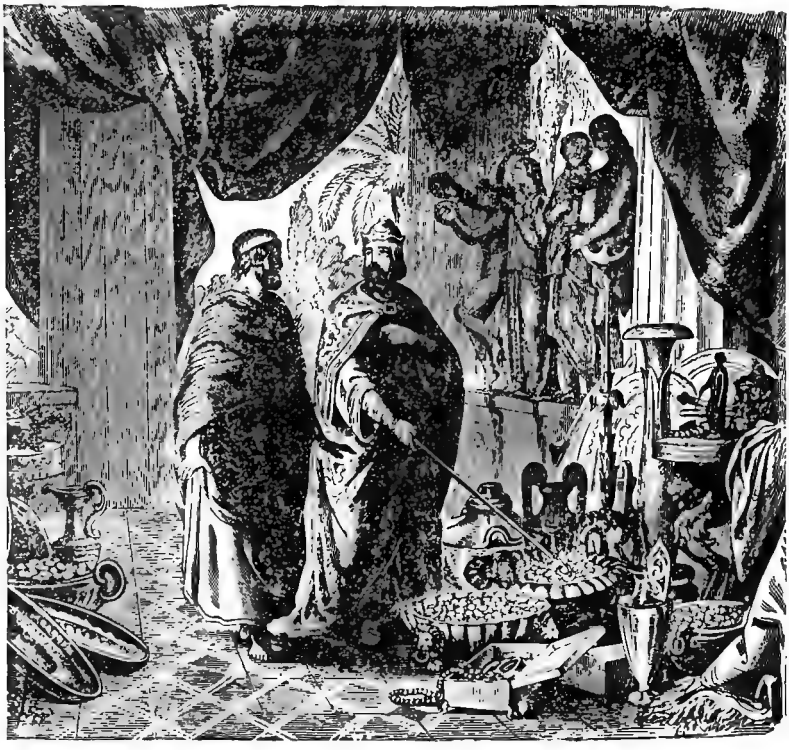
An apochryphal story is told by Greek writers of a happy use afterward made by Crœsus of this remark by Solon. The story runs, that when Cyrus the Great was consolidating, into one harmonious whole, the petty Aryan states of Western Asia, he conquered Crœsus and condemned him to death. He was already placed on a funeral pyre, and the cruel flames were already lit, when Crœsus thinking on Solon's words exclaimed, "O Solon, Solon!" An opportune storm extinguished the flames, and the whole story coming to the ears of Cyrus, made so great an impression on him that he gave Croesus his life and

[1] For a full discussion of this code, see Vol. II. p. 192 *et seq.*

[2] Grote, Vol. III. p. 133-4.

restored him, in a measure, to influence and power. This illustrates how fact, tradition, and myth intertwine in Greek history.

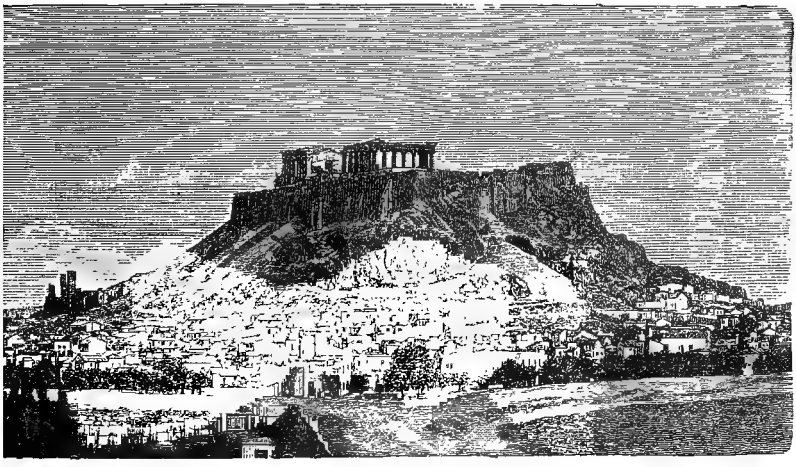
We must not forget that Athens and Sparta were not the only powerful cities in Greece. There seems to have



Solon and Croesus.

been about one prominent city in each of the small states into which Hellas was divided. Now in early times, these settlements seem to have been merely tribal headquarters, or the headquarters of a confederacy of tribes, where dwelt the supreme chieftain, and, as in the case of Sparta, the chieftains and house-fathers of several tribes. Thus was often planted the germ of a powerful city. Argos

was tribal headquarters for Argolis; Sparta, for Laconia; Athens, for Attica; Corinth for the state of that name; Thebes, for Bœotia; and Chalcis, for Euboea. On the coast of Asia Minor, the prominent cities were Myletus and Ephesus in Ionia. Smyrna was first Aeolic but afterward captured by Ionians. The Island of Rhodes was occupied by Dorians. The remaining states and settlements of Greece play a very insignificant part in the world's history, except it be Thessaly and certain colonies founded by the cities already mentioned.



Ancient Athens.

The Greeks at an early date sent out numerous colonies, and thus extended Greek influence and culture, and helped forward the nascent civilization in Europe. Near home Corinth planted a colony at Megara and another on the island of Corcyra.[1] The same year, she sent a colony into Sicily that founded the city of Syracuse. She was preceded in occupying Sicily by one year by an Ionic colony at Naxos sent out by Chalcis in Euboea.[2] Megara was behind Corinth only six years[3] in establishing

[1] 734 B. C. [2] 735 B. C. [3] 728 B. C.

a colony in Sicily, which was called by the name of its mother colony. Then colonization passed northward into Italy, and Sybaris,[1] Cratona,[2] and Messenia were founded. Cumae, on the western coast of Italy, and Ancona on the eastern coast are said to be Greek colonies, though the dates of their foundation are lost in the gloom of antiquity.

The Phocean Greeks from Asia Minor established a colony at Massilia on the southern coast of Gaul in 600. B C. which became a very important trading post. But Phoenician power was so great along the coast of Spain, that the Greeks found little encouragement to settle there. Encouraged by King Psammetichus, some Ionian Greeks founded a colony on the west branch of the Nile in the seventh century B. C. and called it Naucratis.[3] Miletus, and Megara vied with each other in exploring the shores of the Exuine Sea. The latter, in the seventh century, planted colonies at Chalcedon and Byzantium, while the former had sought to command the entrance to the Euxuine by establishing settlements at Abydus and Cyzicus.[4] There were many other smaller colonies planted by the Greeks during this period, but we have mentioned the most important. We have seen that this was a period of growth and spread of Aryan people. Wherever these colonies were planted, there is a hidden story of conquest, where an earlier people were either forced out of their homes to go and prey upon a weaker race, or else the men were reduced to slavery, and the women were made the

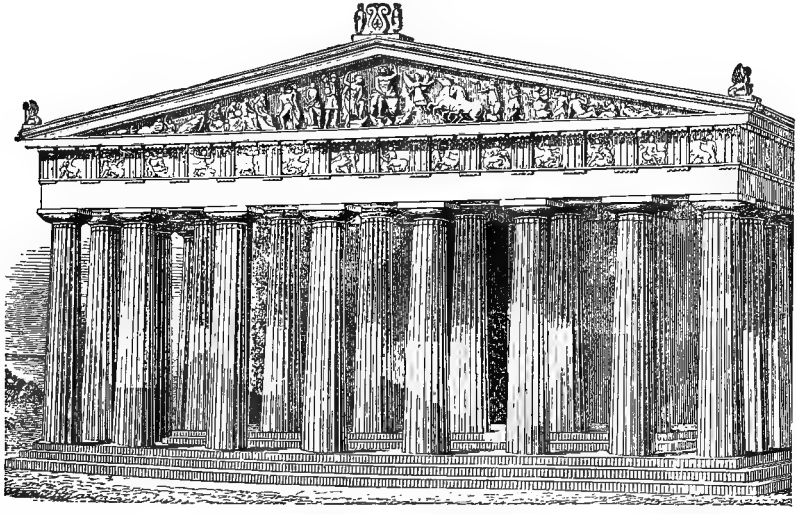
1 720 B. C. 2 710 B. C.

3 For recent researches as to location of Naucratis, see "Contemporary Review," July 1885.

4 For fuller information regarding this colonization scheme, See Bunbury: "History of Ancient Geography," Vol. I. p. 91-119; also Freeman: "Historical Geography of Europe," Vol. I. p. 47 *et seq.*

wives of the conquerors. Such was the history of conquest and colonization in ancient times.

While the population of Hellas was outstripping the surrounding Aryan people in growth and culture, we must not forget that these other tribes did not remain stationary. The power and importance of the early Thracians have already been dwelt upon.[1] During this entire period and for many centuries previously, they must have been



The Parthenon at Athens.

also advancing in culture, and had doubtless attained no inconsiderable stage of enlightenment. The historical and literary world has been for so long a time blinded by the glitter of Grecian later culture, that scholars have had little time and less inclination to study Thracian antiquities. But we doubt not that discoveries will in the future be made that will result in a revolution in the history of Southern Europe. In the time of Strabo, the military force of Thrace was established at two hundred and fifteen thousand men. And so, in earlier times, it must have

1 Above page 41.

been a rival in power to any European nation or confederacy.[1] They had already, in the sixth century B. C., adopted an alphabet and introduced coined money.[2] Their alphabet was akin to the Runic alphabet of the northern regions, and inscriptions are being found, that, when interpreted, may place the northern Aryans in a more enviable light as compared to those of the southern peninsula.

The Danube and the Dnieper, two great highways of travel and commerce, were used from very early times. The Greek colonists about their mouths seem to have been attracted there by the profits of this trade; and, in the days of Herodotus, merchantmen were accustomed to run up these rivers for a distance of five or six hundred miles,[3] while the distance in a straight line between the Baltic and the Black Seas is only about seven hundred miles. A spearhead, bearing an inscription of very ancient type, has been found at Volhynia, showing that the alphabet had been transmitted into the Baltic region at a very early date. Now the Thracians and Germans could not have been rude and painted savages with their alphabet, their coins, and their traffic with southern countries.

Along the northern shores of the Black Sea to the east of the Thracians, dwelt the Cimmerians, who were almost as mysterious a people as the Pelasgians. Reasoning from the similarity of names they have been connected with the Cymric Gauls of Western Europe. Indeed Canon Rawlinson[4] speaks of them fleeing westward in the

[1] Rawlinson: "Herodotus," Vol. III. p. 216.

[2] Taylor: "Greeks and Goths," London, 1879, p. 51 *et seq.*

[4] "Herodotus," Vol. III. p. 186.

seventh century B. C., through land that we know was occupied by powerful Thracians. He also states that the Belgæ were exclusively Cimbrians.[1] But we know now that the Belgæ were Germans. Then, too, Jutland, a German country, was called Cimbric Chersonese.[2] We therefore feel justified in classing the Cimmerians as tribes of pretty thoroughly Germanized Thracians. We do not run counter to any philological question here, for there is nothing known of their language, beyond the word "Cimmeric."[3] Grote[4] speaks of the Cimmerians as "perhaps the northernmost portion of the great Thracian name." Both Strabo[5] and Tacitus,[6] speak of the Cimbrians as German tribes. Until we receive some further light on the origin of the Cimmerians, we can not be judged very much in the wrong if we call them Thracianized Germans.[7]

Their early home was the northern shore of the Black Sea, in the neighborhood of the Tauric Chersonese; and as a souvenir of there presence there, the name Crimea, still clings to that region. As we have stated, they gave their name to a portion of the Bosporus.[8] They are mentioned in the Homeric poems,[9] and they must have been quite an ancient people in the Black sea region. They are mentioned by Eusebius as having made a raid into Asia Minor early in the eleventh century B. C. As no other authority mentions this event, it is not given much credit.[10] But as the people of Southern Europe were on the move about this time, as is indicated in the Aeolian and Dorian migrations, we should not be surprised if

this offshoot of the Thracians was also touched by the spirit of migration even at this early date.

To the north and east of the Cimmerians and contemporaneous with them, dwelt the so-called Scyths. They were also a sort of anomalous people, something like the Pelasgians. The philologist has finally admitted them into the great Aryan family.[1] Sayce[2] calls them Sarmatians or Aryan Slaves, and represents them as mingling with Tartars, in the entire region between Thrace and the steppes of Tartary. They had probably been wandering across these fertile plains ever since the ancestors of the Asiatic Aryans had found their way around the northern shores of the Caspian sea into the Hindoo Koosh mountains.[3] And it is interesting to note that the name of one of their prominent tribes, the Melanchlaenic, is identical in meaning with Siah-Poosh,[4] the name of one of the purest Aryan tribes of the Hindoo Koosh region. Both are translated "black cloaks."[5]

We are also interested in noting the characteristics of the Budivi, another tribe of these ancient Scyths, as they are described by Herodotus. They had deep blue eyes and bright red hair. They dwelt in a city which was surrounded with a wall thirty furlongs each way. They had temples built in honor of Grecian gods and adorned with images after Greek fashion.[6] Were these indeed the half-savage people who were wont to plunder the civilized world? Do they not plainly show their German ancestry?

[6] Herodotus, iv. 108.

It must be remembered that Herodotus wrote of these Scythic people about the middle of the fifth century B. C. Still he represents them as supplanting the Cimmerians early in the seventh century B. C., and we doubt not that they peopled this region from very remote times. We must remember that the most cultured foreign people were but barbarians in the eyes of Greek and Roman authors. But the so-called barbarians of Europe played too influential a part in shaping the affairs of that continent to be the rude savages that they are represented as being.

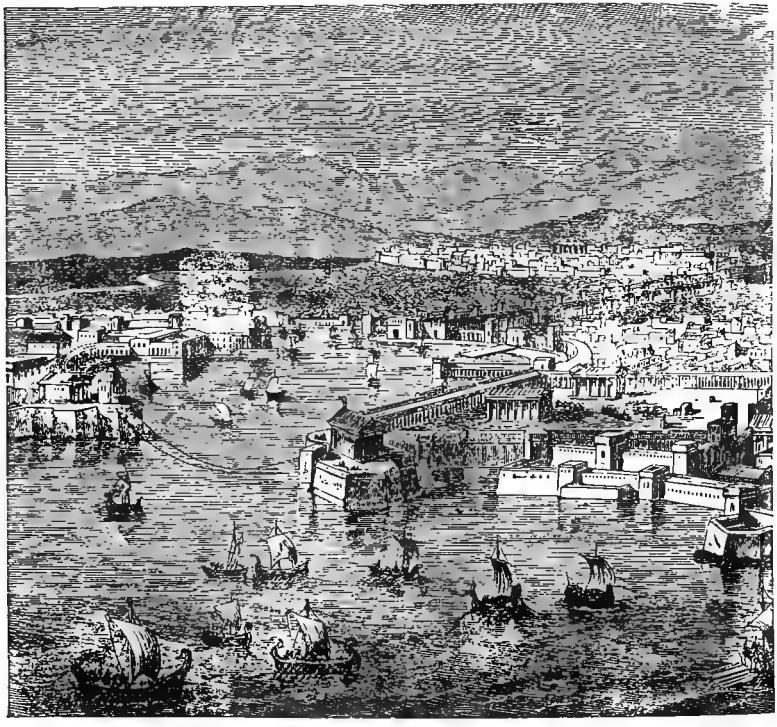
Returning now to the Greeks, we are to observe, that, as the period of Grecian colonization drew to a close, Athens and Sparta were rivals for mastery in Greece. Sparta however had become considerably stronger than Athens before 540 B. C. She held sway over all Peloponnesus, and her extremely well disciplined army caused her to be treated with the greatest of respect by all the states of Hellas. In fact, she exercised a recognized ascendancy over all Greece.[1] At Athens, Peisistratus and his descendants, designated as tyrants, ruled, with intervals of expulsion, from 560 to 509 B. C., when Cleisthenes came into prominence and completely changed the state of government in that city. The old tribal organization was completely broken up and the territory of the city was divided into ten territorial divisions, and thus political society founded on territorial relations, took the place of tribal society founded on personal relations.[2]

Shortly previous to 498 B. C., occurred an event wherein the Greeks were brought into prominence in the international affairs of Europe and Asia. The Ionian colonies of Asia Minor had been conquered and added to the Persian

1 Grote, Vol. II. p. 455.

2 See Vol. II. This Series, p. 194.

Empire. They determined to throw off the Persian yoke, and called upon Athens for assistance, which was readily granted, and the colonies thus gained their freedom. Darius, the Persian, subdued this revolt, and determined to punish the Athenians for interfering with his affairs. In order that he might not forget his resolve, it is stated that



Athens Under Pericles.

he gave one of his servants the special duty every day, at dinner, of calling out three times, "Master, remember the Athenians."[1] In 493 B. C., Darius planned an expedition against Greece which met with defeat both by land and sea. This new and powerful enemy, however, had the

[1] Herodotus, v. 105.

effect of uniting Greece against a common foe as firmly as the Hellenic states were capable of uniting by alliance.

The defeat of his army simply angered Darius against the Greeks all the more. He again sent messengers to all the Grecian states demanding submission. Athens and Sparta refused peremptorily, the latter throwing the Persian embassadors into a deep well with advice to take from thence the earth and water as tokens of submission. A

Miltiades at Marathon.

second Persian army, therefore, entered Greece, more determined than ever to conquer. The great eastern army landed twenty-two miles from Athens, planning to march against that city. But the Greeks, under Miltiades, preferred rather to meet them on the open field, and so an engagement took place on the plain of Marathon.[1] The

[1] 490 B C.

result was the overwhelming defeat of the Persians, and Marathon passed into history as one of the great pivotal battles of the world. The Spartans did not participate in this battle which occurred during a time in the month when their ancient customs forbade them to engage in battle[1]

The remainder of Darius' life was spent in preparations for a third invasion of Greece, but he did not live to realize the desire of his life, the conquest of Greece. No sooner, however, did his son, Xerxes, succeed to the Persian throne than he resolved to accomplish what Darius had begun. The largest army that has ever, in historical times, crossed the border land between the two continents is said to have been marshalled, equipped, and led against the almost insignificant handful of Greeks, by the great Persian king himself. The lesson that this great army was taught at the pass of Thermopylæ, and the story of the martyred Leonidas and his three hundred companions are too well known for mention here. This was followed by the great naval victory for the Greeks at Salamis.[2] The next year, the Grecian fleet crossed the Aegaean Sea, while the Persian army under Mardonius, wintering in Thessaly, invaded Attica.

In that year,[3] occurred on the same day the famous battle of Plataea, in which the Greeks, under Pausanias the Spartan, almost annihilated the Persians, and the naval battle of Mycale, where the fleet of the Persians was destroyed by that of the Athenians. The severe lessons that Persia had received on the memorable fields of Mararthon, Thermopylae, Salamis, Plataea, and Mycale saved the Europeans from any further trouble from that direction. Persian armies did not again try to reduce the Greeks to subjection. In order, however, to be pre-

[1] Grote, IV. p. 342. [2] 480 B. C. [3] 479 B. C.

pared for any future trouble with Persia, the confederacy of Delos, whereby the principal states of Greece were pledged to contribute either ships or money for the maintenance of a navy to keep the Persians out of the Aegaean, gave Athens the care of their funds and navy, and thus elevated that city to the chief rank among the naval powers of that day.

From 479 to 429 B. C., Athens' greatest benefactor, Pericles, was at the head of the State. Though the city had been twice leveled to the ground by the Persians, it was quickly rebuilt. But rebuilt Athens was not the same as Athens of old, simple tribal headquarters. Under Pericles, magnificent buildings were erected and the city was beautified by paintings and statuary. Above all, were her fortifications strengthened by almost Cyclopean walls, leading from the city to the harbor. These walls were two hundred yards apart and extended over four miles, thus uniting the city with her fleet. "The Acropolis was so enriched by magnificent structures that it was called 'the city of the gods.'"[1] In power, Athens led all the Grecian states.

Pericles.

1 Barnes: "History of Greece," p. 25-6.

Abroad, she not only gained the respect of all nations, but inspired fear. "During a single year, she was waging war in Cyprus, in Egypt, in Phoenicia, in Aegina, and on the coast of the Peloponnesus;"[1] while, at the same time, she maintained her authority at home. In 450 B. C., she extorted a treaty from Artaxerxes, whereby the Grecian cities of Asia Minor were declared independent, and the Persian fleet excluded from the Aegaean sea.[2] It was during this time that Herodotus, the father of history, flourished, and literature and art were at their height.

The remaining events of the political history of Greece are too well known to further occupy much of our attention. Athens had at last become a powerful and magnificent city. The jealous Spartans had long sought an excuse to carry war against their rival power. In 431 B. C, a quarrel arising between Corinth and her colony, Corcyra, Athens and her allies sided with the latter; but Sparta immediately proffered aid to the former. The Hellenic forces were nearly equally divided, and this struggle, called the Peloponnesian war, was continued until 404 B. C. Athens, during this time, had no such hand to guide her affairs as that of Pericles. Her most promising young leader was Alcibiades, who was usually undergoing the punishment of ostracism for some wild escapade just when his country most needed his services. Thus it was when the Athenian forces met with their last disastrous defeat in the harbor of Syracuse in 413 B. C. The city itself held out for ten years longer when Sparta compelled submission. The protecting walls and the magnificent buildings were leveled to the ground, and proud Athens groaned under the oppression of the thirty tyrants.

[1] Ibid. [2] Ibid.

Sparta was now mistress of all Hellas. The five unwalled and defenceless mountain villages dictated to the rest of Greece. Persian money, however, again enabled Athens to rise but only to a shadow of her former grandeur. It seems to have been the plan of Persia to subdue Greece by keeping up this internal strife between Athens and Sparta. With Persian gold, Athens' walls were again rebuilt and her fleets were[1] again able to meet the Spartans on the Aegaean. Then Persia made friends with Sparta

Athenian Fleet before Syracuse.

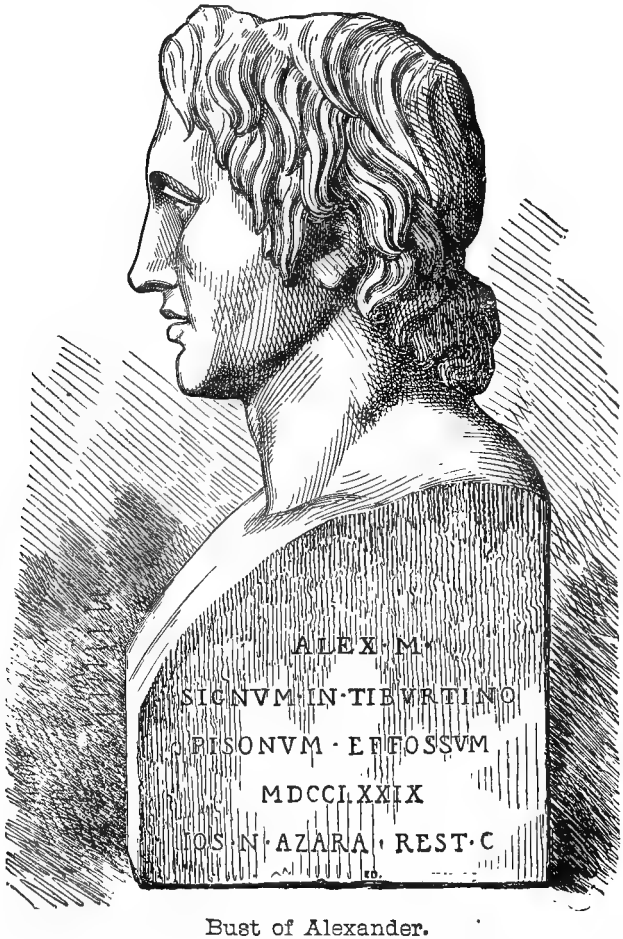
and compelled both cities to accept the "Peace of Antalcidas,"[2] which surrendered the Greek cities in Asia Minor to Persian rule.

Sixteen years later, there arose in the Bœotian city of Thebes, a leader who succeeded in completely changing the political affairs of Hellas. Epaminondas organized and equipped an army that, in discipline, ranked well with

[1] 394 B. C.

[2] 387 B. C.

the Spartan soldiers. When Sparta heard that the Theban army was overthrowing her governments in the Bœotian towns, she sent her forces to put down the rebellion. The famous battle of Leuctra was fought and won by Epaminondas. The stream of Persian gold was now turned



Bust of Alexander.

to Thebes, and Epaminondas, conquering one town after another, was soon the ruler of Hellas. At the battle of Mantinæa,[1] however, he was killed. No one was found

[1] 362 B. C.

after him with ability to fill his place, and Hellas soon became a hot-bed of jealous, quarreling, fighting towns and villages, as bad as it ever was in old tribal times. It only needed some one firm hand and strong mind equal to the situation to change all this into a nation of peace. Such a person arose in the North. A new infusion of Teuto-Aryan blood was needed to invigorate the people of Southern Europe. The "barbarous" Macedonians came to the rescue of Greece, when Philip of Macedon turned his armies toward the south.[1]

Now the Macedonians did not come down into Greece uninvited. The Phocians, a state that had from time immemorial been a leading member of the Amphictyonic council, and had regarded her right to the presidency of that council as indisputable, had, by some political intriguing of her neighbors, been expelled from the league. She raised an army, took forcible possession of the Temple of Apollo, and defied the whole Hellenic world. Philip of Macedon was anxious to be acknowledged as a Greek, and had laid his plans to take a hand in Grecian affairs. Thus far he had confined his campaigns to Thessaly and Thrace, where he had reduced town after town and tribe after tribe to subjection. While professing to be the friend of the Athenians, he had taken forcible possession of all their cities along the coast of Thrace and the Propontis. He was then the most powerful prince in Europe. In the course of his campaigns in Thessaly, he met the Phocians in batttle and was conquered by them. His defeat checked his advance, but strengthened his determination to conquer all Greece. One man in Athens seemed from the first to have detected Philip's intention. Demosthenes, the greatest orator of his age, delivered oration after ora-

[1] 359 B. C.

tion, exposing the designs of Philip. His Philipics are even to-day considered models of oratory.

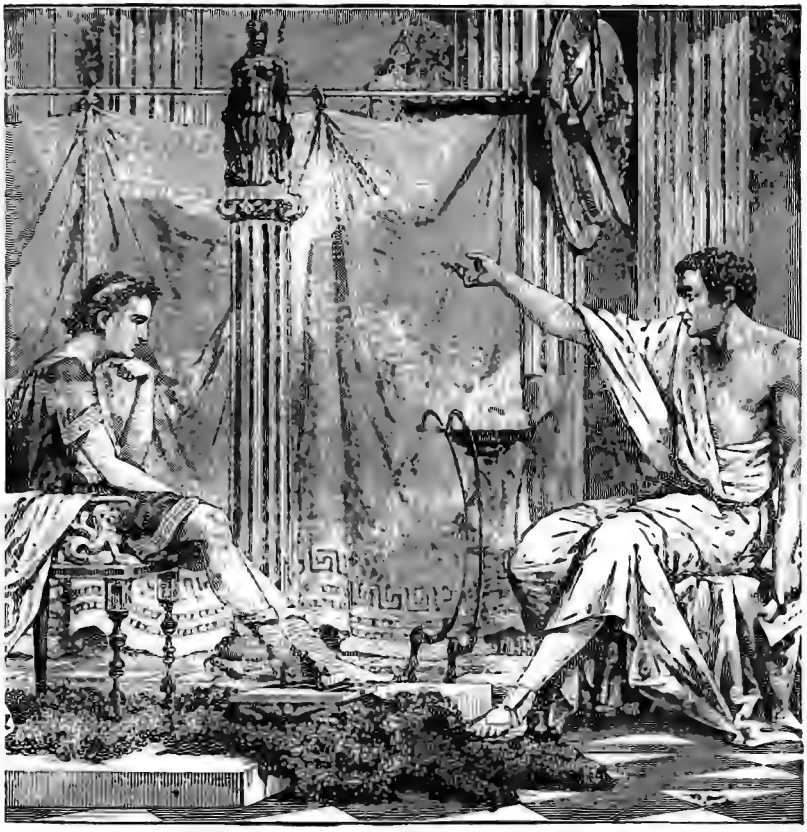
Both Athens and Sparta awoke to the importance of the occasion too late. They now rushed to the aid of the Phocians[1] against the common enemy, who was fast approaching the pass of Thermopylæ, the gateway to Attica and the Peloponnesus. Philip now boldly proclaimed his championship of the cause of Apollo against the sacrilegious Phocians and their allies. His army was the best disciplined of any in the world. He had introduced the Macedonian phalanx and other new tactics that rendered his army almost invincible. He had also fitted out quite a navy to co-operate with his land force; and he plundered the merchantmen of the Aegaean for supplies and to interfere with the commerce of Greece. Thus Philip increased in power. In 352 B. C., he defeated the Phocians and their allies in battle. For four years Philip was engaged in subduing the Olynthians, while the rest of Greece looked on,[2] or lent only too tardy an assistance to the besieged city. In 346 B. C., Philip forced the Grecian states to a treaty whereby he was made a representative in the Amphictyonic council in place of the Phocians. Thus did he gain admission into Greece and realize his most cherished desires, for he was made president of the Pythian festival, the highest honor that could be conferred upon a Greek.

At last, after Philip had stationed his large and finely disciplined army at the pass of Themopylae and had been admitted with honors as a Greek among Greeks, the oratory of Demosthenes awoke the people of Athens to the lamentable condition of Grecian affairs. Now it must be remembered that Philip had conquered as many cities by

[1] Grote, Vol. IX. p. 297-8.

[2] 348-344 B. C.

falsehood and intrigue as by open warfare, so that it is not surprising that the Greeks could place no reliance on his word. Athens and Thebes finally united against the Macedonians, but were[1] defeated at the battle of Cheronaea.



Alexander and Aristotle.

All Hellas passed at once under Macedonian rule, and the Greeks never again gained their independence until after the Roman empire had become a nation of the past.

Under Macedonian rule Greece was united. The hand of a conqueror held all the petty tribes, as well as the more

[1] 338 B. C.

powerful cities, in entire subjection, and could command united action upon any and every occasion. Such being the case, unlimited resources were placed at the command of the ruling prince. Philip now conceived the idea of carrying Grecian arms into Persia to punish that nation for the injury that she had often inflicted upon Greece, and also to extend his own territory. The hand of the assassin was however uplifted against the king, and Philip of Macedon was slain.[1]

Alexander, the young son of Philip, immediately entered upon the plans of his father. After destroying the city of Thebes as a punishment for revolting, he began his march for Asia at the head of thirty-five thousand well disciplined Grecian and Macedonian troops. His life was a short one, but it was a life of conquest from beginning to end. From Thrace, he entered Asia Minor and fought battle after battle until the terror of his armies, preceding him, led his enemies to pledge submission without resistance. We can follow his troops as they passed down the coast of Asia Minor conquering the armies that met him at every point. Entering Egypt as conqueror and thence passing eastward, he subdued Babylon; at the battle of Issus he overthrew the Persian power; burned Persepolis; and penetrated to the Indus river.[2] He laid the foundation of many new cities, among which was Alexandria at the mouth of the Nile, that became so famous as a seat of learning. In 323 B. C., he died from the effects of dissipation, and so never returned to his native land. During the nine years that he spent in Asia, the history of Greece is almost a blank. As the empire that he attempted to found was completely broken up at his death, Greece gained

1 336 B. C.

2 See note 3, p. 140.

very little if anything by his conquests.[1] The government of Greece and Macedon fell to the lot of one of his generals, Cassander. From 323 B. C., until 146 B.C. the old-time struggle of the petty states of Greece for independence was again renewed, but with no definite result. In 146 B. C., Greece

Battle of Issus.

came under Roman supervision ; and, as such, she enjoyed a degree of peace and quiet prosperity before unknown to the Hellenic people.

Now, as we glance back over the history of the Aryans of Southern Europe, we perceive that their growth has been very slow indeed. They were a people of few origi-

[1] In another place we will show the very great influence exerted on civilization in general by Alexander's conquests.

nal ideas except the inborn sentiments of liberty and independence. They were ever ready to adopt new ideas from the nations with whom they came in contact, and to develop the same to the highest state of perfection. Their art was developed from borrowed models, and their laws were compiled from the laws of foreign princes.

In the arts of war, however, they seem to have been about the first to originate a system of military tactics worthy of mention. The Spartan companies of hoplites were all-powerful, the brotherhood of three hundred picked Thebans carried everything before them, and the Macedonian phalanx, under Alexander, was literally invincible. In literature, the Greeks were not only originators of several schools, but attained a degree of culture and refinement that has placed them at the head of the ancients in every department. And long after she had lost her place in the political history of the world, she continued to lead in thought, in philosophy, and in the fine arts. By no means was this a mean end for this great and peculiar people.

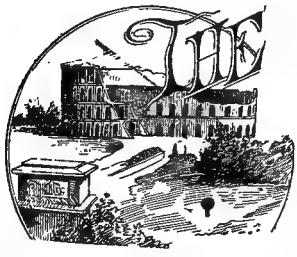
## THE ROMAN ARYANS

FIRST GLIMPSES OF ITALY—Geographical Description—Phoenicians in Italy—First Aryans in Italy—Greek Colonies in Italy—Celtic Influence in Italy—The Latin Tribes—The Confederacy of Alba Longa Physical Sourroundings of Ancient Rome—The Etruscans—Legends of Ancient Rome—Gallic Invasion of Rome—Architecture of Ancient Rome—Rise of Roman Power—War with Carthage—Extension of Roman Territory—Capture of Carthage—Internal Troubles at Rome—Marius and Sulla—War with Mithridates—Gladiatorial Contests—Spartacus—First Triumvirate—Rise of Caesar to Power—Second Triumvirate—Antony and Cleopatra—The Formation of the Empire—The Beginning of the Decline—The Division of the Empire—Review of the Growth of Rome in territory—Conclusion.



NORTHERN shores of the Mediterranean seem to have been the border line between races during the period of the Ancient and Mediaeval Worlds. To the south and south-east of Mediterranean, from time immemorial to modern times, there existed most remarkable civilizations, and there were the homes of the Turanian and Semitic races. Stretching away to the north from the great inland sea even to the lands of the Lapps and Finns, were the homes of the Aryans, the hardiest races of mankind. There was concealed a latent energy and strength of body and mind that were capable of grasping Semitic and Turanian civilization at its summit of development, and bearing it onward to purer ideas higher modes of life, and more perfect forms of government.

We have seen how fully the Aryan inhabitants of the Troad assimilated Assyrian and Babylonian culture, customs, and enlightened modes of life, and grew into a power dreaded by the pharaohs of Egypt, requiring the combined forces of the Hellenic world to crush. The next European Aryans to come into contact with eastern civilization were the Greeks. In tracing their rapid development, we have seen how the Hellenic land was peopled by successive waves of immigration from the North; how the Phoenicians brought a knowledge of Turanian civilization to their doors; and how, with Assyrian and Babylonian models, the Aryan Greeks leaped to the very pinnacle of ancient and medieval knowledge and culture. What a literature they left to the world; what models in architecture; what masterpieces—almost divine—in art! We have now to consider the gradual rise to a commanding position in the affairs of the world, of that remarkable people known as the Romans. Their history and culture fill the entire foreground of the Medieval World. They were the lawgivers of the world, and from the ruins of their vast empire, have arisen the various nations of modern times.

About the time that Philip of Macedon was coming to the front in Grecian affairs, Rome, as a new and rising power, began to exercise a voice among the ruling powers of the world. Before the first quarter of the third century B. C., Rome was scarcely known, though for centuries previously, the Italian peninsula had been an open field inviting the spreading Aryan tribes to settle therein. The general lay of this peninsula is from northwest to southeast. Its semicircular head is cut off from the rest of Europe by the Alps, the highest mountain barrier of the continent. With the Apennines for a backbone, the pen-

insula shoots out into the Mediterranean for a distance of several hundred miles, ending in two spurs which give it the appearance of a boot. Off the toe of this boot is a triangular shaped island called Sicily. The greatest length from the Alps to the toe of the boot is some over seven hundred miles. The head of Italy is about three hundred miles wide, but its average width is only one-third as much. Its area, including the islands along the shores, is about one hundred thousand square miles. The head of Italy is the only extensive plain, and comprises the valley of the Po, or Padus, river.

When we enter the peninsula proper, the rivers are necessarily very short; and, owing to the many cross ranges of mountains and hills, volcanic in character, there are no plains of any size. We must, however, except quite an extensive tract of land on the eastern shore as we approach the heel of the boot. This plain was called Apulia, and was noted for its fertility. The western shore was washed by a portion of the Mediterranean called the Tyrrhenian[1] Sea.

Passing southward along the western coast of Italy, we would pass the mouths of the Arnus, Tiber, Liris, Vulturnus and Silarus rivers. The waters of the Aesis, Aternus, Tifernus, Trento, Cerbalus, and Aufidus flow toward the east, finding there way into the Adriatic. Lying to the west, at some distance out into the Mediterranean, were the two extensive islands of Corsica and Sardinia. The soil of these, as well as that of Sicily, was noted for its fertility.

In ancient times, Italy was cut up into a number of small states, each of which was peopled by a confederacy of allied and kindred tribes. The head of the peninsula

[1] From the Greek name for the Etruscans.

was the home of the Ligurians on the west, the Venetians on the east, and the Upper Etruscans between.[1] Central Italy, or the upper portion of the peninsula proper, extended down to the mouths of the Silarus on the one side and the Tifernus on the other. It comprised the six states that subsequently played prominent parts in the legendary history of the peninsula. These were Etruria, Latium, and Campana, to the west; Umbria, Picenum, and the Sabine territory to the east. Southern Italy contained four countries; Lucania, and Bruttium, on the west; Apulia and Iapygia, or Messapia, on the east.[2] The opposite shore of the Adriatic was peopled by tribes of Illyrians, kindred of the Macedonians.

The Phoenicians were, no doubt, familiar with the coast of Italy long before the Greeks dared venture upon the open seas. How early these daring merchants began trading along these shores, we have no means of ascertaining; but there is no doubt, that they found the whole peninsula teeming with a population ready to barter native products for their Oriental wares. We recognize two distinct races among these primitive inhabitants of Italy; and there is satisfactory evidence that both these races were but immigrants that had in earlier, pre-historic times, supplanted a more primitive race.[3] These two races were Aryan and Turanian. The traces that we find of that earlier people are so few and unsatisfactory, that we can only surmise that they were dark-skinned and extremely

[1] Such is the ordinary belief regarding the early inhabitants of Northern Italy. [See Rawlinson: "Manual.] But Dr. Freeman distinctly states that they were more likely Gauls than Etruscans in the center and in the valley of the Po. "Geography of Europe," Vol. I. p. 47 and note.

[2] Rawlinson, Op. cit. p. 323-333.

[3] Taylor: "Etruscan Researches," p. 11-12, London, 1874.

rude in their social life. In earlier times, we do not find the lines of separation between the races so strongly marked that we can assign to each a definite portion of Italian territory. On the other hand, we find here and there, throughout the length and breadth of the land, a confederacy of Turanians in almost an isolated position, surrounded by Aryan states. So, likewise, we find some Aryan confederacies similarly situated as regards Turanians. Then there appear other tribes bearing such evident marks of a mixed origin, that we can not assign them any definite racial place.

The question as to where the earliest historic inhabitants of Italy came from is an interesting one to us. The facts, that the Aryans were immigrants; that the Greek colonists found Sicily inhabited by Turanians, a part of whom had been driven down from the peninsula; that some of these Turanians were of Iberian origin and, probably, kindred of the Etruscans and Ligurians—all go to prove that the Aryan civilization of Italy was built upon a lower sub-stratum of Turanian life.[1] When the Aryans entered Italy, therefore, they found the land occupied by Turanians, just as they did every other portion of the continent. We are further convinced of this by existing proofs in the shape of monuments, inscriptions, and other remains. From these, we learn that Etruscan territory once extended much further south than when this people became known to Greek historians. There is evidence, that Capua was an Etruscan city, and that the Etruscans were the ruling power from the Alps on the north to the Gulf of Salerno on the south.[2]

No records extend back to the time when bands of

[1] See Ramsey's "Europe," p. 484, London, 1885.

[2] "Etruscan Researches," p. 15.

Aryans began to find their way into Italy. Tradition says, that the ancestors of the Iapygians followed the coast of the Adriatic around from Epirus into Italy.[1] There are other legends, according to which plundering bands of refugees from Troy found permanent homes in Italy.[2] We are told also, that the Latins came into Central Italy from the north along the western coast,[3] that they were later incomers than the Iapygians, and that they "pressed with great weight" upon the population of the southern regions. This all tends to confirm the statement, that there was, from time immemorial, a constant influx of Aryans, both by land and sea, to the Italian peninsula.

As we have seen, the first Grecian colony, the date of whose foundation can be relied upon, was established in Sicily in 735 B. C. But it is very evident, that bands of Greeks had long before this found their way across the Adriatic. Then, too, near the site of modern Naples, a Grecian colony had existed for a long time before vessels from Chalcis landed the first settlers at Naxos, which is the oldest Greek settlement, of which we have authentic history. When Campanian Cumæ was founded and where the colonists came from, even the ancients had forgotten. That they were Greeks was all that could be positively asserted of them. The first vessels known to have brought new colonists to Cumæ were said to be from Aeolic Cyme of Asia Minor. But still, in historical times, Chalcis was the metropolis of Cumae, just as it was of Naxos. Tradition places the date of the foundation of Cumæ way back in the eleventh and twelfth centuries. B. C.[4] On the

1 Rawlinson's "Manual," p. 336.

2 Virgil: "Aenaeid," Book i. 7-12; also Livy: "History of Rome," ch. i. 3 Rawlinson, Op. cit. p. 336. 4 The common date was 1050 B. C., but some authors carry it back to 1139 B.C. Grote: "History of Greece," Vol. III. p .356-360. Taylor: "The Alphabet," Vol. II. p. 131-3.

opposite side of the peninsula and a little farther to the north, was located the Greek colony of Ancona, but nothing definite is known of its foundation. It was there when history dawns on Italy.[1] By the close of the eight century B. C., we find Grecian adventurers pouring into Sicily and Southern Italy so rapidly that the shores were soon lined with villages. The country was given the name of Magna Grecia, and was for several centuries regarded as a portion of Greece proper, to whom the colonists looked for assistance in war and protection from oppressive foes.

The Celts were, doubtless, in possession of the Po valley as early as the Latins were of the hills of Latium.[2] As neither history nor tradition informs us to the contrary, we have no doubt that they occupied Cis-Alpine Gaul even before there were any such tribes as the Latins in Italy. They simply prepared the way for their kindred (the Italians) to enter the Italian peninsula. The legend is probably right in stating that the Iaypgians came from the north down the Adriatic coast. They were probably Pelasgians making their way down from the Aryan home-land.[3] The Celtic Latins followed them up pretty closely although they were probably later in point of time. The one descended along the eastern, and the other along the western coast of the peninsula. The Etruscans, between, were strong enough, perhaps, to keep them from over-running Tyrrhenian lands. The only Etruscan city, Populonia, near the coast would not be much of a barrier to the Celtic migration.[4] These two streams of migration in time met, and fused with the stream of Greeks that was colonizing Magna Grecia. Celtic Latins, Pelasgic Iapyg-

ians, and Hellenic Thracians would probably include the Aryans of the Italian peninsula; and a mixture of these people would give us the peculiar ethnical result known as the Ancient Roman. This Aryan mixture soon succeeded in forcing the Etruscans to the north of the Tiber. There we find the latter in rather close quarters when authentic history of Italy begins.

Nor is language silent on this subject. There was formerly a school of historians who insisted upon deriving Latin from Greek.[1] When they were convinced that they were wrong, a hypothetical language was constituted. It was called "Pelasgic," and was made the common parent of the dialects of Greece and Italy. Being as indefinite as the race of people that furnished the name, it was found wholly unsatisfactory, and that theory was abandoned. Greek and Latin are Aryan tongues, and, of course, must have come from the same source, the primitive Aryan language. But, as Professor Sayce remarks, "it is no longer possible to believe that the relation between Greek and Latin is especially close. Latin gravitates rather toward the Celtic languages."[2] Speaking more plainly, then, Latin is nearer related to Celtic than to Greek.[3]

"Mountains repeat and rivers murmur the voices of nations denationalized or extirpated."[4] No people will pass through a country, stopping here and there to spend a winter or to raise a crop of corn, as tribes do on their migratory tours, without leaving names which will forever cling to the villages, mountains, and rivers along their

routes. The river names are memorials of the very earliest inhabitants of a country. In studying the geographical names of Europe, we can detect the presence of Celts over the greater portion of Southwestern Europe before any other Aryan tribes had traversed this region. In Italy, "we find villages which bear Teutonic or Romance names, standing on the banks of streams which still retain their ancient Celtic appellations."[1] Thus have the locations of several ancient Celtic colonies been found in Central Italy.[2] All this tends to the conclusion, that while, and even before, the Greeks were finding their way across the Adriatic, and, pressing northward in their search for homes and plunder, the Celts were descending from their Trans-Alpine homes in search of better pasture lands upon the Italian hills.

When we consider the modern Italians and Latin speaking people in general, we will find that they have no ethnical unity.[3] Romance languages are spoken in portions of America as well as in various European countries. But in ancient times in Italy, we can understand how the Celts pressed downward and the Hellenic immigrants pressed upward, while the Turanians were either crushed between them or absorbed. Central Italy, then, must have been a common battle ground where races were fighting for bare existence. From the midst of this fighting mass, we at last catch a glimpse of a tribe of Ramnes slowly but surely rising into supremacy. The fabulous wolf had come down to the Tiber to drink, and the royal twins were nourished by the food that she brought them.

Among the Italian tribes, the Latins occupy the most

important position. They settled along the southern bank of the Tiber, occupying a rugged, hilly district, seven hundred square miles in area,[1] which would seem to have been poorly fitted for the development of the hardy Roman people. Across the Tiber to the north, were the Turanian Etruscans, with whom the Latins waged continual warfare. But in wars of races, the Aryans have always been pretty firmly united against a common foe. The Latins were surrounded by the Sabines, the Samnites, and the Campanians. Though forever involved in tribal warfare among themselves, they were often allied against the Etruscans. There were thirty tribes of Latins. Each tribe had well organized tribal headquarters, which are often mentioned by historians as the thirty Latin cities. The fact, that thirty tribes of shepherds occupied only seven hundred square miles of territory, and had room for new colonies to grow into tribes, is sufficient evidence that these headquarters were not cities in the modern sense of the word.

Capitoline Wolf.

These thirty Latin tribes, however, formed a confederacy, powerful enough to make the Etruscans fear them, and even to command respect from the more numerous Sabines on the east. The headquarters of this confederacy were at Alba Longa, the home of the Alban tribe. The supremacy of the Albans seems to have been undispu-

[1] Mommsen: "Rome," Vol. I. p. 60.

ted for a long time; and, as they grew and increased in power, the population, no doubt, became, from time to time, too great for the territory. Colonial bands would be encouraged to make for themselves homes in the adjacent country. The young tribes or colonies thus formed would receive the aid and protection of the mother tribe so long as they did not become rebellious.

The Tiber, that formed the northwestern boundary of Latium, was the most important river of the peninsula, and was, no doubt, the thoroughfare by which the trading vessels of the Phoenicians reached the interior tribes and the war ships of the Etruscans found their way into the open sea. About fourteen miles from the mouth of the Tiber and on its left bank, are located a group of seven hills (the Romans called them mountains), that have been rendered immortal by the many fables and legends that cling to their early history. As we ascend the river, we pass in order the Aventine, the Palatine, and, finally, the Capitoline hills. Here the river makes a great bend toward its right bank, thus forming a level plan that bears the name of Campus Martius. Before the great stone quay was constructed, this level plain was overflowed during high water. Bordering this plain to the east, is another of the seven hills which bears the name Quirinal. The other three—called Caelian, Esquiline, and Virinal—were ranged back of the first three mentioned. These last named were not located along the river bank. As will be seen from the map, this group of hills occupy a commanding position on the river. From their number they were called the "Septimontium."

These hills were of volcanic origin and remarkable for the sterility of the soil. Great natural basins had been formed in their midst, which, when full of water,

were beautiful lakes. But the heat of a southern sun very often transformed them into fever-breeding districts. So that the climate of Rome was not healthful and the water supply was insufficient. But the location was of enough importance to counteract all this. Were we to inquire, however, when these hills were first peopled, we would meet with a great mass of conflicting legends totally

have given us a pretty accurate knowledge of the origin of the different people who early found their way into the Italian peninsula. It took the Aryan tribes a long while to Aryanize even the central and southern part of Italy. As we have stated, the whole peninsula was, no doubt, for some time prior to the arrival of the Aryans covered by a Turanian population. The legends of Rome tell us but very little of these earlier people. We must search in other records for their footprints, and shall, no doubt, find traces of their presence.

There is another source of information regarding ancient Rome that we must not overlook, for it furnishes us with interesting, valuable, and reliable knowledge. The discoveries of archaeologists are throwing light upon the pages of all ancient history, that enables us to see clearly many truths that were hidden from the visions of our predecessors. In 1883 the spade of the archaeologist unearthed under the Esquiline hill some very primitive tombs. Previous to this on the same hill, had been discovered a large necropolis. These ruins probably date from a much more remote period than the alleged foundation of Rome. They are of Etruscan origin, and scholars, on the whole, admit that they are relics of the pre-historic people whom the Aryans conquered. But one significant fact is, that the pottery found among these ruins bears such decorations as to prove that at least the designs were borrowed from Assyria and Babylonia.

Here, again, we run across the work of the Phoenicians, for they undoubtedly were instrumental in bringing these vessels, or a knowledge of this kind of work, to the shores of Italy.[1] The Etruscans were no mean foes for for the Romans to contend with. We have seen how the Turanian

[1] Middleton: "Ancient Rome," p. 42-3.

population of Asia arose to the summit of ancient civilization.[1] The Etruscans were Turanians, related to the Accadians, Elamites, Susians, and Proto-Medes;[2] and the indications are, that they had also attained a higher state of culture than any other European members of their race. They were known to the Greeks as *Tyrrhenians*, to the Latins as *Etruscans*, and they called themselves *Rasena*.[3] They were a great commercial people[4] before the legendary founding of Rome. Their war ships appeared on the coasts of Egypt before the time of Rameses III.[5]

Janus.

Though their history is built upon the ruins of a long forgotten power and opulence, we are surprised at the immensity and abundance of these remains. "The internal history of Etruria is written on the mighty walls of her cities. . . . It is to be read on graven rocks, and on painted walls of tombs."[6] But there are none to interpret her inscriptions. A Scipio might have preserved for us a clew to unravel these riddles of a lost people, but forgotten is the tongue that they spoke, and no one can now interpret to us these messages from their tombs.[7]

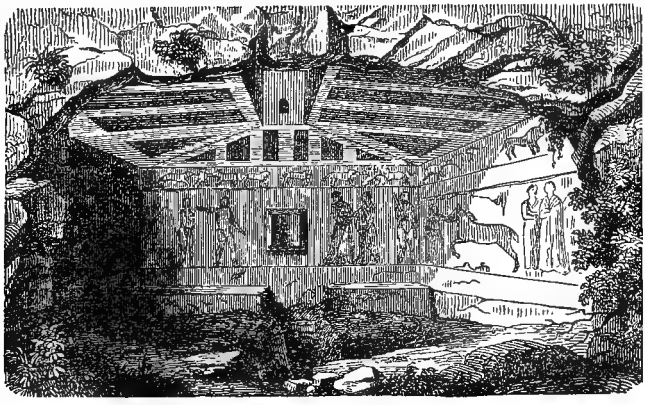
6 Dennis: "Cities and Cemeteries of Etruria," Vol. I. p. xxiii.

7 All modern and ancient languages have been searched and studied in vain for a key by which to read Etruscan inscriptions. Dr. Taylor thinks that he has at last traced Etruscan to the Altai group of languages. See his works referred to in this chapter.

Judging from the remains of her cities and cemeteries, Etruria of old was densely populated. Her cities must have compared favorably with those of the ancient Orient. To support its population, the land must have been under a high state of cultivation. Though Dennis[1] may use too glowing colors when he paints his pictures of Etruscan life, we may with profit glance at his pen-sketch of a portion of that land restored. "What is now the fen or jungle, the haunt of the wild boar, the buffalo, the



Etruscan Graves.

fox, and the noxious reptile, where man often dreads to stay his steps, and hurries away as from a plague-stricken land, of old yielded rich harvests of corn, wine, and oil, and numerous cities, mighty and opulent, into whose laps commerce poured the treasures of the East, and the more precious products of Hellenic genius."

Etruria must have represented the culmination of European Turanian civilization. That she figured in the affairs of the Pharaohs proves the high antiquity of her power, and reveals to us the origin of that Egyptian influence, a trace of which is detected in her art and

1 Op. cit. xxix. xxx.

architecture. The life of Etruria must have been of long duration. Dr. Taylor[1] allows her a thousand years for her development. When, however, we realize that Etruria permitted bands of Aryan immigrants to seize one of her most important posts, and station themselves upon the Septimontium, commanding the Tiber, we can but conclude that her power was even then on the wane. Otherwise we must admit that she had sunken into the wantonness of effeminacy, or perhaps debauchery. As we are only concerned with Etruscan influence upon the Aryans of Rome, we will not enter further upon her history.

Turning then to the first Aryan settlers on the seven hills, we find ourselves in a labyrinth of legend, myth, and fable. The thread which might have led us out was irrecoverably lost before the first Roman historian was born. If we accept a single legendary statement, we must accept them all for they are all alike improbable.[2] It is not strange that the Aryans, building as they did upon a substratum of Etruscan population, should retain some of the old Turanian legends, such as the wolf story and perhaps the rape of the Sabine woman.[3] Still, the entire fabric of Roman history, for about five centuries from the alleged date of the foundation of Rome, is woven out of just such material. We can not use it and shall therefore pass over this period in utter silence, drawing only a few conclusions

1 "Etruscan Researches," p. 15.

2 The whole matter of the legendary history of Rome is discussed by Ihne: "History of Rome," Vol. I. Sir George Lewis "Early Roman History," Vol. I. Schwegeler "Romische Geschichte," Band I. Dyer: "History of the Kings of Rome," gives the fables in full.

3 Dr. Taylor "Etruscan Researches," p. 369 372, classes the Romans with the Turanian, "wolf people" to whom that legend is common. The rape of the Sabine women is, perhaps, an aetiological myth to explain the intermarriage of two tribes, as contrary to primitive tribal usage.

from the condition in which we find Roman life when the light of authentic history first dawns upon the Septimontium.

Brutus Condemning his Son to Death.
*Mythological Period*

It matters little whether we have the details of Rome's early struggle with the Turanians or not. The first five centuries of her history are utterly insignificant even from the stand-point of the legendary historian. Though the

legendary chronology places the foundation of Rome in the year 753 B. C., it was not until 423 B. C. that the Etruscan village of Fidenae was conquered,[1] though it was only five miles up the river. The Etruscan village of Veii was only ten miles from Rome. Many are the legendary wars and battles fought between these two cities. The legends say,

Cornelia and Her Sons. [The Gracchi.]

however, that, while the Gauls were fighting Etruria on the north, the Roman army slipped over there and, after ten years constant siege, succeeded in reducing the Veienites to subjection. This great conquest is recorded for 392 B. C., over three hundred and sixty years after the founda-

[1] Rawlinson's "Manual," p. 363.

tion of Rome. As a remarkable climax to the martial prowess of Rome, it is record that four hundred and eighteen years after her foundation she had conquered the whole of Latium—a district seven hundred square miles in area, less than an average county in a western state. In 280 B.C., Rome did, however, become known to the outside world, because her armies then for the first time met foreign troops even on Italian soil. Authentic Roman history may be said to commence with that date.

We shall, however, be compelled to adopt the periods into which historians divide Roman history in order to make our further remarks intelligible to the reader. Thus it is convenient to consider three periods in the life of the Roman people—the Regal period,[1] the Republic or Commonwealth,[2] and the Imperial period or the Empire.[3] The first division rests upon a legendary foundation, the second is more authentic, and the last[4] is the date of the dissolution of the Western Empire. Our knowledge of tribal confederacies and of the origin of government would lead us to expect a regal period in the life of the Roman people; but this whole period has been sufficiently treated in another place; and we will refer the reader to that place for a knowledge of the constitution and government of Regal Rome and the origin and nature of the two great divisions of its people; the Patricians and the Plebeians.[5]

There is one event in early Roman history that stares us in the face at every point, forces its reality upon us, and thus serves as a starting point in her history. This is the first recorded invasion by the Gauls after Roman history begins. All authorities agree in fixing the date at 390 B. C. It is not strange that the Aryan tribes had, as

[1] 753-509 B. C. [2] 509-31 B. C. [3] 31 B. C.-476 A. D. [4] A. D. 476.
[5] See Vol. II. p. 195-204.

early as that, at least, begun to press down over the Alps. At last, they crossed the Apennines in large numbers. The Etruscans were forced to shut themselves up in their towns, and to buy off the invaders with gold and plunder. At last they reached Rome, defeated her armies, and entered and plundered the city. The capitol is said to have been saved by Roman gold. If Rome had any system of keeping records, from which her early history could

The Gauls in Rome.

have been ascertained, such records were all distroyed at this time.[1] Though writing was, no doubt, in vogue in Italy at an early period, we can thus understand why we have no authentic history of early Rome. These Gauls finally departed from Rome, and tradition follows them through Thrace across the Hellespont, and into Western Asia.[2]

1 Dyer "Kings of Rome," p. 28, argues that the records known as "Annales Maximi," were not wholly destroyed. 2 Above page 36.

The light of authentic history, which at last breaks over the Appennines, thus reveals to us Rome, risen from the ashes of a Gallic invasion and taking her place among the powers of the infant Aryan World. As to the beginning of this period, Sir George Lewis has so satisfactorily calculated the date, that we quote from him.[1] He fixes the termination of the Republican period at the death of Pompey in 48 B.C. "If we take our departure from this point, and ascend the stream of Roman history, we shall find that we are accompanied by native contemporary authors, in the strictest sense of the word, for 177 years, up to the commencement of the Gallic war, in the 529th year of the city, or 225 B. C.; that, with an allowable latitude of construction, this period may be extended to 216 years, up to the commencement of the first Punic War, in the 490th year of the city, or 264 B.C.; and that, if we call in the assistance of contemporary Greek writers, we may mount as far back as 233 years, to the 473rd year of the city, or 281 B. C., when Pyrrhus landed in Italy, and the Romans came for the first time into conflict with an army of Greeks."

Back of the above date, then, we have to rely on the archaeologist for information as to ancient Rome. But considerable has now been made out as to their knowledge of art and practical sciences. The Romans were neither artisans nor architects. They looked to Etruria for everything in this line, until Hellenic culture, in its spread, reached the banks of the Tiber. So marked are these indications that what remains of Roman architecture is grouped under three stages of development: Etruscan, Hellenic, and Roman.[1] The same

1 "Early Roman History," p. 19-20.
2 "Ancient Rome," p. 20.

tomb has been found to contain wall paintings of Homeric scenes, doors and cornices of Egyptian type, and painted vases of Assyrian and Babylonian styles[1] The "Wall of Romulus" was built after Etruscan models, and probably by Etruscan workmen.[2] We are told that the Etruscans were the metal workers for all Europe. The iron founderies at Elba supplied nearly the whole world, and the remains about their work-shops prove that they had an enormous trade in copper and bronze implements.[3] Many of the Latin building words are probably of Etruscan origin.[4] The earliest blocks of stone used in building were worked with metallic tools.[5] Etruscan workmen were the architects of the great temple of Jupiter on the Capitoline. Their knowledge of drainage was brought into use when the great sewer, called Cloaca Maxima, was constructed. Whenever Rome would raise any public building, she employed Etruscan artificers.[6]

The catalogue of Etruscan works at Rome could be enlarged indefinitely, but enough has been mentioned to show how extensive was this foreign influence. To Etruscan knowledge and culture, Rome added "her virtues, her thirst of conquest, and her indomitable courage,"[7] all of which were to a great degree lacking in her almost effeminate neighbors. Etruscan scholars, however, do not hesitate to claim for that people everything that is cultivating and refining in not only Roman, but even in modern Italian life. Prince Bonapart[8] calls standard Italian "the Tuscan

[1] Ibid.

[2] Conquered Etruscans were Roman slaves. It is more probable that they were forced to do this work for their masters than that hired workmen were imported. We, however, follow authoritiss on this point.

ALPHONSE DE NEUVILLE.

GERMAN WOMEN DEFENDING THEIR WAGON CASTLES AGAINST

dialect," and mentions Dante, Petrarch, and Boccacio as "Tuscan luminaries" while Dr. Taylor[1] even claims that the leading schools of art are in cities once belonging to the old Etruscan dominion; and that "Giotto, Fra Angelico, Ghirlandajo, Masacio, Perugino, Fra Bartolemmeo, Leonardo, Coreggio, Garofalo, Michael Angelo, Raphael, Francia, Guido Reni, Domenichino, and the Caracci," were not only Tuscans but probably of Etruscan origin. But it required in Etruria, as in other parts of the world, Aryan blood, energy, and mental and physical strength to carry this knowledge of the arts and sciences to the pitch of development that they have attained. To the Aryan, is due the credit of entering upon the labors of such Turanian civilizations; and, when they are tottering and about to fall under the weight of racial weakness, to carry them forward to a more perfect stage of healthfulness, vigor and grandeur.

After all, Rome had attained no great celebrity for her architecture and buildings until near the close of the Republican period. The Etruscan ceremony of encircling the headquarters of a newly established tribe with a furrow made by a plow drawn by a cow and a bull, was probably early celebrated in the case of Rome.[2] The so-called "Wall of Romulus" followed the direction of this furrow,[3] inclosing a portion or the whole of the Palatine hill; and this enclosure has since been called Roma Quadrata, from the rectangular shape of the building blocks used. These central grounds were afterwards enlarged by a wall, attributed to Servius, so as to include the whole "Septimontium," and considerable space beyond and between the

[1] "Etruscan Researches."
[2] See Coulanges: "Ancient City."
[3] "Ancient Rome," p. 44, note.

seven hills.[1] The Forum Magnum was a large open space between the Palatine and Capitoline hills, where assemblies of people were wont to be held. It was rectangular in shape and was, in later times, surrounded by spacious halls where courts of justice might sit. It was here, at a later day, that gladiatorial fights were witnessed which will

Entrance to the Capitol.

forever tarnish the glories of Rome. Between the Palatine and the Aventine hills, was a long, rectangular valley, called the Circus Maximus, or great Circus. Here were celebrated the great games for which Rome was noted.

[1] Rawlinson: "Manual," p. 348.

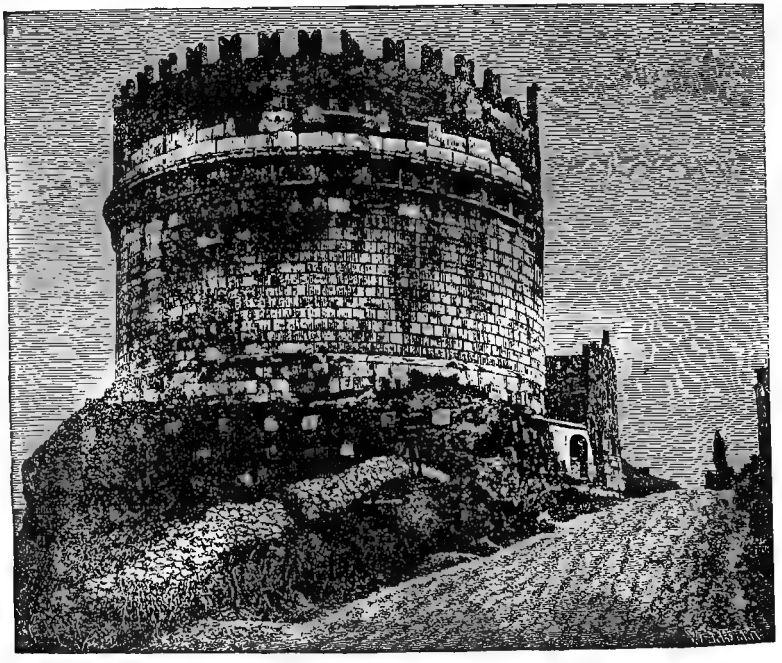
As has been said, the Campus Martius was a great plain without the walls of the city, though above it and near the river's bank. Here the Roman youth engaged in martial sports and the largest assemblies of the people were held. Here, also, the army was wont to assemble at the sound of the horn and listen to commands. A stone wall, bearing many marks of Etruscan workmanship, was early begun and, in time, run along both sides of the Tiber the entire length of the city front.[1] Previous to 142 B. C., the only bridge across the Tiber was constructed of wood, so as to be easily cut down in case of danger from an invasion.

The whole of Etruria was noted for its system of sewerage. It is not surprising, then, that Rome, whose hills were interspersed with marshy, malarial districts, should have looked to matters of health. When the great sewer, called Cloaca Maxima, was constructed, it would be hard to tell, but it is attributed to Tarquin II. It was a wonderful piece of workmanship, and finally developed into a perfect system of drainage. Though the water supply was always poor at Rome, it was not until near the middle of the Republican period that a known system of water works was introduced. It was in the Censorship of Appius Claudius, that the first acqueduct was constructed. It brought the water from a distance of seven or eight miles. In the first century of our era, the city had so increased in size as to require nine of these great water courses to furnish it with a necessary supply.[2] The same year,[3] the first of those great highways, which, in Imperial times, connected Rome with the ends of the

1 At one place, not far from the mouth of the Cloaca Maxima, a piece of the original wall exists, with projecting lion heads, sculptured in bold and effective Etruscan style. "Ancient Rome," p. 78.

2 "Ancient Rome," p. 466. 3 Probably 313 B. C.

world, was built. This was the Via Appia, or Appian road, and extended from Rome to Capua.[1] These roads were master-pieces of engineering, and constructed regardless of the amount of human labor required. Valleys were bridged over by massive stone viaducts, and mountains of solid rock were cut through, in order to make the road level and straight.

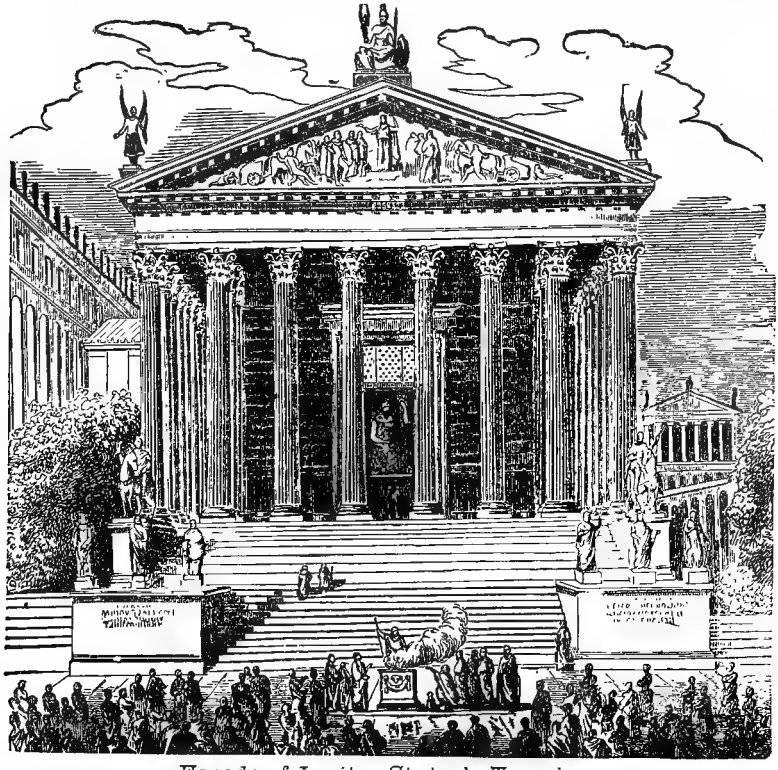


Appian Way.

The principal architectural remains of the Regal and early Republican periods are altars and temples. There were the altars of Saturn and Vulcan; and, at a later date, though built on the site of an older altar, there was in Rome also an "altar to the unknown god." The temple of Vesta, of Janus, and of Castor were among the oldest

[1] Ibid. p. 477-8.

buildings at Rome. But the earliest, as well as the most celebrated of these ancient buildings, was the temple of Jupiter Capitolinus on the Capitoline hill. The legend says, that Romulus vowed a temple to Jupiter; but it is a well known historical fact, that the Etruscans were wont to erect in every new settlement a temple to their triad of



Facade of Jupitor Stator's Temple.

gods, Jupiter, Juno, and Minerva. The triple nature of this temple was undoubted; and, as its architecture is of Etruscan style, it probably belongs to pre-Roman times, though its foundation was attributed to Tarquin I. The statue of Jupiter, also, was modeled by an Etruscan sculptor. This ancient building was "numbered among the seven sacred relics, on the preservation of which the wel-

fare of Rome depended."[1] It was burned in 83 B. C., though subsequently rebuilt on a much grander scale.

Resuming the thread of history once more, we will commence with the invasion of Italy by Pyrrhus, which as we have seen, Sir George Lewis thinks is about as far back as we have historical light to guide us. With each conflict of Rome with her neighbors, we shall see her emerge with increased power and influence. This was long after the termination of the so-called Regal period, about the middle of the period of the Commonwealth. In 281 B. C., Rome violated her treaty with the Greek city of Tarentum by stationing a fleet in the forbidden waters of their bay. The Tarentines resented this act by attacking the fleet and sinking a number of vessels. War was declared. The Tarentines appealed to Greece for aid. Epirus sent an army of twenty-five thousand Greek troops under Pyrrhus, to their assistance.

The Romans, however, had already attained such power, that the combined Grecian forces could not cope with them. The army that Pyrrhus brought with him was at last destroyed, and the colonies were, one by one, subjugated. The Grecian general is said to have quitted Italy in 276 B. C., and all opposition in the southern part of the peninsula was met and subdued by 266 B. C.. Roman arms were at the same time carried north, and when, at the close of the year 265 B. C., Volsinii, chief of Etruscan strongholds, was taken and razed to the ground, "Rome reigned supreme over the length and breadth of Italy."[2]

Rome next interferred in a quarrel between some pi-

[1] "The other six are said to have been the needle of Cybele; the ashes of Orestes; the veil of Ilione; the scepter of Priam; the ancilia of Mars, and [chief of all] the Palladium."

[2] Rawlinson: "Manual" p. 378-9.

rates at Messina, a town at the extreme north end of Sicily, and Carthage. A war with Carthage was the result. It lasted twenty-three years,[1] and resulted in favor of Rome. This war is known in history as the First Punic War. Sicily was made an independent ally of Rome. During this war, the naval power of Rome was greatly increased, and her arms were carried into Africa for the first time. The Cis-Alpine Gauls were, no doubt, continually encroaching upon Roman territory, as they were pressed forward by the restless tribes continually crossing the Alps. Rome was even compelled to act on the defensive against their inroads. She, determining at last to conquer them, became an aggressor in 232 B. C. by planting colonies in Gallic territory. Seven years later,[2] the Gauls crossed the Apennines and advanced upon Rome, but were driven back. The Roman army followed them into the valley of the Po, and, in 222 B. C., extended the dominion of Rome to the Alps, making Cis-Alpine Gaul a province. But in the meantime,[3] a Roman fleet, under the plea of driving the Illyrian pirates from the Adriatic crossed over and established the authority of Rome in Illyria, Dalmatia, and the adjoining islands. Thus the Greeks established those fatal bonds of friendship with Rome which, not only in their case but in all other cases, soon became the bonds of servitude.

Though the armies of Carthage had been conquered, her spirit had not been subdued. We all call to mind how the infant Hannibal swore at the altar of Baal eternal enmity toward the Romans. The young Hannibal had now grown into manhood. Reared in the camps of the Carthagenian army engaged in the conquest of Spain, he succeeded in 220 B. C., to the command of the forces, and

[1] 264-241 B. C. [2] 225 B. C. [3] 230 B. C.

at once began preparations to invade Italy. He chose a route by land across the Alps, and, in 218 B. C., started on his journey with an enormous army and great stores of munitions of war. Two years of Carthagenian conquests followed; but then, Hannibal found himself in the heart of Italy, surrounded by Roman forces, and unable to get reinforcements from Carthage. Now came the time for

Hannibal Swearing Vengeance on Rome.

Rome to revenge the slaughter of the flower of her youth on the field of Caunae.[1] Still for fourteen years longer, Hannibal remained in Italy defying Roman power. At length, Rome carried the war into Carthagenian territory, and Hannibal was recalled to defend his native city, only, however, to be defeated at the battle of Zama by Scipio Africanus, which led to the submission of Carthage.[2] As

1 The story is told that after the battle, 216 B. C,., Hannibal gathered a bushel of gold rings from the fingers of the wealthy Romans that lay slaughtered on the field, and sent them to Carthage to prove the fatality of the day to the Romans.

2 201 B. C.

a result of this war, Rome not only maintained her authority, but again established her supremacy. The terms of her treaty with Carthage, though probably no more severe than might be expected, was such as to forever cripple a maritime power. Carthage could no longer hold possessions outside of the African continent; she could not engage in foreign war without the consent of Rome; she was forced to surrender all her ships, except ten; and, finally, she was forced to pay tribute to Rome. Still Carthage flourished though crestfallen and robbed of her riches and power.[1]

Hannibal.

Hannibal, the greatest of Carthagenian generals, was finally driven from the city by enemies. He fled to the Syrian court, and was instrumental in stirring up a war between that country and Rome, disastrous to the former. Pursued by the Romans into Bithynia, he put an end to his own life rather than fall into the hands of his life-long enemies.

By the terms of peace, Rome gained two provinces in Spain. She also had the best of excuses for the complete subjugation of all the unfriendly portions of Italy.

[1] Rawlinson's "Manual," p. 390-5.

This she effectively accomplished. In the meantime she had entered into alliance with Egypt, Rhodes, and other eastern people. The Macedonians had at first openly assisted Carthage, but a Roman army soon compelled them to make peace. But even after this, Macedonia

Proclaiming Liberty to the Greeks.

secretly befriended Carthage, as well as carried on war with Egypt and Rhodes; so that, as soon as opportunity offered, a Roman army was again sent into Macedonia. Now Rome's military tactics were of a two-fold nature. No power had yet been able to successfully defeat her

armies; but, in almost all cases, she prepared the way to success by stirring up strife among the allied tribes of people, with whom she was at war. This, we will see, was her course against the powerful Gauls and Teutons in the times of the empire. Such was her policy at this time with the Greeks and Macedonians. The Roman consul, Flaminius, entered Greece with an army and proclaimed Grecian independence to all the tribes that would join his cause. The battle of Cynocephalae ended the war, and at the same time the Macedonian empire.[1] Each Grecian state was made separate and independent, except in the case of leagues among themselves, such as those of Achaia, Aetolia, or Bœotia.

When Antiochus received Hannibal at his Syrian court, Rome regarded the act as a challenge for war, and was not long in accepting it. Antiochus was really the aggressor. He formed an alliance with Grecian Aetolians, and even entered Greece with an army. The Roman army finally entered Thessaly, defeated the Syrians at Thermopylae, and drove them out of Greece. The Roman fleet defeated the Syrians near Cyprus, landed in Asia, and compelled Antiochus to withdraw from that part of Asia Minor north of the Taurus and confine himself to the district south of that range.[2] Again[3] the Macedonians, under Philip's successor, Perseus, became rebellious. The battle of Pydna was fought in 168 B.C., and, as usual, the Romans were successful. Macedonia was broken up into four states. The leagues of Greece, except Achaia, were dissolved and many of the separate states again declared independent.

There had always been a party at Rome that considered their own state unsafe as long as Carthage flourished.

[1] 197 B. C. [2] 190 B. C. [3] 171 B. C.

The head of this party was Cato, the Censor. It is said, that he closed every speech to the Senate, or people of Rome with these words, "Carthage must be destroyd."[1]

Return of Regulus.[2]

1 "Delenda est Carthago.

2 During this war occurred the memorable incident of Regulus and his return to Carthage. Captured by the Carthagenians he was paroled and sent to Rome on condition that he return to Carthage if Rome refused to make a certain treaty. Regulus refused to enter Rome, strongly advised the Romans not to make the treaty, and then bidding farewell to his family he returned to Carthage to die.

Resolved therefore upon the ruin of Carthage, a Roman army finally appeared before her walls and demanded the destruction of the city as the only condition of peace. With almost superhuman energy, born of despair, the inhabitants withstood the siege for four years.[1] Finally Carthage surrendered, was utterly destroyed, and the territory made into a province. Another quarrel with Macedonia followed. Corinth was plundered and destroyed.[2] The former became a province at once, and the latter finally assumed a similar relation toward Rome. A Roman army was employed in Spain from 149 to 133 B. C., when two provinces were added to Roman possessions. Pergamus about this time[3] came under Roman power by will of their late ruler, Attalus III.

We have now reached a time in the history of the Roman Commonwealth when her internal troubles had assumed frightful proportions.[4] The Plebeian population of Rome was no longer Latin. It was a mixture of all free people whom the fortunes of war had driven to that city. The public land of Rome or Italy was in the possession of the Patricians, who worked their large estates with slave labor. The great mass of people, the Plebeians, were landless, and there was little chance of their finding employment except as soldiers. This subject class had to be fed; and it, in time, came to be an instrument of every ambitious demagogue, by which he could raise himself into power.[5] The one who could best feed them was their hero for the time being. At times, there arose champions of the Plebeians who deserve great praise for their attempts

[5] We have referred to the workings of the same state of affairs in Greece, resulting in the formation of Tyrannies.

to better the condition of these people by legislation. Such were, no doubt, the Gracchi.[1] But every such noble minded legislator came to an untimely death through the enmity of the Patricians.

The war with Jugurtha, who had usurped the Numidian throne,[2] both proves the corruption of the leading Romans of the time and brings into public notice the two party leaders, Marius and Sulla. For nine years, Jugurtha succeeded in saving his throne by bribing Roman consuls and senators. The inevitable end, absorption by Rome, came at last. Heretofore the Romans, when fighting the ruder people on their northern and western borders, had met only Gauls and Iberians. About this time, they were first called upon to defend themselves from invading tribes of Teutons, whom they found by no means as easily conquered as the former two peoples. In 113 B. C., bands of Cimbri and Teutones (Germans) crossed the Alps and invaded Italy. Contrary to law, Marius was appointed and re-appointed several times to the consulship. He was the ablest commander in Rome, but it took him twelve long years to conquer these Teutonic tribes even on his own Italian soil.

Even before this time, it was no uncommon occurrence for a conspicuous party leader at Rome to meet his death by assassination. In 91 B. C., M. Livius Drusus proposed a "set of measures which had for their object the reconcilement, at Rome, of the Senatorian with the Equestrian orders."[3] Drusus was murdered, which so enraged the popular party, who regarded him as their champion, that the tribes of Central and Southern Italy took up arms, deter-

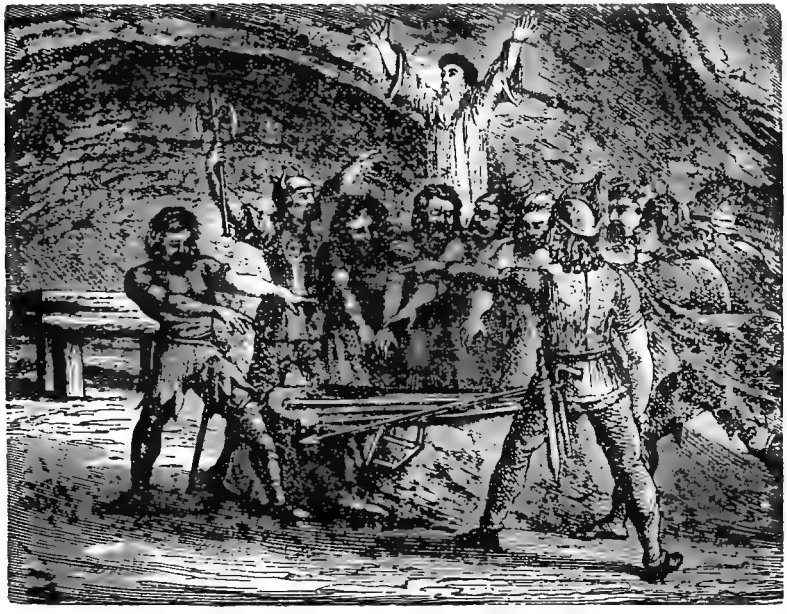
mined to form an independent state. As a source of protection against desertion by the northern tribes, Rome conferred full citizenship upon all Italians who had not taken part in the war or would at once return to their allegiance. In this way, Rome retained her supremacy. The Patricians were compelled, from time to time, to make just such concessions. This policy was, in Imperial times, extended



Celtic Warrors Devoting Themselves to War against the Romans.

to all the provinces, though in a modified from. The influential chieftains and the promising young men were selected as candidates for Roman citizenship, and were duly vested with that title and its privileges. They came to regard it as a mark of honor, as well as a safeguard against punishment from local governments.[1] So great a change was made, that "the grandsons of the Gauls, who besieged Julius Caesar in Alecia, commanded legions,

[1] Vide Paul's answer to the provincial magistrate, Acts, xvi. 37-39.

governed provinces, and were admitted into the Senate of Rome" in the time of the Antonines.[1]

Marius had secretly favored the popular party, while Sulla had remained a firm and powerful support to the city. About this time,[2] Mithridates, ruler in Pontus, was defying Roman arms by carrying war into Asia Minor, even massacreing thousands of Italians and Romans. Sulla was given the command of the resulting war against the Pontic chieftain. Marius, at once championed the popular cause at Rome. In this way, he caused the Comitia Tributa[3] to recall Sulla and give the command to himself. Then for the first time, we see what a dangerous power the command of those fearless Roman legions gave an ambitious leader. Sulla appealed to the legions that had followed him in many a battle. They agreed to support him, so he led them at once against the capital. Marius, not being prepared for such a step, found the mob at his command an illy constituted force, with which to oppose the trained legions. He was at last forced into exile, and many of his supporters, being proscribed, were put to death.

Sulla now led his army into the East, and began war against Mithridates. He succeeded, during the next four years,[4] in compelling that prince to accept his terms of peace. In the mean time, the Marian party had gained the ascendency at Rome, and had invited Marius back to the city, but he died in 86 B. C. Sulla's friends had been proscribed and thousands of them murdered. Sulla, after settling affairs at the East, again turned his forces toward Rome. Carbo and young Marius were then the legally elected consuls. Sulla, however, was sure of the cooperation of the Patricians. When he reached Italy, he was met by

[1] Gibbon, Vol. I. p. 42.
[2] 88 B. C. [3] See This Series, Vol. II. p. 203, [4] 88-84 B. C.

Roman legions. For the first time legion was opposed to legion. At last, Sulla put down all opposition. His first step was to proscribe and murder thousands of people, both in Rome and elsewhere, for no other crime than that they had favored the popular party.[1] He made himself Dictator; and, as such, suceeded in re-establishing the Senate and

In the Arena.

the Patrician order in power and glory. In 79 B. C., he abdicated his office and died in the following year. From this time forward, the political history of Rome is little

[1] It is hard even for the most careless to realize the small value placed upon human life in those times. Three thousand friends of the popular party at Rome and twelve thousand at Praeneste were butchered in cold blood at the nod of Sulla, or his tools. See Rawlinson's "Manual," p. 428.

more than a history of individuals, who, in various ways, arose to power.

The wealthy or ambitious leaders prepared for the amusement of the idle mob inhuman, revolting, and bloody spectacles, known as gladiatorial contests. It is blood curdling, even at the present day, to read the accounts of these scenes. The youth and strength of conquered peoples were brought to Italian cities and skillfully trained in order to make the fight more exciting. The contestants met in the arena to fight for their lives, using all the skill that training could give them. Sometimes man was pitted against man, and sometimes against the fiercest of wild beasts. Nor would the flowing life-blood and the mortal groans of a single score of dying men quench their thirst for human blood; the great Caesar himself, when aedile, gained popular favor by glutting the eyes of Rome with the blood of thousands of gladiators, fighting in a single arena.[2] Not the mob alone were pleased to witness these games, but consuls, senators, knights, the youth and the aged, fair maidens and worthy dames—all seemed to regard such a scene as did the immortal Cicero, who said, that it was the greatest pleasure in life to see a brave enemy led off to torture and death.[1] Even the eloquent pen of Tacitus could not wholly escape contamination from the spirit of the times, for we find him writing in regard to some prisoners, that more than sixty thousand fell, not by Roman arms, but "grander far for our delighted eyes."[3]

All have heard of the gladiator, Spartacus, who, when a body of five thousand gladiators escaped from Capua, placed himself at their head. This band was soon joined by

1 After Trajan's triumph over the Dacians [A. D. 106.], there were more than 10000 exhibited." Smith: "Dictionary of Greek and Roman Antiquities." 2 Elton: "Origins of English History," p. 310.

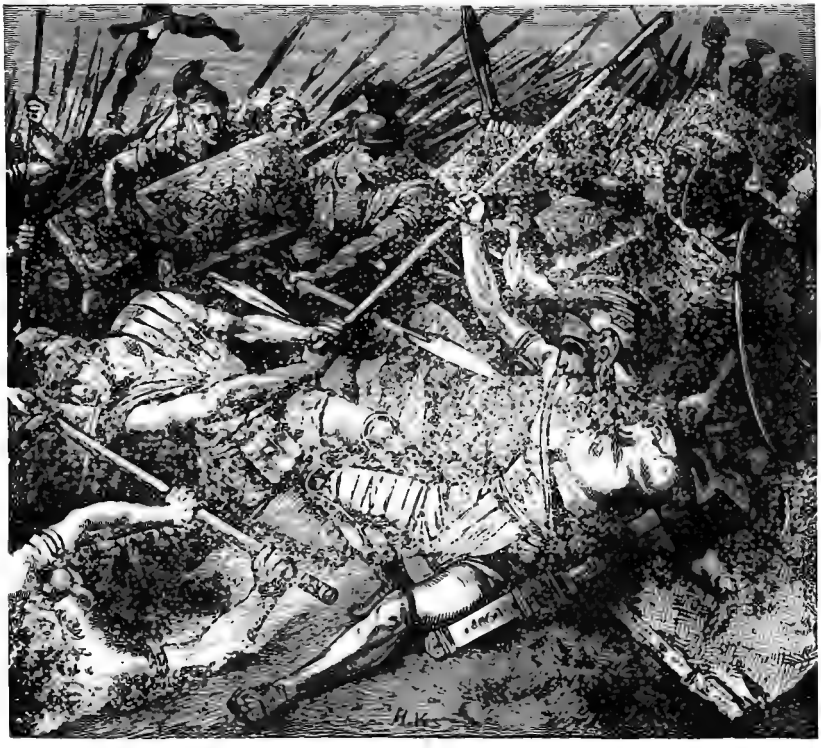
slaves and malcontents enough to swell its ranks to one hundred thousand men. For two years, they ravaged the fields and cities of Italy, before they were finally conquered by a Roman army.

After the death of Sulla, a number of prominent men came to the front in Roman affairs. Amongst these, we



Death of Spartacus.

must mention Cn. Pompeius, or Pompey. He belonged to a new family, but had gained the friendship of Sulla. Another was Crassus, a shrewd but indolent man, who maintained his power by his great wealth.

Greatest among the rising men, was Caius Julius Caesar. We need only mention, in passing, Cato the younger and the great orator and statesman, Cicero. It is not strange

that we should detect a rivalry for supremacy among these influential men. Our interest chiefly centers on Caesar. He passed from one office to another; finally, assuming the government of Spain, he there began to organize that army that was destined to make Rome an Empire. The Senate had become fearful of Pompey's power. He had been made consul, had driven the pirates from the Mediterranean, and was solidifying Roman power in Asia.

Conquest of Gaul.

He returned to Rome to be slighted by the Senate, for they did not even ratify his acts in Asia, nor pay his troops. Thus offended, he was ready, when Caesar proposed it, to unite with Crassus and form a secret league, known as the First Triumvirate. Caesar was made Consul,[1] and popular measures were adopted; Pompey's soldiers were provided for; Cato was given an unimportant foreign office;

[1] 59 B. C.

H. VOGEL.

MOHAMMED II. CROSSES THE DARDANELLES.

while Cicero, the patriot and orator, was banished. The Triumvirate then ruled at Rome. At the close of Caesar's consulate, he obtained the government of the two Gauls and of Illyricum for a term of five years. Then were begun the wars against the Gauls and Germans, which tended to Romanize a great part of Western Europe.

Now Caesar was at liberty to plan for the future. He began at once to raise, equip, and discipline an army that would support him in his ambitious designs. Nor did he fail in the essential point of endearing himself to the soldiers that he led in battle. They were not only ready to obey his commands, but willing to live or die with him. He was not in a hurry, however, feeling that the time for action had not yet come. In 55 B. C., he was re-appointed to the government of the Gauls for another period of five years. Crassus was slain in an expedition against the Parthians.[1] Pompey began to fear the power of Caesar, and induced the Senate to demand,[2] that Caesar should disband his army before coming to Rome to stand for the consulship. Had Caesar complied, he would have abandoned the only means by which he could hold his power, and, perhaps, he would have forfeited his life. He saw that the time had come when he was to abandon all hope of future power, or else strike boldly for the only position of honor left for him. So at the head of his devoted legions, Caesar made the historical "crossing of the Rubicon,"[3] and marched against Rome.

Now Pompey realized the advantage that his opponent had. He, therefore, determined to fall back upon the East, where he had gained so many victories in the past. There he would raise an army with which he might hope to cope with the mighty Caesar. By this step, Caesar was

[1] 53. B. C. [2] 50. B. C. [3] 49. B. C.

enabled to enter Rome with little or no opposition. Stationed at the seat of government, Caesar was master of all Italy. He did not, however, wait for Pompey to bring his army into Italy, neither did he allow time for his enemies to unite their forces. Caesar's army was first successful in Spain, next on the battle-field of Pharsalia, then the Pompeians were defeated in Africa, and finally crushed

Caesar Crossing the Rubicon.

in Spain. Pompey was, at last, murdered in Egypt.[1]

In the meantime, the legislation of Caesar was the best possible for Rome. He was made perpetual Dictator and assumed the reins of government. The Senate was enlarged to the number of nine hundred, the new mem-

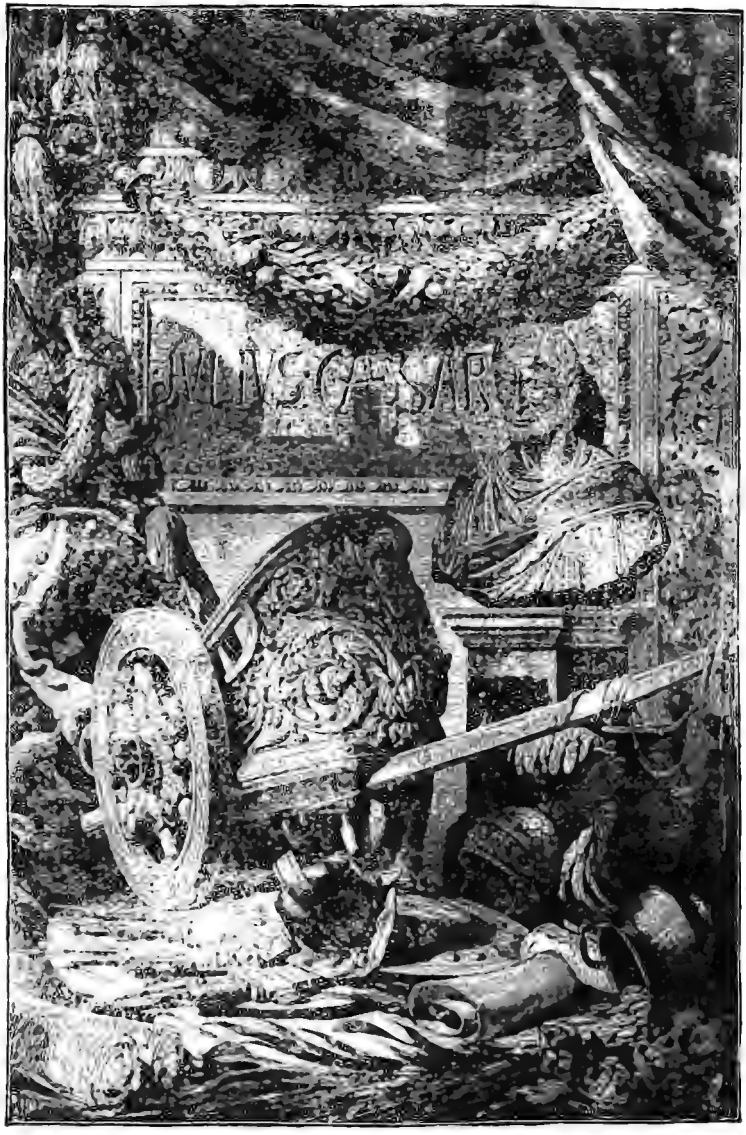
[1] 49-45.

bers being chosen from provincials, as well as from the old class of Roman citizens. The population of a number of Gallic communities was raised to the rank of citizens. The arts and sciences were encouraged. Such cities as Carthage and Corinth were rebuilt; wise laws, arranging satisfactorily and equitably the matters between debtors and creditors, were enacted. Those who held large estates were required to employ free labor. The laws were codified; the Empire surveyed; and the calendar reformed. Thus did Caesar find time for the administration of the civil government while he was, at the same time, busy with his wars.

But the ambition of Caesar led him to extremes. The people of Rome were jealous of their rights. They would endure all manner of oppression so long as the government was in name a Republic, and they had the officers that they were accustomed to. But, when the friends of Caesar hailed him as king, when the crown was offered to him by his tool, Mark Antony, the Roman people began to murmur. A conspiracy was formed, and Caesar was murdered on the Ides of March[1] 44 B. C. Chief among these conspirators were his own friends, Brutus and Cassius. In his will, he left the sum of ten dollars to every citizen, and his magnificent garden across the Tiber was thrown open as a public park. When Mark Antony made this known to the people; when they heard his eloquent words of praise, and saw the dead Caesar lying before them; when Antony held up the torn and bloody toga, which Caesar had thrown over his face to meet his death, their rage knew no bounds. They seized torches from the funeral pyre of their dead hero; and, applying flames

[1] 15th day.

to the houses of Brutus and Cassius, burned them to the



Tomb of Cæsar.

ground. The two arch-murderers fled for their lives.

Antony, the sole surviving consul, now thought that

his way to supreme power was clear, especially as the new consul, Dollabella, was his tool. But the young Octavius appeared upon the scene. He was a great nephew of Cæsar, and had been named in his will as his heir and son by adoption. Though absent from Rome when Cæsar was murdered, he hastened to the Capital. Then, by his

Suicide of Brutus.

liberality to the populace, by paying Cæsar's legacy to the soldiers, by politic action toward his enemies, he soon came to be looked upon as the real successor to Cæsar. Cicero again entered earnestly into public life, and his burning "Philippics" against Antony were as effective as those, in former times, against the great conspirator, Cata-

line. Octavius collected an army, which he paid out of his own income, and pitched his camp near Rome. Antony retired to Cis-Alpine Gaul, and began an attack upon the governor of that province. The consuls, Hirtius and Pausa, were sent against him, while Octavius accompanied them as prætor. The consuls were slain though the army was victorious. In this way, Octavius became sole commander of a victorious army. He was made consul. In 43 B. C., there was formed the second Triumvirate—Antony, Octavius, and Lepidus, a commander of horse when Antony and Caesar were consuls. The last named received Spain for his province; Antony, the two Gauls; and Octavius, Sicily, Sardinia, and Africa.[1]

The combined forces of the three, however, were at once needed to engage the army that the assassins of Caesar had collected in Thrace. The battle of Philippi decided the fate of the Republic. The Triumvirs were successful. Brutus and Cassius were forced to fall upon their swords and thus end their lives. Then Antony was given the government of the East; Octavius, that of Italy and Spain; Lepidus, Africa. Then began the fatal friendship of Antony and Cleopatra. While Octavius grew in power and extended the territory of Rome, Antony was spending his time in voluptous living at the Egyptian court. Lepidus and all other competitors in the West were put down. At last, in 31 B. C., an open breach occurred between Octavius and Antony. The battle of Actium, and later the deaths of Antony and Cleopatra, left Octavius the sole ruler of Rome. He did not, however,

1 As one of the terms of agreement between these three men, a few thousand men were proscribed, and Cicero's name headed the list. He was murdered in a short time and his head and hands were nailed up in the Forum, where he had so often defended the rights of the Commonwealth against such conspirators as Cataline and Antony. *Vide* Steele: "Brief History of Rome," p. 204.

attempt to assume the title of king, but contented himself with such titles as were familiar and not offensive to the people. In every case, he secured his appointment in the usual legal manner, though, no doubt, the Senate and people saw that it was useless to oppose him. He was made, at different times during the first twenty years,

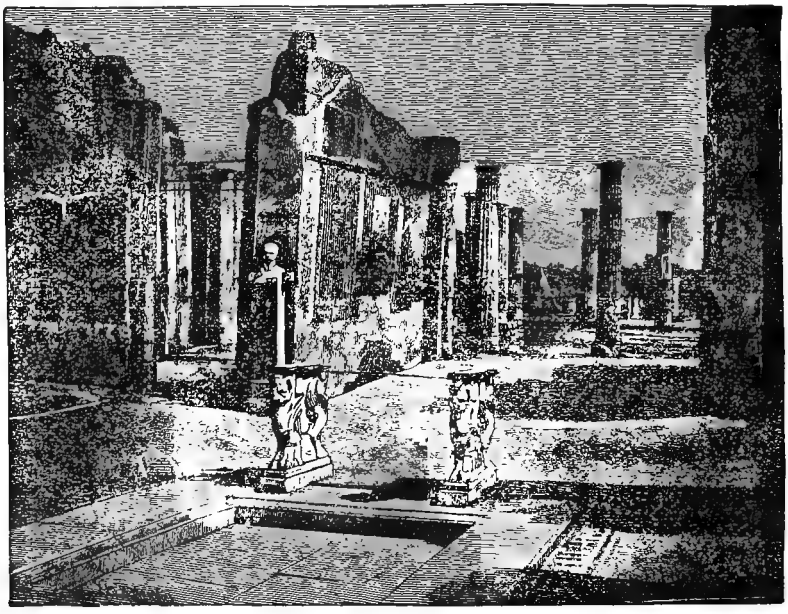
Court of Augustus.

commander-in-chief of the army, leader of the Senate, perpetual tribune, perpetual consul, perpetual censor, pontifex maximus, and was given the title of Augustus.[1]

Rome now enters upon her Augustinian age. The Re-

[1] For the Authorities on this period of Roman history, see Rawlinson: "Manual," p. 377-455; Steele: "Brief History of Rome," p. 34-65; Mommsen's "Rome," Vol II.: Caesar's "Commentaries," and "Gallic War."

public was never re-established. The reign of Augustus lasted until 15 A. D. It was a mild and popular reign. The rights of all people were regarded. Though the Empire maintained its authority and extended its borders, there was almost universal peace. This season of peace and prosperity, in the case of Rome as in that of other nations, was the season of her greatest growth. It was



Street in Pompeii.

during the reign of Augustus and in the Roman province of Judea, that Jesus Christ was born. One important step taken by the emperor was the establishment of an imperial guard which was known as the Prætorian guard. It consisted of ten legions.[1] Three legions were stationed in the city and seven in the various provinces. It was during his reign, that the Germans, under Arminius, by the complete annihilation of Varus and his three legions,

[1] 10,000 men.

forever freed themselves from fear of Roman conquest.[1] Virgil, Livy, Horace, and Ovid were the bright lights of literature during this age.

Upon the death of Augustus, a line of ten Caesars[2] occupied in succession the throne of the Roman Empire. With Nero, however, the Julian family became extinct.[3] The empire soon became the stake for which all ambitious men might play. When Nero's slave pierced the emperor's heart and deprived Rome of a ruler, there appeared no less than six pretenders to the throne, each backed by the authority of a number of legions of soldiers. The history of the next few months is but a tale of the succession and deaths of three emperors. Finally, Vespasian, commander in Judea, was elevated to the throne by his legions. It was during the reign of Vespasian, that the great eruption of Vesuvius occurred, which buried the extensive cities, Pompeii and Herculaneum.[4] The reign of Vespasian was distinguished for its strength and vigor. The authority of the empire was maintained throughout all her vast territory; education and literature were encouraged; and general prosperity was enjoyed.

Upon the death of Domitian,[5] succession by appointment was instituted, and there followed a line of emperors whose reigns were, on the whole, creditable, not only to the wearers of the purple, but to the Roman people as well. Says Gibbon,[6] "If a man were called to fix the period in the history of the world, during which the condition of the human race was most happy and prosperous, he would, without hesitation, name that which elapsed from the death of Domitian to the accession of Commodus.

[6] "Decline and Fall," Vol. I. p. 95.

The vast extent of the Roman empire was governed by absolute power, under the guidance of virtue and wisdom." This was from A. D. 96 to 180. It has been called the "Golden Age" of Rome. Among the five emperors who reigned during this period, Trajan was the most energetic in extending Roman territory. He "was a great builder. Rome grew larger and more beautiful under his hand; and throughout the provinces, innumerable bridges, aqueducts, and temples long served as monuments of the splendor and vigor of his reign." Hadrian followed in his footsteps, continually traveling over the empire and superintending the construction of roads, walls, and buildings.[1] Antonius and Marcus Aurelius, or the "two Antonines," reigned in harmony until the former died, when Aurelius reigned alone. Both seemed to rule with the sole object of making their subjects happy.

Almost every land could now count many Roman citizens among its native inhabitants. It was the policy of the government to gain the lasting loyalty of the rising and influential young men in all her provinces by conferring the honor of citizenship upon them. So that there was a chance for every young provincial chieftain to rise to the loftiest degree of power. Many aspired to the throne, and some reached this pinnacle of their ambitious dreams. The strength of the legions was no longer composed of the old Italian stock of soldiers, but the youth of the provinces were the flower of the army. This army knew its strength. It no longer respected the dignity and authority of the Senate. Anyone who would furnish them with the greatest allowance of money was deemed worthy of the purple. So we find the army in 193 A. D. selling the throne to the highest bidder. From that time, the fate

[1] "Landmarks of History," p 26

ofthe empire was written. There was a steady downward course. Occasionally the army would clothe with the toga of power a spirit stronger than their own united, or rather

divided strength. Such an one was Severus (Septimus) Maximin,[1] who, from a Thracian peasant, rose to be emperor of the world. Then there came a time when a large

[1] 235-238 A. D.

number of independent kingdoms were organized throughout the empire. This was in the time of the "thirty tyrants." At last,[1] there arose a succession of emperors who were able to control the army and restore the empire to its former size and a shadow of its former glory. These were Aurelian,[2] Probus,[3] Diocletian,[4] and Constantine.[5]

Diocletian established a new order of things. He appointed Maximian as his full colleague in office, with equal power and also with the title of Augustus. Then each chose, as son and successor, a young officer, each of whom received the title of Caesar. These were Galerius and Constantius. Diocletian retained for himself the government of Thrace, Macedon, Egypt, and the East. Maximian was given Italy and Africa. Constantius received Gaul, Spain and Britain. Galerius ruled the Danubian provinces. Thus was the authority of the empire enforced throughout the extent of her territory. In 305, both "Augusti" abdicated, and Galerius took upon himself the right to choose two new Caesars. Constantius died the following year, and his legions immediately appointed his son Constantine to succeed him. In 312, Constantine became engaged in war with his associates in the imperial office. In 324, the last one was defeated and put to death. Constantine was sole emperor of the Roman world.

As sole emperor, Constantine ruled with strength and wisdom. He has made his name immortal in two ways. First, though perhaps in a less degree, he is known in history as the founder and builder of Constantinople, which he made the capital of his empire. The walls of magnificent buildings arose on the "Golden Horn" of the

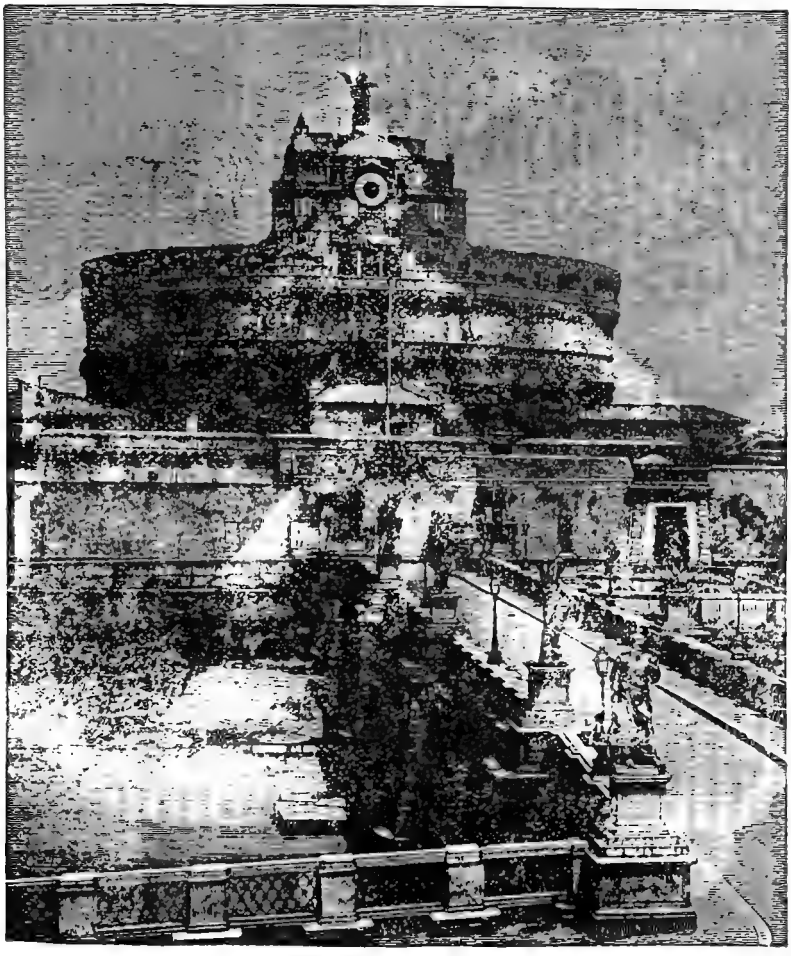
Bosporus, as the imperial city "appeared resplendent in white marble." It remained the capital city of the Eastern Empire until long after the Saracens made their appear-



Mausoleum of Hadrian.

ance in Europe. But the one act in his life that has given Constantine more than ordinary historical prominence was the course that he took in religious matters. He was the first emperor that adopted and championed the

Christian religion. He early became converted to that faith, and made it the state religion.

It had always been the policy of Rome to leave the inhabitants of her provinces free to retain their native religions.[1] They could worship their gods unmolested. We recall how, in the case of the Jews at the trial of Christ, the Roman governor declined to give judgment because it was a religious trial. Christ had not offended against the Roman law.[2] It is true, that many of the emperors were jealous of any man, or company of men, who appeared to be rising into power. So it is not strange that their imagination, poisoned by fear of assassination, saw political enemies in the leaders and secret assemblies of this newly established church. To suspect a man or a company of men of a desire for power, was a sure death warrant in those days. Neither rank nor sex was any protection. Political enemies were put to death in all manner of cruel ways. Some of the so-called religious persecutions may have been instigated through fear of political uprisings on the part of the Christians.[3]

When the emperor adopted the Christian religion, the opportunity was offered for religious fanatics to try to suppress other religions. Constantine was their tool. Though a good emperor, and, no doubt, an earnest man, "he was strangely superstitious, and his religion, so far as it can be gathered from his public acts, his coins, his medals, and his recorded speeches, was a curious medley of Christianity and Paganism."[4] Constantine also established throughout the empire a system of "graduated nobility, the archetype of the modern system."[5]

[1] Gibbon, Vol. I. p. 33-37. [2] John xviii. 28-31.

[3] When we come to treat of the history of Christianity, we will review this period once more.

[4] Rawlinson: "Manual," p. 529. [5] Ibid. 527.

We must recall also[1] the almost continual war of the Roman Empire with Oriental Empires over the eastern boundary of the one, and the western boundary of the other. Upon the ruins of the Empire of Alexander the Great, had arisen first the Parthian empire, which occupied nearly all of Central Asia. The Euphrates river was, as a general thing, the acknowledged western boundary of that empire. When the Neo-Persian empire succeeded the

Imperial Rome.

Parthian, it inherited also this perpetual warfare with Rome. Successes were about equal on both sides. While, however, neither Parthian nor Persian emperors ever adorned the triumph of a Roman consul, Cassius fell in battle against the Parthians, and the emperor Valerian eked out a disgraceful life as royal prisoner to emperor Sapor. While Trajan, during his reign,[2] seized some territory east of the Tigris and Euphrates, his successor, Hadrian, aban-

[1] Above p. 136. [2] 98-117, A. D.

doned it to the Parthians. Generally speaking, in the time of its greatest extent, the eastern boundary of the Roman empire was the Euphrates river.[1]

In following the political history of Rome through the first three hundred and seventy years[2] of the empire, we have omitted to follow carefully its growth in extent of territory. Let us take a hurried glance over this same period, noting the principal accessions that the empire received from the ruder tribes of the West, as well as from the civilized people of the East. Sicily was the first province to be added to the possessions of Rome. Previous to this time,[3] the territory of Rome was confined to Central and Southern Italy. Though early acquired, Corsica and Sardinia never amounted to much, owing, probably, to a lack of Aryan settlers. The boundary of Italy was extended to the Alps by the conquest of Cis-Alpine Gaul,[4] Liguria, and Venetia.[5] The first of the three was not incorporated with Italy until 43 B. C. "We thus see that not only Venice, but Milan, Pavia, Verona, Ravenna, and Genoa—cities which played so great a part in the after history of Italy —arose in lands which were not Italian."[6]

Hannibal began his war against Rome by the capture of Saguntum, a Spanish ally of that city. So when the second Punic war closed, Spain became a province of Rome, though it was not completely subdued until 19 B. C. The southeastern part of Trans-Alpine Gaul was united to Rome under the name of Provence about 105 B. C. The Cimbri and the Teutons, for half a century, held the Roman army in check in that direction. Finally, Caesar appeared

[1] Among the authorities on Imperial Rome, consult Gibbon: "Decline and Fall." Rawlinson: "Manual;" Dawes: "Land Marks of History;" Tacitus: "Annals;" Clintons: "Chronology of Rome."

in Gaul with his well trained legions. "Before Caesar's Gallic war, the rule of the Romans extended approximately as far as Toulouse, Vienne and Geneva; after it, as far as

Romans Warring with the Germans.

the Rhine throughout its course, and the coasts of the Atlantic on the north, as on the west."[1]

[1] Vide Mommsen: "Provinces of the Roman Empire," Vol. I p. 86, New York, 1887.

Grecian and Roman influence early began to spread among the Gauls — the one from the Grecian colony of Masilla, and the other from Italy and Spain. The Provence already referred to was said to have furnished many Roman merchants, farmers and grazers for Gaul.[1] They were the business men of the land. While the Gauls practiced agriculture, they paid more attention to grazing.[2] To their own native productions, they added others that were brought to them by their fleets, that were constantly navigating the streams and plying between Britain and their own land. Thus were procured wool for their manufactures, cattle for their herds. Copper, silver, and gold were obtained from some convenient source, and tin from Cornwall. The Italian merchant found a ready sale for his wine and horses in Gaul. It is said, that a single cask of wine might, in those days, be exchanged for a Gallic slave. The Latin language was not unknown there even before Caesar's time. It had spread through commercial intercourse through Roman merchants. Similarly Greek culture had spread northward from Messalia, which furnished Gaul with physicians and philosophers.[3] "Thus trade and commerce paved the way to conquest."[4]

The great stream of Teutonic migration, that was at this time setting toward the west, was not checked by the Rhine or the fear of Roman arms. As they began to encroach more and more upon Gallic territory, rumors of their movements reached the Roman capital. Caesar came with his legions to force the Germans back across the Rhine, and compel them to remain there. It was

---

[4] In some places [as at Vaison] inscriptions have been found in the Celtic language, using however ordinary Greek letters.

only a temporary check, however, for the pent up forces, in after times, burst through the barriers in all directions; baptising the Western Empire with Teutonic blood, eventually snatching it from the Romans. It took Caesar seven years to subdue Gaul and make of it a Roman province. The Celtic population was conquered, but the Turanian Iberians, disdaining submission, sought refuge in the rocky gorges of the Pyrenees. There they have since lived, and their language has been preserved to tell us of an otherwise lost people.[1] Though Caesar crossed into Britain, he made no conquest of that island. The result of his campaigns was the formation of the province of Trans-Alpine Gaul.[2]

Upon the conquest of Carthage, Africa became a province; but Carthage was not rebuilt until 49 B. C., and, after that, became, next to Rome, the "chief of the Latin-speaking cities of the empire." As Roman territory was extended toward the East, Roman influence found something stronger to contend with than Celtic influence of Western Europe, and Semitic influence of Northern Africa. The Celts were so nearly allied to the Romans that they accepted without dissent, not only Roman customs but also the Roman language. This was not the case with the Germans along the Rhine, nor of Caesar's Belgic Gauls, who were more Teuton than Celt. From the eastern shore of the Adriatic to the Halys river in Asia Minor, the Grecian language was the literary tongue as well as the most cultivated form of speech. Alexandria in Africa and Antioch in Asia were seats of Grecian culture. Now the Greeks were much more Teutonic in

[1] Ethnologically they are said to differ but little from the Celtiberians of Spain, and the Ibero-Celts of France. *Vide* Keane in Ramsay's "Europe," p. 579.

[2] "Historical Geography," p. 58.

ethnology than the Celts; and, besides, we have seen how, from the earliest times, they were strengthened by a continual renewal of Teutonic blood from the north. Although Constantinople was in the center of this Hellenized district, and Latin was the court language of the empire, neither Roman language nor culture had a lasting influence on the habits of this portion of the empire. In later times the Eastern Empire became in reality a Greek state.[1]

The complicated state of Grecian affairs early led to Roman interference. As early as 188 B. C., Rome had, according to her usual line of policy, placed the whole of Asia Minor under the rule of those friendly to her own government. This was sufficient until the time for conquest came. There was a strip of territory bordering the eastern coast of the Adriatic, north of Macedonia, that, in 34 B. C., became the province of Dalmatia. There was a larger district surrounding Dalmatia, however, that became a Roman possession in 168 B. C. and was subsequently known as the province of Illyricum. In 129 B. C., the province of Asia was formed out of her allies across the Aegaean. Bithynia was annexed in 74, Crete in 67, Syria in 64, Cyprus in 58, Egypt in 31 before the beginning of the Christian Era. The lands between the Alps and the Danube were added during the reign of Augustus.[2] Macedonia became a province in 149 B. C. Greece proper for a long time held the anomalous position of an independent dependency of Rome. It finally became the province of Achaia.

The Roman consuls, Caesar, Claudius, and Agricola, were met by a Celtic population when they landed in

[1] Freeman: "Historical Course," p. 162.

[2] These were the provinces of Raetia, Vindelicia, Noricum, Pannonia, and Moesia. They were known as the Danubian provinces.

Britain.[1] The Teutonic wave of migration that brought our forefathers to the shores of the ocean had not yet reached the land of the Britons. Although Cæesar invaded the island in 55 B. C., Agricola[2] succeeded in carrying the conquest only to the wall of Hadrian. So far north only, did the province of Britain extend. It was

Landing of Caesar in Britain.

one of the first provinces to be thrown off by the empire. A few remains only record the presence of the Romans in this now Teutonic Island. Turning again to the East, we find that the northern part of Arabia became a province in A. D. 106, as did Dacia, the only territory north of

1 "Historical Geography," p. 69; also Rhys; "Celtic Britain," p. 23-4.
2 A. D. 84.

the Danube that ever fell under Roman sway. This, the last of the provinces to be annexed, was the first to be given up. Aurelian withdrew from it in 270 and transferred its name to Moesia.[1]

When the Roman empire had at last reached its growth, we can give as its northern and eastern boundaries three great rivers, the Rhine, the Danube, and the Euphrates. In Africa, it included the strip of fertile country north of the Great Desert and Egypt as far south as the Tropic of Cancer. The only provinces lying beyond these boundaries were Britain and Dacia, the last to be added and the first to fall away from the Roman possessions. "In every part of that dominion, the process of conquest was gradual. The lands which became Roman provinces passed through various stages of alliance and dependency before they were fully incorporated. But, in the end, all the civilized world of those times became Roman."[2] We must now remember that Rome carried her own language with her into all countries. The Latin language, however, had no lasting effect upon the Greeks of either Europe or Asia. In some places, it has been since swept away by Teutonic, Slavic, or Turkish conquests, so that it may be said that the Romance world of to-day is built upon a Celtic or Turanian foundation. The occasional attempts to conquer Germany were failures.

Constantine divided the empire into four "Praetorian Prefectures—the East, Illyricum, Italy, and Gaul.[3] These were divided into first Dioceses, and these sub-divided into Provinces. The last emperor of the house of Constantine was Julian, the apostate. He is chiefly known for his attempts to root out Christianity and re-establish Pagan-

1 *Vide* "Historical Geography," p. 70.
2 "Historical Geography," p. 71-2. 3 Ibid. 75.

ism. After his death,[1] Jovian ruled about eight months. He was succeeded by Valentinian who shared the empire with his brother, Valens. The empire was re-united by Theodosius ; but the sons of Theodosius[2] divided it into two empires, Arcadius taking nearly the same territory that was included in the first two prefectures of Constantine, while Honorius took the western two. Thus were formed two lines of emperors who ruled during the greater part of the fifth century—the one having its capital at Constantinople, the other usually at Ravenna or Milan.

We have now traced the history of the Romans from the first arrival of Aryans in the Italian peninsula until the great empire was finally divided into two nearly equal parts. We have seen how the Turanians first gave way before the pressure of the Celts from the north. The latter were met by the Helleno-Teutonic colonists crowding their way toward the north. The resulting Italians were a hardy race (if we may be permitted to use that word) of Celto-Teutonic Aryans. For a long time the Roman people retained their strong and hardy character, capable of ruling the three continents known to the Medieval World. But in the times of the empire, the effeminate Oriental became a Roman citizen. The riches of the East lured the Triumvir Crassus to his death. The great Caesar could not wholly resist the dazzling beauty and the intoxicating charms of Egypt's fair queen, Cleopatra, in the delirium of which the weaker Antony revelled himself to death. The emperor Elagabulus himself was a priest of the Syrian sun-god, and brought his ideas of Oriental court life to Rome.[3] Luxurious baths followed the Roman

---

[1] 263 A. D. [2] A. D. 395. [3] See Gibbon, Vol. I. p. 167-8.

legions to their winter quarters, when formerly the soldiers were hardened by severe and vigorous discipline. The court, which once gloried in the death of the chaste Lucretia, now applauded the shameful lives of the licentious Julia and the voluptuous Faustina.[1] The streams of crimson blood that flowed from the veins of the dying gladiators poisoned the sympathetic hearts of even the gentler sex, and more than one empress prepared the poisoned food for her fated lord. The army had come to know its power, and usually decided the title of the one who aspired to the throne. "Of the sixty-two emperors from Caesar to Constantine, forty-two were murdered, three committed suicide, two abdicated or were forced to abdicate, one was killed in a rebellion, one was drowned, one died in war, one died it is not known how, and no more than eleven died in the way of nature."[2] The imperial life averaged only five years. When we reflect upon this condition of affairs, we see the doom of the Roman empire written so plainly that "he who runs may read."

Still the empire did not fall with its division into two parts. The Eastern Empire continued to exist and exert a great influence until the fanatic tribes of Islam appeared before the gates of Constantinople. The breaking up of the Western Empire is so intimately connected with the "Rise of Modern Nations" that we will consider it in that chapter. We have seen how the Roman legions fixed the boundaries of the powerful German tribes and so limited the primitive Aryan domain. But the destiny of races can not be directed by mortal man. The pent up Aryan forces must come forth. Long since we have seen these same Teutonic tribes climbing the Alps, and fording

1 See Gibbon, Vol. I. p. 151.

the Danube and the Rhine. We now hear the ominous tread of the advancing Goths and Franks, and the resulting baptism of Teutonic blood was destined to vitalize the modern world.

AN ERA of time recedes in the gloom of antiquity, its history seems to cluster around certain master spirits, who, for the time being, virtually swayed the world. During the greater portion of the time, when the boundaries of the Roman Empire circumscribed the historical world, the leading figure of each generation was the Emperor. When the right of succession to the imperial throne came to rest upon the will and power of the strongest organized army, and when the choice of such an authority fell to the one

who could shower the richest gifts upon them, there arose many an emperor whose whole career may be written: "He was emperor of Rome."

An empire that a Caesar could organize and rule was too vast for the playhouse of a childish Commodus. The territory which Trajan added to the empire was lost by his successor, Hadrian. Diocletian (286 A. D.) recognized the fact that the empire was too extensive to be ruled by one man of ordinary ability, so we find him appointing a colleague. Constantine the Great found it to be an advantage to have the empire divided into four prefectures. Later, Valentinian shared the empire with his brother, Valens. And, as previously shown, upon the death of Theodosius (A. D. 395), the empire was divided into two nearly equal parts—one to each of his sons—ruling with nearly equal independent powers. Honorius received the western half and Arcadius the eastern. The empire was re-united again, for a moment only, in the time of Zeno, (474-491) and of Justinian (527-565), though many of the more remote western provinces were never again brought under the rule of one emperor.[1]

This partition of the Roman Empire marks a period when a new element appears in the history of Europe. The history of the continent no longer centers around the emperors of Rome. In fact, individuals are now, for a time, almost lost from history, while the names of tribes and confederacies from the central part of Europe are taking the place of those of individuals. The German people now appear as a great or controlling factor in shaping European events. This is especially the case in the Western Empire. The Eastern Empire, however, was not particularly troubled by the movements of the

[1] *Vide* Freeman: "Historical Course," New York, 1876, p. 103, 114.

Germanic tribes. The most that they asked of it was a passage through its territory and such plunder as they could hurriedly gather on the march.[1]

Europe had become pretty thoroughly Aryanized before this time. The Etruscans were swallowed up by the Celto-Italians. The Iberians, then as now, were, probably,

Arrival of the Huns in Europe.

Turanian merely in speech.[2] The Huns and Magyars had not yet appeared upon the scene of European life. Their place was probably filled by more or less pure Germanic tribes. The Finns and Lapps that had not already yielded

to Aryan influences were but a fringe along the icy shores of the northern seas. To the east, the way was still open to Teuto-Aryan migration; and, during the long centuries that the Roman legions guarded the fords of the Rhine and the Danube against the westward passage of the Germans, the great surplus of Teutonic life must have flooded the steppes and plains of Russia.

But in the fourth century, a new people of Turanian origin appeared upon the eastern horizon, who became known in history as the Huns. Their ancestors were, perhaps, the people who had, before the dawn of history, cut off the Sarmatians from farther migration into the Trans-Caspian region, and who had been gradually filling up the steppes of Southern Russia. The vanguard of the invaders was now pressing hard upon the eastern border of the Slavic possessions. They were in possession of the basin of the Volga long before they were known to the Romans[1]; and, for an unknown time, there had been a steady advance toward the West. They gradually re-claimed the plains of Russia from the Aryans, who had come to consider them as their home.

Dacia was the only province that Rome ever held north of the Danube river, and Aurelian withdrew from this province as early as 270 A. D. It then became the home of powerful German tribes known as Goths. There were two confederacies, known afterwards as the West-Goths (Visi-Goths) and the East-Goths (Ostra-Goths.) Here they formed a state of considerable power. The Arian Bishop Ulfilas dwelt among them (about 375)[2] and by his preaching,[3] converted them to Christianity. For the

[1] Millman's Gibbon: "Rome," Vol. II. p. 125 *et seq.*

[2] This word is not derived from Aryan, but is the name of a religious sect. [3] His translation of the Scriptures is about the only specimen of Gothic writing that we have.

next century, there was much fighting between the Goths and the Romans along the Danube, which was the border line between the two. At last[1] the West-Gothic tribes, forced by the pressure of the Huns at their backs,[2] were allowed by Emperor Valens to cross the river, and were given a large tract of land upon which to settle.

Finally, the flood-gates of the Turanian home-land seem to have been burst asunder, and an irresistible deluge of Hunnish warriors swept over the whole of Eastern Europe and crowded hard upon the Goths. Even these stalwart Teutons were not able to stand against them. "Then the Danube, for many days and nights, was covered with a large fleet of boats and canoes, each sunk to the water's edge by its crowded freight of fugitives."[3] Some of these were induced by Bishop Ulfilas to adopt a settled mode of life in Moesia. But the most of them remained warriors, and their vast army of two hundred thousand fighting men was, for a moment, a barrier between Rome and the Huns.

If we turn now to Gaul, we perceive that the Rhine was no longer a barrier between the Empire and Germany. In the third and fourth centuries, we begin to hear the names of the Franks and the Burgundians, who were crossing the Rhine into the imperial territory.[4] At this time, Rome was steadily growing weaker. The Germans were pressing into her territory in every conceivable manner—they crowded into the Roman army; their chiefs conquered and held lands, as Roman officials, within her boundaries.[5] The time at length came when Rome could no longer defend her vast possessions. The Franks began to

migrate in bands and occupy Northern Gaul, while the Burgundians took like possession of Southeastern Gaul. At the same time, many of the German youths, attracted by the luxury and life of ease of the Roman citizen, were

Incoming of the Barbarians.

willing to sell their birthrights, and change their plainer dress and harsher names for Roman luxuries and the honors of Roman life. All stations in public life were opened

to them, we find that some of the emperors even of this period,[1] who were raised to the purple by the border legions, could not conceal their Teutonic origin.[2]

By the close of the fourth century, Rome began to lose territory on all sides. She had reached the pinnacle of her fame, and the sad period of decline and ever lessening influence was now before her. She could no longer be called the world. Her doom was written. Luxury and profligacy reigned where once discipline and virtue held sway. The land, from which, in ages past, the pure streams of sturdy Romans had poured to subdue the world, had become defiled by Celtic, Egyptian, and Asiatic influence, and could produce nothing but a weak and effeminate race. It needed a powerful mixture of pure Aryan blood to reinvigorate this declining people. Such was to come from the baptism of the Old Empire with Teutonic blood, and was heralded by the Goths crossing the Danube, and the Franks and Burgundians, the Rhine. Such a flood was to cause much destruction, to cost many lives, and to entail much suffering. But from this, there was destined to emerge new nations and new Romes, far excelling the old in grandeur, power, and culture.

As soon as the West-Goths had become settled south of the Danube, they had a chance to test the strength of the imperial armies. Ill-treatment from Roman officials caused dissatisfaction, which led within two years to open rebellion. Emperor Valens, marching against them, was

---

[2] Septimus Severus [193-211], Aurelian [270-275], and Maximian [286-305] were made emperors by the proclamation of the Pannonian legions. Claudius II. [269-270], Probus [276-282], and Valentinian I. [364-375] were of Pannonian origin. Vide Vambery, "Story of Hungary," New York, 1886, p. 22. Justinian was of "Gothic parentage." Vide Stokes: "Medieval History," p. 67.

defeated and slain (378.)[1] Henceforth it was continual warfare between the ruler of the Western Empire, and the Goths and other German tribes. Theodosius, the last real

Stilicho and the Goths.

emperor (379-395) of the united empire, was able by justice and good government to hold the Goths in check. Then

[1] **Freeman: "Historical Course," p. 100-1.**

succeeded Honorius (395-423) in the West and Arcadius (395-408) in the East. The empire was rent asunder, and Honorius, said to have been "cowardly and incapable,"[1] had not the power to defend his territories.

Honorius had one general, Stilicho, who was able to manage the Goths; but, on the whole, they roamed and plundered as they pleased. Stilicho was put to death, and then no one could check their ravages. Under their leader, Alaric, they took and sacked the Imperial city itself (410), and kept the Emperor penned up in his capital, which had been changed from Rome to Ravenna.[2] The same year, the Emperor withdrew from Britain, which was ever after independent of Rome. Alaric soon died; and Honorius entered into a treaty with his successor, Athaulf, whereby the latter became Roman governor of Spain, whither he led the West-Goths and drove the Vandals into Africa. Henceforth Southwestern Europe became a powerful West-Gothic kingdom. These Vandals, a Teuto-Slavic[3] people, who had early passed from Germany into Spain, took possession of Carthage (439), and soon grew in power so as to become formidable to Rome. Genseric, their chief, led his forces against that city which was captured (455), though, by the intercession of Pope Leo I., it was saved from universal pillage.

Pope Leo was the leading man at Rome at this time. The emperors were, as a class, without power, ability or ambition, as we shall see in their dealings with the Huns. This powerful people had now reached the Western Empire (433-454.)[4] The Roman general Aetius commanded the

---

[4] If these people were on the Volga in A. D. 100, forced the Goths out of Dacia in 376, and invaded the Western Empire in 433-454, we fail

imperial forces. Atilla, "the Scourge of God," led the Hunnish horde, and first pushed forward into Gaul, sweeping everything before him. Theodoric, the West-Goth, rallied his forces and went to the aid of Aetius. At the battle of Chalons (451), the Huns were completely defeated, though it cost the life of Theodoric. This is one of the great battles of the world. Christianity, Aryan civilization, and all that distinguished Europe from Asia were at stake.[1] It was a struggle between Irân and Turan. The former were successful; and, although Atilla appeared before Rome (452), which was saved from plunder only by intercession of Pope Leo and by the power of Roman gold, the Turanians ultimately fell back beyond the Danube.

The Western Empire was now rapidly falling to pieces. There ruled a succession of weak emperors until 476 when the Senate voted that one emperor was enough, and that the eastern emperor, Zeno, should rule the whole empire. Zeno assumed the government, but never visited Rome. He appointed Odoacer, commander of the German mercenary troops, to rule as Patriarch at Ravenna as his representative. At the command of Odoacer Romulus, the claimant of the western crown, was forced to yield it up. But the triumph of Odoacer was short. The East-Goths were moving toward the west. Their king, Theodoric, conquered Odoacer, and, though in reality king, he "reigned (493-526) by an imperial commission" as Patrician.[2] "Italy under Theodoric was the most peaceful and flourishing

to understood the "lightening like speed "with which they crossed Europe, mentioned by some writers. We look upon their western advances as that of a powerful people in search of homes or plunder. They were probably no more hideous, blood-thirsty, and cruel than the more ordinary run of invaders of those troublous times.

[1] Freeman: "Historical Course," p. 102.

[2] Freeman: "Historical Course," p. 102-3. "Historical Geography," p. 94-5.

country in the world, more peaceful and flourishing than it had been for a long time before or than it has ever been since till quite lately."[1]

In the meantime, the Eastern Empire was full of trouble. Though the religious history of this period will

Atilla at the Battle of Chalons.

be fully treated in the proper place, it is necessary to remark that already the Christian church was rent with dissensions. Arianism had arisen at Alexandria; Nestorian-

[1] Freeman: "Historical Course," p. 105.

ism, at Constantinople; and both had been condemned by the councils of the Catholic church, while the emperors were continually trying to mediate between these and other factions. The patriarchs at Constantinople, though

Odoacer Compels Romulus to Abdicate.

at the head of the Eastern Church, were always subject to the emperor; but at Rome, the bishops had drifted into popes, who were the acknowledged head of the Western (Latin or Catholic) Church, and were already beginning to gain ascendency in temporal power over political rulers. Now there was always a bitter enmity between the various

religious factions. The Goths and Vandals were Arian Christians. Theodoric ruled at Rome without stooping to the persecution of Catholics; but this stands out as an almost isolated example where, during medieval times, the sect in power did not persecute their weaker brethren.

When Justinian became emperor (527-565), he determined to unite the West with the East, and rule the whole in reality. His generals, Belisarius and Narses, entered Italy, conquered the Goths, and put an end to the Italian kingdom (553). Italy was now ruled from Ravenna by officers called exarchs. For two and a half centuries (550-800), there was no Western Empire. But another wave of Turanian people, the Avars, had now appeared in Central Europe, where they dwelt for nearly two and a half centuries (566-796). They took possession of the valley of the Danube.[1] They displaced a Teutonic people known as Lombards, who, in turn, sought homes in the valley of the Po (567). These Lombards formed the third Teutonic kingdom that had been formed in Italy; and they ruled nearly the whole of the peninsula except Rome, Ravenna, Naples, and Venice. Though Rome never fell before the Lombards, the Exarchate at Ravenna was finally conquered by them (753). The Lombards remained a power in Italy for centuries, and we shall hear more of them as we proceed.

In the fifth century, we find German tribes crossing the English channel, penetrating into Britain, and forming a host of petty kingdoms there, which finally shifted around into seven more or less well defined confederacies. The bonds of confederation were, however, very loose, and many tribes seem to have remained independent for a long time to come. Now three—Sussex (477), Wessex

(495), and Essex (500)—of these confederacies were of Saxon origin; three—Northumbria (547), Anglia (455-579), and Mercia (584)—were of Anglian origin; while one—Kent (465)—was of Jutish origin. All were "Low Dutch,"[1] that is coming from the low lands along the Baltic Sea. These loosely organized confederacies form the so-called Heptarchy, or Seven Kingdoms. The Angles have furnished us with the name of our English race, while from the combination of Angle and Saxon, we have the ethnical term Anglo-Saxon.[2]

Interest now centers in Gaul, and we must consider the rise of the Frankish power. Near the end of the fifth century, we read of Clovis (481-511), who made himself ruler of much of ancient Gaul. Around his head, there cluster many legends of his prowess and virtue, among which, the most often repeated is the one concerning the vase of Soissons—of "marvellous size and beauty." Clovis was a pagan, and this vase was among the plunder that his warriors took from the church at Rheims. At the request of the bishop, St. Reni, Clovis wished to return it to the church, but when the spoil was divided, an ill-natured Frank dashed it to pieces with his battle-axe. This was his right as a Frank, or "Freeman." But before a year had passed, Clovis found an opportunity when it was his privilege to punish the Frank, and struck him dead with a battle-axe saying: "Thus didst thou to the vase of Soissons."[3]

---

[1] The terms High Dutch and Low Dutch often occur in history, the former meaning the inhabitants of inland or Southern Germany, and the latter, the population of the lowlands along the coast. *Vide* "Historical Course," p. 107.

[2] *Vide* Buckley: "History of England," London, 1887, p. 13.

[3] For extended account *Vide* Guizot: "History of France," Black's translation, Boston, Vol. I. p. 138 *et seq.*

In regard to the life of Clovis, this much is true. He was the first Frankish chieftain to rise into prominence. The eyes of the religious world were upon him; and there was rivalry between the Arians and Catholics, each endeavoring to achieve his conversion. He (492) received in marriage Clotilda, the Catholic princess of Burgundy, and soon (496) became a devout Catholic. Henceforth he was the Catholic champion against the Arian West-Goths. At the battle of Poitiers (507), Clovis broke the power of the West-Goths north of the Pyrenees, and checked the further spread of the Arian religion in that direction. He defeated the Roman governor of Gaul and became, at last (508), consul by the appointment of the Emperor Anastasius. Under Clovis, then, we have the first appearance on the map of Europe of a state somewhat resembling modern France.

But this territory was to undergo many changes before our own times. When Clovis died (511), it was divided among his four sons. This line of rulers was known as the Merovingian dynasty. And the history of these princes was "one long, dreary story of blood, vice, and cruelty."[1] They became so weak and incapable that their provinces were ruled by deputies known as Mayors of the Palace.[2] The princes were mere figure-heads and, at last (751), passed away altogether. Pippin, one of these Mayors of the Palace, encouraged by the Pope, asserted his power, deposed the last Merovingian king, and ruled a united Frankish empire for seventeen years (751-768), gaining even greater renown than his illustrious father, Charles Martel (Mayor of the Palace 715-741), who gave the name of Karlings to this dynasty, and of whom we shall hear

[1] "Medieval History," p. 47.

[2] Really the tribal chiefs of the older period.

again in connection with the Lombards and the Saracens.

If we were to glance at a map of Europe showing the ruling people at the beginning of the sixth century A. D., we would perceive how thoroughly Western Europe had become intermixed with Teuto-Aryan blood. The Celts were driven either to the farthest corner of ancient Gaul and to the remotest shores of the British Isles, or had become the serfs of Teutonic over-lords. Cæsar's Gaul and Spain were occupied by the Teutonic kingdoms of the Suevi, West-Goths, Franks, and Burgundians. The East-Goths occupied the whole of Italy. The northern and eastern banks of the Rhine and of the Danube were the homes of the Saxons, Thuringians, Lombards, and Gepidæ; while the Angles, Jutes, and some of the Saxons had already reached the shores of Britain. The European possessions of the Eastern Empire had dwindled away to a small portion of the Hellenic peninsula south of the Danube river—Thrace and Illyricum. The Slaves at last take their place along the eastern borders of Teutonic realms, situated so as to receive the brunt of the later battles with the Avars and other invading Turanians.[1]

The Eastern Empire was at this time eking out an almost uneventful career. Theodosius II. (408-450) initiated the work of compiling the customs, usages, and laws of the Roman court into a code of laws. Justinian (527-565) took up the work and gave the world the "Justinian code," which is the foundation of much of modern European law. As a legislator, he had no equal among the early emperors. The imperial throne was occupied by Heraclius (610-641). During his reign, Jerusalem was captured by the Persians, but was afterward retaken. A new element in the world's history made its appearance early in the seventh century.

[1] Hallam: "Middle Ages," New York, 1880, Vol. I. p. 1-2.

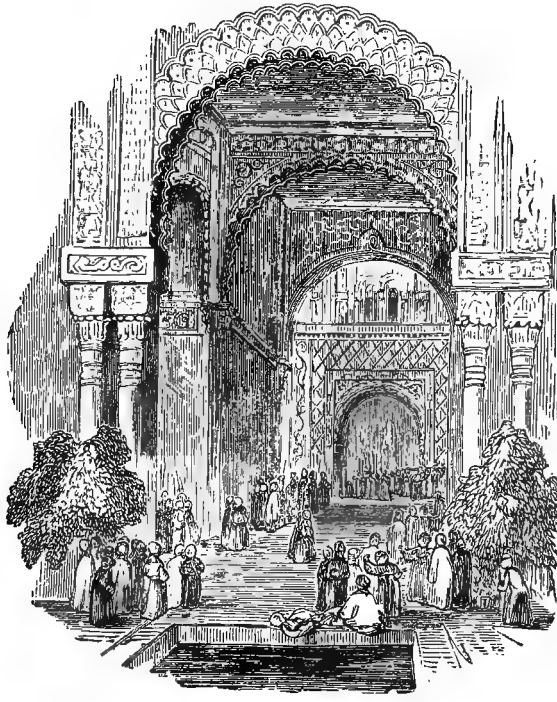
This was the rise of Mohammedanism. It was during the reign of Heraclius (June 18th, 622) that the Hegira of Mohammed occurred. And thus was inaugurated one of the most important religious movements of the world, one that was to weld the Semitic tribes of the desert into a powerful government, destined to make Christian Europe tremble before it.

Mohammedanism will be fully treated in its proper place. It is sufficient here to note that the founder belonged to the ruling family of one of the most powerful tribes of Arabs, the Koreysh tribe, which had for a long time ruled over Northern Arabia. Mohammed was born at Mecca, but was forced to flee to Medina, and this flight is the "Hegira" of Mohammedanism. The Mohammedan era dates from that event. The particular faith known as Mohammedanism is said to have been compounded from all the philosophical religions of that day. Its peculiar tenets are set forth in the Koran, the Bible of Mohammed. This new faith rapidly spread over the plains and deserts of the East, and especially among the wandering tribes of Arabia. The followers of Mohammed are called Saracens; and, with the battle cry of "The Koran, the sword, or tribute," they entered upon their era of conquest. The successors of the Prophet were called Caliphs.

Omar, the second caliph, was father-in-law to the Prophet. Under his rule the faith was carried into Syria, Persia, Central Asia, and Egypt. Alexandria was taken, and its famous library burned. The caliph claimed that if these books agreed with the Koran they were superfluous; if they disagreed, they were pernicious and ought to be destroyd.[1] The Ommiade dynasty of caliphs ruled at Damascus until 750; the Abbasside dynasty, at Bagdad, from

[1] Dawe: "Land Marks of History," p. 91.

750 to 1258, when the last caliph was slain by the grandson of the Mongol chieftain, Genghis Khan. These Saracens spread in every direction. They reached India on the east, and Spain on the west, the same year (711). Twice, during the first century of their existence, they besieged Constantinople. In 673 they were beaten back by



The Alcazar in Spain.
[*Saracen Architecture.*]

the armies of Constantine IV. Finally Leo I. (717) so utterly defeated them that no "Moslem army ever again appeared under the walls of New Rome until the caliphate had passed away and a sterner race of conquerors had assumed its mission."[1] The Saracens entered Spain (711),

[1] Freeman: "History and Conquests of the Saracens," London, 1876, p 91-2.

and in three years had completed its conquest.[1] The comparative ease with which they gained control of this peninsula is somewhat surprising; but, when we consider, that the population of Spain and Northern Africa were no doubt kindred, that the straits were the highway over which the Phoenicians and the other conquerors of Spain had passed, and that the mass of the population were held in the condition of serfs to foreign or West-Gothic over-lords, we can account for the rapid conquest of the country by the Mohammedans. As they spread over the peninsula, the most powerful Gothic chieftains rallied their tribesmen about them, fortified some mountain fastnesses, and waged continual warfare with the Saracens until the latter were finally driven out by Ferdinand and Isabella (1492). In fact, it is to these bands of independent West-Goths in their mountain homes that we are to look for the germs from which sprung the kingdoms of Castile, Aragon, Leon, and Portugal, and by the union of the first three, the kingdom of Spain itself.[2]

The Saracenic government in Spain is said[3] to have been one of the best of its age. Religious persecution happened only in cases where it was invited by zealots who had determined upon martyrdom. Literature was cultivated; and, in architecture, the ruins of the Alhambra[4] testify to the degree of perfection and grandeur which they had attained. In time (about 755), Spanish Mohammedans became alienated from their brethren in the East, and a separate caliphate (the Western) was formed. Not satisfied with the conquest of the peninsula, the Saracens crossed the Pyrenees and began to encroach upon the ter-

4 *Vide* Irving: "The Alhambra."

ritory of the Burgundians and Franks. The cities of Southern Gaul became for a time Saracenic.[1]

Charles Martel, though only a mayor of the palace, was really the chief man among the Franks at this time. As the Saracens grew bolder, by reason of a succession of conquests, they penetrated farther and farther into Frankish territory. Charles Martel summoned all the forces of Gaul, and met the invaders at Tours or Poiters (732). Another of the decisive battles of the world was fought, and the Aryan triumphed over the Semite. The Saracens were driven to the south of the Pyrenees, and these mountains henceforth remained the boundary between the two races in the West. By this battle, Europe was preserved to the Aryans.

It will be remembered that Charles Martel was the founder of the Frankish dynasty known as the Karlings.[2] When Pippin, the son of Charles, was king of the Franks, the Lombards,[3] after conquering nearly all of Italy, appeared at the gates of Rome. Pope Stephen III. invited Pippin to enter Italy and save the imperial city. Pippin was successful, and restored the exarchate to the empire. For this service, he was made patrician, or governor, of the exarchate (Rome and vicinity), for Rome still regarded herself as a part of the empire and bowed to the imperial authority at Constantinople.

Pippin was succeeded by his son, Charlemagne,[4] who raised the Frankish kingdom to its greatest power. His reign might be called the Golden Age of the Franks, as distinguished from the later French, for this people never again enjoyed such power and happiness as during his wise reign. Conquests were pushed in all directions.

[1] "Historical Geography," p. 111-12.
[2] Above p. 346. [3] Above p. 342. [4] Charles the Great, 768-814.

His armies were everywhere carrying peace to those who chose to submit to his authority, the sword to those who withstood his arms. The Saxons were his most obstinate subjects, for he tried to force them to change their religion. They desired independence and the privilege of worshiping

Defeat of the Saracens by Charles Martel.

their own gods. Though many of them submitted to baptism at the point of the sword, they worshiped their pagan gods in peace. The ruthless hand of the destroyer, however, cut down their images and defiled their sacred places. Revolt after revolt happened, proving to Charlemagne that they were still pagans, and the only way to save

their souls was to take their lives. So he assembled over four thousand of their foremost tribesmen and caused their heads to be struck off in one day.[1] The remnant continued to fight until each small band was conquered or annihilated.

The Avars were by this time crowding over the mountains and threatening the Franks.[2] They already held the Byzantine (or Eastern) Empire under annual tribute. But, toward the close of the eighth century, Charlemagne drove them back to their Danubian home.[3] The Lombards were again threatening the imperial city, and Charlemagne responded to her call for help. He (774) completely subdued these dangerous neighbors, and held them under subjection for the remainder of his reign.

The cruel Irene had usurped the throne at Constantinople. The Imperialists at Rome claimed that a woman could not be Caesar and turned their eyes toward Charlemagne, the saver of the imperial city, the champion of Christianity against Paganism, as the only proper person to occupy the seat of Caesar. Amidst great pomp and ceremony, on the last day of December, in the year 800, as Charlemagne knelt at the altar in St. Peters at Rome, Pope Leo III. placed upon his head a crown, and, amid the acclamations of the people, proclaimed him Emperor and Augustus.

In this manner was the Western Empire revived, though a Teuton wore the crown; and we must remember that the Western Empire was ever afterward a truly German Empire, and nearly all the emperors were kings of Germany. Charlemagne never became the slave of the

Pope. He openly differed from the church and its council by rejecting their decrees to authorize image worship when sent to him.[1] So, too, he was in advance of his time in regard to culture. His reign was a period when great progress was making; literature and art were encouraged; and, at his invitation, France became filled with scholars of the day.

The mind of Charlemagne was one of those master minds that could carry on conquest after conquest, spreading his power in all directions, and, at the same time, capable of conceiving and perfecting plans for the improvement of his subjects, for the advancement of education, and for the introduction of good government. Ordinarily, if the prince be a soldier, his mind is too much filled with his plans of conquest to be able to attend to his government; if he be a scholar and legislator, he is utterly incapable of defending his possessions from the encroachment of his neighbors. While Charlemagne was extending his empire in all directions, he was holding the reins of government with a strong hand; shaping the religion of the Catholic church; establishing schools throughout his vast domain; and bringing scholars from the ends of the world to preside over them. Though he was continually called upon to battle with Saxons, Danes, Saracens, Slaves, Avars, and Lombards, the internal portion of his empire was enjoying the prosperity of a time of peace, and reaping the rich rewards in culture that always attend such eras in the history of a country. When Charlemagne died (814), his empire extended from the Baltic to the Mediterranean and from the Atlantic to the banks of the Danube.[2]

[1] Stokes: "Medieval History," p. 51.

[2] We must not forget that Charlemagne is one of those persons

The Eastern Empire did not recognize Charlemagne as Emperor of Rome, neither did they acknowledge the right of the Pope to crown him. They went right on electing emperors, and they considered that "the emperor anointed

St. Sophia at Constantinople.

in St. Sophia had a right which none could take away, to reign over the Old Rome as well as the New. Each emperor (East and West) in short, asserted himself to be the one true Emperor and the other to be an impostor or a tyrant."[1] The act of Pope Leo III. in crowning Charle-

magne was an open and ever widening breach between Rome and Constantinople.

The two empires were now absolutely and finally separated, and henceforth led separate existences. So too with the churches, the Pope became the head of the Western Church, while the Patriarch at Constantinople became the head of the Eastern Church. As time passed, both empires and churches drifted further and further apart, and the most bitter hostilities and jealousies came to exist between them. The Eastern Empire and Church became decidedly Greek, and are often mentioned as the Greek Empire or the Greek Church. The Western Empire and Church as often bear the names of Latin Empire and Latin Church.[1] So great did the hostility bebetween the two become, that we shall find one army of crusaders turning aside to besiege Constantinople as though it were a city of unbelievers. But in the East, we will always find the Patriarch subject to the political power of the emperor; while, in the West, we must notice how the Pope began gradually to acquire political power until his decree of excommuniction was more powerful than the army of a prince.[2]

As the strength of the Mohammedans increased, the strength of the Eastern Empire decreased. Occasionally a superior line of sovereigns would gain control of the government and the empire would blaze out like a meteor among the powers of the world. The Basilian dynasty (867-1057) was such an one. Basil I. was a Macedonian.[3] During his reign, Photius was patriarch of Constantino-

ple and instructor of Prince Leo, the philosopher. The reigns of Leo (886-912) and of his son Constantine VII. (912-959) form "one of the most properous eras of the Byzantine literature."[1] During the childhood of Basil II. (963-1025), Nicephoras (963-969) and Zimices (969-975) were in turn raised to the position of colleague with the Emperor, by marriage with Theophona, the empress. They were the greatest generals of their age, and, in succession commanded the royal army. Basil profited by their training, and was one of the few of the later emperors who was able to lead his own armies to victory.

Under these three generals, the imperial army twice defeated the Russians.[2] The Bulgarians were conquered by Basil himself, and were most inhumanly treated. The boundaries of the empire again embraced the most of Asia Minor, the Euxine basin, the Hellenic peninsula, and a part of Southern Italy. But Basil seems to have introduced changes in the government, which, by promoting favorites to the chief positions, ultimately destroyd the old civil service organization. The Basilian dynasty came to an end in 1057 by the the nobles transferring the crown to one of their own number, Isaac Comnenus.[3]

The capital of the Eastern Empire was not only open to attack from the Turks and Mongols, but her relations with the Western Empire were becoming more and more estranged. In the West, the great crusades were forming. These crusades were great armies of men marching to the rescue of Jerusalem and the Holy Sepulcher. The commanders lacked power; and the soldiers of the Cross, unity and discipline. As they passed

[1] Gibbon's "Rome," Vol. V. p. 379.

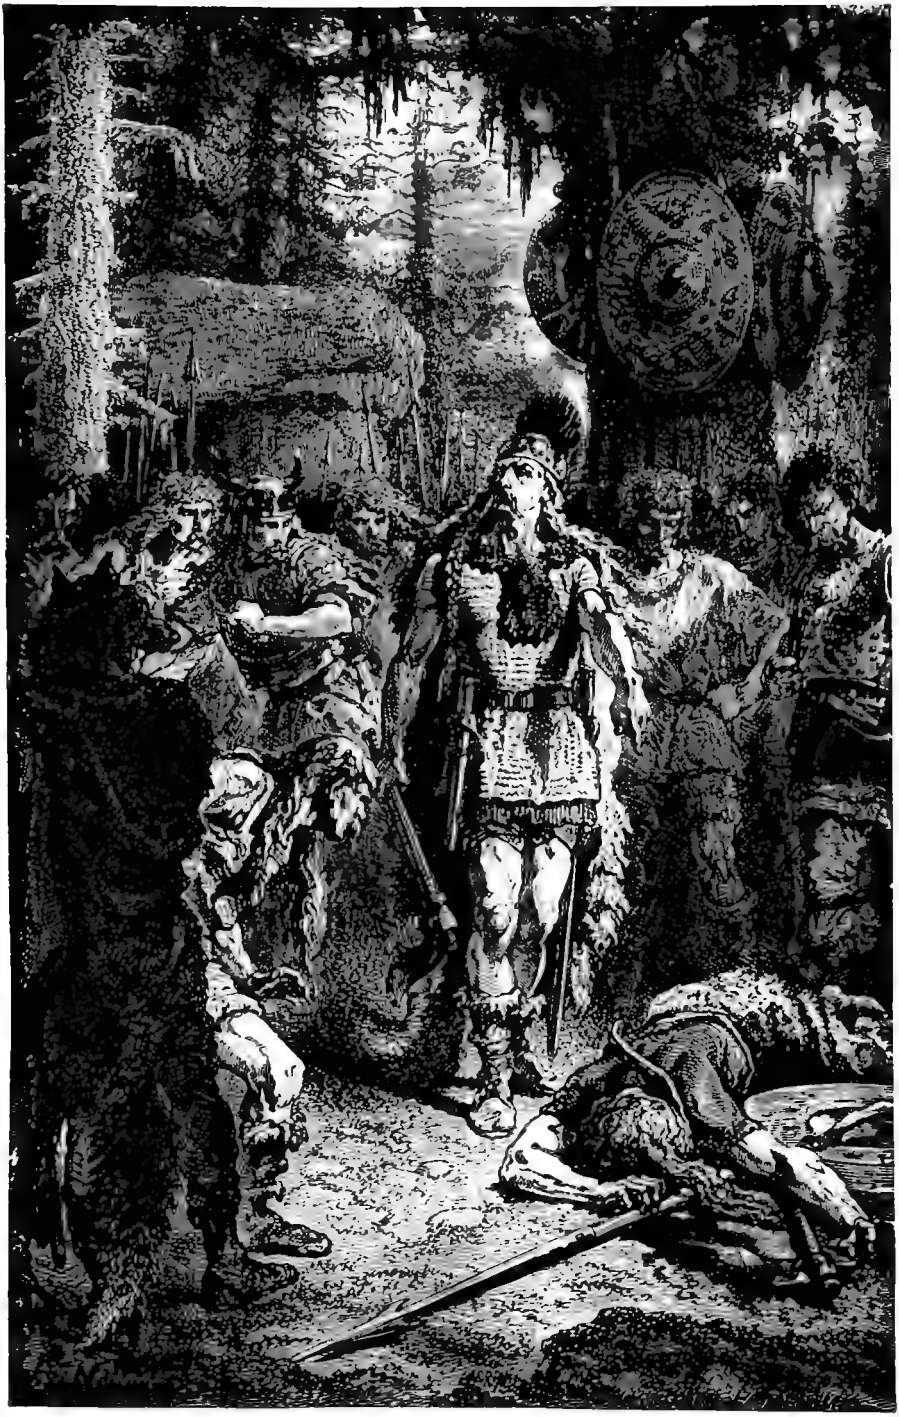
[2] These people had risen in power so as to become formidable to the empire, as we shall see in the proper place.

[3] *Vide* Gibbon, Vol. IV. p. 610 *et seq.*

through the country, they were very lax in observing the rights of property holders and the laws of hospitality. Constantinople, more than any other city, was subject to outrages from these lawless hordes, as they often encamped in that vicinity. Then, too, numbers of these western people adopted the eastern capital as their home, never returning to their native lands. Finally their presence became intolerable, and (in 1183) all the Latin residents in that city were massacred. The fourth crusade, therefore, turned aside from its real mission, twice besieged Constantinople, and captured the city in 1204. For nearly sixty years (1204-1261), a Latin dynasty ruled the Eastern Empire, although the Greek emperors ruled at Nicaea and Trebizond.

In a few lines, we can give the story of the final fall of the Eastern Empire, and with it the disappearance of the Roman Empire from the pages of history. The thirteenth century witnessed strange upheavals in the Orient. The great Genghis Khan subdued nearly all Asia to his rule. His empire, however, as rapidly disintegrated on the death of its founder, as it had sprung into being under the guidance of his genius. Out of the ruins of his empire, there arose into prominence the Ottoman Turks. They rapidly swallowed up the provinces of Asia; and in 1343, they entered Europe. Their season of conquest continued. They conquered the Slaves and the Hungarians. Under Sultan Bajazet, they triumphed over the combined forces of Europe (1396), led by king Sigismund of Hungary, at the battle of Nicopolis.[1] They drafted the flower of the Christian youth into their armies, so that their soldiers were as powerful as any in Europe. The knights of the

[1] *Vide* Vambury: "Story of Hungary," p. 183.



CLOVIS AND THE VASE OF SOISSONS. 359

West were powerless before them. At last, (1402) Sultan Bajazet sent a message to the Emperor which read: "By the Divine clemency, our cimetar has reduced to our obedience almost all Asia, with many and large countries in Europe, excepting only the city of Constantinople; for beyond the walls thou hast nothing left. Resign that city; stipulate thy reward; or tremble for thyself and thy unhappy people, at the consequence of a rash refusal."[1] The Emperor sought aid from the West but to no avail. But the Mongols, rising into power under Timour, or Tamerlane,[2] gained a respite of a half a century for the fated city, while the Turks were busy subduing the rebellious Mongols. The Ottomans, however, besieged the capital in 1421, but still she held out. The Greeks tried, in every way, to reconcile themselves with the Western Empire and the Western Church, but no substantial aid was sent.

Mohammed II. became Sultan of the Ottoman Turks in 1451. Crossing the Hellespont, he laid siege to Constantinople. On the twenty-ninth of May, 1453, that city fell before the arms of the unbelievers, and the Christian temple of St. Sophia became a Mohammedan Mosque. Eight years later the Sultan conquered the Greek empire of Trebizond. The Eastern Empire was no more. Rome, that proud mistress of the world, now existed only as the German Empire of the West; and the seat of Christian power and learning had passed into the hands of the unbelievers. The Turkish power continued to spread, although it had met with some checks by the Hungarians under the great "Raven Knight," John Hunyadi, but this was for a moment only. When the Turkish Empire had

1 Gibbon, Vol. VI. p. 243.

2 Probably a Turk. *Vide* "Historical Course," p. 225.

attained its greatest European limits, it included the Euxine basin, Podolia, Moldavia, Transylvania, and a large part of Hungary. From these boundaries, it has since greatly fallen away.

Fall of Constantinople.

Returning now to the west of Europe, let us take up the thread of history with the successors of Charlemagne. They were weaker and less capable rulers than their illustrious ancestor. By the treaty of Verdun (843), the great empire which he founded was divided among his three grandsons. Charles the Bald was given rule over the Western Franks, who afterward became the French. Lewis became king of the Eastern Franks, or Germans

proper. Lothair was called king of Italy, although his dominions extended in a broad belt from below Rome toward the northwest, between the other two kingdoms, even to the German ocean. Here we have the germs of three prominent nations of our day, although there was

The Huns in Germany.

much shifting about and changing of border lines before they assumed their modern shapes. Nearly the whole territory was again united under Charles the Fat (884-887). Then it again fell apart, and broke up into many king-

doms, principalities, dukedoms, and commonwealths. But throughout all this series of changes, the Western Empire of Rome was still feigned to exist, and one of the kings was elected as emperor.

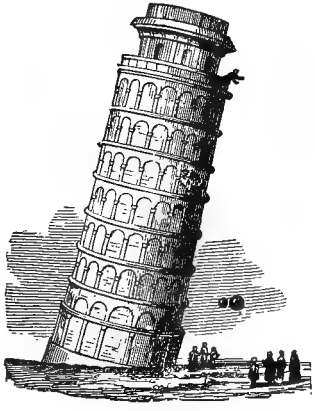
Perhaps the best way of treating our subject from this point is to give a brief outline of the various modern nations in Europe, as they gradually emerged out of these three divisions of Charlemagne's empire. Under the successors of Lothair, Italy was a hot-bed of contending factions. The Greeks entered and occupied Lombardy. The Saracens occupied Sicily and extended their conquests further north. The Magyars penetrated the peninsula from the north, and the Northmen ravaged the coast. Then there came a time when a number of petty kings contended for superiority in Italy. The greater part of Lotharingia had by this time fallen away.

King Otto the Great, of Germany, came to the rescue of Italy, was crowned emperor (962), and Italy was united to Germany. Henceforth it was a rule, that "the king of Germany had the right to be crowned king of Italy at Milan, and to be crowned Emperor at Rome."[1] Now the petty kingdoms were held in check, and the independence of the principal cities was encouraged. Thereafter many of them became republics, or commonwealths, and rose to enormous power and wealth. They made wars and thus added to their possessions, so that their power was by no means limited or indicated by the extent of their city walls. The most important of these cities were Venice, Genoa, Pisa, Naples, Florence, Milan, Verona, Padua, and, of course, Rome as head of the states of the church. Nearly all of the cities of Italy were at times, and some of them at all times, fiefs of Rome. At Florence, the

[1] Ibid. p. 140.

home of Dante (1265-1321) and the birthplace of Michael Angelo (1475-1564), there arose the renowned house of the Medici, that furnished a number of popes, and caused much trouble to the emperors.

While Frederic Barbarossa was emperor (1152-1190), the great Lombard league of the cities of Northern Italy was at the height of its power. There were two factions of cities, Guelphic (Imperial and anti-Pope) and Ghibeline (Popish and anti-Emperor). "Round Guelphic Milan and Ghibeline Pavia, gathered a crowd of famous names: Como, Bergamo, and Brescia, Lodi, Crema and Cremona, Tortona, Piacenza, Parma, and Alessandria."[1] Barbarossa was defeated (1176) by the Ghibelines, and the Lombard cities gained their independence.[2]



Leaning Tower at Pisa.

Pisa, Genoa, and Venice were the great naval powers of medieval times. The former is said to have "forestalled the crusades and won back lands from the Saracens." While an idea of her greatness is still to be gained by her "cathedral, baptistry, and bell tower." Genoa was still more powerful. She extended her commerce to the Black Sea, on whose shore she built factories. She defied the navies of the world, for she could muster and man an armament of one hundred and fifty-five galleys—in one battle conquering the navies of the Venetians, the Catalans, and the Greeks. At last (1378), she threatened Venice herself with siege. But on

[1] "Historical Geography," p 237.

[2] This was during a period when the popes and emperors were contending with one another for precedence in temporal power.

the whole, Venice was the greatest of the three powers and retained her independence until modern times.

When Atilla led the Huns into Italy, they destroyed the city of Aquileia, and her inhabitants fled to the islands of the Adriatic, where they laid the foundations of Venice (452). This city grew and flourished. For a number of centuries, she acknowledged allegiance to the Eastern Empire, but joined the Lombard league, and finally rose to the chief place among the maritime powers of the world. She gained her independence with the rest of the Italian cities. Then she first became an oligarchy (1297), then a republic (1311), remaining such until 1797. We must not regard Venice as merely a city built upon a few islands at the head of the Adriatic. But from that as a center of action, she extended her power in all directions; on the mainland, along the eastern shore of the Adriatic, Dalmatia, Crete, Cyprus, Thessalonica, the Peloponnesus; in fact, she became mistress of the Adriatic and Ionian seas. In naval warfare, she was all-powerful, and was acquainted with the most advanced methods,[1] deeming herself, even in her last days, powerful enough to offer war to England.[2] Her seamen taught other nations the science of navigation as we shall see. When Constantinople fell, she became the bulwark of Christianity against the Turks upon the sea, as Poland did upon the land.

In Southern Italy, the kingdom of Naples arose and grew into the kingdom of the two Sicilies. The foundation of this power was laid by the Normans (of whom we shall speak again), who appeared on the scene early in

[1] *Vide* battle between the Venetians and Normans in Barlow: "The Normans in South Europe," London, 1886, p. 171.

[2] Patton: "Modern History," Philadelphia, 1887, p. 345.

the eleventh century. Their leaders were the De Hautevilles, and came from France. They sought conquest and empire in Italy and found both. Apulia, Naples, Sicily, were conquered in succession,[1] and Roger II. added Capua and a large tract in Northern Africa, reigning over the whole as vassal of the pope.[2] These Norman rulers interfered with the affairs of the two empires, and were among the foremost leaders in the Latin conquest of Con-

The Rialto at Venice.

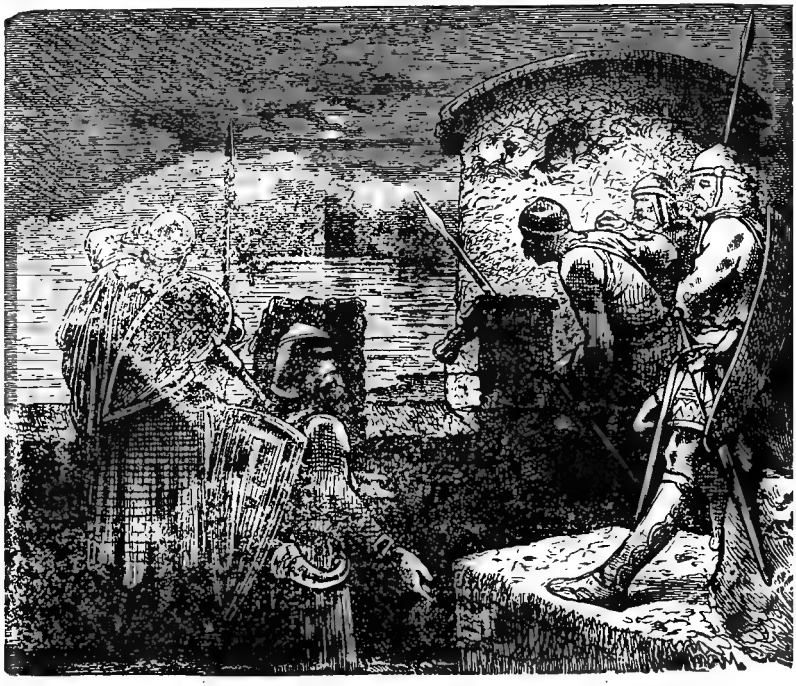
stantinople. They finally became so powerful as to alarm the popes who then favored the Angevin claimants to Italian possessions. Charles of Anjou was raised to the

[1] *Vide* Jewett: "Story of the Normans," New York, 1887, p. 138 *et seq.*

[2] The De Hautevilles were the tools of the Pope [*Vide* Barlow: "Normans in South Europe."] Although they were powerful enough to be independent, they were aware that they were foreigners and usurpers; and they gained much local power and protection from interference on the part of other rulers by holding their possessions as fiefs of the pope.

throne of Naples (1272) and ruled also at Acre as king of Jerusalem. The Spanish Aragonese princes were also claimants to the throne of Naples. Sicily revolted to them in 1282 and Ferdinand was at last (1464) fully recognized as the king of the two Sicilies.[1]

On the whole, however, this was not an unprogressive period for Italy. During this and successive periods the



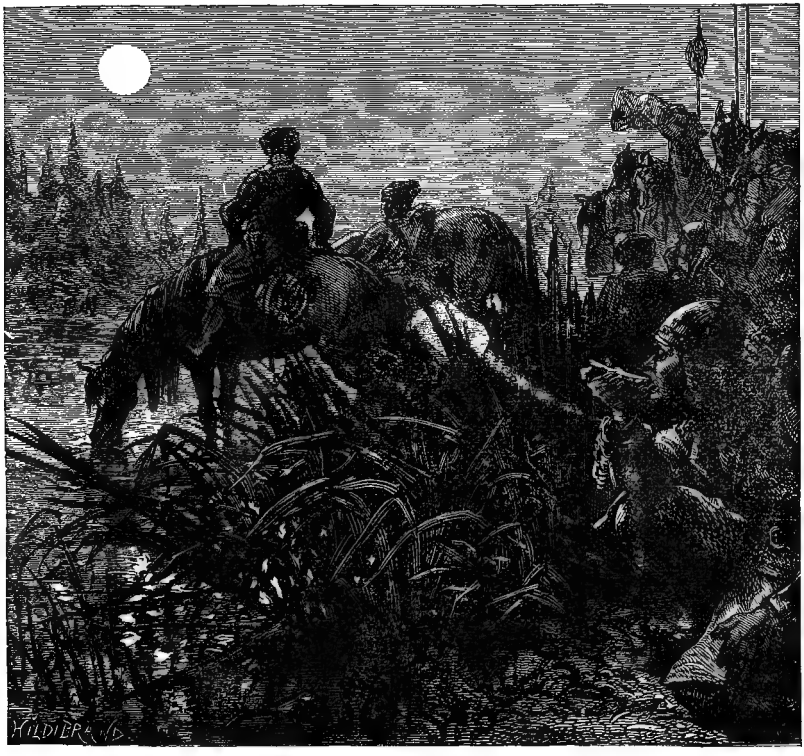
The Norsemen Menacing Italy.

peninsula first fell asunder into principalities, which vanished before the growth of free cities, then these cities became principalities which all have merged into the present kingdom of Italy under the rule of the Savoy princes.

Turning our attention to Germany proper, a wide and

[1] "Naples and Sicily."

confused field of observation is before us. But all through the history of Germany, we must bear in mind, that the king was elective, and that the country was broken up into many independent principalities, duchies, etc., whose ruling men, and, finally, whose princes formed the council of the kingdom and the electors of the king. The dynasty of



Mongols Crossing the Volga.

the Karlings lasted nearly a century when the Saxon Duke, Henry the Fowler, was elected to the throne (918-936). He was called upon at once to defend Western Europe from a new people, who had settled in the Danubian region.

These were the Magyars, a Finnish or at least a Turanian people, who have to this day retained their Ugrian

form of speech. They founded there a state that afterward became the kingdom of Hungary and one of the principal divisions of the Austrian empire.[1] Although they had become Christianized, they had not lost their love of war and conquest. In fact, the gold of the Karlings had more than once saved their kingdoms from Magyar inroads. Henry the Fowler agreed to pay tribute for ten years, and during that time he organized a powerful army and built defenses for the protection of his subjects. At the end of the truce, he was not only determined to stop tribute, but to defend his kingdom, and was successful in doing both. He also made the Danish king his vassal.

Otto I. (936-973) was the "greatest sovereign of the tenth century."[2] He not only crushed the Magyar power, but twice delivered the Pope from the power of petty Italian kings. He was crowned emperor (962) at Rome; and, as we have stated, henceforth the king of Germany was considered heir to the thrones of Italy and the Empire. The imperial crown was received from the hands of the Pope. So far as Germany was concerned, this was not a wise step; for nearly all the rulers who held the triple crown were obliged to neglect the affairs of Germany for those of the Empire, to the detriment of the former. It was customary in those days for bishops, prelates, and abbots to have temporal possessions, and so they became members of the national council. While the king was away attending to his imperial duties, the power of the central government was growing weaker through the demands of the princes, bishops, etc., for greater privileges. But Otto was strong enough to retain his full powers. The

[1] Vambury: "Story of Hungary," p. 28 *et seq.*
[2] Stokes: "Medieval History," p. 79.

boundaries of the empire were enlarged. The kings of Denmark, Poland, and Bohemia were his acknowledged vassals.[1]

Conrad II. (1024-1039) introduced the Franconian line of emperors. Of this dynasty, Henry III. (1039-1056) stands out pre-eminent. In his time, the pope bowed to the temporal power of the emperor. But from his time down, the pope grew in temporal power while the emperor decreased in equal degree. Henry III. entered Italy, deposed three rival popes, and appointed a succession of Germans to the office of chief pontiff, by the first of whom he was crowned emperor. Henry also wore the kingly diadem of Burgundy, so that he possessed four crowns, thus we can see how the boundaries of the empire were changing.[2]

From this time the quarrel between prince and pope grew more bitter. A number of modern nations had begun to form, and the kings of all were devout Catholics, usually ready to fight the battles of the pope and especially when invited to make war against their own natural sworn enemies. The popes were not now dependent upon the temporal power of the emperors, and began to try to render the latter submissive to their dictums. While Henry IV. (1056-1106) was emperor, the great Hildebrande (Gregory VII.) was pope, and he strove in every way to establish the supremacy of the church. He was the first pope to enforce the law that the clergy should not marry, and he established the further rule that no

1 Ibid. p. 55.

2 Burgundy was the name of first, a kingdom, which was often independent, or, at most, a vassal to some greater power, usually Gemany; second, a duchy entirely distinct from the kingdom and usually, if not always, vassal of the French king; third, the country which was a part of the kingdom and a fief of the empire. They all were from the middle or Lothairingian kingdom. *Vide* "Historical Geography"

temporal prince "should bestow any ecclesiastical benefices." The emperors and princes were very jealous of this right of "investiture," whereby they might reward their friends, who were not soldiers, with abbacies and bishoprics. From this time, there was much fighting between the armies of pope and prince over this one cherished privilege. Henry IV., refusing to submit, waged war against Gregory VII.; but the pope's curse against his followers brought the emperor to Conossa as a suppliant, but only to return, raise a new army, and banish Gregory from Rome. Henry V. (1106-1125) inherited the struggle, and so it continued.[1]

The Hohenstaufen dynasty succeeded to the imperial throne in 1137.[2] They were dukes of Swabia and were violently opposed to the dukes of Bavaria. The followers of the one were dubbed Ghibelins (Waiblingen), and those of the other Guelfs (Welf). But the popes were at the bottom of this quarrel also; and, as we have already seen, the former were imperialists and the latter papists.[3] The Hohenstaufens, therefore, inherited this old quarrel, though they were the most devout of Catholics and were foremost in their crusades against unbelievers.

The most illustrious rulers of this line were the two Fredericks. Frederick I. (or Barbarossa–red beard–1156-1190) spent most of his time in Italy, where, as we have seen, he was defeated at the battle of Legnano (1176) by the Lombard league. This is recorded as a great victory for the papists. His rule in Germany, as she was left

principally to herself, was "peaceful, flourishing, and popular." But the Guelfs, under Henry the Lion, caused some trouble. Barbarossa entered upon the third crusade,

Barbarossa Asking Aid of King Henry.

leading a land force to the aid of Richard of England and Philip of France, but was drowned while crossing a stream

on the way. He left the enviable name of the greatest of German emperors after Charlemagne.[1]

Frederick II. [1212-1250], grandson of Barbarossa, came to the throne while a mere boy; and, before he reached maturity, was forced to dispute his throne with two powerful rivals—Philip of Swabia and Otto IV. of Brunswick. He was usually successful in his wars, though the popes were continually stirring up his subjects to rebellion. He regained some of the territories that his predecessors had lost, and, in the end, possessed seven crowns —those of the Empire, Germany, Lombardy, Sicily, Burgundy, Sardinia, and Jerusalem. In order to lessen his power, the popes kept him under the ban of excommunication during the whole of the latter part of his reign. Pope Gregory IX. finally sent him on a crusade. Sickness prevented his reaching the Holy Land at first, but the pope refused to listen to his messengers. When, at last, he did reach Palestine, he accomplished more than any one who had preceded him, for he forced the Sultan to a treaty whereby all the holy places were recovered,[2] though it is said that the pope ordered all eastern Christians to hold aloof from him and render him no aid. When he returned, crowned with success, the bans were not removed. As Freeman[3] says, he was "cursed first, for not going on the crusade, then cursed again for going, cursed most of all for actually winning the prize of so many struggles." When Frederick returned, he found his vassals in rebellion, and a new blast of papal anathemas awaiting him. At last the bans of the pope had the desired effect. To gain the smile of the pope, his vassals fell away from him, one after another. They sought to divide the empire among

[1] Ibid. 120. [2] Ibid. 132.
[3] "Chief Periods of European History," p. 163.

themselves, for now they had an excuse. "The robbers rejoiced over their spoils. Then were the plowshares beaten into swords, and the reaping-hooks into lances. No one went anywhere without steel and stone to set in a blaze whatever he could fire."

Frederick II. died (1250), and the Hohenstaufen dynasty lasted only four years longer. With it, the glory of the empire passed away from Germany. No prince was found daring enough to accept the imperial diadem while the fates of the Fredericks were fresh before their minds.[1] A long inter-regnum followed (1256-1273), with no one at the head of the empire, every prince was independent. There was no power to restrain the ambitious. Everyone did as he pleased. There arose a generation of "robber knights," who built strong castles in places easiest of defense. Rushing out from their defenses, they plundered travelers and the unprotected, robbing, murdering, and imprisoning for ransom the men, and making the women captives. It was a terrible time for Germany, and those princes who desired to restore order were almost powerless. There arose during this period, for the protection of trade, a number of mercantile leagues that gained enough power to carry on wars and to make treaties. The most noted of these was the Hanseatic League, of which we shall say more in its proper place.[2]

Up in the mountains of Switzerland, there lie the ruins of an old castle, that was built in 1020. This was the cradle of the imperial house of Austria. Here the Hapsburgs rose into power. From this old castle, the German empire finally chose an emperor, Rudolph (1273-1291), a vigorous, energetic man, capable of restoring order in Germany. He began by engaging the king of Bohemia

[1] "Story of Germany," p 136. [2] Ibid. 146-7.

in battle, in which Rudolph was victorious, and by which he gained the Duchy of Austria and other possessions in Central Europe,[1] which have ever since remained in possession of the Hapsburgs. Rudolph is said to have destroyed seventy castles of robber knights in Germany. It was during his reign that the foundation to the Swiss Republic was laid. Three cantons—Uri, Schwyz, and Unterwalden—rose in rebellion, formed a league, and later, established their independence.

Albert (1298-1308) established himself on the throne by the defeat of Adolph of Nassau. He sent the "tyrant," Gessler, as governor to crush the Swiss revolt. A half-witted peasant[2] shot him, and Albert himself was assassinated by orders of his nephew, John, a pretender to the throne. Thus we are furnished with the facts from which the fable of Tell and the apple has arisen. The reign of the Hapsburg dynasty was broken (1308-1437) by a succession of emperors elected from the various princes of Germany, Hungary, and Bohemia. The most distinguished of these emperors was Charles IV. (Bohemia, 1347-1378) who is renowned as the author of the famous "golden bull," so-called from its seal of gold. This edict established (1356) a fixed number of electors, by whom and from whom the future emperors should be chosen. It further fixed the place of election at Frankfort and the place of crowning at Aix. The electors were seven, as follows: Princes of Bohemia, Brandenburg, Saxony, and the Palatinate of the Rhine; and the archbishops of Mainz, Cologne, and Treves.[3]

Another house now makes its appearance in Germany.

MARAUDING NORSEMEN.

In 1415 Frederick, count of Hohenzollern, was granted the march of Brandenburg. From that time, the princes of that house have been prominent among the rulers of Europe.[1] The Hapsburgs came into power again with Albert II. (1438-1439). From that time until the male line became extinct (1740), the emperors were of the old Hapsburg dynasty. Emperor William of our own time is a Hohenzollern, descended from the old line of counts.

We have reached a period when religious reforms began to be preached. John Huss and Jerome of Prague were boldly denouncing the evils that had crept into the church. When Sigismund of Hungary was emperor (1410-1437), so great had become the agitation that the council of Constance was evoked by Pope John XXIII., who was himself deposed on account of his enormous vices.[2] This is the period of the Hussite war and of the burning of Huss (July 6th, 1415) and of Jerome of Prague (May 30, 1416). The Germans were in open rebellion against the popes, and were rapidly approaching the great Reformation. Just at a time when the Eastern Empire was breathing its last, they were initiating new movements destined to set the Aryan world ablaze.

Just as new life and new energy arose from the baptism of the Western Empire with Teutonic blood, and new nations mounted into existence, we see the mighty agencies forming in the old German land, destined to lift civilized nations into the blaze of modern enlightenment. The fagots that burned the reformer Huss, cast their rays of light into the ends of the world. Illuminated by their

[1] Frederick V. of this house was raised to princely rank in 1363, another Frederick was made Elector of Brandenburg in 1415, and another Frederick was made king of Prussia in 1701.

[2] Hallam: "Middle Ages," Vol. II. p. 39.

fading light, we catch sight of the mechanic, Gutenberg, fixing the last bolts and driving the last screws into the first of those great "educators of the people," the printing press. Nay, before the followers (1450) of Islam had entered the gates of New Rome, he had given the first press to the world. Then, too, we see the powers at work that were to call out just such rugged natures as those of Martin Luther and his heroic followers. Though these great changes were to cost the world many lives, and much wealth and suffering, we, of the nineteenth century, ought to be the last to say that they have been purchased at too high a price.

We must now trace the development of France from the triple division of Charlemagne's kingdom.[1] The kingdom that fell to Charles the Bald (843-877) barely occupied that portion of Gaul west of the fifth meridian east of Greenwich, and was called Karolingia. It was broken up into duchies, principalities, etc. The most powerful among its petty rulers was the duke of Frankia. While the Karlings still spoke German, these dukes and their subjects spoke a Latin dialect out of which has developed the modern French language. The reign of Charles the Bald is spoken of as a creditable one. He endeavored to follow the course that his grandfather, Charlemagne, had instituted. He was a patron of literature and education. He gathered scholars around his court The famous John the Scot[2] was invited from Ireland to preside over the Palace School established by Charlemagne. Charles made the possessions of his fiefs hereditary in certain families; and, from that time, the power of the Karlings was on the decrease, while that of his vassals grew—the dukes of France more than any others.

1 Above p. 362.

2 Johannes Scotus Erigena.

Odo, duke of France, was finally elected king by the nobles (866-898), but again the crown returned to the Karlings. During the next century, there was almost continual strife between the Karlings and the French dukes. When the former wore the crown, the capital of the kingdom was at Laon; when the latter ruled, it was at Paris. During this time, the greatest event that happened to France was the arrival of the Northmen, or Normans. This new element in the history of Southern Europe made its appearance during the reign of Charlemagne, and led him to prophesy its future greatness.[1] They came from the north lands and so were called Northmen or Norsemen. Their ships sailed far and near; and, appearing suddenly upon some unprotected coast, they plundered its inhabitants without constraint. So they were called vikings or "sea robbers." During three centuries (800-1100), scarcely a foot of the North Atlantic's surface was unknown to them, from Greenland to Hellas, from Vinland to the northern coast of Russia.

Were we to seek the origin of these hardy, daring, giant sailors, with their blue eyes and their blonde hair, we would have to visit the Baltic homeland of the Aryans. Could we but penetrate further into the pre-historic past, we might find these people sharing with the Germans the honor of ancestry of our own race. But as the Northmen penetrated to the north toward the frozen sea, we find them shading off into Turanian—Finns and Lapps. They were also called Scandinavians. By the time of Charlemagne, three kingdoms had arisen in these northern regions—Denmark, Norway, and Sweden. The Western Empire, from Charlemagne's time down, had much fighting with the Danes. The Swedes controlled the Baltic

[1] Jewett: "Story of the Normans," p. 11.

basin, pushed to the east, and, in the tenth century, settled in Russia, laying the foundation of the modern Russian

The Vikings.

Empire. The Norwegians and Danes combined ravaged the coast of Europe from Flanders (Holland and Belgium)

to Asia Minor, completely terrorizing the inhabitants of France and Britain. That these Northmen were not lacking in culture is proved by that store-house of literature which they have left—the Eddas—composed as early as the eighth century, and preserved on the island of Iceland, cut off from all other influences.[1]

The visits of the vikings to the coast of France became more and more frequent. First they came on flying expeditions for plunder; next they built forts, which they occupied for several seasons in succession, and into which they could safely gather their stores; then at last, they came to settle and found homes for themselves, giving up their roaming lives. In 912, a large band of Northmen, under Rolf or Rollo, took possession of Rouen. In order to gain his friendship, king Charles the Simple (893-929) ceded to him a large province in Western France, which he was to hold in fief to the king, but on the condition that he was to be baptized and receive Christianity.[2] To seal the treaty, the king's natural daughter was married to Viking Rolf. Now that these Northmen had possessions in France, and had become vassals of the French king, they adopted the language, dress, and manners of the French. They became Normans and their chief, the duke of Normandy. They were ever ready, however, to assert their independence of kingly authority, claiming as many rights as their overlords.[3]

The Karlings were superseded by the French dukes,[4]

4 Hallam claims that Hugh Capet's accession to the throne was an usurpation. "Middle Ages," Vol. I. p. 30-31.

when Hugh Capet was chosen king (987-996), and then modern France appears in history, for we have now a French people, governed by a French king, who spoke a French language, and the capital of the kingdom was Paris. The number of hereditary fiefs had increased from twenty-nine to fifty-five. However, a few of the great vassals occupied a greater portion of the kingdom and the remainder did homage to them. These greater vassals were six in number, as follows: the counts of Flanders, Champagne, and Toulouse; and the Dukes of Normandy Aquitaine, and Burgundy.[1] And now a feudal monarchy was fully established.[2]

For a long time before and after the accession of the Capets, France can be said to have no national history. The king of France was not powerful enough to compel obedience from his great vassals. Indeed they were nearly all equal in power; and, during the reigns of the first four Capets, they were too busy with quarrels among themselves to trouble the outside world very much. Every great vassal was lord over a number of barons, who, in turn, had their vassals.[3] Every chieftain was independent to rule his own subjects, and every great vassal had power to make treaties and alliances, to wage war and make conquests. Therefore, it is not surprising to find the dukes of Normandy, the most independent of all, continually at war with their neighbors, and even in open rebellion against their lord the king.[4]

[1] *Vide* Hallam Op. cit. p. 35, and compare with Stokes: "Medieval History," p. 88, who mentions the count of Vermandois instead of Toulouse, and adds the duke of Brittany.

[2] Feudalism will be treated in a following chapter.

[3] Hallam, Op. cit. p. 36.

[4] In treating of England we will see how the duke of Normandy became king of England, and thus one of the vassals of the king of France became more powerful than his master.

From the time of Louis VI. (1081-1137) it became the open policy of the French kings to reduce the power of their vassals, and especially that of the Norman dukes. Louis VI. and VII. spent their energies in building up the power of the towns to the detriment of the nobles. It was, however, a flourishing period for agriculture, commerce, and internal improvement.[1] At last Philip (II.) Augustus (1180-1223) succeeded to the throne. He is represented as a cool, calculating, capable ruler—"a great king but not a great man." He found Henry II. of England still in possession (as duke of Normandy), of his great dominions in France; and he began, at once, to lay plans for undermining the English king's power. The entire military forces of England and Normandy were called into activity to repel the encroachments of Philip. Henry II. and his successor Richard I. (Couer de Lion) were able to hold their own against king Philip. In fact, Richard, Philip, and Frederick Barbarossa, had united their forces for the third crusade. But John, Richard's brother and regent, was unable to maintain his rights against the French king. When Richard died, young prince Arthur was murdered (perhaps by John his uncle), and John became king of England (1199-1216.) Philip immediately summoned him, as vassal duke of Normandy, to appear at the court of France in answer to the charge of murdering Arthur, who was the choice of the Norman nobles for the vacant throne. John refused to come, and Philip, declaring his continental possessions forfeited, poured his armies into Normandy, and wrested all except Aquitaine, Gascony, and the Norman islands from England.[2] Philip began also the crusade, or "Albigensian war," against the

1 "Medieval History," p. 146-7.
2 "Historical Geography," p. 333-4.

Manichæans in and around Toulouse. The result of this struggle was the annexation, during the thirteenth century, of a number of provinces—Beziers, Narbonne, Nimes, Albi, Toulouse—which form the valuable province of Languedoc.[1]

Louis the Pious, or St. Louis (1227-1270), "was perhaps the best king that ever reigned, unless it were our own (English) Aelfred."[2] Louis conquered his enemies by arbitration and by just and faultless action. His vassals came to look upon him as their judge and legislator, rather than their master. His yoke sat so lightly upon their shoulders that they perceived not the "transition of the French constitution from a feudal league to an absolute monarchy."[3] By his virtue, justice, and moderation, he raised the power and influence of his kingdom to a much higher level than his more war-like and ambitious predecessors. Thus, during his reign of nearly half a century, we see France, under the smile of the goddess of peace, making enormous strides in culture and internal prosperity. All the feudaries were inspired with confidence in their monarch. France "had havens on the three seas, the Mediterranean, the Ocean, and the Channel." She was prosperous and growing, while Germany was struggling with her Italian dependencies, or was at the mercy of her "robber knights."

About this time, Paris reached her highest fame as a seat of learning. Her university attracted such men as Roger Bacon, Albertus Magnus, and Thomas Aquinas. Louis advocated the highest education for theologians, who only should dispute with unbelievers. If a layman "heard a man to be an unbeliever, he should not dispute with

1 Ibid. 335. 2 "Historical Course," p. 182.
3 Hallam: "Middle Ages," Vol. I. p. 43.

him, he should at once run his sword into his entrails, and drive it up to the hilt." His zeal and bigotry were the cause of his dying outside of his kingdom. He organized and led the last two crusades, dying before Tunis while besieging that city. He had heard that its ruler were longing for Christianity, and he was carrying it to him according to the manner of his age.[1]

Philip the Fair (1285-1314) added Navarre to his kingdom by marriage with the heiress, Joanna. Finally (1312) Lyons was annexed. For openly defying the pope (Boniface VIII.) for usurpation of power belonging to the temporal ruler, he was placed under the ban of excommunication. Pope Clement V. was more lenient with him, for he sought, by alliance with France, protection from the Emperor. The papal chair was removed to Avignon where it remained for seventy years, known as the "Great Captivity." This is recorded as a great victory for prince over pope. The house of the Capets passed away with the death of Charles IV. (1328). Philip of Valois succeeded to the throne in 1350. The rivalry between the French king, and the Norman duke (or English king), was the cause of much quarreling between France and England during all this time. Edward III. of England urged his claim to the crown of France as the son of Philip the Fair's daughter Isabel. And thus began the "Hundred Years War" (1337-1453), which was carried on, with short intervals of peace, during a succession of five English and five French sovereigns. During a portion of the time, the English were supported by the emperors, and the French by the Bohemian kings. For many years, the English were conquerors, and boasted of great victories at Crecy (1346), Calais (1347), and Poiters

[1] Ibid. p. 52.

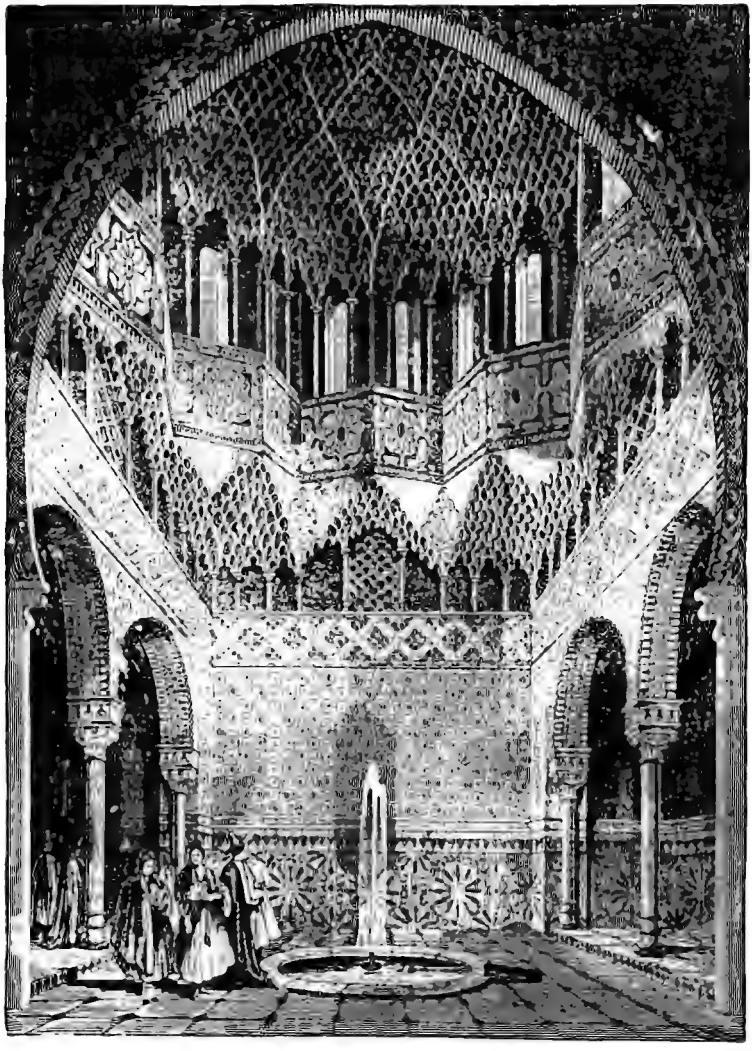
(1356), from which field the French king John was carried a prisoner to England.

Fortune continued to smile upon the English during the next century, for they won the battle of Agincourt (1415), and captured Rouen (1419). Finally, to close this eventful period, that strange personage, professing divine guidance, came to the aid of the frightened king, Charles VII. (1422-1461). When France had lost almost everything; when Paris was occupied by the English; when the English king, Henry VI., had been crowned king of France at Paris (1431); when all France was discouraged, a peasant maid, Joan of Arc, Maid of Orleans, appeared at the head of the disorganized French army, and, in two short years, succeeded in so turning the tide of affairs that English power in France was completely crushed.[1] The war dragged on for twenty years longer, however, though there was not much fighting.

The internal history of France during this whole period is, as we could expect, only a story of confusion, misery, and ruin. When King John was taken captive to London, there was no political head to the kingdom; and an attempt was made to organize a "popular and constitutional government". This led to a peasant war (the Jacquerie), under a leader named Caillet (nicknamed Jacques Bonhomme). Later (1413) another popular insurrection was instituted by one Caboche. Both were miserable failures and cost the lives of many peasants. They were only the harbingers of that greater uprising of a later time—the French Revolution. The medieval period closes with the French kings masters of nearly all of modern France, and stronger than at any previous time.

1 For extented history of Joan of Arc, *Vide* Guizot: "History of France," Vol. III. p. 90. *et seq.*

The Western Mohammedan Caliphate[1] came to an end (1031) by breaking up into a number of small Saracenic



Hall in the Alhambra. [Spain.]

states. The Gothic chieftains, who still retained their independence in their mountain homes, now found them-

[1] Above page 350.

selves able to take the offensive against these small powers where they could accomplish nothing against a united Mohammedan power. So they began to reclaim some territory from the sway of unbelievers. The kingdoms of Leon and Castile became united (1084), and their king, Alfonso VI., was the most powerful ruler in Spain, reclaiming even the ancient capital, Toledo, to the Christians. The power of Aragon also arose, so that Castile and Aragon were the principal states of the Spanish peninsula. As we have seen, the house of Aragon became rulers in Sicily (1282), and finally (1464) they ruled the "Two Sicilies and Sardinia."

In time (1474), the crown of Castile was placed upon the head of Princess Isabella; and, soon (1479), her husband, Prince Ferdinand, was crowned king of Aragon. These are the famous Catholic sovereigns, Ferdinand and Isabella. They soon began a war of extermination against the unbelievers. The Jews were expelled from Spain. The famous stronghold of the Moors (Saracens), the storied Granada,[1] was taken (1491), and the inhabitants were driven out of the country. Though they were married, Fredinand and Isabella ruled their respective kingdoms as separate monarchs. Upon the death of Isabella (1504), the crown of Castile fell to their daughter, Joanna, wife of Philip, a Hapsburg prince. Ferdinand soon supplanted her on the grounds of her incapacity. By giving another of his daughters in marriage to the king of Portugal and by the annexation of Navarre (1512), all the kingdoms of the peninsula became subject to one ruler.

Now Philip, the husband of Joanna, was son of Mary, duchess of Flanders, and of Maximillian, Emperor of Germany and a prince of the famous Hapsburg house. Char-

[1] *Vide* "Conquest of Granada," by Washington Irving.

les, the son of Philip and Joanna, then was duke of Flanders (The Netherlands), Duke of Burgundy, Archduke of Austria, King of Spain (1516), King of the Two Sicilies, Lord of the Spanish possessions in America and Africa; and less than three years more (1519) were to see him "raised to the greatest dignity in the world as Emperor of Germany."[1] Charles I. of Spain became Emperor Charles V. Spain soon became an absolute monarchy, and was ruled with severity. Charles was continually at war with Francis

Charles V.

I. of France. We can see how the interests of the two sovereigns would conflict when we perceive how their possessions lay. Those of Charles extended from Spain through Italy, Austria, Burgundy, Germany, and the Netherlands, thus surrounding France on three sides. But Charles abdicated his throne in 1556—the Spanish (including the Netherlands) throne in favor of his son Philip II. (1556-1598) and that of the empire in favor of his son Ferdinand (1556-1564). Philip was a Catholic, and his cruel bigotry led him to adopt such refined meth-

1 Patton: "Modern History," p 78. *Vide* also Young: "History of the Netherlands," p. 40.

ods of torture and such inhuman modes of execution of heretics, that, had he been a pagan, history would have remembered him only as a bloodthirsty tyrant. We shall hear of him again in connection with the Netherlands.

The small kingdom of Portugal assumed its present shape and size during the thirteenth and fifteenth centuries. By marriage of king Emanuel and the daughters (two in succession, the first dying) of Ferdinand and Isabella, the kingdom became really united to Spain. Then again for a brief moment (1581-1652), she became an actual part of Spain, but finally gained her independence. Her importance is confined almost wholly to her commercial enterprises and extensive discoveries, so her history belongs more properly to our chapter on the Age of Discovery, where it will be fully treated.

We have now briefly outlined the formation of modern nations from two of the three divisions of Charlemagne's kingdom. Let us now turn our attention to the third division, Lothairingia, lying between France and Germany and stretching from Central Italy to the German Ocean. This central strip of land was occupied by a large number of semi-independent princes and dukes, who made themselves vassals of now one king and now another, as it suited their interests, or as they were forced to yield to conquest. Now these central duchies and kingdoms were in their palmy days no insignificant powers. The dukes of Savoy, though they may not be said to hold one foot of the old Savoyard dominions, have made themselves kings of a united Italy. The kingdom of Burgundy occupied a sort of middle position between France and Germany, which Switzerland has inherited.[1] Holland and Belgium have risen from the Spanish possessions of the

[1] "Historical Geography," p. 146.

Netherlands into independent powers, and each has a history of its own.

While the emperors of Germany were busy with their Italian affairs, the princes of their German kingdom were left a great deal to themselves, and were often obliged to unite themselves into leagues for mutual protection. There were a number of such leagues in the thirteenth century. Such was the league of Uri, Schwyz, and Unterwalden, that asserted its independence (1291) and began to extend its power, growing into the greater Swiss Confederation. Luzern (1332), Zurich (1351), Glarus and Zug (1352), and Bern (1353) were added in succession, comprising the eight ancient cantons. A century of internal peace and prosperity followed. The power of the confederation was extended in various directions though no new cantons were admitted. Then there was another season of growth, Freiburg and Solothurn (1481), Basel and Schaffhausen (1501), and Appenzell (1513), were admitted to form the later confederacy of Thirteen Cantons. By conquests and alliances, the power of this confederacy was extended across the Alps into Italy. Thus it remained until the wars of the French Republic, when the "federal system was abolished," and there arose what has been called the Helvetic Republic.

That portion of old Lotharingia bordering the German Ocean had little to attract the immigrant. The soil was poor and a portion of the country had been reclaimed from the sea by means of dykes and windmills Still this part of Europe had become the homes of wealthy "merchant princes." The southern part was the site of the famous Flemish manufactories whose proprietors consumed the wool of England and other parts of Europe. And we shall see how the ships of Holland were foremost in ex-

tending commerce to newly found portions of the world. We have seen how, in the fifteenth century, the Netherlands passed under the control of the dukes of Burgundy; and, finally, to king Philip II. of Spain (1556). Thus we are brought down to the later half of the sixteenth century before the real history of the Netherlands begins.

Philip seems to have been determined, under the cloak of zeal for the Catholic church, to exterminate the population of the Netherlands. His cruel persecutions under the Duke of Alva led to a revolt under William of Orange, called also the Silent.[1] The Duke of Alva with his famous "Council of Blood," was tireless in his endeavors to invent excuses for arresting both peasants and nobles who had offended him or who had money. Arrest meant speedy execution, by the most refined and horrible modes of torture, and often without the form of a trial. The Inquisition was active in prying into men's private lives, and on the least suspicion condemning them to some new torturing, lingering death. The Duke of Alva is said to have ordered more than eighteen thousand executions while governing the Netherlands.[2] After every manner of defeat and discouragement, William the Silent succeeded in establishing the independence (1578) of the seven northern provinces,[3] which form the commonwealth of the Seven United Provinces. William, however, was, after many attempts, assassinated, (1584) by the secret order of king Philip.[4]

That portion of the Netherlands, that now forms

ON THE ROAD TO THE FIELD OF THE CLOTH OF GOLD—HENRY VIII. LANDING AT CALAIS.

the kingdom of Belgium, remained under Spanish rule for some years longer. It then (1595) passed to the Duke of Austria. It was composed of a number

Duke of Alva at Brussels.

of states, such as Flanders, Brabant, Artois, Hainault, etc. As it remained disputed territory for a long time, parts of it were continually changing their vassalage

from one power to another, subject to French, Dutch, German, or Spanish authority. Finally, in the settling of Europe, after the troublous times of Napoleon, the jealousy of these greater powers led to the formation of the kingdom of Belgium. It is fitting here to notice that the existence of these three lesser powers in the midst of so many greater is due, not so much to their spirit of independence and their military prowess, as to their middle position among their greater neighbors. The jealousy of one another's power, that exists among the great nations of Europe, is a sufficient safeguard to the independence of these three nations.

We must now turn our attention to that portion of Europe, lying outside of Charlemagne's kingdom, which was but a part of the Roman empire. Russia has, in historical times, been pre-eminently the home of the Slave. But, as we have seen, the great waves of Turanians, who have, in our era, spread over the steppes of Russia on their way toward the West, must have in places, almost annihilated every trace of Aryan occupation. "Iran and Turan have ever been at feud; they could not dwell on the same soil in peace,"[1] so we find the Slaves and Mongols continually at war. It is not unreasonable, then, to suppose, as Rambaud suggests[2] that the Northmen (Swedes) came upon invitation (862) as allies of the Slaves against the Mongols.[3] Rurik and his followers came, and seem to have had no trouble in conquering and ruling the Slaves. (They were also called Varangians). They made their headquarters at Novgorod and Kief, and increased so rapidly in power that we find them, very early in the tenth

3 Above page 382.

century, besieging Constantinople (907 and 943). In the eleventh and twelfth centuries, three Rurikan princes ruled a territory seven hundred miles from north to south and six hundred miles from east to west.[1]

Like all Europe at this time, Russia was occupied by many independent princes, who became vassals, of all

Entry of Ivan into Kazan.

grades of dependency, to the Rurikans. Chief among them were the princes of Vladimir, Kief, and Novgorod, which correspond respectively to Great, Little, and White Russia of our own times.[2] Under Vladimir (972-1015) the

1 *Vide* Abel: "Slavic and Latin," p. 9.
2 "Medieval History," p. 106.

fifth prince of the house of Rurik, the Russians accepted Christianity from the Eastern Church, and have ever since held to its doctrines. In the thirteenth century, Russia was governed by a number of princes who failed to rule in harmony; and when the Mongols came, they were easily conquered (1223). Russia remained under Mongol rule for two and one half centuries.[1] Still many of the western princes became subject to Lithuanian and Polish rule.[2]

Some of the Rurikan princes, through all this time, held possessions as vassals to the Mongol Khans. Such was the prince of Moscow, who seems to have been a trusted subject of the khan. Around his standard, gathered many of the Aryans of Russia; and, at last, under Ivan the Great (1462-1505), they threw off the Mongol yoke and gained their independence. These new ruling people were called Muscovites, they were probably greatly Turanized by intermixture while subject to the Mongols,[3] as well as by mingling with the subject Finns. Ivan allied himself, by marriage, with the royal house of the fallen emperor at Constantinople. He really laid the foundation of modern Russia. He increased his possessions in all directions; and, receiving embassadors from other European powers, he opened Russia to western civilization.

Ivan III. first bore the name of Czar.[4] Ivan IV. (the Terrible 1533-1584) continued to build up his empire. By the annexation of Astrakan, at the mouth of the Volga,

[1] "Historical Geography," p. 483. Abel makes this period two centuries. "Slavic and Latin," p. 13.

[2] *Vide* Rambaud: "History of Russia," Vol. I. p. 183 *et seq.*

[3] In later times under Elizabeth [1741-1762], a scholar who dared to argue that the Muscovites were of Finnish origin received one hundred stripes with the knout. Under Catharine II. [1762-1796], the subject was again raised, when the Czarina "issued a Ukase commanding Muscovites to be Europeans. Abel: "Slavic and Latin," p. 17.

[4] Probably Caesar, for he was the only person who claims succession to the Eastern Emperors. Rambaud: 'History of Russia," Vol. I. p. 266.

he gained seaboard on the Caspian. About this time, English vessels had found their way to the White Sea along the northern shore of Europe. The seamen visited Moscow, and their kind reception led to commercial relations between the two countries.[1] Ivan gave Russia a valuable code of laws and likewise improved the condition of his subjects. In the later years of his reign, he became involved in wars with Poland, Sweden, and Denmark; and was obliged to seek the assistance of Pope Gregory XIII. in order to save himself.

Feodor I. (1584-1598), the last of the Rurikans, added Siberia to his dominions. Then there followed a time of anarchy and misrule for Russia until Peter the Great (1682-1725), of the Romanoff line of princes, came the throne. Peter did more than reclaim Russia to her former state, for he raised her to a place among the powers of Europe. He extended his dominions until he could boast of seaboard on four seas—White Baltic, Black, and Caspian. St. Petersburg was founded and made the capital. By study, travel, and intercourse with other nations, new ideas and improvements were introduced into all departments of the government and into all lines of industry. Catherine II. (1762-1796) was a patron of literature, science, and education and her reign was a time of great internal improvement for Russia.[2]

Peter the Great.

[1] Patton: "Modern History," p. 138.

[2] *Vide* Rambaud: "History of Russia," Vol. II., for a full account [3]the reign of Peter and Catherine.

But in early times there was a broad belt of territory, or middle land, stretching from the Baltic sea southward to the Turkish dominions, between Germany on the west, and Russia on the east. Here were the states of Lithuania, Poland, Bohemia, and a number of others of less importance. They were occupied by a mixed population of Germans, Slaves, and Turanians. But it is safe to say, that they all now differ little from other Aryan people. The Magyars of Hungary are the only ones that have kept a Turanian dialect.[1] All of these states were factors in the settling of Europe into its modern political divisions. But their individuality has long since passed away, and we can give the parts that each played in the history of Europe only a passing notice.

In the ninth century, when the Magyars of Hungary were so troublesome to the empire, there was established a number of outposts (marks) as defences against their invasions. Among these was the Eastern Mark (Oesterreich) almost between Bohemia and Hungary. Thus was planted the germ from which modern Austria has grown. By a series of marriages, successions, elections, and conquests, the Hapsburg[2] dukes of Austria became sovereigns of Bohemia, Hungary, and a number of smaller principalities, of various Aryan and Turanian populations, which were finally united into the Austro-Hungarian Monarchy. There was much shifting about before Austria assumed its present form. We have seen that the Hapsburg princes were usually emperors. We have noticed that Charles I. of Spain was Archduke of Austria and emperor Charles V. So we would find, were we to trace the history of Austria down to modern times, that, in the treaty of

[1] Keane in Ramsey's "Europe," p. 554 *et seq.*.

Pressburg (1805), Francis of Austria is styled "Emperor of Germany and Austria."

Poland was one of the greatest European states of the seventeenth century. Previous to this, for a moment only, Poland had become an Angevin possession by the election

Death of Louis II. of Hungary.

of Henry of Anjou as king. Poland and Lithuania accepted the faith of the Latin Church (Catholic). When the Mongols were rulers of Russia, these countries were the champions of Christianity against the invaders. The great general and king, Sobieski (1674-1697), at this time, made himself immortal by hurling back the Turks who

were advancing on Europe.[1] When the Muscovites came into power in Russia, Poland was the fighting ground between the Latin and Greek churches. Russia, Prussia, and Austria, becoming jealous of Polish power, resolved upon her destruction. The gallant defence, which Poland made against its enemies, gained the admiration of the world, and the name of Kosciusco will never be forgotten.

John Sobieski.

In the Baltic region, composed of two great peninsulas and numerous islands, were forming, as we have seen, the three kingdoms of Scandinavia; Denmark, Norway, and Sweden. In the tenth century, the kingdom of Denmark included the greater part of the northern peninsula, as well as the southern. Under Cnut (1017-1035), a momentary empire of the northwest was formed, embracing also the British Isles. In the fourteenth century, Denmark waged frequent wars with the great Hanseatic League. By the "Union of Calmar" (1397), Norway, Sweden, and Denmark were united under queen Margaret.

This union lasted, in the case of Sweden, until 1523, when Gustavus Vasa broke the yoke of Denmark. Norway remained a part of Denmark for three centuries longer (1814). The latter part of the sixteenth and the beginning of the seventeenth centuries was a period of growth and prosperity for Denmark. This was under Frederick II. (1559-1588) and Christian IV. (1588-1648). They were patrons of literature, science, and art. It was in their time that the great Tycho Brahe (1546-1601) flourished.

[1] Above page 361.

Sweden was ruled by Gustavus Vasa until 1560. The latter part of that century was filled with wars with Poland and Russia. Gustavus Adolphus then came to the throne (1611-1632); and, as we reach the modern period of history, we can see him leading a Protestant army from victory to victory in the heart of Europe; and, finally, to his own death on the field of battle. As the period of Medieval history closes on the continent, we see the whole country convulsed with religious wars. The liberty gained by so much bloodshed nourished the growth of the enlightenment of our own time.

Gustavus Vasa.

We have now only to give an outline of English history, the country that had so much to do with our own early history. We have already[1] seen the commencement of this history. We will resume the thread with king Egbert, a West Saxon prince, who had resided at the court of Charlemagne, and who could boast of descent from the great Cedric. He ascended the Wessex throne (802-847). Filled with that ambition and spirit of conquest that must have pervaded the court of Charlemagne, Egbert planned the conquest of the whole island. Mercia and Northumbria fell before his power (829), and Egbert styled himself "King of England."[2] He was not master of the whole island, however. Scotland and some portions of the

[1] Above p. 342.

[2] "Medieval History," p. 60.

Western Celtic territory were never conquered by Egbert. Already the Danes had begun to plunder the coasts of these islands, and his armies were needed to guard against their attacks. His successors (837-881) inherited this conflict with Danish vikings. The Norsemen now began to form settlements, although they were merely headquarters or camps, where their marauding bands could store their plunder.

When Aelfred the Great, grandson of Egbert, came to the throne (871-901), nearly the whole island had been lost to the English. From the very commencement of his reign, he engaged in war with the Norsemen. He became so reduced in power and resources that he had no followers, and was obliged to hide himself in the marshy lands of Somersetshire. There be built himself a stronghold and secretly organized an army, with which, during the next seven years, he won many battles against the Danes. Finally they entered into treaty with him, by the terms of which the Danish chieftain, Guthrian, was permitted to occupy all of England north of Watling street, or the road running from London to Chester, as vassal to the English king, on condition, however, that he should embrace Christianity. Aelfred, therefore, was real ruler over only the southern portion of England.[1]

Aelfred.

1 "The Norman Conquest," Vol. I. p. 34.

The reign of Aelfred, after the conquest of the Danes, was a season of peace and prosperity for England. Ranke[1] calls him "a marvelous phenomenon," not merely a king and a great general, but a wise legislator and the foremost author of his times. He organized his government. He adopted a system of defenses by which he was able to protect his kingdom from all foes. He built and maintained a navy which was serviceable alike for war, for commerce, and for discovery. Thus was laid the foun-

Aelfred's Mother Teaching Him Saxon Songs.

dation of the naval power that has kept England among the foremost nations of the world. He made the accumulated customs, practices, and usages of his Teutonic forefathers the common law of the land.

The aim of Aelfred's legislation seems to have been the elevation and happiness of his subjects. He tried in every way to introduce advanced ideas in learning and culture. Not satisfied in simply inviting foreign scholars

1 "A History of England," Oxford, 1875, Vol. I. p. 19.

to his court, he placed himself in their front and even surpassed them all in the amount and character of his literary work. A large number of volumes that had previously been written only in Latin were translated into English by the king himself. Thus English was made the popular literary language. Now Aelfred is not to be compared with other literary kings, who, in general, rank very poorly as writers. He wrote just as he fought and legislated, "with a single eye to the good of his people." "The culture already existing, the whole future of which had been saved by Aelfred, attained in him the fullest development. We weaken the impression made on us by this great figure.... by comparing him with the brilliant names of antiquity."[1]

The descendants of Aelfred, "for nearly a century, form one of the most brilliant royal lines on record." All the Teutonic elements—English and Danish—were at last drawn into one kingdom. Then the chieftains and princes of the Welsh and Scots became vassals to the English king (924), who was often styled Emperor or Basileus of Britain. Under Eadgar (959-975), the royal house of Aelfred and Saxon England reached the summit of its power. This king is called "the peaceful," though never before were vaster military preparations made. A standing army was organized. A naval-fleet was kept in readiness for action and constantly encircling his domains, in order to guard against attack by sea. Eight of his vassal kings met at one time and place to do him homage. It was, therefore, a time of peace and prosperity for England, during which no foe dared to approach her borders.

Succeeding kings were not as careful as Eadgar about their defences; and the Danes, who had now effected a lodg-

[1] Ranke, Op. cit. p. 20.

ment in Normandy, again plundered the coasts of the British Isles. Aethelred, the Unready, and his son Edmund Ironsides (979-1016) were so hard pressed by them that they were obliged, season after season, to buy off the invaders. An annual and ever increasing tax was levied to furnish the crown with this "Danegeld" instead of to

Aelfred the Great in his Study.

place the kingdom in a state of defence. Finally, on St Brice's Day, 1002 A. D., the king ordered a general massacre of the Danish freebooters, who had by treaty been promised protection in his realms. This only hastened the final conquest of England by the Norsemen.

Another element appeared in England during Aethelred's reign, which continued to grow in power and impor-

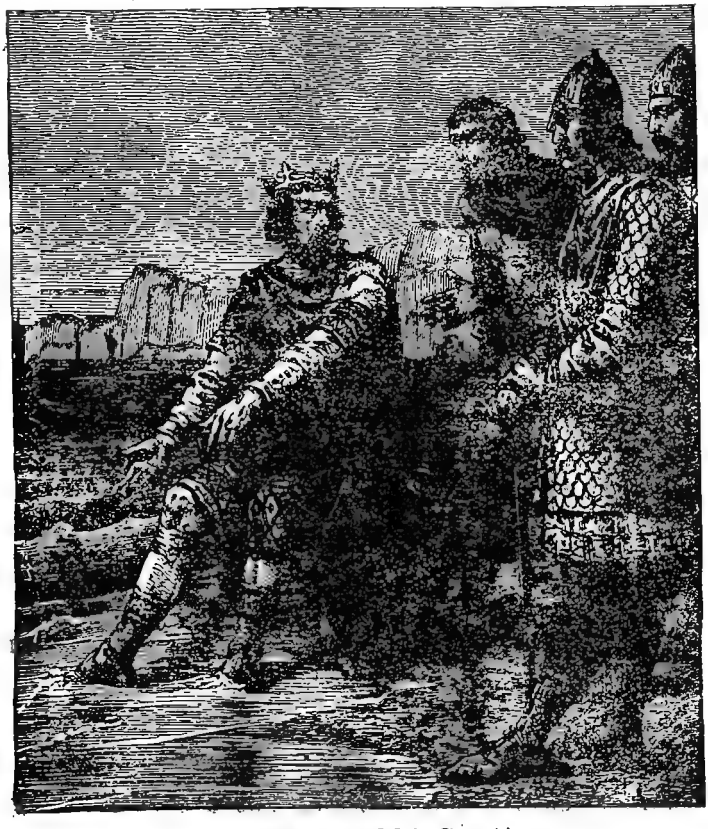
tance, until it ruled the whole island. His queen, Emma, was a Norman lady. Her appearance at the court of England opened the gates of the government to a host of Norman adventurers, who flocked around her, and received many profitable offices at her hands. The Danish king, Swegen, soon appeared to revenge the murdered Danes. To the weakness of the English king, were added the distrust and disloyalty of his noblemen and his generals (many of them Norman favorites of Emma) and a lack of zeal on the part of his subjects. So, in spite of the almost superhuman efforts of Edmund Ironsides, the Danes were successful, and Britain was added to the great Empire of the Northwest; and Cnut, the Dane, son of Swegen, was crowned king of England (1017-1035.)

Cnut dwelt at London, and married the widowed queen Emma, thus reconciling himself to many of his subjects. "Cnut had entered England as a conqueror and a destroyer; but his reign, as far as the internal state of England is concerned, was a time of perfect peace. No invasion from beyond the sea, no revolt, no civil war, is recorded during the eighteen years of his government..... Within England itself we read of no district being ravaged either by rebels or by royal command, we read of no city undergoing, or being threatened with, military chastisement. This is more than can be said of either the reign of Eadgar the Peaceful or of Eadward the Saint."[1] Here we have another instance of a wild "barbarous viking" from "pagan lands," who made one of the best kings that history mentions and that, too, in the middle of the "Dark Ages".

Still, the successors of Cnut were failures as kings, and the banished son of Aethelred and Emma, Eadward

[1] "Norman Conquest," Vol. p. 296-7.

the Confessor, or Saint, was hailed with joy then he came over from Normandy to occupy the English throne (1042–1065). He was a grandson of Robert the Fearless, duke of Normandy, and had been educated at the Norman court; so, it is not surprising, that many Norman adven-



Cnut the Great and his Courtiers.

turers followed him across the channel, and that they received good offices and large possessions for their homage and friendship. Meanwhile, there had arisen an Englishman from humble birth to the first position in England. This was Earl Godwine. As Eadward was better suited to the monastery than to the throne, Godwine, became

virtual ruler of the kingdom. Though never himself a king he "was the maker, the kinsman, the father of kings."

Next to Godwine, his son Harold, was the first man in all England. He already ruled as vassal earl over the East Angles; and, upon the death of Godwine, he became earl of the West-Saxons, which, as Freeman[1] says, was "equivalent to investing him with the practical management of the King and his Kingdom." When Eadward, the last of the line of Cedric, died, Harold was the choice of the people as king; he had also been named by Eadward, upon his death-bed, as his successor; and finally he was the choice of the Witan (or English council) who alone claimed the right of electing a king. He was crowned 1066.

We now have arrived at the Norman conquest. William,[2] duke of Normandy, claimed the right to succeed Eadward on three grounds—the promise of Eadward, the promise of Harold, and the right as a descendant of Aelfred through the female line. As to these claims, William had visited Eadward, and may have been at that time promised the succession, but there is no doubt that Harold was the final choice of the dying monarch. As to the second claim, Harold had, upon a time, been shipwrecked on the coast of Normandy, where he was held a prisoner until he had sworn that he would not accept the English crown. The third claim savors so much of the legendary that it is usually pronounced fictitious.[3]

William landed in England at the head of a vast army of Norman knights; and, armed with a papal curse

3 The work of some unreliable Chronicler who wished to make all English kings of English birth. On this point *Vide* "Norman Conquest," Vol. II. p. 116.

THE TRIAL OF QUEEN CATHERINE.

against those who dared support Harold, as well as with the sword, he demanded the crown from Harold. The battle of Hastings followed (October 14th, 1066), in which Harold was killed. William was then crowned King of England. From this time the King of England held possessions in France as vassal of the French king, which led to endless wars between the two nations.

William the Conqueror.

Norman knights now besieged the English court for appointments and possessions. They obtained both, even if a loyal English subject had to be robbed to accommodate them. The policy of the new king seemed to be to crush out the English. Norman customs and language were introduced and forced upon the people, whom the rulers had made little better than slaves. William was now the "Conqueror," and he seemed to have deserved that title in every sense of the word. When William had succeeded in thoroughly subduing England, he returned to Normandy, where he died (1087) from an accidental injury received while urging his soldiers to plunder and burn the city of Mantes, in order to satisfy some old grudge. His second son, William Rufus (the Red), was his successor (1087-1100), although there was much quarreling over the throne among his three sons—Robert, William, and Henry. By the treaty of Winchester (1101), Henry, the youngest, became king (1101-1135) to the exclusion of Robert, the oldest.[1] Henry could trace

[1] Norgate: "England under the Angevin Kings," London, 1887, Vol. I. p. 1-12.

his lineage back to the good King Aelfred through his mother, Matilda of Flanders.[1] He united himself with Scotland by marriage with Matilda, daughter of Queen Margaret,[2] so that his descendants could trace lineage back to Aelfred by two descents.[3] Henry's daughter, Matilda, became the wife of

Burial of William the Conqueror.

Emperor Henry V., and, after his death, of Geoffrey, count of Anjou, thus becoming the mother of the Angevin, or Plantagenet kings of England. We perceive

[2] Who was grand daughter of Edward Ironsides."

[3] "Norman Conquest," Vol. II. p. 200, note.

at once the politic plans that Henry pursued in uniting himself with as many of the contemporary powers as he could. He was no less politic in his government, though most of his plans for reform died away in promises to nobles and subjects. These broken promises, however, had the effect of so arousing the people that future kings were compelled to make many concessions to them.

When Henry died, the Witan elected his nephew, Stephen (1135-1154), to the exclusion of his natural son, Robert, earl of Gloucester. The nineteen years of Stephen's reign are called a "time of utter anarchy" and a "time of utter wretchedness, such as we may safely say England never saw before and never saw again."[1] It was a season of strife between Stephen and Matilda about the right of succession of her offspring. At last to settle the matter, Stephen adopted Henry (Plantagenet), son of Matilda, as his son and successor.

Henry II. (1154-1189), the first of the Angevin kings, inherited greater possessions than any of his predecessors. He was heir to England, Scotland, Normandy, Anjou, Maine, and Aquitaine. Thus, as vassal of the French king, he held greater possessions in France than did that monarch. The next year (1154), he obtained a bull (bulla) from Pope Hadrian IV. giving him permission to conquer and possess Ireland, as prompted by his "ardour of faith and love of religion,"[2] though Ireland was the cradle of Western Christianity.[3] We see, therefore, that England was only a small part of the possessions of her kings.

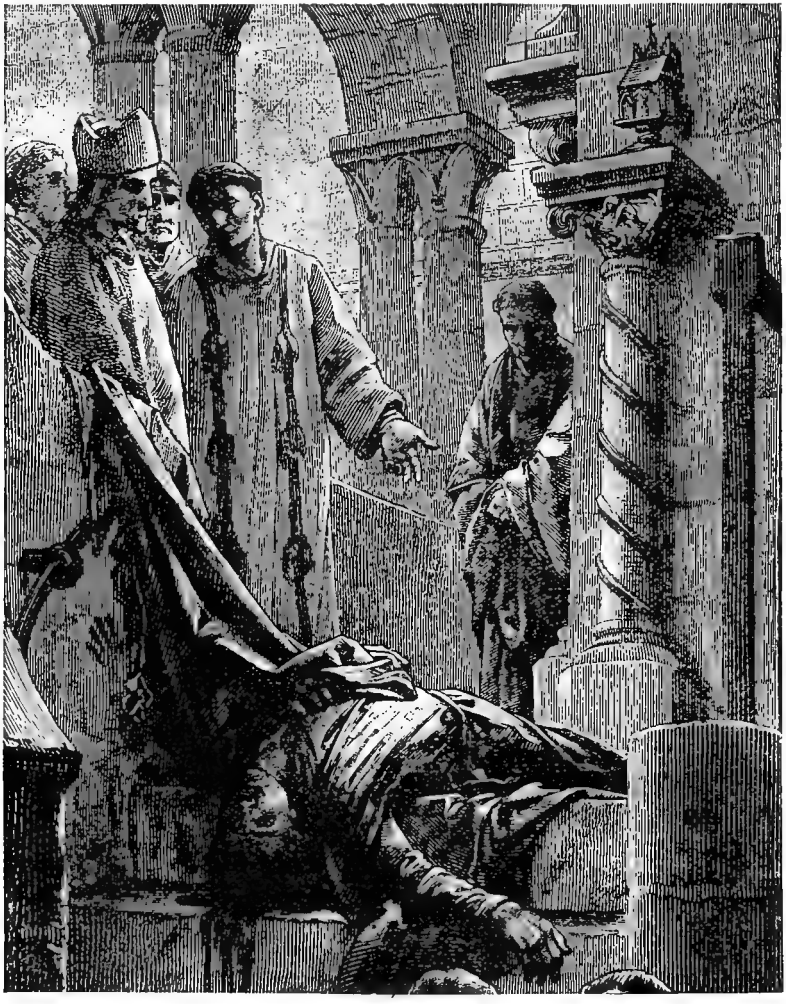
For a long time all Christendom looked upon Ireland as the favorite home of religion and wisdom. Justin McCarthy: "An Outline of Irish History," Baltimore, 1883, p. 23.

Henry is remembered as "the law-giver," for during his reign not only many useful and wholesome laws were enacted but the well known legal system of England took



Death of Becket.

its shape.[1] His ablest counselor was Thomas a Becket, Archbishop of Canterbury as well as King's Chancellor,

[1] "Medieval History," p. 161.

whose murder, by order of Henry, has left an ineffacable blot upon that king's name. The first years of Henry's reign brought peace and order to England; the last years, however, marked a succession of quarrels between Henry, his wife, and his heirs.

Richard the Lion Hearted (1189-1199) was a great crusader, joining his forces with Emperor Frederick Barbarossa and Philip Augustus of France. He spent the most of his time out of his kingdom. John (1199-1216), through his quarrels with Philip of France, lost almost his entire possessions across the channel.[1] But to English people the one event, important above all others of John's reign, was the granting of the Magna Charta, which the united barons compelled the king to sign (1215).[2] Several of the last kings had been obliged to grant new and greater privileges to their subjects and especially their old English thanes (nobles). The granting of the charter was the culmination of their demands. It assured to Englishmen their most cherished rights, among which were freedom, justice, good government, security of property, and freedom against unjust taxation. Though the mortification of John was great, and though he swore terrible vengeance against his barons, the great charter has lived and gained new strength and greater privileges from succeeding kings. Every king thereafter was made to confirm it upon receiving the crown; but nearly all were ready to break it when once firmly seated upon the throne.

The Witan about this time began to shape itself into

---

[2] The *Barons* of this age were only the old English thanes under a new name and a baron's war of the time of Henry III. "meant a war which the people, with native barons in their forefront, waged against a foreign-hearted king." *Vide* "Norman Conquest," Vol. V. p. 264 and 277.

the modern Parliament. Its power grew as freedom was granted to the English people. It refused to raise money for the foreign wars of Henry III. (1216-1273). The Commons were then admitted to Parliament. During the reign of Edward I. (1273-1307), the "English Justinian," many new laws and reforms in existing statutes were enacted, not the least among which was a law forbidding the levying of taxes without the consent of Parliament. Wales was annexed to England, but the Scots, under Wallace, rose in open rebellion, (1297) which was continued under Robert Bruce.[1] His armies gained a victory over the English at Bannockburn (1314), and at last captured Berwick (1318).

John.

Parliament had now gained sufficient power to depose King Edward II. (1327), for incapacity, for breach of coronation oaths, and for loss of Scotland, electing Edward III. to the throne (1327-1357). But the tide of Scottish war did not turn with the coronation of a new king. The independence of Scotland was finally acknowledged with Robert Bruce as king. Henceforth Scotland was, for some centuries, a separate European power; though, for a moment, young David Bruce was driven from the throne by John Balliol, at the head of the English barons.

We have reached the period of the "hundred years war" between England and France. We have already

[1] Greene: "History of the English people," New York, 1880, Vol. I. p. 271 *et seq.*

seen[1] how successful England was until the last years of the war. That need not be repeated. But during this time, England was filled with clamors of the barons and the people for greater privileges and greater personal and political freedom. The spirit of religious freedom, too,

John Swearing Vengeance against his Barons.

had awakened. The great Wycliffe (1324-1384) was at the height of his fame. He preached his doctrines and spread his tracts over all England, and laid the foundation for the great Reformation of the next century.[2] Then fol-

[1] Above p. 387 *et seq.*

[2] *Vide* This Series Vol. IV.

lowed the popular outbreaks under Wat Tyler, and the bloody scenes that resulted, the promises and broken promises of young Richard II. (1387-1399), the rising of the Lollards (a term applied to Wycliffites) and their persecution as heretics; all of which are more or less connected with the religious history of that time, and will be treated in the proper place.

With Henry IV. (1399-1413), the house of Lancaster began to reign. Henry V. (1413-1422) made "himself lord of the two great western kingdoms," England and France, and was closely related to the royal lines of Portugal and Castile.[1] Henry VI. (1422-1461), however, saw the English ignominiously expelled from France. There was a strife at this time between the houses of York and Lancaster over the right to the crown of the kingdom. The Yorkists claimed it as descendants of the fifth son of Edward III. while the reigning house was descended, through the fourth son, from the same monarch. The Yorkists wore a white rose as a badge and the Lancasters a red rose, the quarrel has since been called the "wars of the roses." The white rose succeeded in deposing Henry VI.; then three white roses—Edward IV. (1461-1483), Edward V. (1483, three months), and Richard III. (1483-1485)—wore the crown in succession. The Lancasters again came into power with Henry VII. (1485-1509); and forever healed the strife between the two houses by his marriage with Elizabeth, daughter of Edward IV. When their son, Henry VIII. (1509-1547), came to the throne, there was none to dispute his title, for he represented both houses.[2]

This strife seems to have been instrumental in de-

[1] Greene, Op. cit. Vol. I. p. 546.
[2] Greene, Op. cit. Vol. II. p. 86.

stroying feudalism in England by exterminating the nobility, and it also left the crown with greater powers than it had previously enjoyed.[1] Indeed the war seems to have been confined to the nobility, and disturbed the population but little. Commerce was maintained all through this period. Henry VII. was the patron of the Cabots, of whose voyages to America we shall hear again. Literature and education flourished, while printing was introduced by John Caxton (1476). Scotland was, during this time, governed by the Stuarts, the ablest of whom was James I., while James IV. became the husband of Henry's daughter, Margaret. This marriage furnished England a line of kings at a later date.

It would require a volume to record the political history and internal development of the English people during the reign of Henry VIII.[2] One fact we must now observe in English history; and that is, the king is no longer the only individual that plays a part in the world's drama. Among the most powerful men of that day, was the king's chancellor, Cardinal Wolsey. In fact, his power and fame lacked little of royalty. Able to perform Herculean mental tasks, he gained the favor of his sovereign, and was allowed to hold the reins of government. As a diplomat, he had no equal. Both King Francis of France and Emperor Charles V. are said to have acknowledged the Cardinal's power and courted his favor by bestowing upon him liberal pensions and costly gifts. Henry showered riches upon him, and he became the most powerful subject of the English king. When that celebrated meeting, known as the "Field of the Cloth of

[1] Stokes: "Medieval History," p. 172.

[2] *Vide* for this reign Froude: "History of England," London, 1870, Vol. I. Hume: "History of England," Vol, III.

Gold" (1519) took place between Henry and Francis, gorgeous was the appearance of Wolsey. Clothed in a crimson robe, mounted on a mule trapped with gold, he rode beside his king as they entered the "camp of three hundred white tents that surrounded a fairy palace with gilded posterns and brightly colored oriels which rose like a dream from the barren plain of Guisnes, its walls hung with tapestry, its roof embossed with roses, its golden fountain spouting wine over the greensward."[1]

Still when his day arrived, Henry proved how little the powerful Cardinal was in his way, by casting him from his lofty seat and depriving him of life itself. So with all his powerful subjects, the will of the monarch sufficed for their death warrants, and they were often led to the fatal block without the form of a trial. He is said to have ordered seventy-two thousand executions during his reign.[2] Nor was Parliament an obstacle to attaining his ends. Instead of fearing the power of that body as former kings had, he made it his tool, and ruled it as he ruled his subjects. So that, when he wished money, Parliament voted a tax to raise it. As Henry could not brook a superior, he finally cast off allegiance to the pope and had himself declared head of the church in England. The arbitrary manners of the king are illustrated by the treatment of his wives. He was the husband of six successive wives, whose sad fates gained for them world-wide sympathy, but for him eternal condemnation.[3]

It must be added, however, that Henry VIII. was a great legislator, a scholar, and a patron of literature.

[1] Greene, Op. cit. Vol. II. p. 114.

[2] Patton: "Modern History," p. 130.

[3] These were Catharine of Aragon, Anne Boleyn, Jane Seymour, Anne of Cleves, Catharine Howard, and Catharine Parr.

During no former reign, did England make such advances in all departments. She ceased to be a secondary power and took her place in the front ranks of the great nations of the age—England, the Empire, Spain, and France. Oxford had gained a world wide reputation for the learning and the independence of the masters who taught there. John Colet, Dean of St. Pauls and founder of St. Pauls school,[1] trained up a class of scholars who were not afraid to think, talk, and write upon all political and religious subjects. Even the king was not spared in their criticisms; but, with wit and irony, they held his actions up before the world and tried to prove that kings were only men. Among these free and earnest reformers, Erasmus and Sir Thomas More stand foremost.

Erasmus.

Henry, himself, was a patron of this "New Learning," as it had been called. His was by no means an inferior mind. But to a powerful, well proportioned, well trained physical frame, was added a superior intellect and a powerful will. Erasmus had been his teacher; and, in wit and learning, he appeared at no mean advantage among the most illustrious scholars who thronged his

[1] *Vide* Lecture by Rev. Ronald Bayne in "God's Englishmen," London, 1887, p. 108.

court and his universities. As we have intimated, his will was a strong and overbearing one. Though his subjects might boldly write and talk, their doom was sealed if they dared to cross their king's will. Even Wolsey's successor, the bold and polished Sir Thomas More, was led away to the block, because he would not sacrifice his religious freedom to the caprice of his stern sovereign.

In this chapter, we have attempted to give a short outline of the gradual formation of the Modern Nations of Europe out of the crumbling ruins of the great empire of Rome. Even though extending over many centuries, like all formative periods in the world's history, it was a time of confusion and shifting of power. Let us attempt to keep in mind the main points brought out. Looked at broadly, it is the period of the gradual emergence into the full blaze of history and into the light of modern culture of the Teutonic people of Europe. Of necessity, only the main details of this outline could be given. The development and growth of culture during this period of time require a separate chapter for a full treatment.

With this chapter, we bring too a conclusion the historical part of this volume. Before turning to study the culture of the Classical and Medieval periods, let us summarize this sketch of Aryan history. Although we have every reason to conclude that the Aryans (whether immigrants or not) were in Europe at extremely early times, yet their history is, comparatively speaking, modern. We are to regard the Aryans of Asia as emigrants from Europe, who wandered so far toward the rising sun that their route home became cut off by returning waves of Turanian people. In their new homes, their native energy for centuries blazed forth, a light to surrounding people; but as far as the main history and culture of the Aryan

people are concerned, the Aryans of Asia are not of great importance.

Turning to Europe, the development of her history is that of a cymiferous flower, the terminal blossoms are the first to unfold. Pushing away from the Baltic homeland, the people of Greece and then of Rome caught the sunlight of Oriental culture and unfolded in the light of the same. And then other blossoms, successively nearer and nearer the base, unfolded in turn until, finally, we have before us the full flowered plant of European history.

In this hurried review, we have tried to outline the history of Aryan people from a prehistoric past to the final appearance of the Modern Nations of to-day. Let us now turn to consider their development in culture. We will then see more clearly than ever that Aryan civilization and history are the civilization and history of the Medieval and Modern worlds; the Semitic and Turanian history and culture belonging to the Ancient period of history.

WE ARE now ready to study Aryan civilization. The great importance of this will be apparent when we reflect, that the civilization of the world to-day is Aryan. Let us, therefore, strive to learn what we can of the growth and development of Aryan culture. We have before remarked, that the peculiarity of Aryan culture is not that the Aryan people, for the first time, discovered and applied the various factors which make up their culture, but that they adopted, applied to new uses, and developed the ideas that had long been extant in the world.

On the whole, though Aryan culture has flowed on in an ever widening and deepening stream, yet we may conveniently consider it under three great divisions, periods,

or epochs. In this connection, we will not consider the Aryans in Asia. For the latter are but exotics, and their culture is not a fair test of Aryan culture. The first Aryan people to come in contact with Oriental culture, to seize on it, make it peculiarly their own, and develop it to an extent before unthought of, were the Hellenic people of Asia Minor and Greece. Here we find the first stage of Aryan development. When, in the course of time, the inevitable hour came that the power and influence of Greece declined, we detect the dawning greatness of Rome, that country that for many centuries was to rule the world. In Rome, accordingly, we find a second stage of development.

In the case of Greece, the culture was confined to a very limited area. Rome ruled a much greater country; but the centuries sped by, and, at last, Teutonic Europe, spurred on by Aryan destiny, demanded a share in the culture of their more favored southern kinsmen. Accordingly, when their armies brought down in ruins the Roman Empire, and their people commenced to absorb the culture of Classical times, we enter on a third period in the intellectual development of modern Europe. Under these three divisions, then, we will study the culture of the Aryans.

It is needless to dilate on Grecian culture. The most casual reader knows of its importance, and understands somewhat of the great influence it exerted in the culture history of the Aryans. Greek art has always been, and always will be, considered the purest and most perfect approximation to the ideal. Even the poor remnants of their architecture and sculpture, which we admire in the museums of Europe, and in some places of Greece, Sicily and Asia Minor, even these dilapidated fragments of the

original works fill us with awe, with wonderment, with unbounded admiration. The pottery works found in Grecian tombs exhibit the most exquisite designs, the most delicate use of colors, and the most delightful ornamental forms. All these objects breathe the very spirit of high art; and the severest critics of modern times are unable to find fault with the gorgeous, and yet chaste, orders of Grecian columns, or with their representations of male and female beauty.

It is the same in Literature. The dramas of Sophocles or Euripides, the odes of Pindar, and the comedies of Aristophones have survived the varying tastes and fastidious criticism of over sixty generations, and they still shine forth in unfaded brilliancy and poetic splendor. In Philosophy, with the exception of the founders of new religions, no other individuals can compare with Grecian philosophers in point of influence on the thoughts and opinions of mankind. It has well been said, that every man is either a born Platonist or a born Aristotelian; meaning thereby, that men are naturally divided into two classes of mental caste, of peculiar turn of mind—into such as would lean toward Aristotle and his way of thinking, and into such as would feel inclined to follow the footsteps of Plato.

Let us first inquire into the cause of Grecian culture. What was it which enabled this people, inhabiting a very limited area of country, to achieve so great conquests in the culture history of the world? Many scholars have attempted to answer this query. Some have thought that their geographical location explained all. As is pointed out in a previous volume,[1] "the culture of a people is greatly influenced by their surroundings. The

[1] Vol. I. p. 765.

very appearance of a country, whether it is mountainous or plain, sea-girt or inland, influences the character of a people." Buckle[1] shows how much the culture of a people depends on climate, food, and physical surroundings. Von Humboldt and Ritter have pointed out the strange relation between the length of a country's coast line and the intelligence of its inhabitants. Others, again, seek to explain everything strange in the culture of the Greeks and other people by referring to inborn race qualities. We need not discuss these various opinions; but let us, in the case of Greece, point out a potent factor.

In our search, we must not loose sight of the results obtained in a former chapter.[2] It has been abundantly shown that the organization of a people for social and governmental purposes exerts a wonderful influence on their culture. Since society in ancient Greece was tribal society, we know that when we talk about a "state," we mean something altogether different from a political "state" of the present day. Long before the dawn of authenic history, owing to their limited expanse of territory, their tribal head-quarters had expanded into cities, and finally the tribe lost itself in the city. City and tribe became exchangeable terms. Hence we understand why, in ancient Greece, "city" and "state" were identical and co-extensive terms. This one point is of such importance for the whole of Greek civilization that it must not be lost sight of. In fact it is the main point.[3] It shows at once a vast difference between modern and ancient times. In Greece (as well as in the Roman empire), people did not know of any other dwelling place than a city. Every-

[1] "History of Civilization," Vol. I. chapter ii.

[2] This Series, Vol. II. chapter ii.

[3] This important point in Grecian culture has been elaborated in a recent work by Kuhn.

body belonged to a city, because city and tribe, or confederacy, were co-extensive. In the "Politics" of Aristotle, the great work on Greek state-institutions, we read of

Grove of Altis.

nothing else but of cities. This statement does not, however, exclude the existence of little settlements outside the

precincts of cities. We know the names of a number of such settlements in Attica, in Argolis, in Messene, etc. But these little "villages" (as we would call them)[1] had no existence of their own. They were incorporated into the city (of Athens, of Corinth, of Argos, etc.) as wards of the city, and they were administered by boards of commissioners whose head-quarters were invariably in the city.

The experience of all ages has proved the powerful influence of city-life on all descriptions of mental activity. The inhabitants of cities are continually subject to the stirring, suggestive, animating atmosphere of a higher developed life. They see more, they undertake and risk more, they experience more than country-people. All the energies of their souls are called forth, and almost daily, by an unceasing array of grave and less serious affairs, by meetings of all kind, by street occurrences, by shows, by business transactions, etc. It is, accordingly, a mere matter of course, that the inhabitants of cities develop more rapidly than those of country-places, villages, or hamlets. Their intellect, being taxed to its utmost capacity, responds by a more comprehensive and profound activity. Nothing can illustrate this remark more vividly than a comparison of Greek civilization with medieval culture.

In the Middle Ages, at least in the first half of the Medieval period, there were but very few cities in Northern and Central Europe. In England, in the northern part of France (the southern part was an old province of Rome), in Germany (northeastern part), in Austria only a few small cities were to be found.[2] The bulk of the people

[1] In many cases these "villages" were tribal head-quarters of subject tribes, or of tribes whose union made the confederacy whose headquarters were the city.

[2] Because in these countries, the land had become the basis of division [See Vol. II. p. 164].

lived in the country in "marks," as they were called in Germany, in "shires,"[1] as they termed them in England. The cities of Europe, at that time, were mostly in the southern part of the continent; that is to say, in the very parts where the wisdom and energy of the Romans had erected numerous bulwarks against the inroads of the barbarians. This being the state of affairs in the Middle Ages, we need not be astonished to hear, that the people of those times

Siege Machine.

display a very slow development of intelligence and enlightenment, that superstitious beliefs were rife amongst them, and that, in all higher walks of literature and art, they were sadly deficient.

Here then we come upon one important factor in the culture of Greece. Owing to their contracted area, the

[1] These had taken the place of tribes of the older period. Ibid. p. 173.

land did not become with them the basis of society at the expense of kinship. Hence their tribal headquarters grew into cities and their culture became *intense*, the social contact of mind with mind spurred them on to ever greater flights. Now let us turn to study some of the peculiarities of every day life in Greece. In reading the Homeric poems, we gain a clear and highly gratifying picture of the constitution of old Greek tribal life (1200-1000 B. C). The father is the head of the joint-family, which had become, by that time, the unit of society. The house-father was not an irresponsible despot. The house-mother seems to have lived on terms of equality with him. The people lived in single mansions, although cities are mentioned.[1] In the political life described by the Homeric poems, the tribal chief, basileus or king, rules, and his office generally passes by inheritence, though the gentes exercised the right of election if necessary. But he is not, like an eastern monarch, even practically despotic; he is bound, first, by "themistes," viz., the traditional customs of the people; he must consult the "boule," the tribal council; and lastly, his proposals require to be ratified by the "agora," or popular assembly. Many of the pictures of manners, especially in the Odyssey, have the refinement of a noble simplicity in thought and feeling and of genuine courtesy which is peculiarly Hellenic. The useful arts are still in an early stage. The use of the principal metals is known, but not, apparently, the art of smelting or soldering them. Money is not mentioned, oxen being the usual measure of value; and there is no certain allusion to the art of writing. The main occupation of the people was agriculture and war.

This picture, however, differs from historical Greece,

[1] Argos, Troja, etc.

that is to say from Greece as it developed from the ninth century B. C. to the time of the Roman conquest. Monogamy, it is true, was kept up as formerly. But in the position of women, a radical change took place, a change the explanation of which requires a thorough understanding of the whole frame of Grecian culture. In general, we seldom hear of anything else than the deeds and exploits of men. Battles, sieges, truces, adventures of all sorts are told, and all and each of them bespeak the audacity, the adroitness, the failures, or successes of men. We constantly hear of their state of affairs, of the way they governed and were being governed, of their assemblies and war-councils; of the state of women, however, we hear but little. They usually sink back into the insignificance of their households, and are not considered worth mentioning.

But such is not the method and duty of a real History of Civilization. It is a fact of all experience, that women exercise a vast although silent, and, as it were latent, influence over the destinies of men. To ignore such influence in the study of nations is equivalent to ignoring one of the most powerful factors in the development of culture.[1] Hence we have first to dwell upon the condition of women in historic Greece. Now in modern times, the social condition of women is pretty much the same all over the Christian world. Nobody thinks of curtailing their natural rights as free-born women; they obtain the same rank and positions that their husbands hold; they can move freely; they can join their fathers or brothers at public shows or other localities; they can have free intercourse with male and female

[1] Buckle writes a very elaborate chapter, showing the influence of women on civilization.

persons; they can dress as they please, etc., etc. In one word, a modern "lady" of South or North America does not essentially differ from a "lady" in Spain or Germany. As to personal demeanor, as well as to social standing, they occupy an almost identical position.

Types of Greek Women.

This, however, was not the case in ancient Greece. The position, the social standing of a women in Athens was totally different from that of a woman in Sparta, although only a few miles intervened between the two. Athenian women lived in upstairs-rooms, so that their husbands would know when they left their apartments. They were obliged to stay at home in the midst of their servants.

They were not permitted to go to theaters or other public shows, unless some very serious tragedy was given. From the social gatherings of their husbands, from the so-called symposia (which are so charmingly described in Plato's works), they were excluded; and even at family suppers, they had to sit apart. When in the streets, they were constantly attended by slaves, and nobody dared to address them, nor were they allowed to approach anybody.[1]

The choice of a wife among the Athenians was rarely grounded upon affection, and taking into consideration the secluded existence of an Athenian maid, could have been but seldom the result of previous acquaintance or familiarity. In many cases, a father chose for his son a bride whom the latter had never seen, or compelled him to marry for the sake of checking his extravagance. Nor was the consent of a female to a match proposed for her generally thought necessary; she was obliged to submit to the wishes of her parents, and receive from them her husband and lord, even though he were a stranger to her.

Sophocles, the greatest of all Greek drama writers, thus describes the lot of woman in this respect. "When we are grown up (he makes a female say), we are driven from our parents and paternal gods." So also in Euripides, Hermione,[2] a representative Greek woman, declares that it is her father's business to provide a husband for her.[3] And, for fear the father might not be strict enough, there were magistrates in Athens, the *gynae-*

[1] See "Athenaeus," Lib. vii, and Aristotle in the fourth book of his "Politics." In the Excursus "On Women," in Becker's admirable "Charicles," many instances will be found of the rigid measures adopted as to exclusion of women in Greece.

[2] Andromache, 951.

[3] But match-making among the ancients was not, in default of legal regulations, entirely left to the care and forethought of parents, for we read of women who made propositions of marriage. Pollux, iii. 31.

*conomi*, who superintended the conduct of women.[1] They, most probably, were instituted by Solon, whose regulations concerning the female sex certainly rendered some special officers necessary for their enforcement. In their official capacity, they had to see that the regulations concerning the conduct of Athenian women were observed, and to punish any transgressions of them.

Athenian women were always minors, subject to some

Home Life of Greek Women.

male—to their father, to their husband, to their brother, or to some of their male kin. Here we see the working of the joint-family in tribal society.[2] The woman were always members of some joint-family, and so under the rule of some house-father. Marriage simply transferred them to some

[1] Pollux, viii. 12. Plutarch, Solon, 21.

[2] This Series, Vol. II. p. 216,

new joint-family.[1] Aristotle always classes women and children together.[2] An unfaithful woman was practically expelled from society and excommunicated. If she appeared in a temple, and even in those temples which foreign women and slaves were allowed to enter, any one might treat her as he pleased, providing he did not kill or mutilate her.[3] It is in accordance with the spirit of this treatment of Athenian women that Athens did not allow her citizens to marry with foreign women, nor conversely.[4]

This peculiar and unworthy position of women in Athens found its counterpart in Sparta, in the Laconian state. Women in Sparta were much less restricted in their personal freedom. They were not only permitted to join the social gatherings of men, and to appear alone in public, but they were simply obliged to partake in the athletic exercises of the stronger sex, proving their physical valor by wrestling and boxing matches.[5] Accordingly their flesh became developed to the statuesque beauty of marble figures; and, on their occasional visits to Athens or other cities, they roused the envious wonderment of their lady hosts. When married, they were expected to have children; and this main and principal object had to be obtained by any means. An old husband had to be supplanted by a young lover, with both the consent of public opinion and the approval of the state.[6]

In Sparta, the state, the conservation of those old, time-hallowed institutions, was the first and last consid-

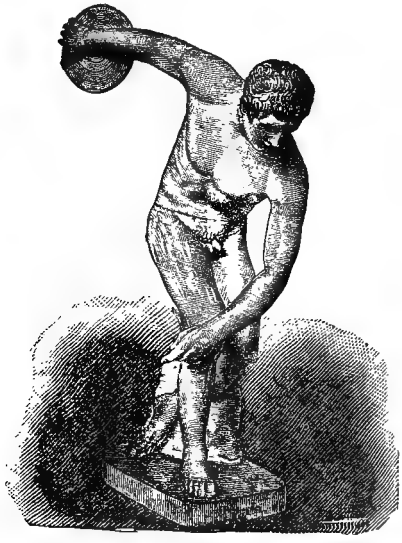
eration. It is a well-known fact, that in Sparta every newly-born baby had to be submitted to a jury of commissioners, who passed an ultimate decision on the vitality of the child. In cases of an unfavorable decision, the baby was simply flung into the abyss of the Taygetus.[1] The State had no use for weak, fragile citizens.



Discus Thrower.

For the meditative mind, these facts are highly suggestive. Why did women enjoy a liberty in Sparta that was absolutely withheld from them in Athens? Can such broad facts be ascribed to mere accidental causes, to the mere whim of legislators? On the contrary, the general and determining facts of history, or, in other words, the institutions of nations do not, and never did, depend on accidental, whimsical freaks of this or that prominent man or men. They invariably depend on some broad, general cause, the working of which can not be tampered with by the interference of single individuals.

Often all, or the majority, of Athenian and Spartan institutions are attributed to the wisdom and legislative prudence of Solon and Lycurgus respectively. And no doubt, these two eminent men enacted a few very wholesome laws, and administered their states with great insight into the character and tendencies of the people. But far from being the sole originators of all Athenian or

[1] Plutarch, Lycurgus.

Spartan institutions, they found these institutions already in existence and did nothing else but simply sanction them. The institutions of a nation can not be created by municipal ordinances or by state-laws. The real root of the peculiar standing of the women of Athens and Sparta lies outside the scope of individual lawgivers. The real source will be found in the rights and duties of citizenship in these two states, and the care taken to preserve purity of blood. Let us then inquire into the rights and duties of Athenian citizenship. As we would expect, being in the advanced stage of tribal society, the city-states in Greece were thoroughly democratical states; that is to say, each citizen was called upon to take an active part in the administration of the state.

Solon.

But this, in itself, was not sufficient. Citizens may take part in the administration of their state by exercising the right of suffrage only. They elect boards of individual officials and entrust them with the administration of affairs, occasionally controlling them by some other board. This, in general, is the American system. In Greece, however, the affairs of the state were carried on, not by a few boards of offcials, but by the people themselves. The whole people, as such, took part in the government. There were several thousand judges (dikastes), several hundred councilmen, priests, civil and naval officers—and these thousands of offices were occupied by nearly every single citizen in turn.

We will form a more adequate idea of Greek civilization by representing to ourselves the daily life of an

Athenian citizen. The average citizen of Athens spent his day mostly out of his house. His material cares were reduced to a very low measure. The warm, bracing climate of his country did not require much substantial food or much or costly clothing, and his private income was considerably enhanced by the fees and compensations received at the hands of the state. Athenian citizenship was an ample source of all kinds of small revenues. In visiting the public theaters, the poorer citizens, instead of paying their entrance-fee, were, on the contrary, the recipients of a small remuneration.[1] In a lawsuit at Athens, the jury did not consist of twelve good men and true, but generally of several hundred,[2] and consequently every single citizen had frequent chances to act and to be paid as a juror.

Besides there were numerous festivities[3] of a public character, and at the expense of the state, at which every citizen could indulge in all kind of merry-making, feasting, and frolic. In addition to all these great attractions, all public halls and thoroughfares, arcades and "academies" were swarming with all sorts of orators, philosophers, "sophists," and politicians, who were continually haranguing the people, and a great number of whom were model representatives of their art or profession: like Pericles, the unique statesman; Isocrates and Demosthenes, the unrivaled orators; Socrates, Plato, Aristotle, Antisthenes, Theophrastus, the philosophers; etc. Very few Athenians were so poor as to be without a slave, who was considered his legal property and who, in fact, did all the business, all the work and drudgery in his stead. Finally the nu-

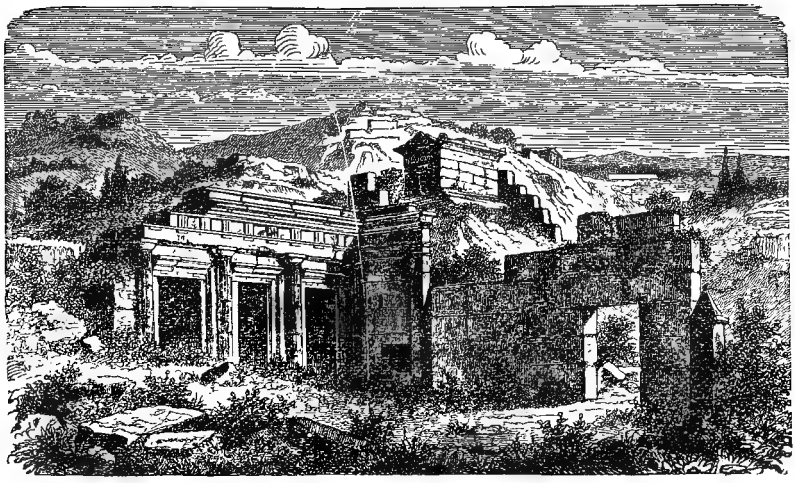
[2] Maer and Schoemann: "Altisches Prozess," p. 125.

[3] The Dionysia, the Delphinia, the Eleusinia, etc., etc. These will be treated later.

merous wars of the Athenian Commonwealth were a fruitful source of revenue for the state as well as for the individual citizen.

If we now combine these features into one whole, we will readily see that a citizen in Athens did not possess any more precious good or boon than his citizenship. It was not only an honor, a high standing, as in modern states; but it was an almost sure guarantee of a safe living. Hence it is but a matter of course, that the Athe-



Graves at Cyrene.

nians looked upon their citizenship as upon a treasure, the great value of which would be greatly impaired by a lavish distribution of the same. They established, therefore, very strict and rigid laws as to the capacity of foreigners to become citizens of Athens; and, as a matter of fact, this honor was conferred on but very few outsiders.

Even a born Athenian had to undergo a great variety of inquiries into his descent, parentage, etc., before being admitted into the rank of the full citizen. The candidate, on whom the citizenship was to be conferred, was proposed

in two successive assemblies; at the second of which at least six thousand citizens voted for him by ballot. Even if he succeeded, his admission, like every other decree, was liable, during a whole year, to an indictment for propounding an illegal measure, in other words, it was liable to the question of its constitutionality. He was then registered in the gens and phratry to which he belonged. We have pointed out how the phratry, as one of the divisions of tribal society, early tends to disappear.[1] In Greece, the phratries survived, indeed, but simply to preserve a record of the descent of the citizens. Aristotle says[2] that for practical purposes it was sufficient to define a citizen as the son or grandson of a citizen, and the register of the phratry was kept chiefly as a record of the citizenship of the parents. If any man's claim were disputed, this register was at hand, and gave an answer to all doubts about the rights of his parents or his own identity.

Every newly married woman, herself a citizen, was enrolled in the phratry of her husband, and every infant registered in the phratry of its father. All who were thus registered must have been born in lawful wedlock, of parents who were themselves citizens; indeed, so far was this carried, that the omission of any of the requisite formalities in the marriage of the parents, if it did not wholly take away the right of citizenship, might place the offspring under serious disabilities.[3] If we now compare the mode of acquiring the citizenship of Athens with modern measures with regard to the same object, we can scarcely fail to see the great stress laid upon purity and legitimacy of descent. This again is a mere outcome of the pure and legiti-

[1] This Series is, Vol. I. p. 782; Vol. II. p. 148, 173.
[2] Aristotle, Pol. iii. 2.
[3] Plutarch, Pericles, chapter 37.

mate conduct of women. If the slightest doubt can be thrown on the purity of a woman's life, the purity of citizenship is also at stake. And, consequently, it was nothing but self evident, that the Athenians, in order to preserve their most precious attribute free from all stains, took recourse to the severe measure of keeping their women in the state of perfect prisoners. In doing so, they did not show much confidence in the natural bent of women towards

Wedding March.

a virtuous life; they preferred a sure lock to all specious promises.

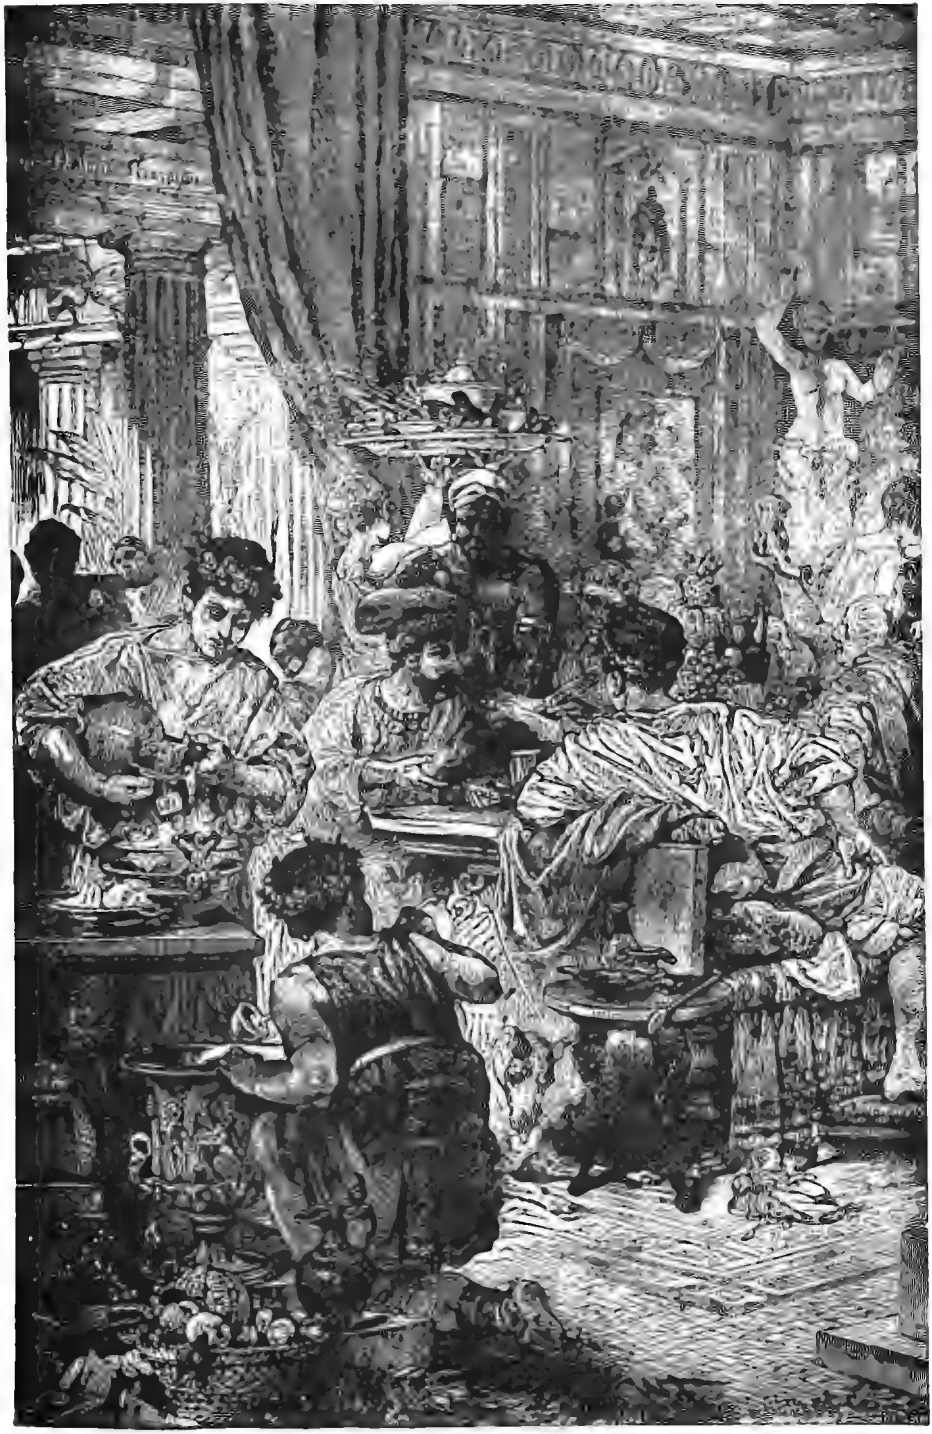
We have so far succeeded in accounting for the peculiar state of women in Athens. But what as to Sparta? How shall we explain the freer state of women in Sparta? Did not the Spartans estimate their citizenship as highly as the Athenians? Did not it confer upon them similar emoluments and privileges? Most certainly. Why then

did they not think of debarring their women from all intercourse with the outward world? To this there is a very simple and satisfactory answer. Of all the Dorian people, the Spartans kept themselves the longest unmixed with foreign blood. So jealous were they to maintain their exclusive privileges, that they had only admitted two men into their body before the time of the historian Herodotus, (the fifth century B. C.)[1]. There being no strangers in the state, they did not dread the admixture of foreign blood, entertaining, as we remarked above, rather latitudinarian views about matrimonial exclusiveness.

In addition to this, there was another cause at work in Sparta, which illustrates the peculiar bent of the Spartan mind. The constitution of the Spartan state displayed a decided aversion to foreign immigrants; and, in order to hold out as few attractions as possible, they instituted the use of a money, that had no intrinsic value whatever. Thus their money consisted of huge iron discs, and no gold or silver was admitted into the country. The iron discs, while red hot, were dipped in vinegar to render them unmalleable and useless for any other purpose than money. Of a consequence, this kind of money was no allurement to the trading people of other communities. Market for the same was restricted to the community of the Spartans. Hence Sparta, not being pestered with the dangerous influence of foreigners, who helped to swell the population of Athens to hundreds of thousands of people, could easily dispense with rigorous measures with regard to the private conduct of women.

---

[1] Herodotus i. 33-35. Afterwards their numbers were occasionally recruited by the admission of Laconians, Helots, and foreigners, but this was done very sparingly prior to the time of Agis and Cleomenes, who created large numbers of citizens.



GREEK FESTIVAL.

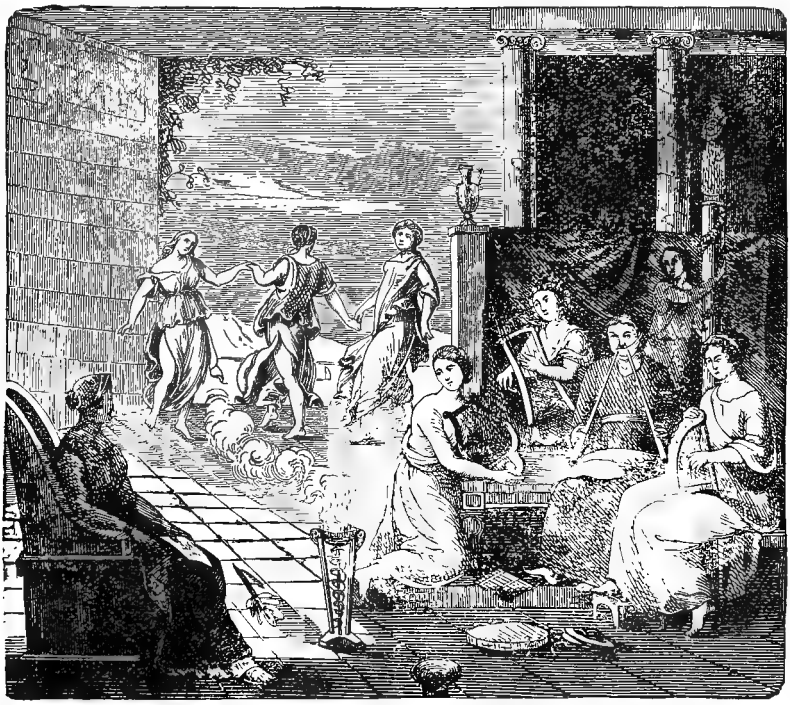
We have now gained an insight into the state of women of Athens and Sparta, and likewise into the causes of the same. Our information about women in other Grecian communities is rather scanty. But by what we occasionally read in the historians and dramatists of Greece, we may fairly infer, that the cities of Asia Minor, Sicily, Thessaly, Macedonia, and of other Greek settlements followed the example either of Athens or of Sparta.

This peculiar position of women in Greece, more especially in the cities where women were treated after the Athenian pattern, did not fail to produce national features equally peculiar and important for the historian. We mean the strange love of men for men and the "Hetairae". The eternal yearning of men for deeper emotions like love and sympathy could not be gratified by a system which regarded women as a means for maintaining the purity of citizenship rather than the sweet and consoling companions of life. As a mere consequence, men became alienated from their wives; and the tender relation between the two sexes was exchanged for the stern duties of guard and prisoner.

But the emotions, which men were unable to find and to indulge in at their homes, were sought for in other directions. Thus arose a closer intimacy between men and men than would else be explicable. Men attached themselves to their male friends with all the unalloyed force of their soul, and sought to make up for the joys of wedlock by delighting in the charms of friendship. We read of famous friends, like Epaminondas and Pelopidas, Harmodius and Aristogiton, Damon and Pythias, etc., who, to the present, serve as the model archetypes of elevated friendship. The celebrated three hundred Theban youths were all closely united by the bonds of unswerving friendship; and, as

a rule, we hear more frequently of the friendship than of the love of a Grecian.

Friendship, however, is not able to quench the passionate longing for more vehement feelings, which is so natural to humanity. And hence the Grecians, with their keen sense of beauty and their highly susceptible minds,



Music and Dance.

turned to more gratifying sources of pleasure. It is no wonder that these sources were represented by females and these females are called "*Hetairae*". They were free, emancipated women, who lived by their physical and mental charms. There were several classes of these women. The lowest were much like their equivalent class of to day, they lived in public houses (*perneia*), state-institutions,

which were first established by Solon.[1] Then comes the numerous class of freed-women, comprehending the flute-player, cithera-player, etc., who were hired to assist at the domestic sacrifices. Many in this class were probably distinguished for wit and vivacity. But those remarkable personages, who by their intellect and power of fascination, rather than by their beauty, exerted such an extensive sway over their age, and who, by the position in which they stood to the greatest men of the day, have secured an historic celebrity, were sprung from a different order.

For Aspasia and the Corinthian Lais, as well as Phryne and Pythionice were aliens, and Lamia was the daugter of a free Athenian citizen. Almost every famous man of Greece had one of these lady-companions with whom he discussed the pursuits and soothed the evils of life. Thus we read of Plato and Archaenassa, Aristotle and Herpyllis, Epicurus and Leontion, Isocrates and Metaneira, Menander and Glycera. The beauty of some, especially of Phryne, said to have been the most beautiful women that ever lived, attracted the eyes of all Greece; Apelles painted her picture, and Praxiteles made her the model for the Cidian Aphrodite, the loveliest representation of womanhood that ever the sculptor's chisel produced. Some were renowned for their musical faculty, some were celebrated painters. Socrates, the wisest of men, did not hesitate to say that he considered Aspasia his teacher.

It was not to be expected that all women would acquiesce in the general view of their rights and duties. Some of the women in Greece were aware of their unworthy social standing; and, in the seventh century, a movement began with a view to a reformation, or an emancipation of women. The center of this movement was the great

1. Athenaeus, xiii. p. 569.

poetess Sappho. She was the only women in all antiquity whose productions, by universal consent, placed her on the same level as the greatest poets of the other sex. Solon, on hearing one of her songs sung at a banquet, got the singer to teach it to him immediately, saying that he wished to learn it and die. Herodotus, the historian, Plato, and Aristotle refer to her in terms of profound respect. Plato called her the tenth muse.

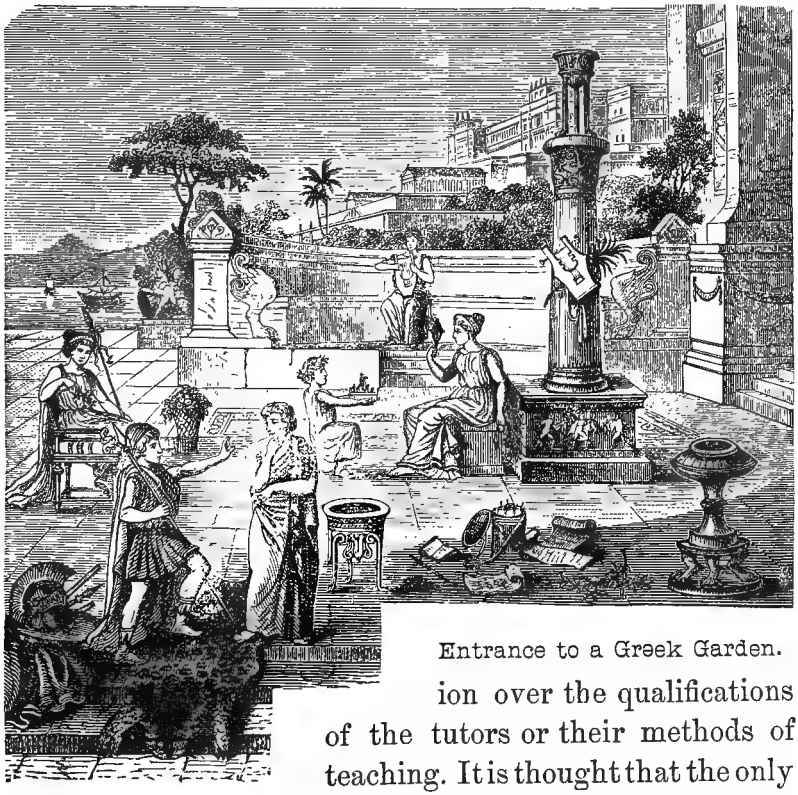
Sappho determined to do all she could in order to elevate her sex. The one method of culture open to women at that time was poetry; and, accordingly, Sappho established a school of Greek poetesses, the most celebrated of her disciples being Erinna. But this, as well as similar other efforts to raise Greek women from the stagnancy of their lives, failed entirely of its object. Their condition being a growth and natural product of deep-rooted institutions, it could not be altered or modified by the spasmodic efforts of a few individuals. Great changes are never the result of measures taken by isolated individuals, whom the near-sighted opinion of the public are pleased to call "heroes". Great national changes are brought about by new institutions or by the decay of old ones.

When we think of the great influence of political institutions in Greece, we are surprised at the lack of public schools. Very few people could do without a knowledge of reading and writing, but still they never had a system of public schools. The state never thought of erecting public institutions of that kind to be maintained at the general expense. The sort of an education that children received depended mainly on the parents' own conscientiousness. Some got none at all.[1] This however was not usual; and so necessary a thing did school-going seem, that

[1] The Sausage seller, for instance. Aristophanes, Equities, 1234.

when the women and children of Athens fled to Troezen, at the time of the Persian invasion, the inhabitants, besides supporting them, paid persons to teach the children.[1]

The selection of a teacher rested entirely with the parents. The tutors were, in some degree under the surveillance of the state, though this latter exercised, little supervis-



Entrance to a Greek Garden.

ion over the qualifications of the tutors or their methods of teaching. It is thought that the only requirement was one as to age.[2] Instruction was in three branches; grammar, music, gymnastics "Grammar" was

1 Plutarch, Themistocles, 10. See also Aelian Var. History vii. 15. Where we read that the Mytelenaeans, when masters of the sea. punished their revolting allies by not allowing their children to be taught, ddeming this the severest penalty they could inflict.

2 In our account of Greek customs, etc., we have freely drawn from Becker's "Charicles."

the most indispensible part of instruction. It comprehended reading, writing, and arithmetic. When the children could read and understand what they read, the works of the poets were put in requisition, to exercise their minds, and awaken their hearts to great and noble deeds. The study of music began somewhat later, according to Plato with the thirteenth year.[1] The Greeks knew nothing of a two-months' or four-months' summer vacation for the school-children. Attendance at school was continued till the pupils reached riper years in the Greek sense, which would generally be at the age of sixteen.

The more advanced instruction was imparted by teachers of a higher order, the Rhetoricians and Sophists, whose charges only the rich could defray. But this did not prevent the lovers of knowledge from purchasing their instruction even at the greatest sacrifices. Thus Cleanthes, Menedemus, and Asclepiades worked by night in gardens and mills, in order to be able to attend by day the classes of the philosophers. With the Spartans, however, mental culture was a secondary consideration, and Aristotle[2] justly upbraids them for bringing up their offspring like animals. We nowhere hear anything of educational institutions for girls, and indeed, they would have been incompatible with the universal training of the female sex. The lack of public state schools will more easily be understood if we consider the innumerable occasions for instruction of all kind afforded by the publicity of all proceedings in statesmanship, science, and art. To listen to the great orators of the court-hall, of the assembly, or of the philosophical "academy" was an ample resource of useful information. But perhaps the most fruitful source of general instruction was afforded by the

[1] Leg. vii. [2] Polit. viii. 4.

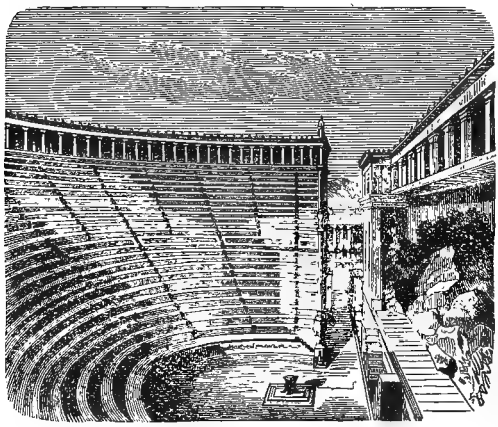
magnificent theaters and their tragedies and comedies, which comprised all that is great, profound, and suggestive.

Here, as well as in other cases, our main information refers to Athens, but we can the more readily acquiesce in it since the other cities of Greece arranged their theatricals according to the Athenian standard. The Athenians, before the time of the great tragedian, Aeschylus, 525-456 B. C., had only wooden scaffolding on which their dramas were performed. Such a wooden theater was erected only for the Dionysiac festivals, and was afterward pulled down. The first drama that Aeschylus brought upon the stage was performed upon such a wooden scaffold, and it is recorded as a singular and ominous coincidence that on that occasion[1] the scaffolding broke down. To prevent the recurrence of such an accident, the building of a stone theater was forthwith commenced on the southeastern descent of the Acropolis; for it should be observed, that, throughout Greece, theaters were always built upon eminences, or on the sloping sides of hills.

The Attic theater was, like all Greek theaters, placed in such a manner that the place for the spectators formed the upper or northwestern, and the stage, with all that belonged to it, the southeastern part, and between these two parts lay the orchestra. The seats for the spectators, which were in most cases cut into the rock, consisted of rows of benches rising one above another; the rows themselves formed parts (nearly three-fourths) of concentric circles, and were at intervals divided into compartments by one or more broad passages running between them and parallel with the benches. The entrance to the seats of the spectators was partly underground, and led to the lowest row of benches.

[1] 500 B. C.

The orchestra was a circular, level space, extending in front of the spectators and somewhat below the lowest row of benches. But it was not a perfect circle, one segment of it being appropriated to the stage. The orchestra was the place for the chorus, where it performed its evolutions and dances, for which purpose the orchestra was covered with boards. As the chorus was the element out of which the drama arose, so the orchestra was originally the most important part of a theater. It lay under the open sky. Steps led from each side of the orchestra to the stage. The machines in the Greek theatres were extremely numerous, but we are in many cases unable to form an exact idea of their nature and their effects.



Entrance to a Greek Theatre.

Theatrical representations at Athens began early in the morning, or after breakfast, and when the concourse of people was expected to be great, persons would even go to occupy their seats in the night. When the weather was fine, especially at the Dyonisiac festivals in spring, the people appeared with garlands on their heads. As it was not unusual for the theatrical performances to last from ten to twelve hours, the spectators required refreshments, and they used to take wine and cakes.

The whole of the *cavea* in the Attica theatre must have contained about fifty thousand spectators. The places for generals, archons (chief magistrates), priests,

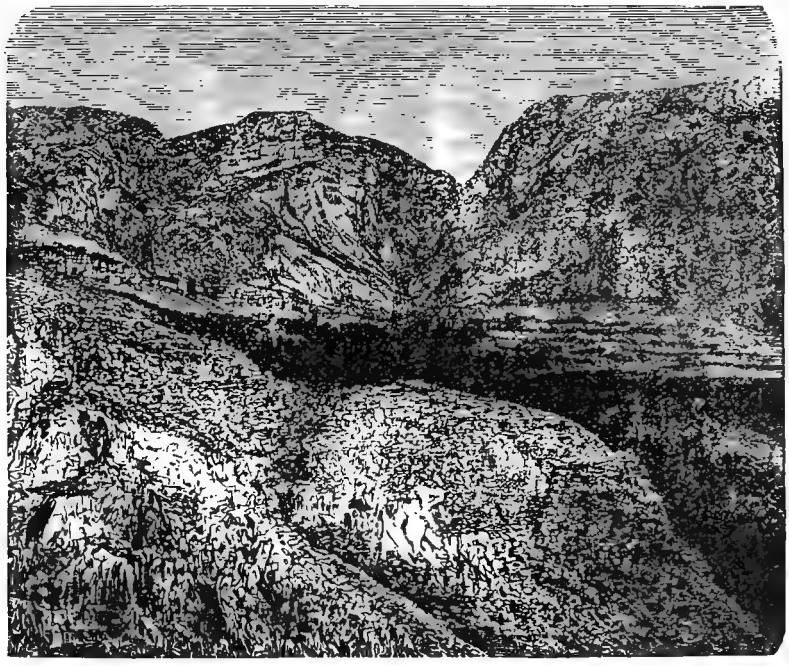
foreign embassadors, and other distinguished persons were in the lowest rows of benches, and nearest to the orchestra. On the stage the actors were playing, all of them wearing characteristic masks. It seems to us rather inappropriate that an actor should have one and the same mask all the play through. But we must bear in mind the immense dimensions of a Greek theatre, where the most distant spectators were not likely to see the features of the actors unless artificially enlarged. These

Rural Festivities among the Greeks.

masks, therefore, were a means to make up for our modern opera glasses.

The Greek theater leads us to a consideration of the Greek games. The public games of Greece were athletic contests and spectacles of various kinds, generally connected with, and forming part of a religious observance. Probably no institution exercised a greater influence in molding the national character and producing that unique type of physical and intellectual beauty, which we see

reflected in Greek art and literature, than the public contests of Greece. For them, each youth was trained in the gymnasium; they were the central marts to which poet, artist, and merchant each brought his wares, and the common ground of union for every member of the Hellenic race.



Delphi and Parnassus.

The Olympian games were the earliest, and to the last, they remained the most celebrated of the four national festivals. Olympia was a natually enclosed spot in the rich plain of Elis. There was the grove of Altis, in which were ranged the statues of the victorious athletes, and the temple of Olympian Zeus, with the chrys-elephantine (ivory and gold) statue of the god, the masterpiece of Phidias. In 776 B. C., the Eleians engraved the name of their countryman, Coroebus, as victor in the foot-race; and

thenceforward we have an almost unbroken list of the victors in each succeeding Olympiad, or fourth recurrent year. The Olympian games survived even the extinction of Greek liberty, and had nearly completed twelve centuries when they were abolished by the decree of the Christian emperor, Theodosius, in the tenth year of his reign. The last Olympian victor was a Romanized Armenian named Varastad.

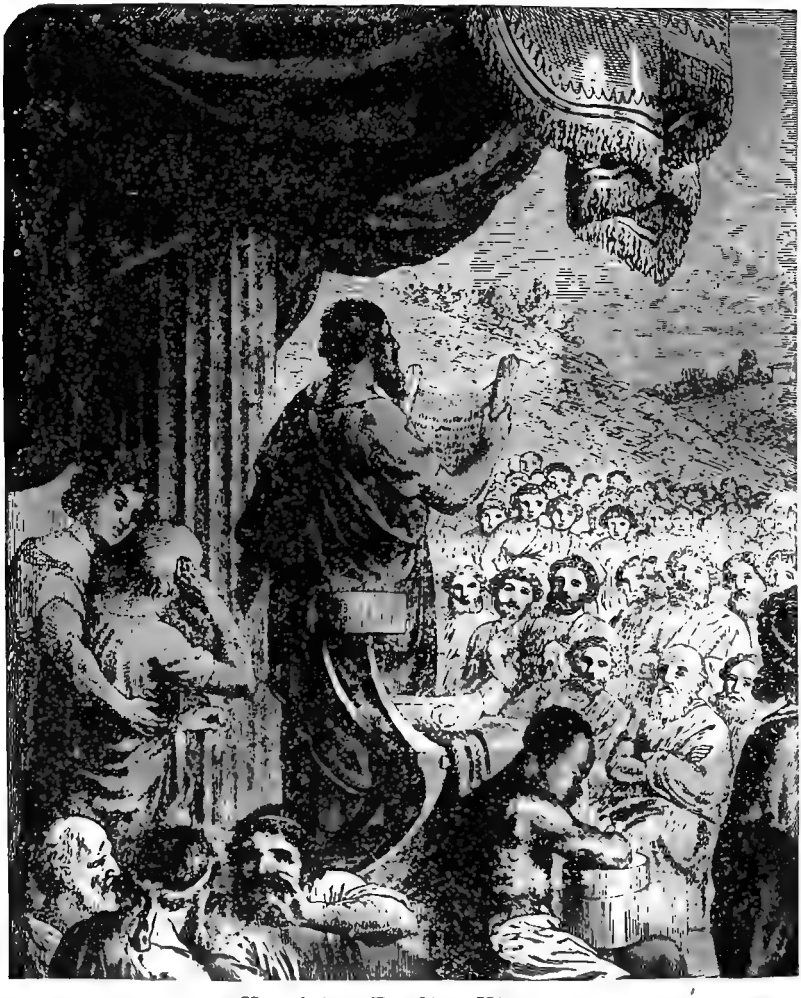
Let us attempt to call up the scene which Olympia in its palmy days must have presented as the great festival approached.[1] Heralds had proclaimed throughout Greece the truce of God, which put a stop to all warfare, and ensured to all a safe conduct during the sacred month. So religiously was this observed that the Spartans chose to risk the liberties of Greece, when the Persians were at the gates of Pylae, rather than march during the holy days. Those white tents, which stand out against the somber gray of the olive groves, belong to the *Hellanodicai*, or ten judges of the games, chosen one for each tribe of the Eleians. They have already been here ten months, receiving instructions in their duties.

All, or most, of the athletes must have arrived, for they have been undergoing the indispensible training in the gymnasium of the Altis. But along the "holy road" from the town of Elis, there is crowding a motly throng. Conspicuous in the long train of pleasure seekers are the sacred deputies, clad in their robes of office, and bearing with them in their carriages of state offerings to the shrine of the god. Nor is there any lack of distinguished visitors.

It may be Alcibiades, who, they say, has entered seven chariots; or Gorgias, who has written a poem for

[1] In the description of these games we follow Conrad Francis Stoer.

the occasion; or the sophist Hippias, who boasts that all he bears about him, from the sandals on his feet to the *dithyrambo* he carries in his hand, are his own manufac-



Herodotus Reading History.

ture; or Aetion, who will exhibit his picture of the marriage of Alexander and Rosana—the picture that gained him no less a prize than the daughter of the Hellanodicas, Praconides; or, in an earlier age, the poet-laureate of the

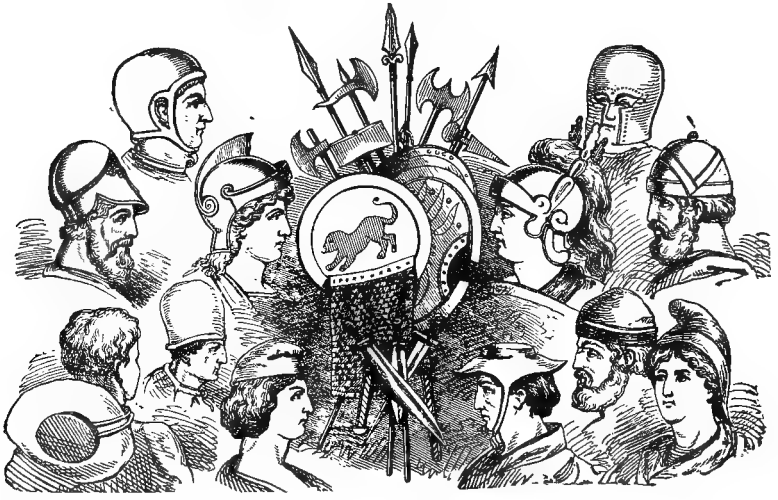
Olympians, Pindar, himself. Lastly, as at the medieval tournament, there are "scores of ladies whose bright eyes rain influence;" matrons, indeed, are excluded on pain of death, but maidens, in accordance with Spartan manners, are admitted to the show.

At daybreak, the athletes presented themselves in the *Bouleuterion*, where the presidents were sitting, and proved by witnesses that they were of pure Hellenic descent, and had no stain, religious or civil, on their character. Laying their hands on the bleeding victim, they swore that they had duly qualified themselves by ten months' continuous training in the gymnasium, and that they would use no fraud or guile in the sacred contests. Thence they proceeded to the *Stadium*, where they stripped to the skin and anointed themselves. A herald proclaimed: "Let the runners put their feet to the line," and called on the spectators to challenge any disqualified by blood or character.

If no objections were made, they were started by the note of the trumpet. The presidents seated near the goal adjudged the victory. The foot-race was only one of the twenty-four Olympian contests which Pausanias enumerates. Till the 77th Olympiad all was concluded in one day, but afterward the feast was extended to five. The following were the chief games: foot-racing, wrestling, leaping, boxing, and chariot-racing.

The prizes were at first, as in Homeric times, of some intrinsic value, but after the 6th Olympiad, the only prize for each contest was a garland of wild olive. Greek writers from Herodotus to Plutarch, dwell with complacency upon the magnanimity of a people who cared for nothing but honor, and were content to struggle for a corruptible crown. But the successful athlete received in addition to the imme-

diate gift of the crown and the congratulations of his friends, very substantial rewards. A herald proclaimed his name, his parentage, and his country; the Hellanodicai took from a table of ivory and gold the olive crown and placed it on his head, and in his hand a branch of palm; as he marched in the sacred revel to the temple of Zeus, his friends and admirers showered in his path flowers and costly gifts, singing an old song of Archilochus, and his name was canonized in the Greek calendar.



Helmets, Head Covering, and Weapons.

Fresh honors and rewards awaited him on his return home. If he were an Athenian, he received, according to the law of Solon, five hundred drachmae,[1] and free rations for life in the *Prytaneum*; if a Spartan, he had as his prerogative the post of honor in battle. Poets like Pindar, Limonides, and Euripides sang his praises, and sculptors like Phidias and Praxiteles were engaged by the state to carve his statue. We even read of a breach in the town walls being made to admit him, as if the com-

[1] $20.

mon road were not good enough for such a hero; and there are well-attested instances of altars being built, and sacrifices offered to a successful athlete.

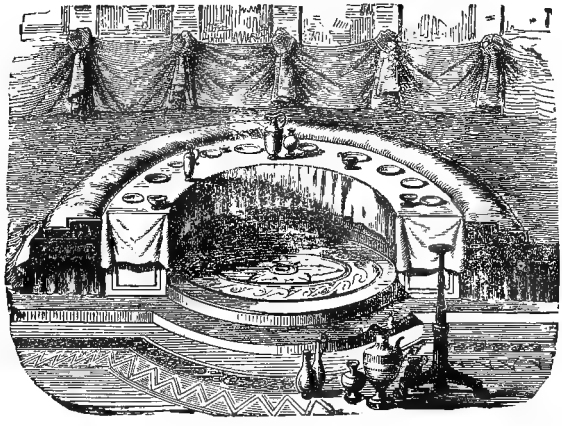
No wonder, then, that an Olympian prize was regarded as the crown of human happiness. Cicero, with a Roman's contempt for Greek frivolity, observes with a sneer, that an Olympian victor receives more honor than a triumphant general at Rome; and he tells the story of the Rhodian Diagoras, who, having himself won the prize at Olympia and seen his two sons crowned on the same day, was addressed by a Laconian in these words: "Die, Diagoras, for thou hast nothing short of divinity to desire." Alcibiades, when setting forth his services to the state, puts first his victory at Olympia, and the prestige he had won for Athens by his magnificent display. But perhaps the most remarkable evidence of the exaggerated value which the Greeks attached to athletic prowess is a casual expression which the historian Thucydides employs when describing the enthusiastic reception of Brasidas at Leione. The government, he says, voted him a crown of gold, and the multitude flocked round him and decked him with garlands, "as though he were an athlete."[1] The above description of the Olympian games will serve generally for the other great festivals of Greece.[2]

The peculiar caste of a nation's civilization manifests itself, not only in those broader and more striking institutions like political or military devices, but also in the most ordinary customs and habits of every day life. Nay, for the historian of civilization, these latter customs are the central point of attention. It is from this point of view, that we are now going to treat of the manner, in

[1] Thucydides, Bell. Pel. iv. 121.

[2] Other national games were the Pythian, Nemean, and Isthmian.

which the ancient Greeks used to take and enjoy their meals. The ways in which different nations take their meals, the kind and the quality of food they use, are just as characteristic of their culture, of their degree of development, as are their language and their laws. Some people are vegetarians; and, to the present day, the peasant class in Europe, especially in the eastern part of Europe, are almost exclusively vegetarians. Other nations will be more fond of eating than drinking. Others, again, have a decided predilection for meat, using pastry but



Arrangements for a Meal.

very sparingly. In doing so, they are not prompted by mere economic reasons; it is not the scarcity or the abundance of meat or flour which regulates the wants of a people above the primitive stage of civilization. There are other causes of a purely social character. In Sparta, for instance, the inhabitants took their meals in common, in a public place, in the *Syssitia*.[1]

[1] The custom of taking the principal meal of the day in public prevailed not only at Sparta and Athens [where it was kept up until comparatively recent times] but also at Megara in the age of Theognis [ v. 305.] and at Corinth until the age of Periander [ about 620 B. C.], by

Every head of a family was obliged to contribute a certain portion at his own cost and charge; those who were not able to do so, were excluded from the public tables.[1] The guests were divided into companies, generally of fifteen persons each, and all vacancies were filled by ballot, in which unanimous consent was indispensible for election. No persons, not even the kings, were excused from attendance at the public tables, except for some satisfactory reason. Each person was supplied with a cup of mixed wine, which was filled again when required; but drinking to excess was prohibited at Sparta. The repast was of a plain and simple character. The principal dish was the "black broth" with pork. The after meal was however more varied and richly supplied by presents of game, poultry, fruit, and other delicacies which no one was allowed to purchase. Moreover, the entertainment was enlivened by cheerful conversation, though on public matters.[2] Singing also was frequently introduced as we learn, from Alcman,[3] that "at the banquets of the men it was fit for the guests to sing the paean." (a hymn).

The use and purpose of this institution are very manifest. They united the citizens by the closest ties of intimacy and union, causing them to consider themselves as members of one family. At Sparta, also, they were eminently useful in a military point of view, for the members of the *syssitia* were formed in corresponding military divisions, and fought together in the field as they lived together at home, with more bravery and a keener sense of shame than could have been the case with merely chance

whom it was abolished as being favorable to aristocracy [Aristotle, Polit. v. section 32]. Nor was it confined to the Hellenic world [Pol. vii. 9], for, according to Aristotle, it prevailed still earlier among the Venotrians in Southern Italy.

[1] Aristotle, Pol. ii. 7, 4.

[2] Xenophon, Rep. Lacon. v. 6.

[3] Fragm. 31.

comrades.[1] The refinement of private cookery was of course almost totally excluded; the bulk of the courses consisted of roughly roasted beef or venison.

Let us now cast a glance at the other meals of the Greeks. From the earliest times, it was usual to take three meals a day. The names of these were *Ariston* (corresponding to our breakfast), *Deipnon* (luncheon), *Dorpon* (supper). The breakfast was taken quite early,

Living Room in a Greek House.

directly after rising.[2] The chief meal, as among the Romans, was the third, the *Dorpon*. If a person ate alone without any company, the Grecks did not call it a regular meal. It was very common for several to club together and have a feast at their joint expense. Picnic parties were often made up to dine in the country, especially on

1 Herodotus, i. 65.

2 See Aristophanes' Birds, 1825.

the sea-shore. It was not thought a breach of good manners to bring to a friend's house an uninvited guest. It was expected that guests should come dressed with more than ordinary care, and also have bathed shortly before. As soon as the guests arrived at the house of their host, their shoes or sandals were taken off by the slaves and their feet washed. After the feet had been washed, the guests reclined on couches.

Homer never describes persons as reclining, but always as sitting at their meals; but at what time the change was introduced is uncertain. The Greek women and children, however, like the Roman, continue to sit at their meals. It was usual for only two persons to recline on each couch. In eating, the Greeks had no knives or forks but made use of their fingers only, except in eating soups or other liquids, which they partook of by means of a spoon. After eating, they wiped their fingers on pieces of bread. They did not use any cloths or napkins.

The most common food among the Greeks was the "*madra*," a kind of frumenty or soft cake which was prepared in different ways. Wheaten or barley bread was the second most usual species of food, it was sometimes made at home, but more usually bought at the market. The vegetables ordinarily eaten were mallows, lettuce, cabbages, beans, lentils, etc. Pork was the most favorite animal food; sausages also were very commonly eaten. It is a curious fact, which Plato has remarked, that we never read in Homer of the heroes partaking of fish. In later times, however, fish was one of the most favorite foods of the Greeks.

A dinner given by an opulent Athenian usually consisted of two courses. The first course embraced the whole of what we consider the dinner, namely; fish, poultry,

meat, etc.: the second, which corresponds to our desert, consisted of different kinds of fruit, sweetmeats, confections, etc. When the first course was finished, the tables were taken away and water was given to the guests for the purpose of washing their hands. Crowns, made of garlands of flowers, were also then given to them, as well as various kinds of perfumes.

Wine was not partaken of until the first course was finished; but as soon as the guests had washed their hands, unmixed wine was introduced in a large goblet, of which

Dwelling of a Rich Greek.

each drank a little, after pouring out a small quantity as a libation. This libation was usually accompanied with the singing of a paean and the playing of flutes. Then the regular *Symposion* began. The symposion was the principal part of a supper. It consisted chiefly of hard drinking, enlivened with brisk conversation and music. The Greeks, with the exception of the Spartans, Cretans, and a few other communities, were devoted drinkers. But, with the exception of the first goblet mentioned above, none but watered wine was used. To mix it half and half was considered rude, the proportion generally was three

to one; or two to one; or three to two.[1] Drunkenness was not considered a shame, and even Plato himself apologises for it.

Every Greek symposion had a *Symposiarch*, a president of the entertainment, a "master of the revels," who was generally chosen by the throw of dice. The symposiarch determined the proportion of the mixture and the number of *Kiatoi* (goblets); he could also impose fines, etc. It was customary, at least at Athens, to drink out of small goblets, or, at all events, to begin with them, afterward resorting to larger. According to Ephippus,[2] Alexander the Great drained off a goblet holding a gallon and a half. In the "Symposion" of Plato, Alcibiades and Socrates each empty an immense cup containing nearly four pints, and frequently such cups were emptied at one draught.

The cups were always carried round from right to left, and the same order was observed in the conversation. The company frequently drank to the health of one another, and they did so in a peculiar way. They drank as many goblets as there were letters in the name of their friend. Thus Alcibiades would drink to the health of Socrates by emptying eight goblets, to which Socrates would respond with a still greater number of goblets, the name of Alcibiades being composed of ten letters.

Music and dancing were usually introduced, as already stated, at symposia; and we find few representations of such scenes on ancient vases without the presence of female players on the flute and the cithera. But these symposia

[1] In this as well as in all our statements regarding the meals and symposia of the ancient Greeks, we follow chiefly the incidental remarks in Plato's dialogues, and the ample allusions in Aristophanes and other Greek comedians.

[2] Athenaeus, x.

were not wassailing excesses only. All that Athens, Corinth, or Argos could display of refined, cultured, witty people—all these choice minds used to meet at these symposia, and the most charming conversation, spiced with games of all societies, was the usual feature. The dancing of the Greeks formed quite a telling feature of their civi-

Ornamental Articles used in Greek Life.

lization. It had very little in common with the exercise which goes by that name in modern times. The fundamental notion of all Greek dancing is the bodily expression of some inward feeling, and that which poetry affected by words, dancing had to do by movement. Dancing

was originally closely connected with religion. Plato[1] thought, that all dancing should be based on religion. Accordingly the dances of the chorus at Sparta and in other Doric states were intimately connected with the worship of Apollo. All the religious dances were very simple and consisted of gentle movements of the body with various turnings and windings around the altar.

We have thus far been considering the unofficial life of an ancient Greek; before considering the official life, let us notice the absence of private home life. Public life engrossed the time and attention of every Grecian to such an extent that private life was, as it were, at the mercy of public life. Their games, religious exercises, and manner of living were public. Home life was reduced to a minimum. This constant association of men with men, mind acting on mind, contributed in no small degree to bringing about the state of culture found in ancient Greece.

Let us now consider official life in early Greece. As was the normal state in all tribal society, the ultimate power of legislation rested with the people, or, more correctly, with the legitimate assembly of the people, with the *Ecclesia*. In it, and through it, the sovereign will of the people of Athens was expressed. Here were brought before them all matters, which, as the supreme power of the state, they had to order or to dispose of; questions of war and peace, treaties and alliances, levying the troops, raising of supplies, religious ordinances, bestowing of citizenship; likewise the election of a great variety of magistrates, embassadors, commissioners, etc.

Anciently the people used to assemble once only in each *Pritany*, or ten times a year; afterward, they met every week. These were called the regular or ordinary

[1] Plato, Leg. vii.

assemblies. On what days they were held is not known; the Athenians avoided meeting on holidays or unlucky days. The assembly used anciently to be held in the market-place, Agora.[1] Afterward it was transferred to the theater of Bacchus. But it might be held anywhere, either in the city or in the Piraeus (harbor of Athens), or elsewhere. The assemblies were usually convened by the presidents of the council (senate), who published a notice four days before, specifying the day of meeting and the business to be transacted. All citizens of the age of twenty, who had been duly registered, were entitled to attend and vote.[2]

Before the business of the day commenced, a sacrifice of purification was offered. The lustral victims were young pigs, whose blood was carried round and sprinkled on the seats, while at the same time incense was burned in a censer. The cryer then pronounced a form of prayer and commination, imploring the gods to bless and prosper the consultations of the people, and imprecating a curse upon all enemies and traitors. The chairman then opened the business of the day. If any bill had been prepared by the senate, it was read by the crier or the usher, and the people were asked if it met their approbation. If there was no opposition, it passed.

Any citizen, however, might oppose it, or move an amendment. Every member of the assembly was at liberty to speak, but only once during a debate. According to the institutions of Solon, those who were above fifty years old were first called upon, and afterward the younger men. But this custom fell into disuse.[3] Although all

citizens had the right of speaking, the privilege was, of course, exercised by a few only, who felt themselves competent for the task; it was not very easy to get up after one of those matchless speeches of orators like Isacus, Lysias, Isocrates, or Demosthenes, and to address the assembly in a befitting way. Whoever rose to speak put on a wreath of myrtle,[1] as a token that he was performing a public duty, and entitled on that account to respect.

It was a breach of decorum to interrupt the speaker. When the debate was ended, the chairman put the question to the vote. The method of voting was either by show of hands (*Cheirotonia*) or by ballot.[2] Show of hands was the most common. When all the business was concluded, the crier by command of the president dismissed the assembly. A decree having been carried by the votes of the people, it was copied on a tablet, and deposited by the secretary among other public records in the temple of Cybele.

The great power of the assembly was held in proper balance by the influence of two other political and judicial institutions of the Athenians; by the Areopagus and the Senate. The areopagus,[3] so called from the Hill of Ares (Mars) where it held its sittings, near the Acropolis, was a judicial and deliberative body greatly esteemed at Athens. It was from time immemorial established as a court of criminal jurisdiction, to try cases of murder, maiming, and arson. It sat in the open air, to escape the pollution of being under the same roof with the guilty. In its proceedings the utmost solemnity was observed. Both parties were sworn to speak the truth, and the facts alone were

[1] Aristophanes, Eccles. 130. 147.

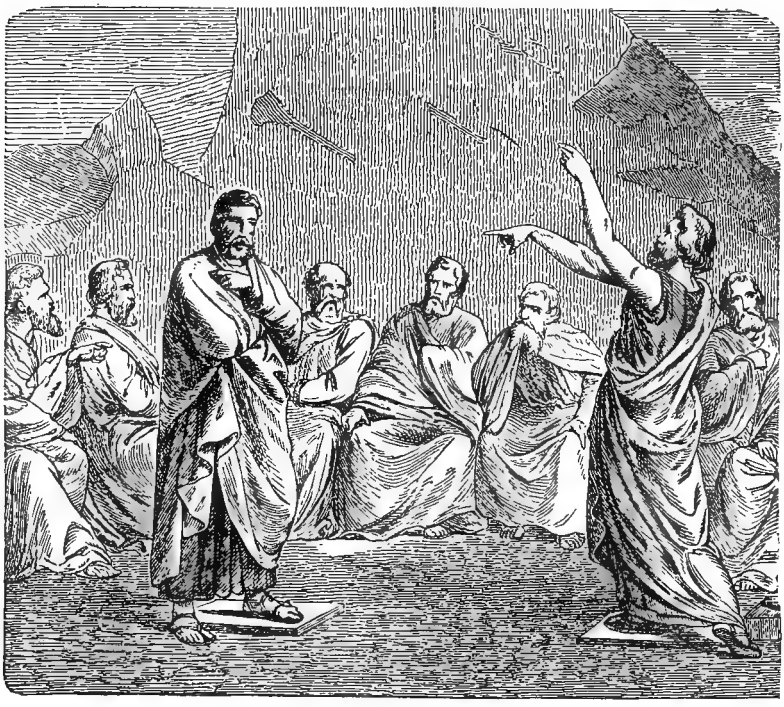
[3] The find development of the council of the chiefs of the phratries, See Vol. II. p. 192.

inquired into, without appeals to the feelings or oratorial display. The Areopagus used to be taken from the noble families of Attica. But Solon introduced a new law, that the archons whose official conduct had been approved should be members of this council for life. At the same time he enlarged the power of the council, attaching to it



Gathering of the Areopagus.

political and censorial duties,[1] in order that, together with the council of five hundred (senate), it might act as a check upon the democracy, or to use Solon's own words, that "the state riding upon them (areopagus and senate) as anchors, might be less tossed by storms."

In their censorial character, the areopagites kept watch over the religion and morals of the city, maintained order

[1] Plutarch, Solon, chapter 22. Isocrates, Areip. p. 147.

and decency, looked to the education of the young, inquired how people got their living, and checked riotous excesses and debauchery. We read of their entering houses on feast days to see that the guests were not too numerous. A party in Athens consisted of either three persons, in agreement with the number of Graces, or of nine, according to the number of Muses. Any thing above that was considered excessive.

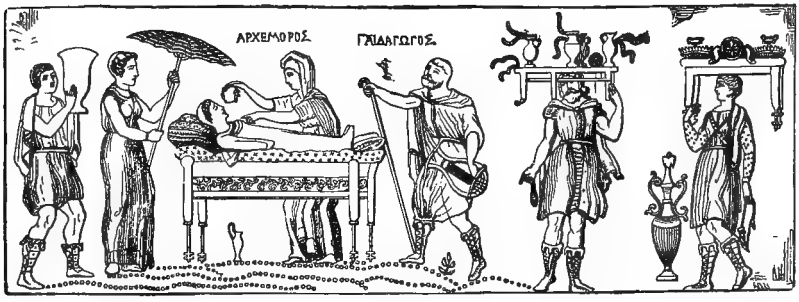
The second great and effective check on the power of the democratical assembly was the senate (boule),[1] or, as it was also called (at a later stage), the council of the five hundred. This executive and deliberative body managed various departments of the public business, more especially those which related to the public assembly. They were annually chosen by lot—in Solon's times from the first three classes only, but afterwards from the whole body of the people—with no other restriction than that they must be genuine citizens on both the father's and the mother's side and of the age of thirty. At the expiration of their year of office, they had, like all other functionaries, to render an account of their official conduct to the auditors.

For the more convenient dispatch of business, the tribes apportioned the year among them, and took the duties in rotation. The council was thus divided into ten bodies of fifty men, who were called *Prytanes*, or Presidents, and who for the time represented the whole council. This term of office was called a *Pritany*. As the lunar year at Athens consisted of three hundred and fifty-four days, it was so arranged, that there were six prytanies of thirty-five days each, and four of thirty-six. The turns were determined by lot. The council was to be, according to Solon's design, a sort of directorial committee, to assist

[1] In the first stage, the chiefs of the gentes.

the people in their deliberations and to guide and control their acts in the assembly. It was their duty to discuss beforehand and to prepare in proper form the measures submitted to the people. Besides preparing questions for the assembly, the council had a right to issue ordinances of their own, which, if not set aside by the people, remained in force for the year.[1]

The excutive duties of the council were very numerous. The whole financial department of the administration was under their control. The income of the Athenian state ranged between twelve and fifteen hundred talents,[2]



Funeral Customs Among the Greeks.

besides the tributes of dependent states. Taxes were levied, but not regularly. Neither an Athenian nor a Roman had any idea, that the first duty of a law-abiding citizen was to pay taxes. The accounts of the moneys that had been received, and of those still remaining due, were delivered to the senate by the *Apodectae*, or public treasurer. The senate arranged also the application of the public money, even in trifling matters, such as the salary of the poets, the superintendence of the cavalry maintained by the state, and the examination of the infirm supported by the state.

These are the outlines of the Athenian state. We see

[1] Herrmann: "Griechische Staats Alberthümer," ss. 125 *et seq.* Boeckh: "Publ. Econ. of Athens," p. 154 *et seq.* [2] $2,000,000.

an assembly of all citizens, meeting almost twice every week, and, apparently at least, determining and ruling every thing by a majority vote. But we perceive also powerful checks on the activity of the assembly, namely the areopagus and the boule (senate). In fact the ultimate lawgiver in Athens was not to be found in the assembly. For a bill that had passed the votes of the assembly was not considered an ultimate law, a *Nomos*, but only a *Psephisma*. It had still to pass the supervision of a board of law-revisers, *Nomothetai*, who were entrusted with the power of deciding whether a bill carried in the ecclesia (assembly) was to be considered constitutional, or whether, on account of its divergence from the fundamental laws of Athens, it was to be discarded. In this the nomothetai of Athens exercised a right of negative legislation identical with the right of the supreme courts of the states of the United States.[1]

We have now gained an idea of life, both public and private, official and non-official, in Ancient Greece; and have pointed out the tendency of the same to active, mental life. Hence, at this point, we turn to the consideration of some other department of Greek culture, and there we find the basis of the great merits of Grecian civilization. The men and women of Greece have passed away, and their political institutions no longer determine the fate of nations. But the achievements of the Greeks in other fields of mental activity are well-nigh imperishable, and thus they still continue to exercise a strong influence over the civilization of mankind.

These achievements are in the fields of philosophy, art, and science. Our review of Grecian civilization would be incomplete, were we to neglect the great works of Gre-

[1] *Vide* Vol. II. p. 190

cian writers in these fields. Their philosophy is not, like the systems of the old Egyptians, of the Persians, or of many other nations, alien and strange to our mind; it is not an obsolete product of antiquity, in no connection whatever with our modern line of thought. On the contrary, it is in intimate contact with our latest endeavors to investigate the problems of philosophy; and hundreds of treatises are being published every year, elucidating and commenting on the writings of Greek philosophers.[1]

Greek Art—Vases and Ewers.

The first real philosophers of Greece arose about the beginning of the seventh century B. C., and it is almost generally agreed that Thales was the first in point of time.[2] Thales, together with Anaximander, Anaximenes, and Diogenes of Apollonia, form what is usually called the Ionic school of Greek philosophers. These profound

1 At the twenty-six universities of Germany and Austro-Hungary, there are separate chairs for Greek philosophy, and every year turns out at least fifty new dissertations on Aristotle alone. "Statistik des Deutschen Buchhandels."

2 Zeller: "Die Philos. der Griech," Bd. I. s. 133.

thinkers turned their thoughts chiefly to an explanation of the *arche*, the origin of things, and this being their aim they speculated principally on the first principle of nature. Hence, (*physis* being nature in Greek), they were also called Physiologists. It is highly interesting to follow their peculiar train of ideas.

Thales taught, that the *arche* of all things is to be found in water.[1] In other words, he thought that water was the first principle, the first cause of nature, out of which everything arose. Anaximander taught, that the first principle was an endless, unlimited mass, subject to neither old age nor decay and perpetually yielding fresh materials for the series of beings which issued from it.[2] Out of the vague and limitless body, there sprang a central mass—this earth of ours, cylindrical in shape. Man himself and the animals came into being by transmutations.[3] Man was supposed, by Anaximander, to have sprung from other species of animals, probably aquatic.

Anaximenes taught that the air, with all its variety of contents, its universal presence, was what maintained the universe, even as breath, which is our life and soul, sustains us.[4] Everything is air of different degrees of density. By a process of condensation, brought forth under the influence of heat and cold, the broad disk of earth was formed, floating like a leaf in the circumambient air. Similar condensations produced the sun and the stars.[5] Diogenes of Apollonia adopted the teachings of Anaximenes respecting air as the *arche* of things. But he declared that

[2] Aristotle, Phys. iii. 4, 203, c. 10.

[3] It is more than likely that this doctrine of Anaximander was one of the numerous precursors of Darwin's Theory.

[4] Aristotle, 984. Met. ch. i. 3, a 5.

[5] This seems an anticipation of the celebrated Kant-Laplace theory concerning the origin of our planetary system.

air was not only force, substance, but also intelligence, that it was endowed with consciousness and reason; for without reason, he said, it would be impossible for all to be arranged duly and proportionately.[1]

Hesiod.

After the Physiologists came the Pythagoreans, the head and originator of whom was the celebrated Pythagoras, equally renowned as mathematician, philosopher, physicist, and lawgiver. The central thought of Pythagoras' philosophy is "*the number.*"[2] Instead of alleging that this or that material substance was the *arche* of the Universe, Pythagoras taught, that "the number" was the essence, the first principle. Thus he accounted for the origin of the world by placing a formal cause, an ideal conception (the number), in the center of his speculations. "Number," said Philolaus, one of his disciples, "is great and perfect and omnipotent and the principle and guide of divine and human life."

Immediately connected with their central doctrine is the theory of the opposites, held by the Pythagoreans. Numbers are divided into odd and even, and from the combination of odd and even, all numbers and all things seem to result. The odd number was identified with the limited, the even with the unlimited. Following out the

[1] Mullach: Fragm. Philos. Gr. I. 259. When we come to study Hindoo philosophy we will discover the close similarity between the Ionic system of philosophy, and the Vedantic school of Indian philosophy.

[2] Aristotle, Met. i. 5.

same thought, they developed a list of ten fundamental opposites, which roughly resembles the tables of "categories" framed by later philosophers. The ten groups of opposites are as follows: Limited and unlimited; the odd and the even; one and the many; right and left; masculine and femenine; rest and motion; straight and crooked; light and darkness; good and evil; square and oblong.[1] Hence the whole universe is harmony, and the regular movements of the heavenly bodies produce the famous harmony of the spheres; the seven planets being considered as the seven golden chords of the heavenly heptachord.[2]

The holy number of the Pythagoreans was four, because it is the first square number; the number five signifies marriage, because it is the union of the first masculine and the first feminine number, namely three plus two; the number one is identified with reason, because it is unchangeable; two with opinion, because it is indeterminate. The most renowned doctrine of Pythagoras, however, is the transmigration of the soul, the Metempsychosis. The bodily life of the soul, according to this doctrine, is an imprisonment suffering for sins committed in a former state of existence. At death, the soul reaps what it has sown in the present life. The reward of the best is to enter the cosmos, or the higher and purer regions of the universe, while the direst crimes receive their punishment in Tartarus. But the general lot is to live afresh in a series of human or animal forms.[3]

Next to Pythagoras and his numerous followers, stands the subtle school of the Eleatic thinkers. Instead of

1 Ibid. i. 5, 986. 2 Aristotle, De Cocle, ii. 9.

3 Clemens-Strom, iii. 433 A. Plato, Gorg. 493 A. Everyone must see the connection between this belief and the Hindoo belief.

attempting the solution of the *arche* problem, they entered upon new lines of thought, and their profound speculations form one of the most striking features of Greek philosophy.[1] Their leading men were Xenophanes, Parmenides, and Zeno.

Euripides.

Xenophanes recognized no distinction between truth for the many (exoteric knowledge) and truth for the initiated few (esoteric knowledge), as Pythagoras did; Xenophanes thought and acted as if truth was for all men; for three-quarters of a century he wandered into many lands uttering the thoughts which were working in him. He combated the prevailing belief in many gods chiefly on account of the personification of the gods, and his doctrine was, that "the One was the All,"[2] in other words his doctrine was Pantheism. It was expanded by Parmenides, the most notable of the philosophers of the Eleatic succession.

His doctrine is, that the *Ens*, the Being (*to-on* in Greek), is one, invariable and immutable, and all plurality, variety, and mutation (viz: all the shifting, individual things and persons in existence) belong to the *Non-ens*. Whence it follows, that all the states and processes which we commonly recognize as generation and destruction, change of place, alteration of color, and the like, are little more than empty words.[3] The difference between Parmenides and his predecessors in Greek speculation is this, that he, far from assuming a corporal prin-

[1] The best resume of the Eleatic doctrine is given in Duckring's "Krit. Gesche. d. Phil."

[2] Parmenides [A fragment of his Philos. poem], v. 33.

[3] Cf. the Hindoo doctrine of Illusion.

ciple (air, water, etc.,) as the *arche* of things, declared all corporal things to be mere phantasms, teaching that all plurality is but apparent, and that all so-called individual things are merely passing modes of the One Being, the *Ens*.[1]

The third great leader of the thinkers of the Eleatic school was Zeno. In order to render the doctrine of his master, Parmenides, unassailable, he attempted to prove, that the common notions of time, space, motion, multiplicity, sight, sound, etc., are self-contradictory and unthinkable. His so-called "paradoxies" were stated with a subtlety which has forced distinguished thinkers (for instance Hamilton) who were opposed to his main position to admit that some of them were unanswerable. Against motion Zeno directed several arguments, the most celebrated being that of the well-known problem of Achilles and the tortoise.

Next in point of importance as a system of philosophy are the profound teachings of Heraclitus of Ephesus. This celebrated thinker used to clothe his ideas in extremely obscure language, and it was this quality which occasioned his surname, "the obscure." He tried to get rid of the difficulty so prominent in the Eleatic philosophy of overcoming the contradiction between the One and the phenomenal Many, by enunciating, as the principle of the universe, the process of Becoming, implying that everything is and at the same time, and in the same relation, is not. His favorite way of expressing this abstruse doctrine was as follows: "Everything is flowing." Accordingly he selects fire as the *arche*, this being the most appropriate embodiment of the principle of

[1] These speculations form the basis of two of the most important systems of philosophy of modern times, Brunoism and Spinozism.

Becoming, of simultaneous existence and non-existence.[1]

The next great Greek philosopher is Empedocles. He propounded a new doctrine. There are, according to Empedocles, four ultimate kinds of things, four principal divinities, four elements, from which are made all structures in the world—fire, air, water, earth. These four elements are eternally brought into union, and eternally parted from each other, by two divine powers: Love and Hatred—an attractive and a repulsive force, which the ordinary eye can see working amongst men, but which really pervade the whole world. Flesh and blood are made of equal parts of all four elements, whereas bones are one-half fire, one-quarter earth, and one-quarter water. Nothing new comes into being, the only change that can occur is a change in the juxtaposition of element with element.[2]

Aeschylus.

The similarity, or rather identity between modern and ancient Greek thinking is still more striking, when we approach two other schools of Greek philosophy, the Atomists and the Sceptics. The chief of the former was Democritus. The intensity of his thinking was figured by the ancients in the story that he put out his eyes in order that he might not be diver-

---

1 The most elaborate treatise on Heraclitus has been written by F. LaSalle, the German Socialist. Zeller's review (in his D. Phil. d. Grich.) is highly valuable. Although he assumes fire as the *arche*, we must not connect him with the Ionic school. He uses it more as a symbol.

2 Our knowledge of Greek philosophy, anterior to Aristotle, rests largely on the philosophical works of this philosopher; as to Empedocles, see Aristotle, Metph. i. 4.

ted from his meditations. His theory of the universe is to the present the prevailing theory among physicists. He taught, that all that existed is vacuum and atoms. The atoms are the ultimate material of all things, including spirit. They are uncaused and have existed from eternity, and are in constant motion. Democritus reduced all sensation to touch, and all qualities of bodies to these two main qualities, extension and resistance.[1]

The sceptics, or Pyrrhonists, bear a still greater resemblance to modern thought. Pyrrho, their founder, asked, what is the criterion of our opinion? Reason, it is said. But what is the criterion of Reason, he again asked? And, as he could find no adequate answer, he simply inferred, that all philosophy and all science is groundless, there being no general criterion of Truth.[2] All these philosophers (with the exception of Pyrrho) lived before Socrates, and they are to be considered as the precursors of the most perfect development of Greek philosophy, as represented in the teachings[3] of Socrates, and in the writings of Plato and Aristotle.

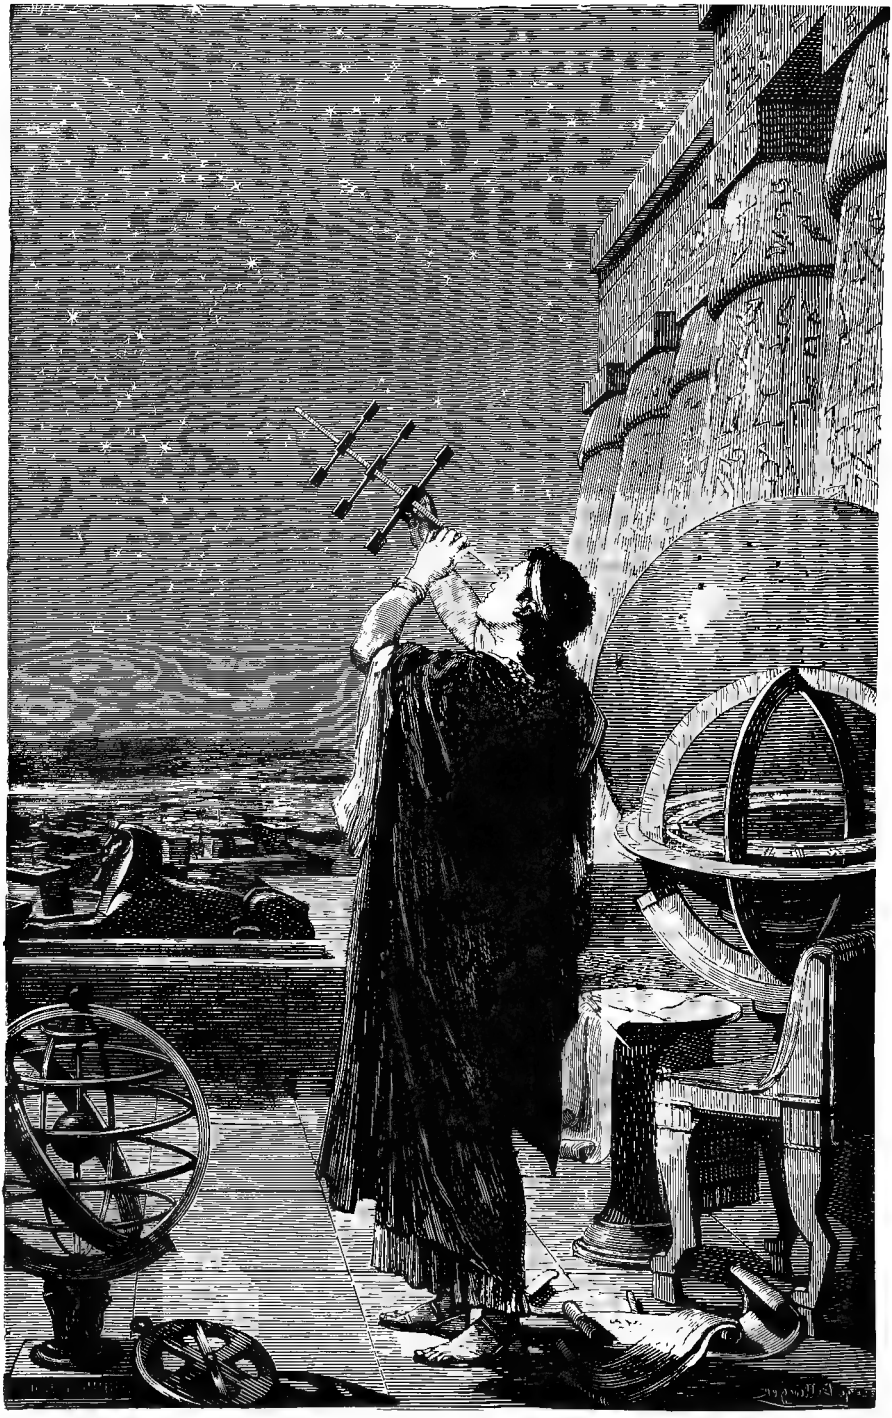
Socrates, born in Athens in 470 or 469 B. C., embraced the whole of philosophy (Ontology, Logic, Metaphysics, Psycology) with a new spirit, the spirit of self-conscious truth. The skeptical movement had confused men's notions as to the value of ethical ideas. If "right" be one thing in Athens and another at Sparta, why strive to follow right rather than expediency? Every case seemed capable of being argued in opposite ways. Even on the great question of the ultimate constitution of things, the conflicting theories of absolute immutability (Parmeni-

[1] Aristotle, De gen. et corrupt. i. 8. [2] D. Phil. d. III. Bd.

[3] Socrates has left us no writings of his own; our information about him we take from Plato and Xenophon.

des) and eternal change (Heraclitus) appeared to be equally creditable. But the faith of Socrates remained unshaken by these conflicting views. He did not ask: "Is virtue a reality?" or "Is goodness a delusion?" But with perfect confidence that there was an answer, he asked himself and others, "What is it?" or, more particularly, as Xenophon testifies, "What is a state? What is a statesman? What is just? What is unjust? etc." In this form of question, however simple, the originality of Socrates is typified; and by means of it he laid the first stone, not only of the fabric of ethical philosophy, but of scientific method. The secret of his success lay in the combination of a deep sense of human ignorance with a confidence not less deep in the power of reason. He taught, that human life and experience are the sphere of search; truth and good, regarded as identical, the end of it; universality, the test of reality, conversation the method, rational thought the means—these are the chief notes of the dialectics of Socrates.

Applying the native strength of his intelligence directly to the facts of life, he revealed their significance in countless ways, by unthought-of generalization, by strange analogies, combining what men had not combined, distinguishing what they had not distinguished—but always with the single aim of rousing them to the search after eternal truth and good. But all this equanimity, virtue, and genius could not save him from the ill-will of his countrymen, whose anger was roused by a few of his personal enemies. The great philosopher was indicted for atheism and contempt of the gods, and sentenced to the hemlock-cup. He suffered death with perfect composure of mind, sealing the tenor and activity of all his life with a glorious submission to the dictations of his fellow-citi-



AN EGYPTIAN ASTRONOMER; OR, HIPPARCHUS AT ALEXANDRIA.

zens and the doctrines of his own profound mind.[1]

This lifelong work of Socrates, in which the germ of all later philosophy was contained, was idealized, developed, dramatised, first embodied, and then extended beyond the original scope, in the writings of Plato, which may be described as the literary outcome of the profound impression made by Socrates upon his greatest follower. These writings (in pursuance of the importance given by Socrates to conversation) are all cast in the form of imaginary dialogues. The Platonic dialogues are not merely the embodiment of the mind of Socrates and of the reflections of Plato. They are the portraits of the highest intellectual life of Hellas in the time of Plato—a life but distantly related to military and political events, and scarcely interrupted by them. It is, of course, next to impossible to delineate the leading principles of Plato within the extremely limited space we can devote to a consideration of his philosophy. But we can not omit adducing some of the main ideas of his system, especially those that have an historical bearing on the course of civilization.

For very few thinkers have exercised such a vast influence on the thoughts of mankind as Plato. In fact, his influence is almost equal to that of Aristotle. Many schools were formed in Asia,[2] Africa,[3] and Europe, in which the thoughts of Plato were made the subject matter of profound study, and scarcely a treatise on philosophy ever made its appearance without showing the unmistakable traces of the Platonic philosophy. Plato was the first

[1] A whole literature treats of the sentence and death of Socrates; and some great authorities lean toward the opinion, that Socrates could have easily escaped the fatal sentence but for his high sense of obedience. See a very able discussion in Zeller.

[2] Not only in the time of the Greeks and the Byzantine empire, but in the time of the Saracens as well.

[3] Neo-Platonists in Alexandria.

to establish that fundamental distinction between the abstract and the concrete, between the rational and the empirical, between the *a priori* and the *a posteriori*, which, to the present day, pervades the whole of philosophy, and without which no philosophical thinking is deemed possible. This distinction reappears in that other fundamental division of philosophical subjects, in the division of things into universal and particular.

Plato declared that philosophy is the study of the abstract, of the *a priori*, of the universal. This is one of the pivots of his system. The particular, the empirical, the *a posteriori*, belong to the practical knowledge of the ordinary mind; it has nothing to do with the investigations of the philosopher. But this was not sufficient. Plato not only excluded the empirical, he pointed out, in a distinct and clear way, what were the proper subjects of real philosophy. He taught, that previous to all experience, and underlying it, there are innate conceptions, notions born with the mind, in one word, *Ideas*, the study of which forms the chief object of the philosopher.

These ideas (*ideai* in Greek) are divine models, eternal types of the objects in nature, and the principles of our knowledge. By propounding this theory and by his endeavor to apply it to all branches of science, to natural philosophy as well as to politics and ethics, Plato became the founder of "Idealism," that is to say, he is to be considered the founder of that truly philosophical tendency of confining our thoughts to the ideal aspect of things. He openly taught, that there is but one God, the creator of this world, the preserver of it, who governs it with providential care.[1] Virtue is the attempt at an imitation

1 The Monotheistic tendencies in Plato are evident in every line of "Timaeus." The most comprehensive work on Plato and his philosophy is by Grote.

of God, and consists of four elements, of *Sophia* (wisdom), of *Andreia* (consistency), of *Sophrosyne* (temperance), and of *Dicaiosyne* (justice). Politics is the application of the great law of morals, the state being a union of a mass of people under the same law. Its object is liberty and harmony. Beauty is the preceptible representation of moral and physical perfection. Being one and the same with truth and with "the good," it inspires *Eros* (Platonic love) which leads to virtue.

The greatest of all Greek philosophers was Aristotle, the disciple of Plato. He was born in 384 B. C., at Stagira in Macedonia, and this circumstance gave rise to his surname, the Stagirite. His works cover the whole ground of both philosophy and science. In order to illustrate his merits, we will select his works on Logic. The matter of the "Prior Analytics" has become the common property of all modern books on logic; and what he wrote upon the syllogism, the mode of inference, has scarcely been altered. Both Kant and Hegel, two of the greatest of German thinkers and scholars, acknowledge, that from the time of Aristotle to their own age (nineteen centuries), logic made no progress. His was the proud distinction of having discovered and fully drawn out the laws under which the mind acts in deductive reasoning. That in deduction the mind proceedes from some universal proposition, and how it proceeds, these were amongst the most important things which Aristotle had to tell the world.

Sophocles.

We have now begun to exhaust the list of Greek

philosophers, we have, however, only space to name some of the great leaders and founders of schools of philosophy in post-Aristotelian times. Foremost in the ranks of these was Epicurus, born 341 B. C. The scene of his philosophic life and teaching was a garden in Athens which he bought at the cost of about eighty minæ.[1] There he passed his days as the loved and venerated head of a remarkable society, such as the ancient world had never seen. The mode of life in this community was plain. The general drink was water, and the food barley bread; half a pint of wine was considered an ample allowance. The company was held in unity by the fascinating charms of Epicurus' personality, and by the free sociality which he inculcated and exemplified.

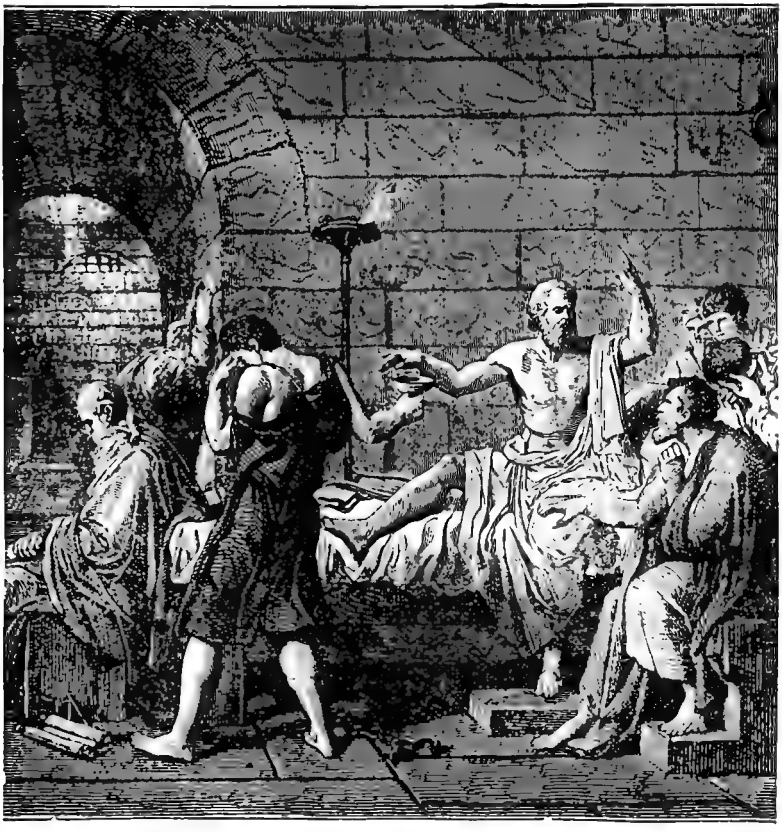
Aristophanes.

All that exists, says Epicurus, is corporal; the intangible is non-existent, or empty space. If a thing exists, it must be felt; and to be felt, it must exert resistance. But all things are not intangible, which our senses are not able to detect. The fundamental postulates of Epicureanism are atoms and the void. This universe of ours is only one section out of the innumerable worlds in infinite space; other worlds may present systems very different from the arrangement of sun, moon, and stars, which we see in this. In the sphere of human action Epicurus would allow of no absolutely controlling necessity. There is much in our circumstances that springs from mere chance, but it does not over-master man. With a latent optimism he asserts

[1] $1500.

that, though there are evils in the world, still their domination is brief at their height, and there are many consoling circumstances while, on the other hand, it is easy to attain the maximum of pleasure.[1]

Toward the close of the fourth century B. C., another



Death of Socrates.

school of Greek philosophy was founded by Zeno of Citium. The disciples of this school were named Stoics, from the *Stoa*, or painted corridor on the north side of the

[1] *Vide* Gasendi's works on Epicurus and Steinthal's article in Ersch., Gruber.

market-place at Athens, where its chief members were delivering lectures on the problems of philosophy. But, though it arose on Hellenic soil, the school is scarcely to be considered a product of purely Greek intellect, but rather as the first-fruits of that inter-action between the West and the East which followed the conquests of Alexander the Great. Hardly a single stoic of eminence was a citizen of a city in the heart of Greece, unless we except Aristo of Chios, Cleanthes of Assus, and Panaetius of Rhodes. Nor did Stoicism achieve its crowning triumph until it was brought to Rome, where the grave earnestness of the national character appreciated its doctrines. For two centuries or more, it was the creed, if not the philosophy, of all the best of the Romans.

Aristotle.

One of the grandest of the stoics was Chrysippus, who lived from 280 to 206 B. C. He was the author of a great number of works, of which, however, but small fragments have come down to us. He taught that, as the sole aim of philosophy is to discover man's duty, ethics is the only science that is of real importance in itself, while physics (*i. e.* the study of nature) is to be regarded merely as an aid to this study. The explanation of the universe

adopted by Chrysippus is that of the stoics in general. The real is the corporal; man and the world are all that exist. In each there is that which is inert, and also the informing soul, or vivifying fire. The soul of the universe is God, or destiny. Each human soul is part of the universal soul, in which the souls of all, except the wise, are again swallowed up at death. The universe is perfect. So-called physical evil there is none. Moral evil is the necessary complement of good, and is turned by Providence into good. All is the result of perfect law. Perfect unanimity of life can only be achieved through the unrestricted dominion of right reason, that is, by our reason not only ruling unconditionally over our other energies and circumstances, but also coinciding with the Universal Reason—the reason which governs nature.[1]

The achievements of the Greeks in the field of philosophy were equalled, if not excelled, by their productions of a strictly scientific character. In fact, the Greeks must be considered as the real originators of modern, as well as of all science. They were the first to reduce a mass of observed facts to a coherent, lucid, and well arranged system of science. Their power of generalization and an innate delicate perception of fitness kept them free from the wild plays of imagination, in which, amongst others, the Indian masters of science used to indulge. To the present day, we have no better examples of scientific reasoning than Euclid's works, or the writings of Archimedes and Ptolemy. They continue to form the foundation of our studies, and all modern trials to supersede them have proved abortive.

[1] The sources of Stoicism are the seventh book of Diogenes' Laertius, the philosophical books of Cicero [especially De Finibus] Stobaeus and Plutarch. The most exhaustive modern treatise is that by Zeller.

The scientific achievements of the Greeks are chiefly concerned with mathematics (arithmetic as well as geometry); mechanics, astronomy, geography, and medicine. They founded both elementary arithmetic and the most important portions of plain and solid geometry. In mechanics, they laid the foundations of statics and hydromechanics. In astronomy, they discovered some of the

Greek Art—Phidias in his Studio.

most important and fundamental laws of the heavenly bodies. Pythagoras as well as Philolaus and Nicetas of Syracuse taught, that the earth is a planet revolving around the sun. Copernicus himself confesses his great obligation to the Pythagoreans.[1]

[1] In the preface of his work: "De Revolutionibus Orbium Coelestum."

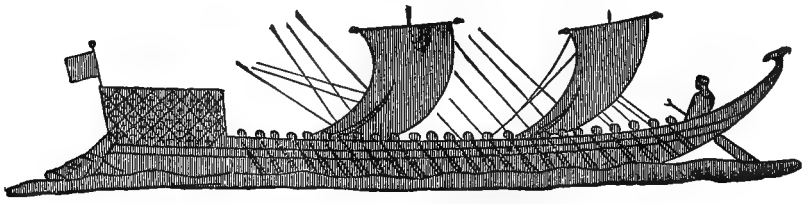
Aristarchus of Samos, who left us a very valuable treatise on the magnitudes and distances of the sun and moon, measured the diameter of the sun, and his results do not differ very much from the calculations of modern astronomers. Eratosthenes determined the magnitude of the earth by a most ingenious method, and Hipparchus[1] added the most essential discovery—the precession of the equinoxes. Hipparchus, furthermore, discovered the eccentricity of the solar orbit. He accounted for the apparent inequality of the sun's motion by supposing that the earth is not placed exactly at the center of the circular orbit of the sun, and that, consequently, his distance from the earth is subject to variations. When the sun is at his greatest distance, he appears to move more slowly, and when he approaches nearer, his motion becomes more rapid. The attention of that great astronomer was also directed to the motion of the moon, and, on this subject his researches were attended with equal success. From the comparison of a great number of the most circumstantial and accurate observation of eclipses recorded by the Chaldeans, he was enabled to determine the period of the moon's revolution relatively to the stars, to the sun, to her nodes, and to her apogee. These determinations are among the most valuable results of ancient astronomy, since they corrobo-

Hippocrates

1 Of the life of this, the greatest of all Greek astronomers, we know but very little. Suidas, the lexicographer, placed him at from B. C. 160 to 146, but without naming these epochs as those of his birth and death.

rate one of the finest theoretical deductions—the acceleration of the mean lunar motion—and thus furnish one of the most delicate tests of the truth of Newton's law of gravitation. Hipparchus, likewise, approximated to the parallax of the moon. Besides he drew up a catalogue of ten hundred and eighty fixed stars.

In the 130th year of our era, Ptolemy, the prince of astronomers, as he was called, flourished in Alexandria, a man who did inestimable service to astronomy. Although his system of astronomy has been supplanted by the system of Copernicus, his merits, nevertheless, entitle him to the esteem and admiration of mankind. His works are a perfect treasury of astronomical dates



Fifty-oared Greek Boat.

and theories; and all civilized nations took their first information on astronomy from the "Almagest" of Ptolemy.[1] If we were to characterize the scientific labors of the Greeks in the shortest and still most effective manner, we would sum up all points into the one remark, that the Greeks pre-eminently possessed the rare power of generalization, the ability to rise above the immediate wants of practical life, and to soar to the abstract relation of ideas.

It is strange that the Greeks did not invent the so-

[1] The original Greek name of Ptolemy's work was Syntaxis or Megas Astronomos (the Great Astronomer). To designate this valuable work, the Arabs used the superlative "Megiste" (Greatest), to which the Arabian article 'al' being prefixed, the hybrid name Almagest, by which it is now universally known, is derived.

called Arabian (properly speaking Indian) way of denoting numbers. They used the letters of the alphabet, as did the Hebrews and other Semites, and this extremely clumsy way of figuring formed a check on the free development of Grecian arithmetic. Some of the simplest problems of arithmetic (especially those where fractions come into play) become, in Greek letter-denotation, so complicated that, amongst others, some of the arithmetical writings of Archimedes, wherein he used letters instead of digits, are almost unintelligible. The Greeks had a decided bent for

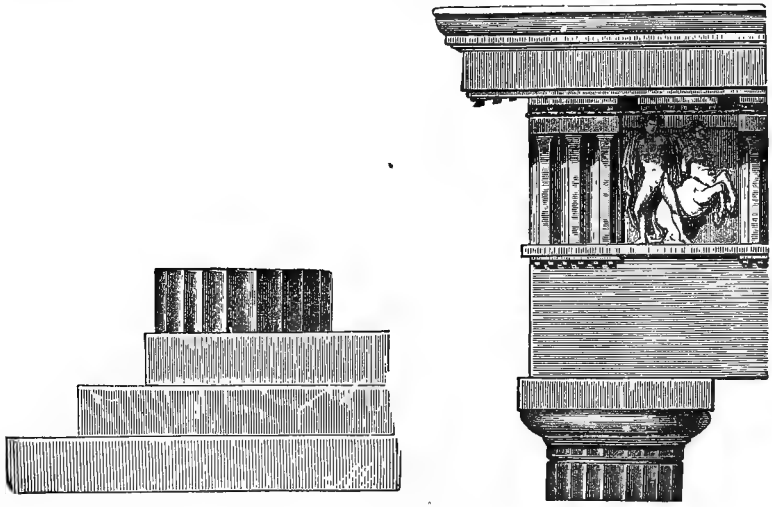
Greek Art—Hector Taking Leave of Andromache.

geometrical investigations, in preference to arithmetical ones. Their geometry remained a model presentation of geometrical truths for twenty centuries, and, in all likelihood, will never be surpassed.[1]

We are now to approach one of the most attractive

1 Modern Geometricians (especially Steiner, Plücker, Grassman), almost unanimously concede the greater perfection of form and system in Greek geometry.

and most enduring features of Grecian civilization, one which will never loose its sway over the ideas and thoughts of civilized mankind. We refer to Greek art. The achievements of the Greeks in this field of culture apparently laid the foundations of all that is beautiful and in keeping with harmony. Greek art continues to be the study of the artists of all nations who spend years



Doric Column.

in obtaining a mastery of the rules laid down by the artists of ancient Greece. The Greeks possessed charming freedom of mind, and superabundance of inventive ingenuity. Delicacy of preception, an aptitude for seizing nice relationships, the sense of proportions are what enable an artist to construct a unity of forms, colors, sounds, and incidents—in short, elements and details—so closely united among themselves by inward dependencies, that their combination brings to pass a result, surpassing in the imaginary world the harmony of the actual world.

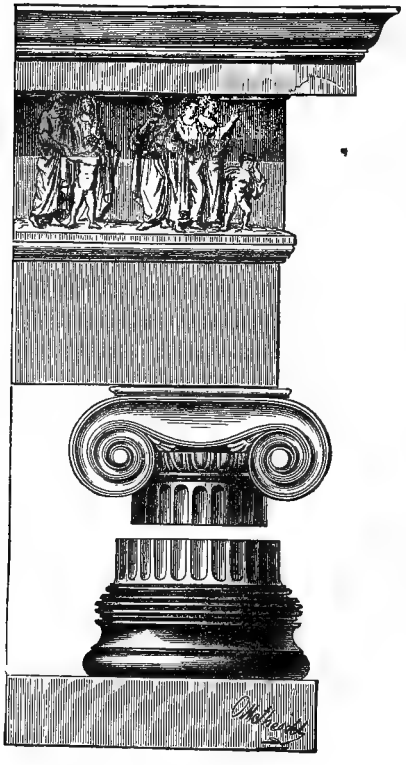
Let us take an object exposed to the eye, and that which first attracts attention on entering a Greek city.

We refer to the temple.[1] It stands usually on a height, called the Acropolis, on a substructure of rocks, as at Syracuse; or on a small eminence which, as at Athens, was the first place of refuge and the original site of the city. It is visible from every point on the plain and from the neighboring hills; vessels greet it at a distance on approaching the port. It stands out in a clear and bold relief in the limpid atmosphere.[2] It is not like our medieval cathedrals, crowded and smothered by rows of houses, secreted, half concealed, inaccessible to the eye save in its details and its upper section. Its base, sides, entire mass, and full proportions appear at a glance. We are not obliged to divine the whole from a part.

In order that the impression may be clear and distinct, they give it medium or small dimensions, that bear no resemblance to the vast monuments of India, Babylon, or Egypt; the storied and crowded palaces, the masses of avenues, enclosures, halls, and colossi, so numerous that the mind at last becomes disturbed and bewildered. On the contrary, the Greek temple is so simple that a glance suffices to comprehend the whole. The edifice has nothing complicated, quaint, or elaborate about it. It is a rectangle, bordered by a *peristyle* (range) of columns; three or four of the elementary forms of geometry suffice for the whole. The crowning of the pediment, the fluting of the pillars, the abacus of the capital—all the accessories and all details—contribute yet more to show in stronger relief the special character of each member; while the diversity of colors serves to mark and define their respective value.

1 In the description of the architectural beauties of a Greek temple, we follow mainly the accurate and well expresssed statements in Taine: "L'Art en Grece." 2 See the restoration, accompanied with essays, by Tetar, Paccard, Boitte, and Garnier.

In other respects, Greek art was equally excellent. A school of sculptors in marble existed in Chios as early as 660 B. C., and there also Glaucus is said to have discovered the art of welding iron. as to the remains of Greek sculpture, which may with more or less certainty, be assigned to the period in which Glaucus, Dipoenus, Scyllis, and other noted sculptors were at work, there are the metopes from some of the most celebrated temples in .the island of Sicily, which up to the present have been regarded as furnishing the first authentic, and as yet, the clearest glimpses of that early stage of Greek art. There are also some other authentic remains, especially the sculptures from the temple of Athene at Aegina, now in Munich.



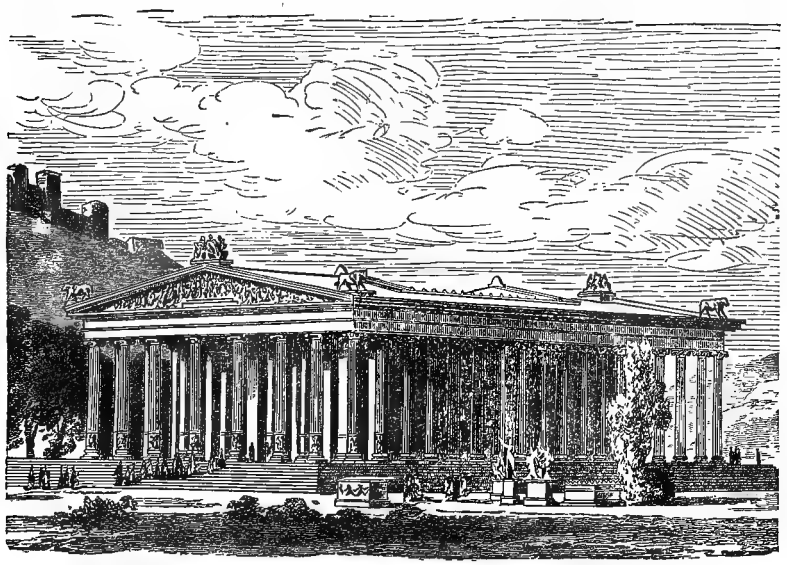
Ionic Column.

Greek painting, or rather coloring, as it would be more properly described in its earliest phase, in which it was entirely subservient to architecture and ceramography, is said to have been first elevated to an art by Cleanthes of Corinth,[1] who introduced the drawing of figures in outline; by Telephares of Sicyon,[2] who improved on this by indicating the principal details of anatomy; and Eumaras of

[1] Pliny: "Historia Naturalis," xxxv. 5. [2] Ibid.

Athens, who is said to have first distinguished in his paintings men from women, probably by the means adopted in the early vases, that is, by painting the flesh white in the case of women. Like their followers down to the time of Apelles, these painters used only the simple colors, white, yellow, red, and bluish black, greater attention being paid to the drawing than to the coloring.

In temple architecture, the principles of both the Doric and Ionic orders were already fully established; the latter in Asia Minor, and the former in Greece proper.



Temple of Diana at Ephesus.

Among the remains of Doric architecture assignable to this period, are, amongst others, the two temples of Paestum. Of the Ionic order during this period (the sixth century), the principal example was the temple of Diana at Ephesus, the construction of which, begun by Theodorus of Samos, was carried on by Chersyphron of Crete and his son Metagenes, and completed by Demetrius and

Paeonius about the time of Crœsus. It is said that from first to last, one hundred and twenty years were consumed on the work. This temple having been burned by Herostratus was restored under the directions of Alexander's architect, Dinocrates.

We have reached the time of Phidias, and have now done with imperfections in sculpture, so far at least as they originated in want of knowledge either of the human form or of technical means. Phidias, the son of Charmides, was an Athenian, and must have been born about 500 B. C. When Pericles succeeded to the administration of affairs, and it was determined to erect new temples and other public buildings worthy of the new glory which Athens had acquired in the Persian wars, it was to Phidias that the supervision of all these works was entrusted, aided by an army of artists and skilled workmen. By 438 B. C., the Parthenon was completed, with its colossal statue of Athene, in gold and ivory, by Phidias himself, and with its vast extent of sculpture in marble, executed at least under his direction, and reflecting in most parts his genius. After the completion of the Parthenon, Phidias accepted the invitation of the people of Elis to exert his highest power in fashioning for their temple of Zeus at Olympia a statue worthy of the majesty and grandeur of the supreme god of Greece.

His workshop was near the Altis, or sacred grove, where through successive centuries down to the second century of our era, it was preserved and pointed out with feelings of reverence. The finished work was over forty feet high, and represented the god seated on his throne. On his head was a wreath of olive. The drapery was of gold, richly worked with flowers and figures in enamel. On the footstool was inscribed the verse: "Phidias, the

son of Charmides, an Athenian, has made me." The throne was mostly of ebony and ivory, inlaid with precious stones, and richly sculptured with reliefs, and in parts painted.

Pallas Athene, after Phidias.

All Greece made a pilgrimage to this marvelous statue and every one who had seen it was pronounced happy. Most affectingly is the unsurpassable character of the work expressed in that beautiful legend, which tells how that Phidias, after the completion of his statue, when he stood thoughtfully contemplating his work, raised his hands in prayer to Jupiter, and implored a token whether his work was well pleasing to the god. Then suddenly, through an opening in the roof, a lightning flash glanced from the sky upon the temple floor, as an unmistakable sign of the perfect satisfaction of the Thunderer.[1] We possess, in the sculptures of the

[1] Pausanius, Deser. Gr. v. 10.

Parthenon, a large series of works in marble, at least designed or modeled by Phidias and executed under his immediate care, if not in many cases finished by his own hands.

Olympian Zeus, after Phidias.

The mantle of Phidias fell on his pupil, Alcamenes, an Athenian, the lofty conception in his figures of deities was highly praised, while in point of gracefulness in womanly form he appears to have excelled his master. His most celebrated work was a statue of Aphrodite for her temple, of which, however, the merit of the last touch was ascribed to Phidias. Her cheeks, hands, and figure

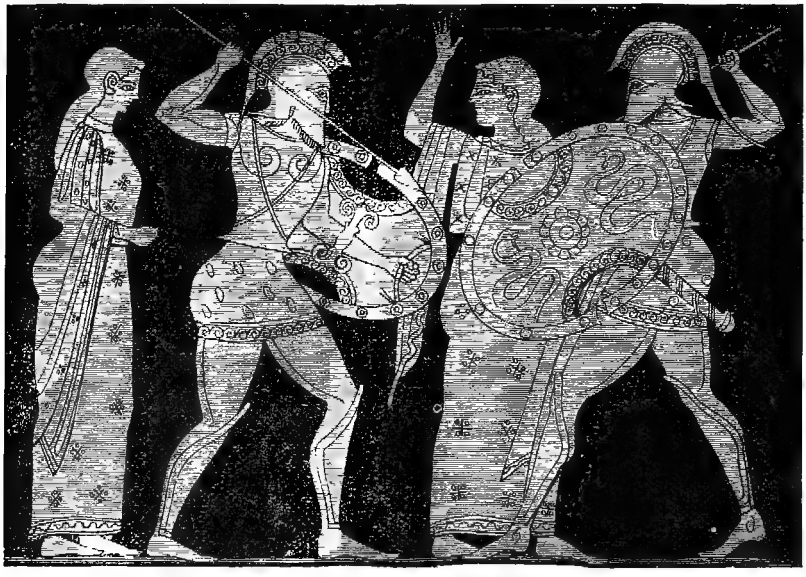
were specially admired; but as to the attitude and general effect we have no information, and are not justified in accepting the Aphrodite of Mino in the Louvre at Paris as a copy of it, much less as the original work.

Amongst the painters of this period, Polygnotus deserves particular notice. He found favor with Cimon, to whose zeal the new impulse for the improvement of Athens was due, and was employed to execute wall paintings for the Stoa Poecile, the Theseum, and the Anaceum, or temple of the Dioscuri. For his services, and especially for the disinterestedness of his character, Polygnotus received what was then regarded as the highest distinction—the freedom of the city of Athens. As regards the style of Polygnotus, we have the distinction drawn by Arisotle between it and that of Zeuxis (another celebrated Greek painter), a distinction which he expressed by the words *ethos* and *pathos*. By ethos, as applied to the paintings of Polygnotus, we understand a dignified bearing in his figures and a measured movement throughout his compositions, such as the Parthenon frieze presents, compared with the pathetic rendering of scenes in the frieze from the temple of Apollo at Phigalea, or in the frieze of the Mausoleum of Halicarnassus. The sculptures of the latter monument were made by Scopas, a native of Paros, who settled in Athens about 380 B. C., where for thirty years he maintained a reputation for an unparalleled power of rendering the human or divine figure, especially in a state of excited feeling. When considerably advanced in years, he was invited by Artemisia, the queen of Caria, to direct the sculptors for a monument that she was erecting at Halicarnassus in memory of her husband Mausolus.[1] The

[1] Cicero, Tusc. Quaest. iii. 31; Strabo, Geog. xiv.; Pliny, Hist. Nat. xxv.

site of the Mausoleum, one of the seven wonders of antiquity, was discovered and excavated by C. T. Newton in 1856-7, the result being the recovery of an important part of these celebrated sculptures.

More celebrated still than Scopas was Praxitèles. The scene of his labors was mostly Athens and the neighboring towns. His model was Phryne, the courtezan. Like Scopas he had little taste for bronze in comparison



Greek Art—Fight of Achilles.

with marble, with its surface finely sensitive to the most delicate modulation. Unsatisfied with even this, he endeavored to soften the asperity of the marble in the crude parts by a process of encaustic. That he was peculiar in thus tinting the marble and an exception among other Greek sculptors can not be meant in the face of so many instances of coloring in the remains of Greek sculpture and architecture. Of his works, the number of which was unusually large, the most celebrated were the following

ones: The marble statue of Aphrodite at Cnidus, a statue of Aphrodite at Thespiae, a statue of Phryne, and a statue of Eros.

In painting, a great step in advance was made by Zeuxis and Parrhasius of Ephesus. An interesting tale describes their contests. Once Zeuxis painted some grapes so perfectly that birds came to pick at them. He then called on Parrhasius to draw aside the curtain and show his picture; but, finding that his rival's picture was the curtain itself he acknowledged himself to be surpassed, for Zeuxis had deceived birds, but Parrhasius had deceived Zeuxis.[1] The next great painter was Timanthes. But it is Apelles, in whose person were combined, if we may judge from his reputation, all the best qualities of the hitherto existing schools of painting. The best part of the life of Apelles was probably spent at the court of Philip and Alexander the Great. Many anecdotes are preserved of Apelles and his contemporaries, which throw an interesting light both on his personal and his professional character. He was ready to acknowledge that in some points he was excelled by other artists, as by Amphion and by Asclepiodorus in perspective. He first caused the merits of Protegenes to be understood.

By the general consent of ancient authors, Apelles stands first among Greek painters. To the indiscriminating admiration of Pliny, we may add the unmeasured praise which Cicero, Varro, Ovid, and other writers give to the work of Apelles and especially to his Venus Anadyomene.[2] Apelles is said to have made great improvements in the mechanical part of his art. His principal

[2] Cicero, Brutus 18, de Orat. iii. 7; Varro, de Lingue, Lat. ix. 12; Ovid, Art Amandi, iii. 401.

discovery was that of covering the picture with a very thin black varnish, which, besides preserving the picture, made the tints clearer and subdued the more brilliant colors. That he painted on moveable panels is evident from the frequent mention of *tabulae* with reference to his pictures. Pliny expressly says, that he did not paint on walls.[1]

Greek Art—Capture of Helen.

We have now made a short study of Grecian Civilization. We have seen how, owing to their contracted area and their mode of life, the mental activity of the Greeks was wrought up to a high pitch; and we have traced the results of this in the fields of philosophy, science, and art. Taking a general view of this whole matter, regarding Greece as simply the first point where Aryan civilization

[1] Hist. Nat. xxxv. 37.

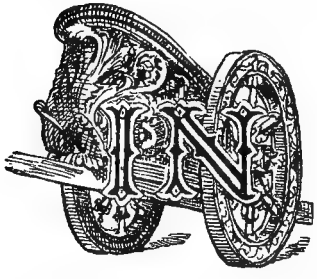
came to its fruitage, we are now to turn to the study of Roman Civilization. And here we are to notice that the waves of Aryan culture are swinging in a greatly wider circle than in Greece. This is but a prophesy of the time when all Aryan Europe was to glow refulgent with the light first focussed in Ancient Hellas.

Bacchus.

# CHAPTER VII.

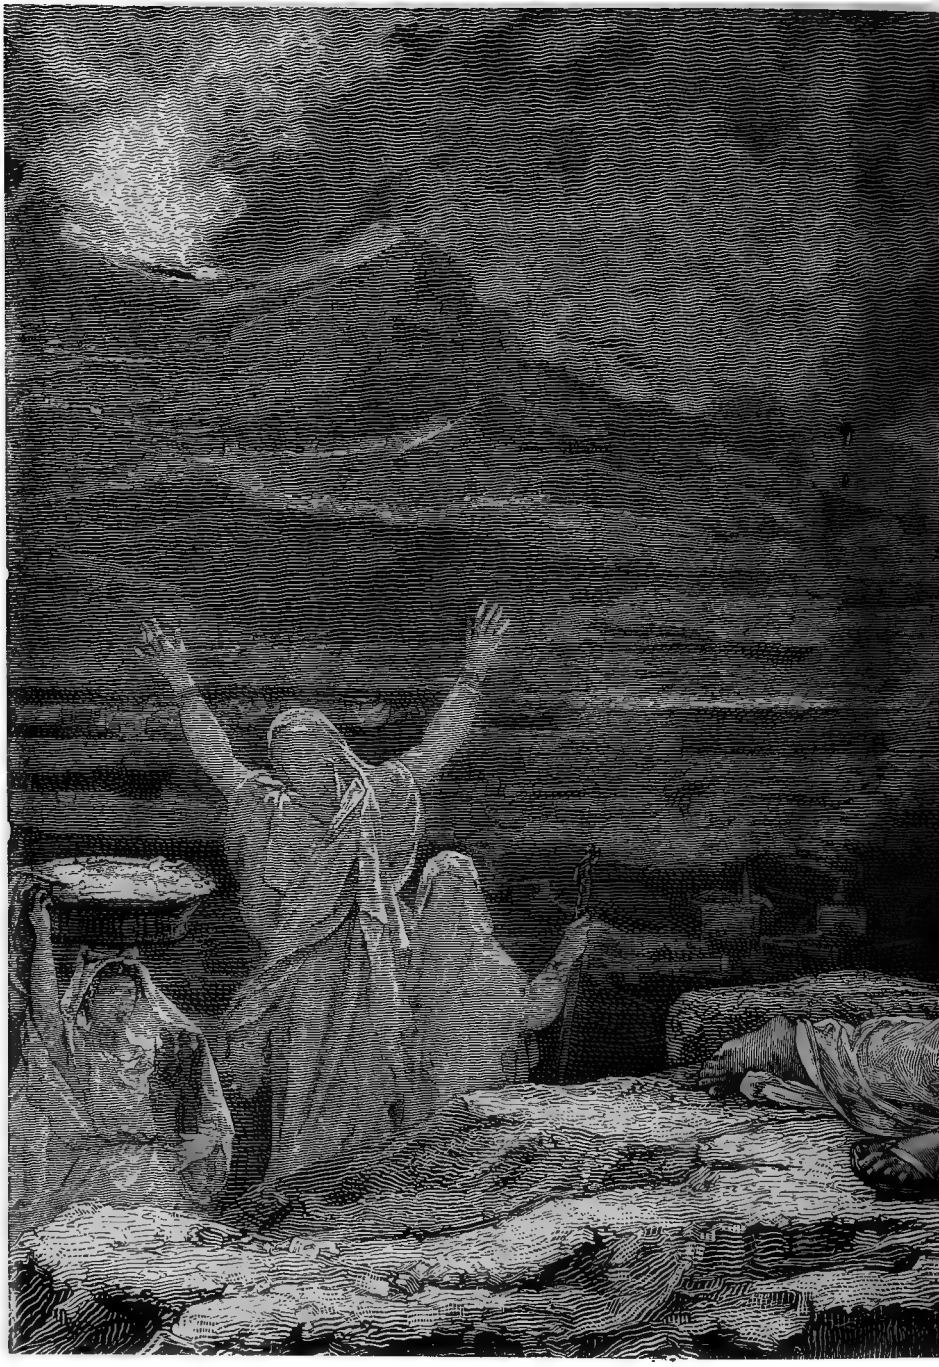
## ROMAN CIVILIZATION.

INFLUENCE of the City of Rome—First History of Rome—Description of Rome—The Houses—The Fora—Slavery in Ancient Rome—Different Classes of Slaves—Treatment of Slaves—Manumission of Slaves—The House Sons—House Daughters—Marriage in Ancient Rome—The Status of Married Women—Ceremonies of Marriage—Education in Rome—Compared with Greek Education—Public Life in Rome—Public Games—Races—Gladiatorial Games—The Coliseum—The Gladiators—Influence of these Games on the People—The "Ludi Magni"—Public Baths—Meals and Foods of the Romans—Use of Wine in Rome—The Dress of Romans—The Toga—The Tunica—Special Articles of Dress—Female Dress—Roman Literature—Cicero—Tacitus—Finances in Rome—Taxes—Commerce—The Government in Ancient Rome—Normal Development of Tribal Government—Roman Civil Law—The Vast Influence on Our Civilization—Conclusion.

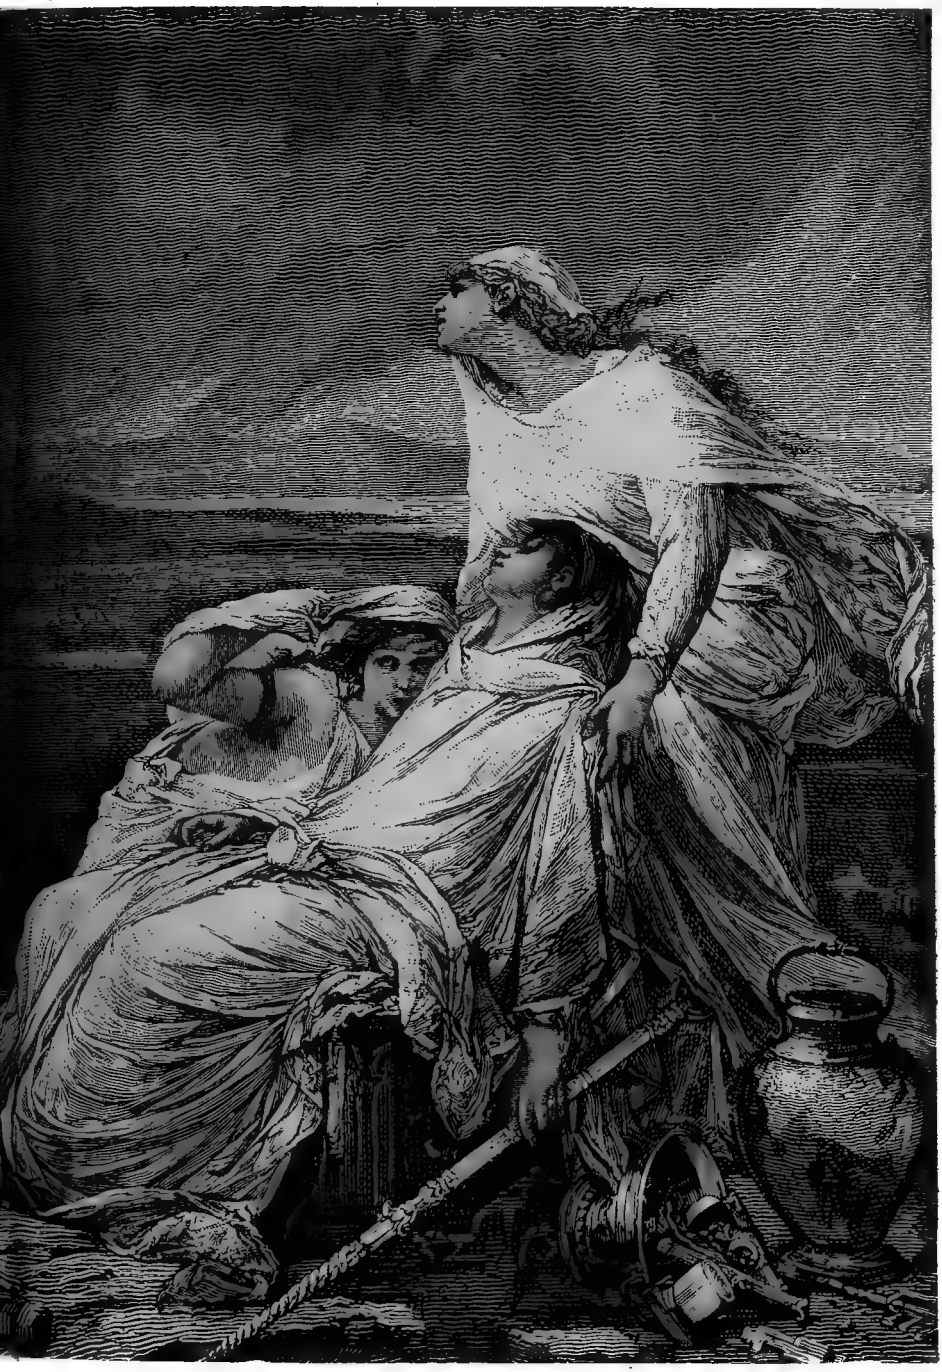


OUR delineation of Grecian Civilization, we dwelt, to a considerable extent, on the general fact, that it developed in cities; and thus we reduced quite a number of the most important features of that civilization to one far-reaching cause. This feature of city life is not peculiar to Grecian civilization. It applies in a still greater degree to the civilization of Rome. For, though in Greece civilization radiated from cities, there were many such centers distributed over the mother country and Asia Minor, the southern part of Italy and Sicily.

As a rule, Athens is considered the head and the



DESTRUCT



N OF POMPEII.

H. LEROUX

leader of Grecian civilization, but this holds good only with respect to a few departments of the mental development of Greece; and, even here, the cities of Sicily and Asia Minor contributed considerable, and so, to the great name of Athens, we have to add those of Crotona, Elea, Syracuse, Halicarnassus, etc. Thus Greece displays the spectacle of a de-centralized mental development. This de-centralization was carried to a still greater extent in the political life of the Greeks.

With regard to Rome, however, there was no room for de-centralization. Rome was the exclusive center of Roman civilization. Neither the political, the intellectual, nor the moral life of the Roman Empire had its roots elsewhere than in Rome. It was from Rome, that all the functions and activities of the vast empire radiated. The great Roman jurists were educated in the city of Rome. They might have been Phoenicians, like Ulpian; or Greeks, like Gajus; but their development as jurists was completed in Rome. It was likewise there, that the great generals and heroes of Rome found their instruction, their object, and their success. This one city decided the affairs of Italy, Spain, Greece, Egypt, Asia Minor, Palestine, and Macedonia. Political success was sought for in this city; thus, when Cicero wished to be consul, his brother Quintus advised him to gain first the votes of the city of Rome, for, in comparison with these votes, the balance of the Italian votes would scarcely count.

That the civilization of a vast empire should be, as it were, dependent on one city is one of the most singular facts in history. There have been large cities, possessing millions of inhabitants, cities commanding great influence over the destinies of countries; but the influence of vast cities, like Babylon or Nineveh, London, Paris, or Berlin,

is far from being an exclusive one. In addition to these large cities, there are others which exercise similar influence and prevent the civilization of those countries from depending exclusively on the development of one single point.

The city of Rome is situated on the Tiber. At the time when the seat of Rome was building, there were many other small cities in Italy, which belonged to the Etruscans and the various Aryan tribes of the peninsula.[1] These cities were really each the headquarters of a tribe, and consequently, as a rule, they were independent of one another. Inter-tribal wars were, of course, frequent, but in spite of their feuds, they had many things in common. Thus, in the first place, their language, with the exception of the Etruscans, evidently pointed to a common origin. Their religious rites were more or less the same. Their social and political institutions show a general resemblance; and thus we are enabled to explain many of the Roman institutions by some hints, and remnants found in the districts of the Umbrians and Oscans.

We have had occasion to point out that almost nothing is known of the early history of Rome. The mass of fables on which it rested has been swept away before the destructive criticism of modern scholars.[2] This, however, will not prevent us from a description of the political and social institutions of Rome in the Regal period, as well as in the first part of the Republican times, because those criticisms are directed more against the chronology of battles and similar military affairs, than against those quiet and peaceful institutions, the contemplation of which forms the prominent part of a history of civilization. In order

[1] Above page 268.

[2] This Series, Vol. II. p. 195 *et seq.*; This Vol. p. 274 *et seq.*

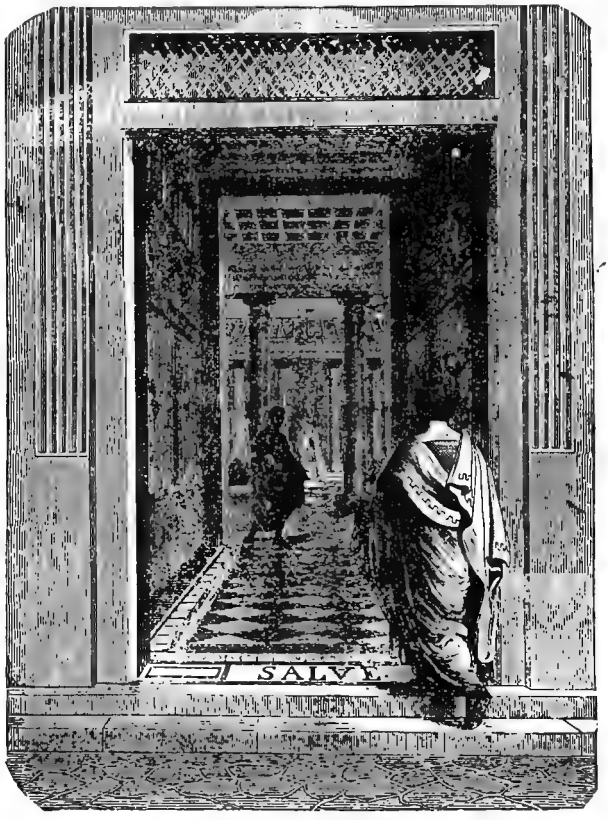
to form a clear picture of Roman civilization, we will begin with the description of the city, of street life, and of public and private life in Rome. Accordingly we will imagine a visit to Rome in the second century B. C., when the Republican institutions were not yet destroyed, and the institutions of the Regal period were still more or less active. It is a mistake to suppose that the institutions of the Regal period differed essentially from those of the Republic.[1] In every respect, these two periods were, of one and the same cast and tenor, save that the life-kings of the first period were replaced by the year-kings of the second. Even the city of Rome herself did not appear much different in the second century B. C., than she did in the times of the kings.

The oldest part of the city was called Roma Quadrata; and in the second century B. C., as well as now, the huge walls, attributed by tradition to king Servius, were extant. The streets of the city, with the exception of two, were narrow and short. The pavement was a privilege of very few streets. Houses were divided into two classes. The regular private house of a wealthy Roman citizen was called *domus*. It consisted of a one-storied building, with a flight of three or four large halls opening into one another. The first of these halls was called the *atrium*. The adjoining hall was called the *tablinum*, and the third was called the *perystylium*. The domestic life of a Roman house centered in the atrium. It was there, where the family took their meals, where they sacrificed to the gods, where the family council was held, and where the matron of the house cooked the meals. In addition to these three large halls, there were small compartments for the slaves of the house, for the children, and for bed-rooms. A Ro-

[1] This Series, Vol. II. p. 304.

man private house had no windows facing the street. They had only sky-light arrangements, so that the house resembled a castle more than a private residence.

The number of houses of this kind, in the times of Augustus, is given as seventeen hundred and eighty. The



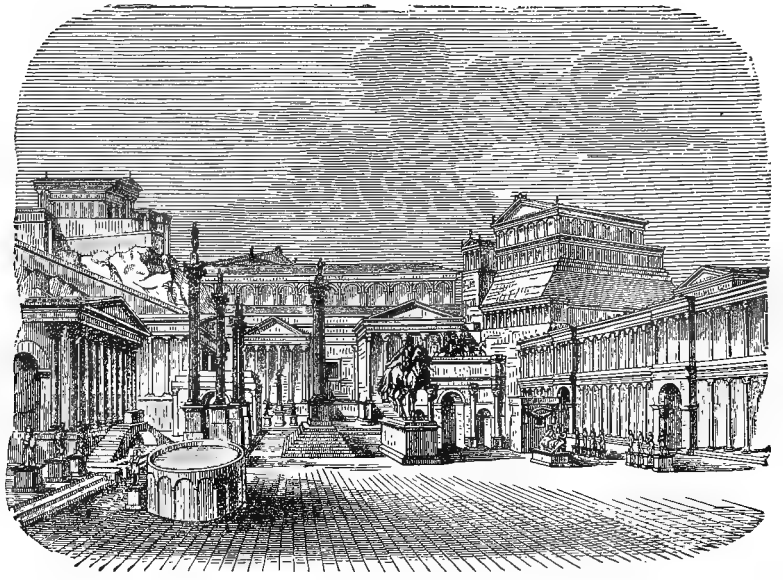
Entrance to a Roman House.

second kind of house was the so-called *Insula*, which is identical with our tenement house There were about forty-four thousand in the time of Emperor Augustus. They had several stories and hundreds of persons were living in them. The real estate business in Rome was conducted on a very large scale, and millionaire Crassus

gained most of his fortune in *insula* speculations. In spite of the narrow streets, there were, comparatively speaking, few cases of house-burning; and this fact may be accounted for by the circumstance that tenement houses were perfect blocks, apart from one another, so that small lanes separated them, and danger from spreading fire was thereby lessened. In the streets, no carriages were to be seen, with the exception of those of high dignitaries, or of public conveyances for city purposes, before four o'clock in the afternoon. Private conveyances were not permitted to drive in the streets of Rome before that hour. The carriages afforded a very interesting show for the lover of sport. They were two-wheeled, three-wheeled, and four-wheeled; and the horses were of the very best race, having been imported from the most beautiful breeds of Numidia and Arabia.

Early in the morning, the life of the city began its course. There were several large market halls, one for pork, another for sweets, a third for meats of all kinds; and these market-halls were under the strict surveillance of the *Aediles*. These market-places were called *Fora*. But the most important forum in Rome was the one that was properly called "the Forum." It was situated between the Palatine and Capatoline hills, and its extent was seven *jugera*. It was originally a swamp or marsh, but was said to have been filled up by Romulus and Tatius, and to have been set apart for a place of administration of justice, for the assemblies of the people, and for the transaction of other kinds of public business. In its widest sense, the Forum included the *comitium*, or the place of assembly for the *Curiae*, which was separated from the forum, in its narrower sense, or the place of assembly for the *Comitia Tributa* by the *Rostra*.

These rostra were elevated places of ground, from which on a stage, the orators addresssed the people. They derived their name from the fact that after the subjugation of Latium their sides were adorned with the beaks (*rostra*) of the ships of the Antiates. The orators addressed the people from the rostra, and from thence the tribunes of the people, in the early times of the Republic, used to confront the comitia and the curiae. In 300 B. C., the



The Forum.

Romans adorned the Forum with gilt shields, which they had taken from the Samnites; and, subsequently, this custom of adorning the Forum was observed during the time of the public Roman games, when the magistrates rode in their chariots in procession around the Forum. After the victory of Duillius over the Carthagenians, the Forum was adorned with the celebrated *Columna Rostrata.* In the principal part of the Comitium the laws of the twelve tablets were exhibited for public inspection. Besides the

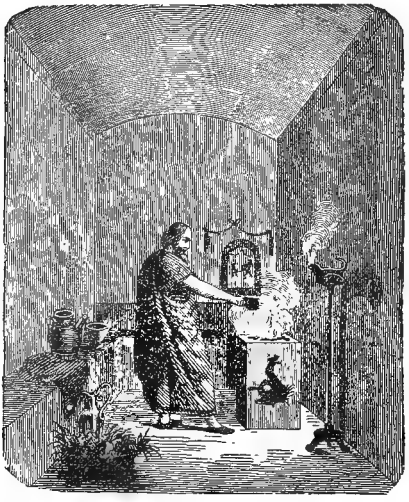
ordinary business which was carried on in the Forum, we read that gladiatorial games were held there, and that there prisoners of war and faithless colonists were put to death.

The second forum was built by Julius Cæsar, and was called Forum Julii. The leveling of the ground alone cost him about a million of *sesterces*, and he adorned it besides with a magnificent temple of Venus Genitrix. A third forum was built by Augustus, and called Forum Augustium, because the two existing ones were not found sufficient for the great increase of business which had taken place. Augustus adorned his forum with a temple of Mars and the statues of the most distinguished men of the Republic.

Besides these fora, were the numerous temples in Rome dedicated to the gods and goddesses of Greece and Rome, and even to the gods and deities of foreign nations. The distinctive feature of a Roman temple was, that it was considered the abode of the god and not the place of devotion. The people never thought of going to church as we do. The temple was the residence of the god, his private dwelling place, and people prayed and observed their devotional exercises in their own houses. There were of course religious processions, which frequently filled the streets of the city, but they were generally such as exerted an influence on political factors. The city of Rome had a suburb, as we might say, in the neighboring cemeteries. The most splendid tomb-stones and burial monuments adorned both sides of the magnificent Via Appia, and made the impression of a city of its own. Rome had a most excellent system of sewerage of which there are considerable remnants left. There were, besides, several aqueducts conveying water to the city. The whole territory

of Rome was divided by Augustus into fourteen regions, as it were wards, and at the head of every ward there was an official directing its internal affairs.

Interesting though the architectural and monumental appearance of ancient Rome may be, the people who inhabited that city afford a still greater interest. It was the sturdy and energetic, relentless and shrewd, painstaking and severe people of Rome, which presented the spectacle of men, who were at once the best conquerors and rulers and the best obeyers known in general history. To obey, to stand by the command of a superior, was engrafted on the mind of every Roman from his childhood; and, even in the times of the wildest licentiousness, we do not hear of a Roman who ventured to revolt against the authority of his father, or against the principal magistrates of the city.



Household Chapel.

The population of Rome was divided into three parts. In the first were the free-men; second, the freedmen; and third, the slaves. But if we consider the condition of a son who was still in the household of his father, and if we notice the utter dependence in which he was left on the good will of his parent, we might say that, practically, there were only two classes of people in Rome, that is to say, Free-men and Slaves. For the son, as long as he was not emancipated by his father, was legally unable to earn his living, to acquire a fortune, or to live independently. In

everything necessary to support himself, he had to depend on his father, with one exception; as far as political life was concerned, he was considered a free, independent man, and it was there that the power of his father ceased.

The slaves in Rome formed over two-thirds of the city. Of course we speak of the later times of the Republic, for in the beginning of Rome, there were comparatively few slaves in the city. The slaves, forming such an overwhelming part of the population, claim our close attention; let us therefore describe their condition in detail. The most fruitful sources of slavery were the continual wars of the Romans. The number of captives brought home into slavery sometimes appears incredible. The captives were divided with the spoils upon the battlefield, and each soldier provided for the slaves allotted to him. It became common for the slave-dealers, or as they were called *Mangones*, to accompany the armies for the purpose of purchasing the captives. Prices at such times became very trifling. Sometimes as small as four *drachmae*.[1] According to Josephus, ninety-seven thousand captives followed the destruction of Jerusalem. Men of the highest rank in Rome engaged in this horrible calling and constituted a powerful organization. Children of slaves followed the condition of the mother. There were great slave markets in Carthage and in Delos, but the center of the trade was at Rome. Slaves, generally, were sold at auction, standing upon a stone so that they might be closely scrutinized. Slaves of peculiar beauty and rarity were kept separate and sold privately.

Newly imported slaves had their feet whitened with chalk. Those from the East had their ears bored. Each of them had a scroll suspended around his neck, giving

1 About 75 cents.

his age, birthplace, qualities, health, etc., and the seller was held to warrant the truth of this statement. He was bound to discover all defects, especially as to health, thievishness, disposition to run away, or to commit suicide. If the seller was unwilling to warrant, instead of a scroll, he placed a cap (*pileus*) upon the head of the slave. A crown

Roman Slave Market.

upon the head indicated a captive taken in war. The seller would cause the slave to run, leap, or perform some other act of agility. They possessed the art of causing their limbs to look strong, their flesh young, and to retard the appearance of age. The nationality of the slave gave some indication of his qualities. Thus the Phrygian was

timid; the African, vain; the Sardinian, unruly etc. The private slaves of the rich Roman were divided into two classes, the country and the city slaves. Any number of them, owned by the same master, were called respectively *familia rustica* and *familia urbana*.

The slaves were still further classified according to their occupations, such as *Ordinarii*, *Vulgares*, *Mediastini*, *Literati*, etc. They were chiefly employed in agricultural pursuits or the mechanical arts. Many, however, were used as personal attendants, it being considered discreditable for a person of rank to be seen without a train of slaves. From the moment a stranger entered the vestibule of the Roman house, through the hall, in the reception room, at the table, everywhere he was attended by different servants, each taking his name from his occupation. The number of slaves at any given period can not be accurately ascertained. That they were very numerous, in fact more numerous than the free population, is indisputable; and, it is further known, that the numbers increased during the latter days of the Republic and under the emperors. The number sometimes owned by a single individual is almost incredible. A Greek writer, Athæneus, says, that some persons owned as many as twenty thousand.

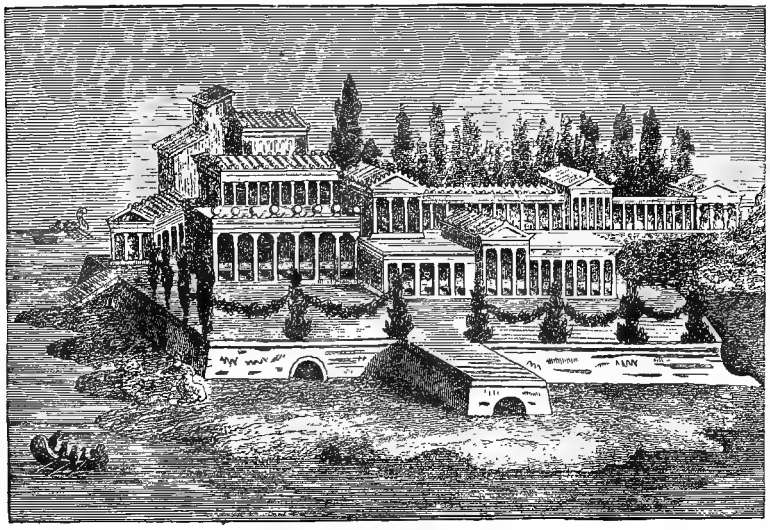
The same system was in use in every part of the household. The female slaves were distinguished in like manner. Every conceivable want being attended to by a separate slave. The smallest service had its slave. Thus the holding of the umbrella, of the fan, of the sandals, etc., gave names to particular slaves. Similarly the arranging of dress, the setting of the teeth, and the painting of the eyebrows, required separate attendants. A prominent Roman always had a *nomenclator*, that is to say, a slave who told

him the names of the passers-by on the street, for it was considered gentleman-like to address everybody by his name. The wife, upon her marriage, received a confidential slave, *dotalis servus*. He belonged to her, the master had no control over him. He frequently had the confidence of the wife more than her own husband. Even the schoolboy was followed by his little slave to bear his satchel to school. The old and luxurious were borne in sedans or chairs by special slaves. Slaves were even trained for gladiatorial contests, especially was this the case under the emperors, who encouraged the sports in order to disengage the thoughts of the people from their own bondage. We should not, however, judge the Romans too hashly for this cruelty, as frequently free men, knights, senators, and even emperors, for instance Commodus, descended into the arena and engaged in the fatal encounter. Sometimes even women joined in the conflict.

The price of slaves in Rome varied much at different times and according to the qualities of the slave. Under the Empire, immense sums were paid for beautiful slaves and such as attracted the whim of the purchaser. We have accounts of their selling as high as from five thousand to ten thousand dollars. In the time of Horace, about a hundred dollars was a fair price for an ordinary slave. Clowns, jesters, and pretty females brought high prices, although females generally sold for less than males. Hannibal, after the battle of Cannæ, being encumbered with his prisoners, suffered the knights to be ransomed at seventy-five dollars; the legionary soldiers, at fifty dollars; the slaves, at twenty dollars.

There were certain feasts, during which, for the time being, slaves were allowed perfect liberty. Of these, the most remarkable were the *Saturnalia*, when such perfect

equality existed that the master waited on the slaves at table. This feast was in the latter part of December and lasted seven days. Another was a feast in honor of king Servius Tullius, he being himself, according to tradition, the son of a captive and a slave. This feast lasted from the Ides of March, the date of his birth, to the Ides of April, the date of the inauguration of the temple of Diana.



A Roman Villa.

The punishment inflicted upon slaves for offenses were various and some very severe. They necessarily differed from those prescribed for the same offenses when committed by free men. Minor misdemeanors were submitted to the correction of the master. Cato the censor, instituted upon his farm, a kind of jury-trial among the slaves themselves, and submitted to them the guilt and the punishment. The courts took cognizance of graver charges. The removal of the urban slave into the *familia rustica* was a mild and yet a much dreaded penalty,

for in such cases they worked in chains. The hand-mill was also a place of punishment. Sometimes they were scourged, after being suspended with mancles to the hands and weights fastened to the feet. Another mode of punishment was a wooden yoke upon the neck and bound to the arms on either side. Upon every Roman farm there was a private prison in which refractory slaves were confined. They were, however, abolished in the time of Hadrian. In some cases very severe punishments were resorted to, such as cutting off the hands for theft, and death by the cross. These however were very rare. To protect the master, the Roman laws were very stringent and provided that, where the master was found murdered in his house and the perpetrator was unknown, all the domestic slaves should be put to death.

There was no distinctive dress for slaves. It was once proposed in the senate to give slaves such a costume, but it was rejected since it was considered dangerous to show them their number. Male slaves were not allowed to wear the *toga* or *bulla*, nor females the *stola*, but otherwise they were dressed nearly in the same way as poor people, in clothes of dark color and slippers. The rites of burial, however, were not denied to slaves, for as the Romans regarded slavery as a political institution, death was held to put an end to the distinction between free-men and slaves. In view of the many false opinions as to the treatment of slaves, in the times of the Romans, we will add a few well established facts, concerning the treatment accorded them in some instances.

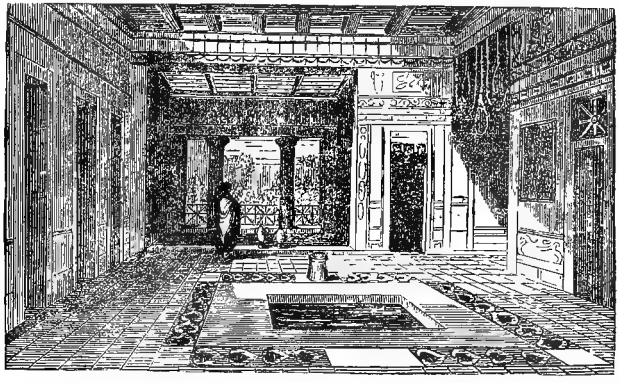
Cato ate and drank the same course of victuals as his slaves, and even had the children nourished by his wife, that they might imbibe a fondness for the family. He allowed the marriage of male and female slaves at the

price of a money payment from their savings. Columella, another Roman writer, regarded the gains from the births as a sufficient motive for encouraging these unions, and thought that mothers should be rewarded according to the number of their children. The immense extension of the majority of Roman real estates made it impossible for masters to know their slaves, even if they were disposed to do so. In the *familia urbana*, the favorites of the master had good treatment and exercised extensive influence over him. Doubtless there was often mutual affection. Slaves sometimes, as in noted instances during the civil wars, showed a noble spirit of devotion to their masters. Those who were common inmates of the household, but were employed outside of it as keepers of a shop or boat; chiefs of workshops or clerks in the mercantile business, had the advantage of greater freedom of action. One proof of the generally humane treatment of slaves in Rome, may be found in the fact, that conspiracies and rebellions against the masters belonged to the rare and exceptional features of Roman history.

Blair, in comparing the Greek and Roman systems of slavery, points with justice to the greater facility and frequency of emancipation as the great superiority of the Roman system. "No Roman slave," he says, "need despair of becoming both a free-man and a citizen." Manumission, or emancipation, took place in either of two general ways, *Justa*, and *Minus Justa*. Of the last form, there were four modes. First, by *adoption*, rarely resorted to; second, by *testament*; third, by *census*, which was of exceptional use and did not exist later than the time of Vespasian; and, fourth, by *vindicta*, which was the general form. In the last method, the master turned the slave around with the words "liber esto," in the presence of the prætor, that

officer with his lictors, at the same time, striking the slave with his rod.

The manumissio justa was effected by a sufficient manifestation of the will of the master; as by letter, by words, by putting the cap of liberty on the slave, or by any other formality which had by usage become significant of the intention to liberate, or by such an act as making the slave the guardian of his children. The free-man, unless he became such by operation of law, remained client of his master and both were bound by the mutual obligations arising out of that relation. These obligations existed



The Atrium.

also in the case of freemen of the state, of cities, temples, and corporations. The free-man took his former master's name, he owed him deference and aid, and neglect of these obligations was punished, in extreme cases, even with the loss of liberty. Conditions might be annexed by the master to the gift of freedom, such as continued residence with him, or of general service, or some particular duty to be performed, or of a money payment to be made.

In the second century of the Greek era, we find a marked change with respect to the institution of slavery, both in the region of thought and in that of law. Al-

ready the principles of reason and humanity had been applied to the subject, as by Seneca, who, whatever we may think of him as a man, deserves our gratitude for the just and liberal sentiments he expressed respecting slaves, who, he says, should be treated as humble friends; and especially for his energetic reprobation of gladiatorial combats and of the brutality of the public who enjoyed these sanguinary shows. The military vocation of Rome was now felt to have reached its normal limits, and the emperors, understanding that, in the future, industrial activity must prevail, prepared for the abolition of slavery, as far as was then possible, by honoring freemen, by protecting the slave against his master, and by facilitating manumission.

The state granted to public slaves the right of bequeathing half of their possessions, and private persons sometimes permitted similar dispositions even to a greater extent, though only within their *familiae*. Hadrian took from masters the power of life and death and abolished the subterranean prisons. Antonius Pius punished him who killed his own slave, as if he had killed another's. Already in the time of Nero, the magistrates had been ordered to receive the slave's complaint of ill-treatment and the *Lex Petronia*, belonging to the same or an earlier period, forbade masters to hand over their slaves to combat with wild beasts; and Antonius Pius directed that slaves treated with excessive cruelty, who had taken refuge at an altar or imperial image, should be sold; and this provision was extended to cases in which masters had employed a slave in a way degrading to him or beneath his character. Marcus Aurelius gave to masters an action against their slaves for any cause of complaint, thus bringing their relation more directly under the surveillance of law and public opinion. A slave's oath could still not be

taken in the court of war. He was interrogated by the torturer, but the emperor and jurists limited in various ways the application of torture.

We learn more about the private and intimate relations between Roman slaves and their masters from the numerous mortuary inscriptions found all over Italy and, in fact, all over the Roman Empire, and which have been most carefully collected and compiled. In these inscriptions, we find numerous allusions to the relations of Roman slaves to their masters; and it is both pleasing and instructive to see how frequently the relation between master and servant assumed the form of real friendship. On many tombstones, we read of the master's will to let his slave be the sole heir to his fortune. On others, he expresses a desire to lie beside his slave, who was his only and most trusted friend. On others, again, he expresses his deep gratitude for all the beneficial work that his slave had bestowed upon him. These and similar testimonials bespeak the real condition of slavery in Rome in a much clearer and in a more unequivocal way than the text of Roman laws, which by their very nature, had to be harsh and severe. In the real life of the Romans, the slaves formed a very considerable constituent of the comfort, of the industry and commerce, of the instruction of the people. The slaves were the trades-people; they were the agents, commissioners, representatives; they carried on a brisk trade for their masters; they were the private tutors and instructors of the master's children; they were the physicians of the house, and to them the lives of noble Romans were trusted daily and hourly.

The second class of people in Rome, technically known as free-men, comprises those persons who were free, and yet, as being members of a joint-family, were under the

control of a house-father. Here it is of the utmost importance for us to keep in mind the results of previous inquiry into Ancient Society and especially as to the rights and duties of the various members of a joint-family. Many of the laws and institutions of ancient Rome admit of easy explanation when we once recall the peculiar standing of the joint-family.[1]

We have seen, that wherever ancient society has had a normal development the joint-family invariably made its appearance. Every known branch of the Aryan race achieved its development. Now in ancient Rome, when the other institutions of ancient society were fast breaking down, when we can only dimly make out the tribe, phratry, and gens, we find the joint-family still enjoying a vigorous life. The constant tendency of advancing civilization, which is to break up this form of the family, had made but slight inroads upon the joint-family among the Romans. Recall to mind that, in the developed form of the joint-family, the house-father or house-chief owned and controlled all its

A Roman Citizen.

[1] This Series, Vol. II. p. 217 *et seq.*

property, voted for it in the general assemblies, was its judge and general executive.[1]

We have further seen how most people made arrangements for liberating the sons from the control of the house-chief. But in Rome this step had not been taken. Hence a house-son had no public civil rights whatever. He could not acquire a cent's worth of property, he could not call his own the minutest thing in the world, and anything that he acquired belonged to his father. He could not marry without his consent and, when married, he had to ask for the means of his sustenance, and he remained dependent just as in the days of his childhood. His father could punish him, nay, more than this, in point of law, his father could put him to death, and we have several records in the Roman and Greek historians of Roman fathers who executed their sentence of death, and did not hesitate to sacrifice their own sons to their stern morality. But within the family he probably did have some rights. He was entitled to maintenance, and could probably be punished only in accordance with the decree of the family council.[2]

The position of the female members of this joint-family were, in the first stage, even more dependent than the house-sons. Theoretically they were always members of some joint-family, and always under the power of some house-chief. Marriage, in the first stage, simply transferred her to a new joint-family, of which her husband was chief. Legally she was in the same relation to him as was her daughter. On the death of a house-father, the female members did not thereby gain their liberty. They simply passed under the control of the new house-father. There-

---

[1] Ibid. 218. [2] Ibid.

by the mother might come under subjection to her own son, sisters to their brother.[1]

Such was the joint-family among the Romans. It was not something peculiar to them, but it long retained its archaic rights and privileges; the reason of which retention is probably to be found in the peculiar surroundings of the Patrician tribes. By skillful management, these three tribes had gained enormous power, and acquired great wealth. We have also seen how from the very earliest times they were called upon to exert all their skill, power, and diplomacy to keep their Plebeian population in subjection and how many centuries went by before they were finally vanquished in this matter. Of necessity, such a people became very conservative of old customs. Nearly every change was forced from them. It is not strange, then, that the joint-family was one of the very last to be attacked.[2]

Yet we detect the entering wedge. If the process of civilization be the bringing to the front of individuals and individual rights, the joint-family must disappear in time. So in Rome, sons in the service of the state were in a measure released from the control of the house-father. What they gained in such service they did not turn in to the family treasury. And, of necessity, the public officers were released from this control, at least as regards all official acts.

We have just pointed out that women were always considered members of a joint-family and hence under the control of a house-father. It becomes then of interest to consider marriage in Rome and the transferrence from one joint-family to another. When the joint-family as-

[1] Hearn: "Aryan Household," p. 89.

[2] This Series, Vol. II. p. 229.

sumed the highly artificial form that it did in ancient Rome, we would naturally expect to find many ceremonies attending the transferrence of a female from one joint-family to another. Hence arose the solemn and stately form of marriage known as the *Confarreatio*. This was largely a religious act. The woman was about to renounce the household gods of one family, and henceforth worship another set. She was to break all legal connections with one family, and unite herself with another. Hence the set words to be spoken before ten witnesses, and the religious ceremonies, in which the eating of a symbolic meal occurred, and from which this form of marriage was derived.[1]

Roman Matron.

As we would expect, this form of marriage long survived among the conservative Patricians, and when it had died out in common use, was still employed in the marriage of priests.[2] But there were other forms of marriage in use, which were not so solemn and stately, and which may have been the older forms.[3] One was *Coemptio*. It was effected by a formal sale of the woman, in the same manner and form as the sale of any article of personal property. Still a third form was that

1 *Vide* Hearn: "Aryan Household," also Coulanges: "Ancient City."

2 Becker: "Gallus," Excursus i.

3 Wood: "Wedding Day in all Ages," p. 51. McLennan: "Primitive Marriage," p. 8.

of *Usus*, in which marriage was implied by the living together of the parties for one year, though should the woman absent herself for three whole nights this legal presumption would not follow.[1]

Besides these legal forms, there were many ceremonies at which we will glance. After the parties had agreed to marry and the house-fathers, in whose dominion they were, had consented, a meeting of friends was sometimes held at the house of the maiden for the purpose of settling the marriage contract, which was written on tablets and signed by both parties. The woman, after she had promised to become the wife of a man, was called *Sponsa* or *Pacta*. The man put a ring on the finger of his betrothed as a pledge of his fidelity. This ring was probably, like all rings at this time, worn on the left hand and on the finger nearest to the smallest. The last point to be fixed was the day on which the marriage was to take place. Towards the close of the Republic, it became customary to betroth young girls while they were yet children. Augustus put a check on this custom. Girls, before they had completed their tenth year, could not be betrothed. The Romans believed that certain days were unfortunate for the performance of the marriage rites, either on account of the religious character of those days themselves, or on account of the days by which they were followed, as a woman had to perform certain religious rites on the day after her wedding, which could not take place on a *Dies ater* (a black day). Days not suitable for entering upon matrimony were the first, ninth, and fifteenth of every month. Furthermore, the whole months of May and February were excepted, as well as a great number of festivals. Widows,

1 Wood, L. C.: Becker: "Gallus," Excursus i.

however, might marry on days which were inauspicious for maidens.

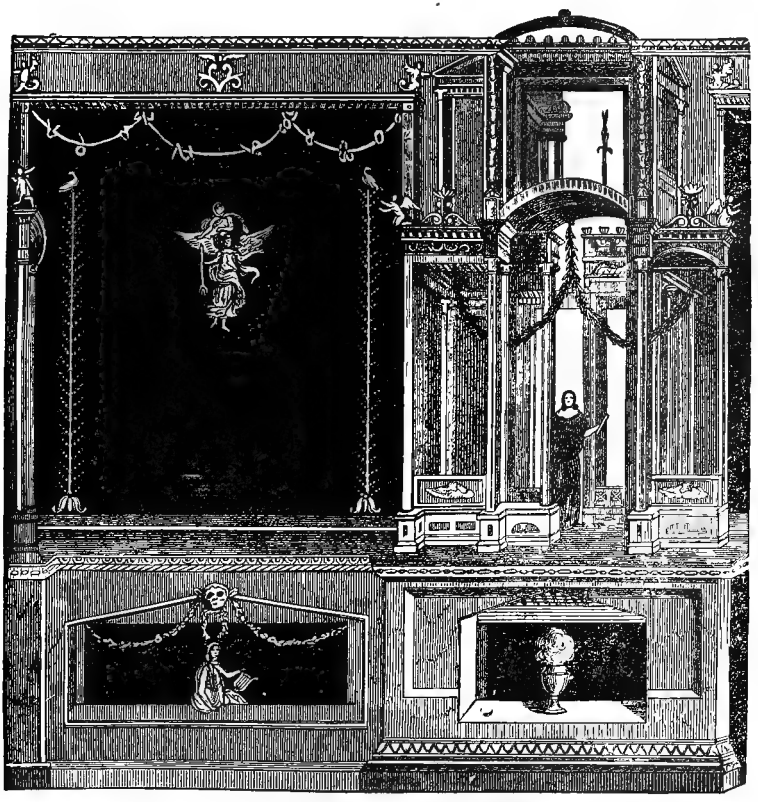
On the wedding day, the bride was dressed in a long white robe, with a purple fringe adorned with ribbons. This dress was called the *Tunica recta* and was bound round the waist with a girdle, which the husband had to untie in the evening. The bridal veil was of a bright yellow color, and her shoes likewise. Her hair was divided, on this occasion, with the point of a spear.[1] The only form of marriage which was celebrated with solemn religious rites was that by confarreatio. Then a sheep was sacrificed and its skin was spread over two chairs, upon which the bride and bridegroom sat down with their hands covered. Hereupon the marriage was completed by pronouncing a formula or prayer, after which another sacrifice was offered. The bride was conducted to the house of her husband in the evening. She was taken with apparent violence from the arms of her mother or of the person who had to give her away.[2] On her way, she was accompanied by three boys dressed in the *Praetexta* and whose fathers and mothers were still alive. One of them carried before her a torch of white thorn, or according to others, of pine wood. The two others walked by her side, supporting her by the arm. The bride herself carried a distaff and a spindle with wool. A boy called *Camillus* carried, in a covered vase, the so-called utensils of the bride and playthings for children.

Besides these persons who officiated on the occasion, the procession was attended by a numerous train of friends, both of the bride and the bridegroom, whose attendance

[1] A probable survival of marriage by capture. This Series Vol. II. p. 126.

[2] Notice the survival of capture.

was called *officium.* When the procession arrived at the house of the bridegroom, the doors of which were adorned with garlands and flowers, the bride was carried across this threshold by men who had been married to only one woman, that she might not knock against it with her foot,



Wall Ornament at Pompeii.

which would have been an evil omen. Before she entered the house, she wound wool around the door-posts of her new residence and anointed them with oil. The husband received her with fire and water, which the woman had to touch. The bride saluted her husband with the mystic words, "Ubitu Caius, Ego Caia." After she had entered

the house, she was placed upon a sheepskin, and here the keys of the house were delivered into her hands. A repast given by the husband to the whole train of relatives and friends who accompanied the bride generally concluded the solemnity of the day.[1]

These strict forms of marriage, which we have described, all had, as one result, the adoption of the wife into the joint-family of her husband; and, consequently, she came under his power, or as the Romans expressed it *in Manum Mariti*. From a very early time, there existed a less binding form of marriage, in which the wife did not become a member of the joint-family of her husband.[2] She remained in the family of her father. Instead of being dependent on her husband, and instead of loosing all her individuality, she kept her independence and freedom to an extraordinary degree. She did not even share the name of her husband, and instead of being called by his family name, she kept her old maiden name as before. So we see that Roman wives were either in a kind of legal bondage, which seems to be utterly repulsive to our modern feelings, or they were independent to an extent which seems to clash with the natural and religious tendencies of matrimonial life. On the one hand, a Roman wife was considered a babe, a minor, a ward, a person incapable of doing or acting anything according to her own individual taste, a person continually under the tutelage and guardianship of her husband. On the other hand, she was considered

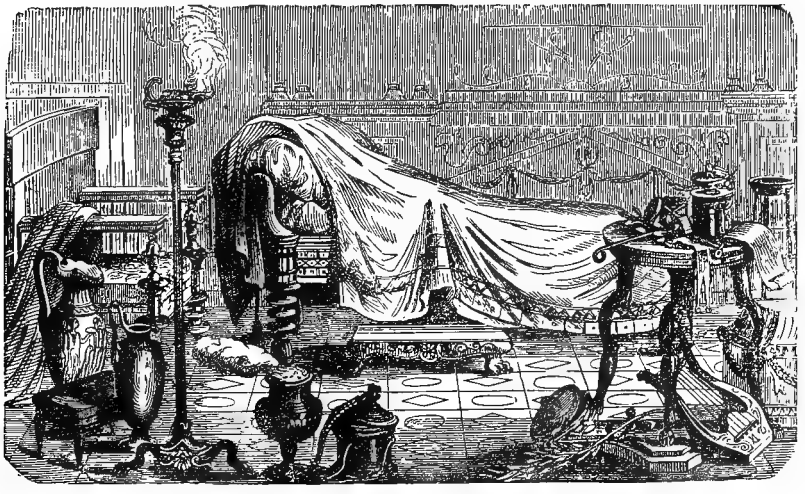
---

1 These various ceremonies are largely extracted from Smith's Dictionary of Greek and Roman Antiquities. Article "Matrimonium."

2 This was *Matrimonium justus without conventio in manum*. Here we have followed Becker: "Gallus." Some think that only the first form of marriage *confarreatio* placed the wife in *manum*. Yet if *coemptio* and *usus* be the older forms, of necessity they must, at least in the first place, have placed the wife in the power of the husband.

capable of exercising a freedom of action which seems out of place with our ideas; and her life with her husband was anything but that intimate and religious companionship which forms our ideal of wedded life.

We need only remark that this form of marriage grew in favor. Property considerations largely conduced to this result. Marriage, thus loosely contracted, could be as loosely dissolved. Thus toward the close of



Furniture, etc., in the Room of a Rich Roman.

the Republic, the marriage tie was looser in Rome than in almost any other Aryan community. Against this merely nominal marriage, a reaction set in under Christianity. We must observe how greatly this change must have affected the old joint-family, and this doubtless had a great deal to do in effecting its dissolution, and so bringing on the stage the modern family.[1]

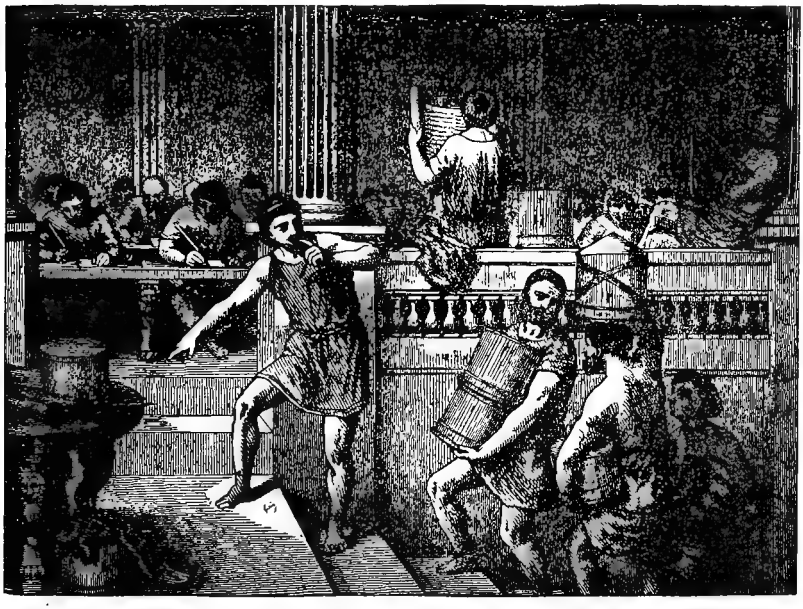
However restricted the legal rights of women were theoretically, practically they enjoyed a great amount of

1 *Vide* Hearn: "Aryan Household," p. 479.

freedom. The legal enactments were disregarded, and the social position of a Roman woman was as free, honored, and as high as the social position of any woman in any other country. In fact, the women of Rome enjoyed a far greater social liberty than the women, for instance, in Greece. In the latter country, as we have seen, women were not permitted to join the meals and associations of men; whereas the Roman matrons could freely mingle with gentlemen and enjoy the evening parties of their husbands or sons. They could go to theaters; they could appear in the assembly hall of the Senate; they could go to the arena, and their influence on the education of children was decisive. In fact, their great influence made itself manifest, in the first two centuries of our era, in that they were mostly instrumental in starting the new religion, which, under the name of Christianity, had commenced to exert its beneficial influence.

In spite of the republican and more or less democratical character of their state, the Romans never thought of establishing public schools, and, least of all, of making them free. A home education was all that a Roman child received, and the range of this studies was rather narrow. Tuition was left entirely in the hands of private tutors who, as we have observed, were mostly slaves or freedmen. The Roman boy learned to read and to write; and, as far as our historical knowledge of Rome goes, the art of reading and writing was known almost generally even from the earliest times. It would have been almost impossible to do without a knowledge of these arts; for, according to Roman usages and Roman exigencies, it was almost indispensable for every citizen to know the art of writing, and, consequently, that of reading. For instance, every house-father was compelled to keep a strict account of his

income and of his outlays. In modern times, such accounts are generally incumbent on merchants only, but in Rome the house-books, as they were called, were of great value as evidence in cases of litigation. In addition to reading and writing, a little arithmetic was taught; but, in this respect, the Romans were greatly deficient. Even in times when the Romans had conquered the whole civilized world, they still displayed a curious ignorance of mathe-



Copying Manuscripts in Rome.

matics, and they were obliged to resort to the help of Greek mechanics and engineers. The last part of a Roman education was a knowledge, or at least a smattering of the fundamental law of Rome, in other words the so-called twelve tablets.

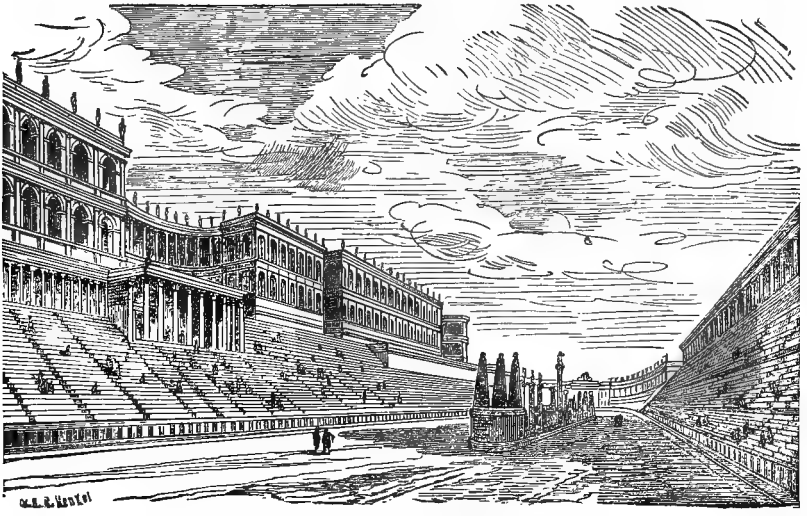
If we compare the amount of knowledge imparted to a young Roman boy with that to a young Grecian, we will readily see the great difference in the character of these

two nations. From his early childhood, every Grecian was compelled to learn by heart the poems of Homer, which gave him a treasure of poetical knowledge as well as a stock of practical wisdom. Accordingly we find that the Grecians had a decided inclination to a more elevated conception of life, to a more poetical, tender, sympathetic love for their fellow beings and for the world in general. The bent of a Roman's mind, on the contrary, was thoroughly practical, stern, unbending; his life was not filled with images of poetry, with high strung conceptions of fancy. He was taught to struggle for what is immediate, for earthly goods, for money, and for power. It was only in later times, that the Romans were accustomed to go to Greece and spend several years in Athens and Rhodes, in order to acquire part of that noble and philosophical knowledge, which the Greeks, even in their decadence, did not fail to teach. Down to the latest times, Roman education was mainly a practical one, shunning all the higher and moral ideal objects which were so fervently embraced by the Greeks. In the times of the emperors, the Romans devōted an undue amount of attention to the art of oratory, but even then they neglected the science of philosophy, as well as mathematical and astronomical speculations, by the cultivation of which the Greeks immortalized their names.[1]

The education of a Roman resembled, in its main features, the education of the majority of the people of our land, who, after having laid a foundation of general knowledge, rush into real life, and the experience there obtained completes what the schools omit. Public life was the domineering factor in Roman education. Their

[1] "As the twig is inclined, the tree is bent." The difference here pointed out characterized the two people throughout, and left indelible marks on history.

men were public men, men who either yielded to public opinion, or who tried to wield the opinion of the public. We will fail to understand the spirit of Roman civilization, unless we represent to ourselves the great importance of public life as opposed to private life. Without exaggeration, we can say that there was little private life in ancient Rome. Rome knew only of public life, the life of the streets, of the forum, of the campus, of the army and navy, and every Roman was more or less engaged in these



Circus Maximus.

public activities. Hence, all the sports, games, amusements, etc., of the people, were of a public character. This point must be steadily kept in view, if we would understand Roman institutions. These general reflections will help us to understand the public amusements of the people, and in the first place, the amusements of the circus.

The circus was a place for athletic contests and for chariot and horse races. When Tarquinius Priscus had taken the town of Apiolæ from the Latins, he commemorated his success by an exhibition of races and pugi-

listic contests in the Murcian Valley, between the Palatine and Aventine hills, around which a nnmber of temporary platforms were erected by the *patres* and *equites*, each one raised a stage for himself upon which he stood to view the games. This course, with its surrounding scaffoldings, was termed "circus." Previous to the death of Tarquin, however, a permanent building was constructed for such games, with regular tiers of seats in the form of a theater. To this the name of "Circus Maximus" was subsequently given to distinguish it from other similar buildings, which it surpassed in extent and splendor, and hence it is often spoken of as *the* circus, without any distinguishing adjective.

Of the Circus Maximus, scarcely a vestige now remains beyond the palpable evidence of the site it occupied and a few masses of rubble work in the circular forum, which may be seen under the walls of some houses in the Via de Cerchi, and which retain traces of having supported the stone seats of the spectators. This loss is fortunately supplied by the remains of a small circus on the Appian Way, commonly called "the circus of Caracalla," the ground-plan of which, together with much of the superstructure, remains in a state of fair preservation. The seats, termed collectively the *cavea*, were arranged as in a theater. The last rows were separated from the ground by a *podium*. The tiers of seats were divided longitudinally and diagonally by passage ways. Toward the extremity of the upper branch of the *cavea*, the general outline is broken by an outwork which was probably the *pulvinar* or station for the emperor, as it is placed in the best situation for observation and in the most prominent part of the circus.

In an opposite branch is situated another interrup-

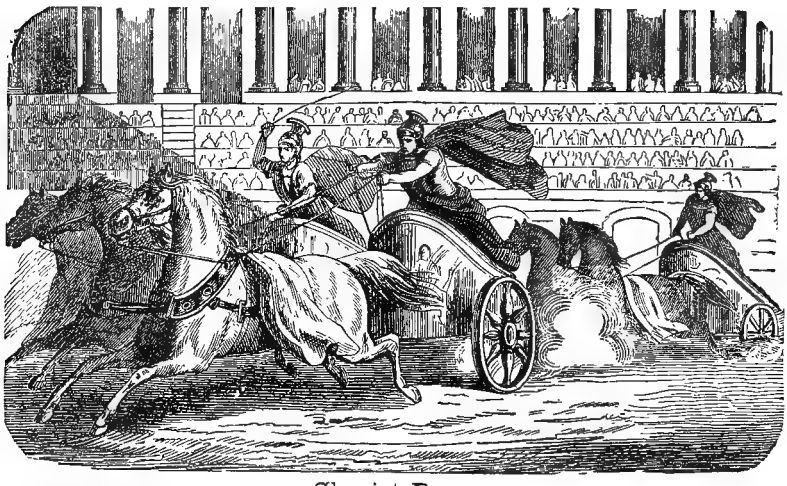
tion to the uniform line of seats, showing also from its construction a place of distinction, which might have been assigned to the person at whose expense the games were given. In the center of the area, was a low wall running lengthwise down the course, which, from its resemblance to the position of the dorsal bone in the human frame, was termed *spina.* At each extremity of the spina, were placed upon a post three conical, wooden cylinders like cypress trees, which were called *metae* (the goals). The most remarkable objects upon the spina were two columns supporting seven conical objects, which, from their resemblance to eggs, were called *ova.* Their use was to enable the spectators to count the number of rounds which had been run, for which purpose they were first introduced by Agrippa. They were, therefore, seven in number, such being the number of circuits made in each race, and as each round was run, one of the ova was put up or taken down.

At the other extremity of the spina, were two similar columns, sustaining seven dolphins, which do not appear to have been intended to be removed, but only placed there as corresponding ornaments to the ova. At the extremity of the circus, in which the two horns of the cavea terminated, were placed the stalls for the horses and chariots, commonly called *carceres.* The number of these carceres is supposed to have been usually twelve. They were vaults, closed in front by gates of open wood work, which were opened simultaneously, upon a signal being given, by removing a rope attached to pilasters placed for that purpose between the stalls.

The games in the circus embraced six kinds. First, the races; second, the Trojan games; third, the equestrian battles; fourth, the gymnastic contests; fifth, the chase; and, sixth, the naval battle. The games com-

menced with a grand procession, in which all those who were about to exhibit in the circus, as well as persons of distinction, took part. Statues of the gods, paraded upon wooden platforms, formed the most conspicuous feature in the procession.

They were borne upon the shoulders as the statues of saints are carried in modern processions. The races (*cursus*) formed the most common games. The chariots, employed in the races, were drawn by two or four horses. The usual number of chariots entered for each race was



Chariot Race.

four. The drivers were also divided into four companies, called *factiones*, each distinguished by a different color, to represent the four seasons of the year. The driver stood in his car within the reins, which went around his back. This enables him to throw all his weight against the horses by leaning backwards, but it greatly increased his danger in case of an upset; to avoid this peril, a sort of knife or bill-hook was carried at the waist, as is seen in some ancient reliefs, for the purpose of cutting the reins in the case of emergency.

When all was ready, the doors of the carceres were flung open, and the chariots were formed abreast of the *alba linea.* The signal for the start, sometimes the sound of trumpet or, most generally, the fall of a napkin, was then given by the person who presided at the games. The alba linea was then cast off and the race commenced, the extent of which was seven times around the spina, keeping it always on the left. A course of seven circuits was termed *unus missus*, and twenty-five was the number of races run each day. The victor descended from his car at the conclusion of his race, and ascended the spina, where he received his reward, consisting of a considerable sum of money, which accounts for the great wealth of Roman charioteers. A single horseman attended each chariot, the object of which arrangement seems to have been twofold—to assist his companion by urging on the horses, when his hands were occupied in managing the reins, and, if necessary to ride forward and clear the course.

The enthusiasm of the Romans for these races exceeded all bounds. Lists of the horses with their names and colors and those of the drivers were handed about, and heavy bets made upon each faction; and sometimes the contests between two parties broke out into open violence and bloody quarrels. The Emperor Justinian nearly lost his crown in consequence of disputes which originated in the circus. The Trojan games were sort of sham fights, said to have been invented by Aeneas, performed by young men of rank on horseback. As to the other kinds of games, their names show their nature.[1]

A most important class of games yet remains to be described; the gladiatorial combats. These games were

[1] This account is extracted from Smith's Dictionary, "Greek and Roman Antiquities," art. Circus.

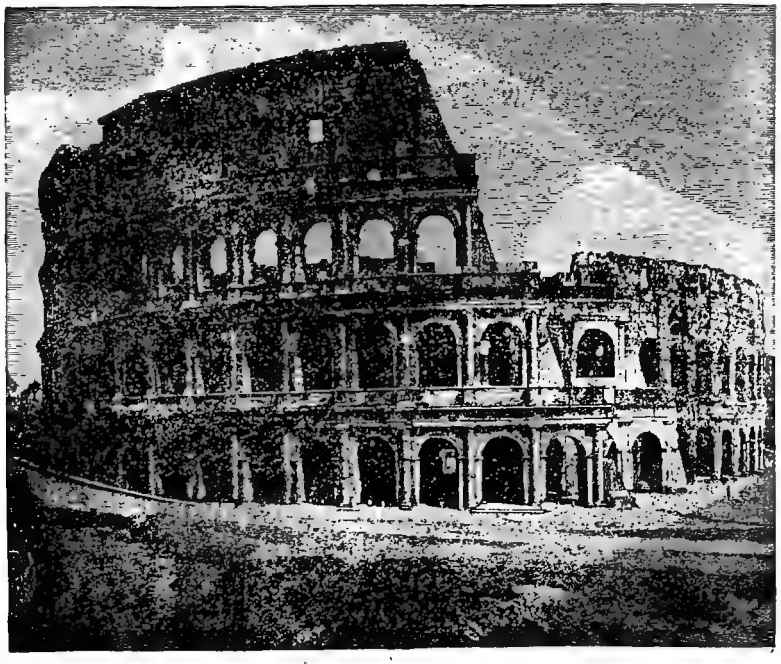
generally executed in the amphitheater. There were several amphitheaters in Rome at different times, and it was among the designs of Augustus to erect an amphitheater in the midst of Rome in keeping with the magnitude of the city. It was not, however, until the reigns of Vespasian and Titus, that the design of Augustus was carried into effect, by the erection of the Amphitheatrum Flavium, or as it has been called the Colosseum. This wonderful building, which for magnitude can only be compared to the pyramids of Egypt, is perhaps the most striking monument of the material greatness of Rome under the empire. It was commenced by Vespasian, but at what precise time is uncertain. It was completed by Titus, who dedicated it in the year 80 A. D., on which occasion five thousand animals of different kinds were slaughtered. The Flavian amphitheater became the place where princes and people met together to witness those sanguinary exhibitions, in which the Roman people delighted. In the reign of the emperor Macrinus, it was struck by lightning, by which the upper rows of benches were consumed, and so much damage was done to other parts of the structure, that the games were for some years celebrated in another locality. Its restoration was commenced by Emperor Elagabalus, and completed by Alexander Severus. It was again struck by lightning in the reign of Emperor Decius, but was soon restored and the games continued to be celebrated in it down to the sixth century. Since that time, it has been used sometimes in war as a fortress and in peace as a quarry. Whole palaces, such as the Cancellaria and Polazzo Farnese, were built out of its spoils. At length, the popes took steps to preserve it.[1]

Notwithstanding the damages of time, war, and spolia-

[1] Consult Smith's Dictionary, art. Amphitheater.

A ROMAN TRIUMPH.

tion, the Flavian amphitheatre still remains complete enough to give us a fair idea, excepting in some minor details, of the structure and arrangement of this kind of buildings. The very site of the Flavian amphitheater, as of most others, furnishes an example of the prodigal contempt of labor and expense, which the Roman emperors displayed in their great works of architecture. The Greeks, in choosing the sites of their theaters, almost always availed them-



Colosseum at Rome.

selves of some natural hollow on the side of a hill; but the Roman amphitheaters, with few exceptions, stand on plains. The site of the Colosseum was in the middle of the city, on the marshy ground which was previously the pond of Nero's palace. Figures can not give an adequate conception of this vast structure. Its dimensions and arrange-

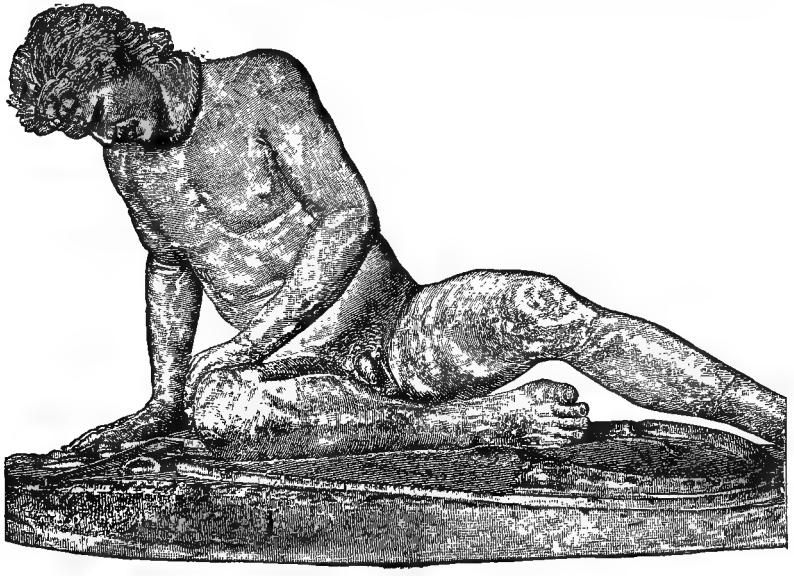
ments were sufficient to furnish seats for eighty-seven thousand spectators; it inclosed an arena large enough to afford space for the combats of several hundred animals at once, or that sufficed for the evolution of mimic sea-fights and the exhibition of artificial forests. Its passages and staircases gave ingress and egress without confusion to the immense mass of spectators, and for those who fought in the arena. There were dens for the thousands of animals devoted to destruction. There were also channels for the rapid influx and outlet of water, when the arena was used for the naval battle; and the means for the removing of the carcasses and the other abominations of the arena. We need simply add, that the wealth and luxury of Rome were exhausted in adorning this enormous building.[1]

The gladiators who fought in this arena, were men who were trained to fight either with their fellow men or with wild beasts. The origin of such contests is thought by some to be the practice among savage people of immolating slaves and prisoners on the death of illustrious chieftains, a practice recorded in Greek, Roman, and Scandinavian legends, and even much later in the Indian suttee. Even at Rome, they were for a long time confined to funerals and hence the older name for gladiators was *bustuarii*; but in the later days of the Republic, their original significance was forgotten and they formed as large a part of the public amusements as the theater or the circus. The first gladiators are said to have been exhibited at Rome by Marcus and Decimus Brutus, at the funeral of their father, B. C. 164. On this occasion only three pairs fought, but the taste for these games spread rapidly and the number of combatants grew. Julius Caesar engaged

1 An admirable picture of the magnitude and magnificence of this amphitheater is drawn in the latter part of Gibbon's twelfth chapter.

such extravagant numbers for his aedileship, that his political opponents took fright and carried a decree of the Senate imposing a certain limit of numbers; but notwithstanding this restriction, he was able to exhibit no less than three hundred couples.

During the later days of the Republic, the gladiators were a constant element of danger to the public peace. The more turbulent spirits among the nobility had each his band of gladiators to act as a body-guard, and the armed

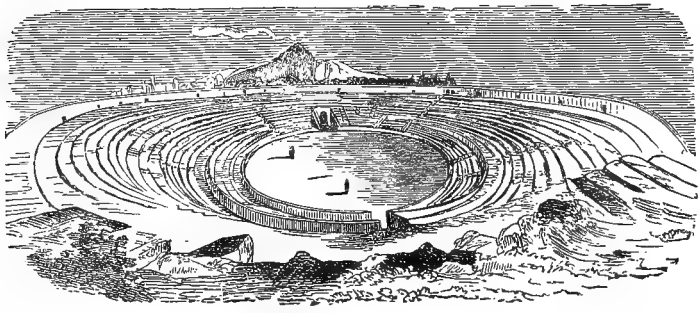


Dying Gladiator.

troops of Clodius, Milo, and Catilina played the same part in Roman history as the armed retainers of the feudal barons or the *condottieri* of the rebellious republics. Under the Empire, notwithstanding sumptuary enactments, the passion for this species of games steadily increased. Augustus limited the shows to two a year and forbade a praetor to exhibit more than a hundred and twenty gladiators; but many allusions in the Roman poets, show that a hun-

dred pairs was the fashionable number for private entertainments. In a description still extant, the emperor states that more than ten thousand men had fought during his reign. The Emperor Claudius was devoted to this pastime and would sit from morning until night in his chair of state, descending now and then to the arena to coax or force the reluctant gladiators to resume their bloody work.

Under Nero, senators and even well born women appeared as combatants. Emperor Titus ordered a show which lasted one hundred days, and Trajan, in celebration of his trumph over Decebalus, exhibited five thousand pairs of gladiators. Domitian instituted chase by torch-



The Amphitheater in Pompeii.

light, and at a festival, in the year 90 A. D., he arranged a battle between dwarfs and women. Even as late as 200 A. D., an edict was passed forbidding women to fight. How widely the taste for these sanguinary spectacles extended throughout the Roman provinces is known by monuments, inscriptions, and the remains of those amphitheaters. From Britain to Syria, there was not a town of any size that could not boast its arena and annual games.

Gladiators were drawn either from prisoners of war, slaves, or criminals condemned to death. In the first

class, we read of tattooed Britons in their war chariots, Thracians with their peculiar bucklers and cimeters, Moors from the villages around Atlas, and Negroes from Central Africa. Down to the time of the Empire, only great malefactors, such as highway robbers and incendiaries, were condemned to the arena; but by Caligula, Claudius, and Nero, this punishment was extended to minor offenses, such as fraud and peculation, in order to supply the growing demand for victims. In the first century of the Empire, it was lawful for masters to sell their slaves as gladiators, but this was forbidden by Hadrian and Marcus Aurelius. Besides these three regular classes, the ranks were recruited by a considerable number of freedmen and Roman citizens who had squandered their estates and voluntarily took the profession of gladiators. Even men of birth and fortune frequently entered the lists, either for the pure love of fighting or to gratify the whim of some dissolute emperor, and one emperor, Commodus, actually appeared in person in the arena.

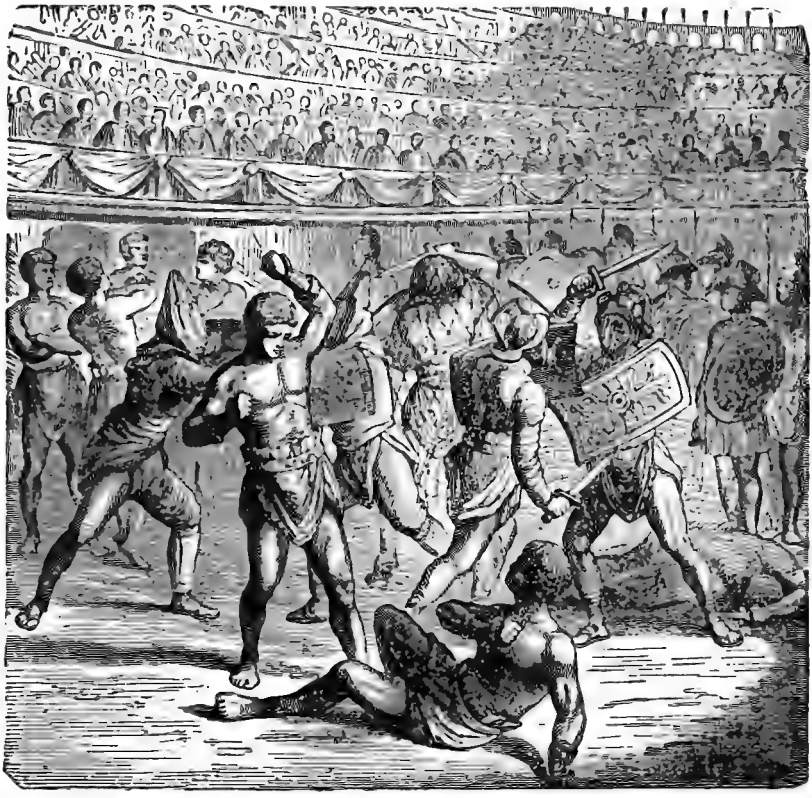
Gladiators were trained in schools, owned either by the state or by private citizens; and, though the trade of a *lanista* (a trainer of gladiators) was considered disgraceful, to own gladiators and let them out for hire was reckoned a legitimate branch of commerce. Cicero in his letters to Atticus, congratulates his friend on the good bargain he had made in purchasing some gladiators, and urges that he might easily requite himself by consenting to let them out twice. Men recruited mostly from slaves and criminals, whose lives hung on a thread, must have been more dangerous characters than modern galley-slaves or convicts; and, though highly fed and carefully attended, they were, of necessity, subject to an iron discipline. In the school of gladiators discovered at Pompeii, of the sixty-

three skeletons buried in the cells, many were in irons. Still, hard as was the gladiator's lot, so hard that special precautions had to be taken to prevent suicide, it had its consolations. A successful gladiator enjoyed far greater fame than any modern prize-fighter or athlete. He was presented with broad-pieced chains and jeweled helmets, such as may be seen in the museum at Naples; and poets, like Martialis, sang his praise, and his portrait was multiplied on vases, lamps, and other articles, and (human nature is so persistently the same) high-born ladies contended for his favors. Mixed, too, with the lowest dregs of the city, there must have been many noble barbarians condemned to the vile trade by the hard fate of war. There are few finer characters in Roman history than the Thracian Spartacus, who, escaping with seventy of his comrades from the school of Lentulus at Capua, defied the legions of Rome. After the Emperor's defeat at Actium, the only part of his army that remained faithful to his cause was the gladiators, whom he had enrolled to grace his anticipated victory.

There were various classes of gladiators, distinguished by their armor or the modes of fighting. The Samnites fought with their national weapons, a large, oblong shield, a visor, a plumed helmet, and a short sword. The Thracians had a small, round buckler and a dagger curved like a scythe. They were generally pitted against the *mirmillones*, so-called from the fish which served as the crest of their helmet. In like manner the *retiarius* was matched with the *secutor*. The former had nothing on but a short tunic or apron and sought to encircle his pursuer, who was fully armed, with the cast-net that he carried in his right hand, and if successful, he dispatched him with the trident that he carried in his left. We may also mention the *andabatae* who wore helmets with closed visors.

The *essedarii* who fought from chariots like the ancient Britons, and the *laqueatores* who tried to lasso their antagonists.

The estimation in which gladiatorial games was held by Roman moralists deserves notice, and so also the influence that they exercised upon the morals and genius of



Fighting Gladiators.

the nation. The Roman was essentially cruel, not so much from spite or vindictiveness, as from callousness and defective sympathies. This fact may be easily explained by the daily habits of the Roman people. If a people are accustomed to move in masses, in aggregates of

men, they will quickly loose those delicate emotions which the individual private life requires and which, as a rule, are entirely stifled in the movements of masses. We may easily observe the change of feelings which comes over us when we stand in the midst of a large mass of people. Our finer sentiments become obtuse and we lose our sense of delicacy, which is entirely supplanted by the rougher, coarser, and also more cruel kinds of sentiments natural to a mass of people. That the sight of blood-shed provokes love of blood-shed and cruelty is a common-place of morals.

To the horrors of the arena, we may attribute in part the frequency of suicide among the Romans. It is one of the finest remarks of Lessing that the Romans were unable to produce a great dramatic writer because of their love of the arena. People, who could see, unmoved, real agony and the real unmitigated horrors of death could not be satisfied with the imitation of agony on the tragical stage; and, accordingly, we find that the Romans, while they produced a few good writers of comedies, as Plautus and Terentius, never produced a great writer of tragedy. In connection with this fact, we remind the reader that the Greeks, as remarked above, abhored the games of the arena and, by thus retaining all the delicate, subtle nature of their feelings were enabled to write the most touching tragedies.

But we must not exaggerate the effects or draw too sweeping inferences from the prevalence of gladiatorial or similar amusements in Rome. Human nature is happily illogical, and we know that many of the Roman statesmen who gave these games and themselves enjoyed these sights of blood were in every other department of life irreproachable. They were indulgent fathers, humane

generals, and mild rulers of provinces. In the present state of society, it is difficult to conceive how a man of taste could gaze upon a scene of human butchery: yet we should remember, that it is less than half a century since bear-baiting was prohibited in England; and we are only now attaining that stage of morality in respect to cruelty to animals that was reached in the fifth century, by the help of Christianity, in respect to cruelty to men.

We shall not, then, be greatly surprised if few of the Roman moralists be found to raise their voices against this amusement, except on the score of extravagance. Cicero, in a well-known passage, commends the gladiatorial games as the best discipline against the fear of death and suffering that can be presented to the eye. The younger Pliny, who perhaps of all Romans approached nearest to our ideal of a cultured gentleman, speaks approvingly of them. Marcus Aurelius, though he did much to mitigate their horrors, yet, in his writings, condemns the monotony rather than the cruelty. Seneca is indeed a splendid exception, and his letters to Lentulus are an eloquent protest against this inhuman sport. In the Confessions of Augustine there occurs a narrative, which is worth quoting as a proof of the strange fascination which the games exercised even on a religious man and a Christian. He tells us how his friend Alipius was dragged against his will to the amphitheater; how he strove to quiet his conscience by closing his eyes; how, at some exciting crisis, the shouts of the whole assembly aroused his curiosity; how he looked and was lost, grew drunk with the sight of blood, and returned again and again, knowing his guilt, yet unable to abstain. The first Christian emperor was persuaded to issue an edict abolishing gladiatorial games in the year 325 A.D., yet, in 404, we read of an ex-

hibition of gladiators to celebrate the triumph of Honorius over the Goths, and it is said that they were not totally extinct in the West until the time of Theodoric.

Besides the gladiatorial games and the races, there were the *Ludi Magni*. They were originally a votive feast to Capitoline Jupiter, promised by the general when he took the field and performed on his return from the annual campaign. They thus presented the appearance of a military spectacle, or rather a review of the whole Burgess force, which marched in solemn procession from the capitol to the forum and thence to the circus. First came the sons of Patricians, mounted on horseback; next the rest of the Burghers, arranged according to their military classes; after them, the athletes, naked save for a girdle around their loins; then the company of dancers with the harp and flute players; next the priests in colleges, bearing censors and other sacred instruments; and, lastly, the images of gods, carried aloft on their shoulders or drawn in carts. The chase in the circus was the baiting of wild animals, which were pitted either with one another or with men. The taste for these spectacles grew until the most distant provinces were ransacked by generals and pro-consuls to supply the arena with rare animals, giraffes, tigers, and crocodiles.

Roman Lictors.

The other great public amusement of the Romans was the theater. Plays given in the Roman theaters were not national plays, representing the types and figures of Ro-

man life, but they were mostly composed after Grecian patterns. The two most celebrated writers of Roman plays, Plautus and Tarentius, modeled their plays almost exclusively according to their Grecian masters. The actors and actresses were despised by the public, and thus theaters were far from forming a part of the nation's life as they did in Greece. There successful writers of plays, as Sophocles, were honored with a military leadership; or, in modern times, great actresses and dramatic authors were generally the recipients of great honors. The peculiarly stern and rigid character of the Romans is well shown by their abhorrence of dancing. In the words of one of their great writers (Cicero), no sober man will dance. They considered dancing a consequence of intemperance and could not conceive of a man enjoying the pleasure of dancing in a decent way. Among them all, dances were performed by hired people, mostly servants or profligate women.

The Romans attributed great importance to the cultivation of bodily exercises and bodily purifications. Almost every city in the vast empire, possessed bathing-houses with the most luxurious, practical, and beautiful arrangements, where, in addition to the lotion of the body, all possible amusements were offered. It was in their public bath-houses where the Romans met; where they generally discussed the events of the day; where they listened to the arts of great reciters, to the lectures of jurists, of philosophers, and of all kinds of scientists. Frequent bathing, was a necessity for the Romans, since as they did not know the use of shirts, cleanliness demanded a constant purification of the body.

The Romans had only two meals a day or, if we take it in a strict sense, only one. The breakfast consisted of

a piece of bread and dried fruit. Many people did not take it at all. Then followed a very light luncheon and, after the bath, the meal proper, the *coena*. The table, which in rich houses was made of citron, maplewood, or even ivory, was covered with a table-clothe (*mantele*); and each of the different courses, sometimes amounting to seven, was served upon a waiter. But the dinner usually consisted of three ourses only. First the *promulsis*, called also *gustatio*, made up of all sorts of stimulants for the appetite. Eggs were considered so indispensable to the first course that they almost gave a name to it. Of birds, the Guinea hen, the pheasant, and the thrush were most in repute. The liver of the capon steeped in milk and becaficoes, dressed with pepper, were considered delicacies. The peacock acquired such repute among the Roman gourmands, that it was commonly sold for fifty *denarii*. Other birds are mentioned, such as the duck, especially its head and breast, the woodcock, the turtle, and flamingo, the tongue of the latter especially commended itself to the delicate palate of Roman nobles. Of fish, the variety was still greater. The charr, turbot, sturgeon, and mullet were highly prized and dressed in the most various fashions. Of solid meat, pork seems to have been the favorite dish, especially sucking pigs. The paps of a sow, served up in milk, the flitch of bacon are mentioned by Roman writers. Bear's flesh and venison were also in high repute.

Roman Soldier

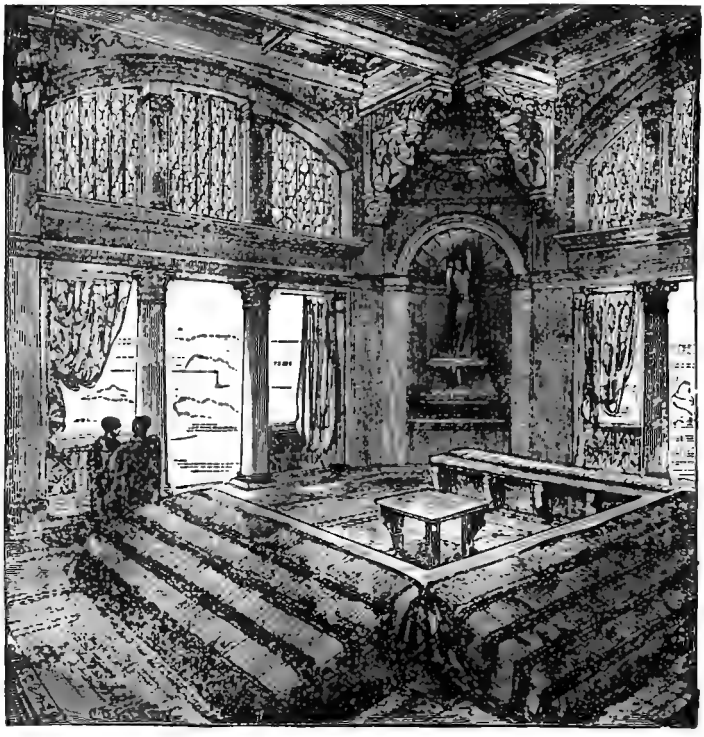
Condiments were added to most of the dishes. Such

was the *muria*, a kind of pickle made from the tunny fish. Another condiment was made from the intestines of the mackerel. Several kinds of truffles and mushrooms are mentioned, which either made dishes by themselves or formed the garniture for larger dishes. It must not be supposed that the cooks of imperial Rome were at all behind ourselves in the preparation and arrangement of the table. In a large household, the functionaries, to whom this important part of domestic conomy was entrusted, were four—the butler, the cook, the arranger of the dishes, and the carver. Carving was taught as an art, performed to the sound of music with appropriate gesticulations.

We will now suppose the table spread and the guests assembled, each with his *mappa* or napkin, and in his dinner dress, usually of a bright color and variegated with flowers. First they took off their shoes for fear of soiling the couch, which was often inlaid with ivory or tortoise shell and covered with a cloth of gold. Next they lay down to eat. They reclined on the left elbow, supported by cushions. There were usually, but not always, three on the same couch, the middle place being the most esteemed and honorable. Around the table stood the servants clothed in tunics. Some removed the dishes and wiped the table with a rough cloth. Others gave the guests water for their hands or cooled the room with fans. Here stood a servant half behind his master's couch, ready to answer the noise of the fingers, while others bore large platters of different kinds of meat to the guests.

The coena, in Cicero's day, at all events, was an evening meal. A dinner was set out in a room called *Coenatio*. The coenatio, in rich men's houses, was fitted up with great magnificence. The historian Suetonius mentions a supper-room in the golden palace of Nero, constructed like a thea-

ter, with shifting scenes to change with every course. The Greeks and Romans were accustomed in later times, to recline at their meals, but even in the time of the early Roman emperors, children, in families of the highest rank, used to sit together at an inferior table while their fathers and elders reclined on couches at an upper part of the room.



Roman Dining Hall.

Roman ladies continued the practice of sitting at the table, even after the recumbent position had become common with the other sex.[1]

The Romans, as well as the Greeks, indulged in very hard drinking. In their time, as well as at present, Italy

[1] This account of the dining customs of the Romans is extracted from Smith's Dictionary of Greek and Roman Antiquities, article "Coena."

produced some of the most delicious wines of the world. It is a remarkable fact, however, that the places celebrated for very delightful grapes in antiquity are nowadays entirely deprived of good vine-yards and do not furnish a drinkable wine. The Romans made all kinds of fruit-wines from the various fruits of their orchards, but they never indulged in beer. At their meals they accepted the Greek custom of electing a "master of the revels," who

Taking the Toga Virilis.

directed the number of goblets to be emptied by each guest. In addition to this, they generally drank the health of their friends according to the Greek fashion, that is to say, they drank as many goblets as there were letters in the names of their friends. They never drank wine without a mixture of water; to do so was considered barbarous. We seldom or never hear of Roman women joining the drinking parties of men, and even the frequent exaggerations in Roman satirists, like Martial and Juvenal, show their exaggerated character but too evidently.

The chief dress of a Roman was the toga. This was a nearly elliptical piece of cloth, its greatest length being three times the height of the person who wore it and its greatest breadth equal to at least twice the height of the wearer. It was of thin, woolen stuff, and, as to color, was always white for the ordinary citizen. A white toga with a purple border was worn as a distinction by those holding public offices, entitling them to the *curule* chair (made of ivory) and the *fasces* (a bundle of twigs with an ax); by the great college of priests (*Flamenes Diales*, *Pontifices*, *Augurs*, *Arvales*), but in this case only during the act of performing their offices; and by boys up to their sixteenth year, when they assumed the *Toga Virilis*. The tribunes and aediles of the Plebeians and the quaestors were denied the right to wear the purple bordered toga. A purple toga was always the mark of high office and as such was worn by the magistrates of republican times, though only on public occasions, as well as by the emperors. It was sometimes embroidered with gold and it could only be worn with an under-dress of the same color. The toga with a purple border could only be worn over a white tunic with a purple stripe. It was laid aside when the wearer retired from office, but the purple stripe on the tunic was retained, and became, in consequence, the distinguishing mark of the senatorial order.

The *tunica* was the other dress of the Romans. It reached half-way down the thigh and was girt around the waist. The people generally wore two tunicas; some, like the Emperor Augustus, even wore four. The one next to the skin was known as the *subucula* and the other as the *intusium*. Only the latter had sleeves and over it passed the girdle. The tunicæ of the senatorial order were adorned with a broad purple stripe down the front, while

those of the knightly order had two narrow stripes of the same color. This garment was usually of linen, and the national color, for ordinary purposes, was white. Poor persons, were doubtless content with the natural color of the linen or wool; and, when in mourning, the higher classes generally wore a dark colored one though this was not always the rule.

More convenient than the toga, but retaining a general likeness to it, was the *pallium*. Some toilet articles were worn only by certain classes, or at certain times. The *trabea* formed the official dress of the seers (*Augurs Salii*) and was purple. The *paludamentum*, worn by the emperor as head of Rome, was also purple in color, though white was allowed. The *sagum*, similar to the last, was worn only by soldiers. The *paenula*, was worn, in rainy weather generally, to cover the dress. It was made of thick, flaxen material or of leather, with or without a hood. It was elliptical in shape with a round hole in the middle for the head to pass through. The *lacerna*, formed of expensive materials and colors, was worn in the theater or circus in the presence of the emperor. As regards covering for the head, there was the hood of the pænula in rough weather, or the toga could be drawn up over the head, or there was a separate article, called *ricinium*, in the form of a veil. Workmen and others wore hats or caps. As an ornament for the head, the diadem was only occasionally used by the emperors before the time of Constantine. It was declined by Caesar. After Caracalla, the most usual mark of an emperor was a crown of rays.

The heavy garments worn out of doors were replaced at dinner, as we have said above, by garments of thin material. Trousers were not worn until comparatively late, and even then only by soldiers, who were exposed to

northern climates. The Romans ridiculed the tight trousers and pants of northern nations, and they could not understand how people of sense could prefer tight garments to the comfortable ample dress of the toga or tunica. The legs were protected by flat bands, laced around them up to the knees. On the feet, senators wore shoes of red leather, ornamented with knobs of ivory or brass and having a

Household Utensils.

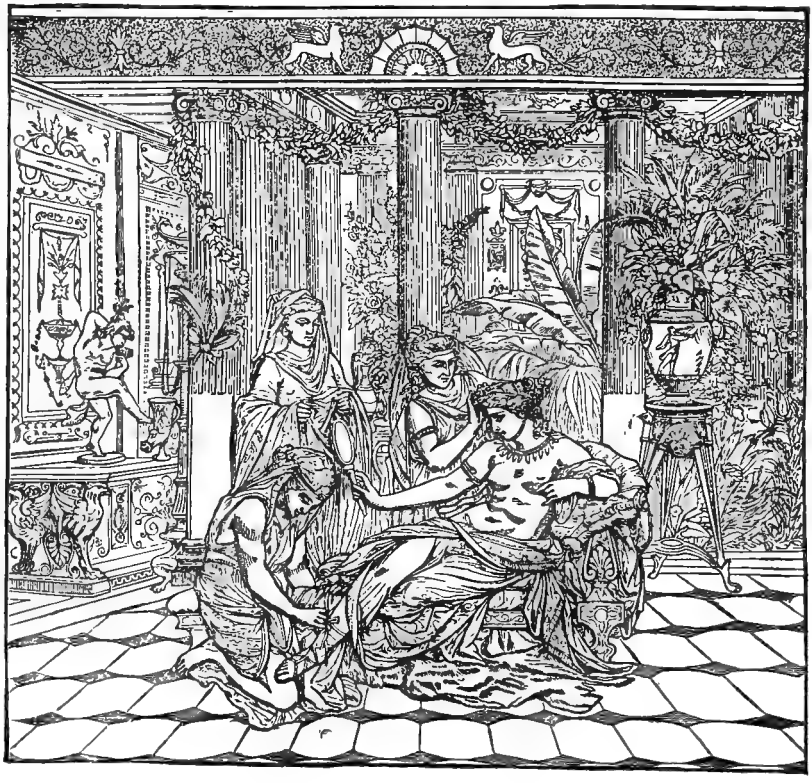
high sole. The Patrician order wore shoes of black leather, ornamented with an ivory crescent for non-official occasions. Persons not belonging to these orders wore sandals. The *compagus*, said to have been introduced from Etruria, appears to have been a sort of shoe.

For personal ornament, finger-rings of great variety of material and design were worn, sometimes to the extent

of one or more on each finger. Many persons possessed small cabinets of them. At first the Roman citizen wore only an iron ring as a signet, then a gold ring was introduced for persons sent on foreign embassies, but by degrees the right of the golden ring was extended to all classes of citizens. In the case of baldness, a wig was allowed to men as well as women during the Empire. The hair and the beard were allowed to grow long until about 290 B. C. From that time, shaving the hair short was the fashion, but, under Hadrian, long beards again came into fashion.

For the lady's toilet we may mention first, the *tunica interior*, loose and without sleeves. Across the breasts passed the *mamillare*, then came the tunica proper, generally called *stola*, girt at the waist, and having sleeves fastened down the arms as in the Greek *chiton*. Over this was thrown, for out-door wear, the *palla* or plaid. A veil over the back of the head was the mark of a well-to-do matron. In rainy weather, a hood like the Etruscan *cucullus* was worn. To cover or hold up the hair, nets were used; but this simple article was far from common among the Roman ladies, whose chief characteristic inworking of art is the elaborateness of their manner of braiding and twining the hair. Subsequently a blonde color of hair became fashionable, and to produce this color dying was resorted to. Nor were the ladies of ancient Rome unacquainted with various innocent means of increasing their charms. Generally the eyebrows and eyelashes were painted. Even the veins on the temples were sometimes touched with delicate blue color. The complexion was improved by various powders and waters. The teeth were carefully looked after, false ones making up the deficiency of nature. For the feet, sandals, but, by preference, shoes were made use of, generally of bright colors

and embroidered with gold or pearls. Socks or stockings were confined to ceremonial occasions. Personal ornaments consisted of brooches, bracelets, armlets, ear-rings, necklaces, wreathes, and hair-pins. The torques, or cords of gold, worn around the neck, were introduced from Gaul. A profusion of precious stones was used. Roman jewelry



Roman Lady at her Toilet.

was distinguished from Greek or Etruscan by the absence of skill and refinement in workmanship, but not in character of designs.

From what we have had to say of Roman education and manner of life, we would not expect to find them in the possession of a very extensive literature unless it be

on some intensely practical subject; such for instance, as law. Yet, as wealth and luxury increased, it became fashionable to gather together libraries. The books were rolls; the material used varied, but that most generally employed was papyrus. *Librarii*, or publishers, supplied the demand for books. The only way in which books could be duplicated was by laboriously transcribing the contents. The scribes who performed this work were either slaves or free-men who worked for hire. Probably one person dictated to several scribes at once.

Roman Books and Rolls.

We will mention only a few of the authors of Rome. We will speak first of Cicero and his writings. Cicero, as a statesman and politician, acquired a vast knowledge of the factors and working causes of Roman civilization; and, consequently, in his writings we find the reflections of a mind richly stored with the treasures of both Greek

and Roman thought. These consist of fifty-six orations, several books on the art of oratory, philosophical treatises private letters and a few historical books. In his orations, we have the most perfect examples of oratory. Every oration is lucid; the diction is fluent and always appropriate. He never indulges in redundant phrases; he is always simple, always naive; he saves all the strength of his oratory for certain points, toward which he is constantly working; and so the whole of any of his orations is so well balanced and well proportioned, that we seldom leave him without being convinced, if not of the justice of his cause, at least of the magnificence of his defence. The most perfect of all his orations are those directed against Catiline and Verres. The daring courage of his orations against Catiline and the wonderful composure which he keeps up amidst the most furious onslaughts of political enemies will forever remain the delight of the reader and the dispair of the imitator.

In the domain of history, Rome can boast of several very great authors. There is, in the first place, the masterwork of Livy. It is, or rather it was at the time of its appearance, a complete history of Rome in one hundred and forty-four books,[1] of which we at present possess but thirty-five and a few abstracts of the rest. But even these fragments suffice to show us the great value, the fascinating style, the vast store-house of facts, the beautiful arrangement and general fairness and reliability of the work. Although he may lack the profoundness of Greek historians, he is still a most interesting narrator and one of the most instructive teachers. All are pleased with the pictures of the lives and actions of those heroes of Rome,

[1] The Romans divided their work according to books. A book corresponded to our modern chapter.

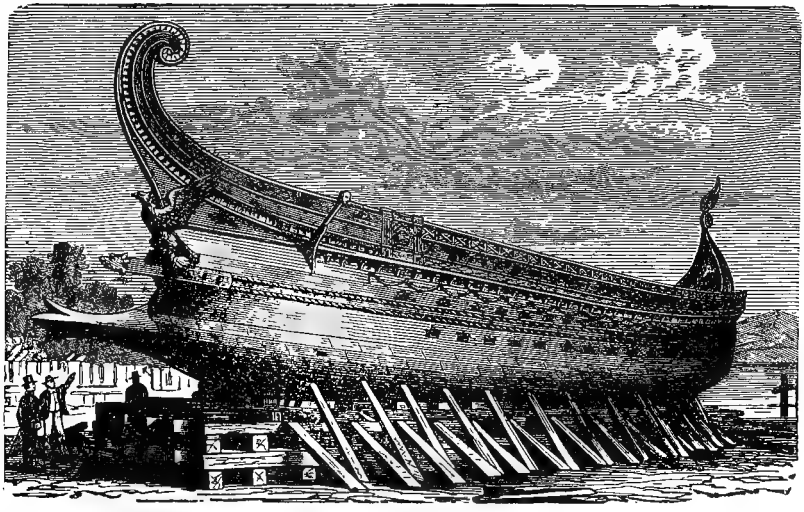
for in this form is told the history of Rome. Modern critics, it is true, have pointed out many a deficiency, especially in the first books of Livy, but Livy himself confesses that the first five books of his work are more poetical legends than sober history.

A second great historian of Rome is Tacitus. His works, the "Annales" and the "Historiæ," treat of the times of the first emperors with the exclusion of Augustus. He is full of deep reflections, although his temper is rather soured with the despondency of an old republican, who hates to see those institutions succumb to the encroachment of the emperors. His style is a work of art. It is so precise, so terse, that but seldom a word can be omitted without upsetting the fabric of a sentence. But he sometimes expresses a variety of ideas in two or three words, and this frequently leads to a certain darkness of expression; and, besides, many of his sentences admit of several explanations. But his meditations on the characters of individual emperors, or as he called them tyrants, his investigations into the constitution of a free people, his scathing remarks on the weakness and frailty of courtiers and of the people in general, are subjects of deep interest to the reader of all times, and more especially to the people of this country, where the republican system has been developed to a greater extent than ever before, and where, therefore, the dangers of loosing it are equally great.

Sallust

We had occasion to remark, a few pages back, that

the Romans did not produce any great writers of tragedy. Owing to the workings of the same law, perhaps, poetry was never a very favorite branch of literature among the Romans, and they do not rank as high as the poets of Greece. Every one knows the classical value of Virgil's writings. There is also a charm in the writings of Horace. In his poems, we find the composure of a well-balanced mind, the quietude, not of a dead intelligence, but of a philosophy, which, as the usual saying is, "takes things easy" and finds a blessing where the majority of people



Ancient Roman Ship.

find nothing but injury and misfortune. His writings exhale, as it were, the soothing odor, the quieting flavor of one of those Eastern aromatic compounds, of which, it is said, it allays all plaints and relieves the most violent attacks of pain.

Money and the mechanism of exchange play a very important part in the culture of all civilized nations of the present day. We have also pointed out the very great

influence of commerce in developing civilization.[1] We must therefore inquire as to the standing of the Romans in this matter. The passages in Roman writers treating of this topic are very obscure, admit of different explanations, and frequently have no co-herence with one another. Thus it was taught that the Romans, for several centuries, had no other money than the heavy, copper *as*; and it is related by Pliny, that a large debt in ancient Rome could be defrayed only by using several vehicles to transport

Funeral Ceremonies.

the money. As to the time when silver money came into use, the ancient authors have different reports; and, although we still possess a large number of silver coins of the time of the Republic as well as of the Empire, we can not fix the exact date of their introduction into the commerce of the city.

One point has, however, been made clear; that is that

[1] This Series, Vol. II. p. 230, 732.

the copper as was a representative money analogous to the use of paper in our times. Many people suppose, that paper money is an ingenious invention of the last few centuries, and that the ancient nations had no idea of the contrivance by which value is ascribed to a valueless thing and by which, in the opinion of some people, we could make ourselves independent of the products of silver and gold mines. But the idea of representative money goes back to the second millennium before Christ, the difference being that those nations did not use paper, and this for a very simple reason, they had no paper. They used iron bars or copper bars or leather, and they had a very distinct and precise idea about the commercial functions of such money. The Romans however had a complete banking system, and, through the excavations in Pompeii, we are pretty well acquainted with the inner machinery of the Roman banks. Their business consisted more or less in what it does to-day, in exchanging, advancing, loaning money, mortgaging property etc. Even their commercial books resembled ours to a great extent, although they were much simpler and much was trusted to the memory.

The Roman state, as such, never incurred debts; and, consequently, the modern ideas of "state debts" were entirely unknown. The Romans did not have the modern idea of taxing every citizen as high as possible, and of having a regular annual tax levy upon every household, in order to cover the expenses of the state. On the contrary, taxes were considered as an irregular, almost accidental thing. Booty from conquered people rendered the levying of taxes unnecessary. In the times of the Macedonian war, the immense booty from the conquered Greeks was sufficient to meet all demands of the state for many years. The income of the provinces, as well as the management

of the different mines, was leased out to corporations, and thus the whole system of the state was reduced to its simplest form of management.

Roman ideas about riches differed very extensively from our modern ideas. None of the Romans was as rich as some of our great bankers or railroad magnates, and the largest fortunes we occasionally read of, like that of Crassus or some of the savings of the Roman emperors, amounted to fifteen or twenty million dollars; but the trouble in Rome was, that riches and poverty were so unequally divided. The small land holders, at the time of Augustus, were almost entirely extinct; and in the time of the elder Pliny, that is in the latter part of the first century, almost all the land of Italy was concentrated in the hands of a few powerful land-owners. The Romans did not fail to notice this element of danger in the economical structure of their country, and the author just mentioned confesses that the *latifundia*, or the large estates as he calls them, would be the ruin of the state.

Although there were all necessary conditions for a brisk trade and an extensive commerce, the Romans as a rule were adverse to mercantile transactions. It is very easy to account for this fact. The Romans, in the first place, were soldiers, and military pride disdains the occupation of trading. The average Roman preferred to gain his wealth by plundering weaker people rather than trusting to the more prosaic chances of trade and commerce. Consequently the commerce of Rome was more or less in the hands of non-Romans, especially of Greeks, Jews, and Egyptians. Our ideas of commerce, as being a great interchange of necessaries, does not apply to the commerce of the Romans. The merchants generally rushed to those departments of trade, which promised big returns; jew-

elry, eastern pearls, opals, and eastern silk found a ready market in the imperial city.

Amongst the Romans many ceremonies attended the burial of the dead. Believing, as all ancient people did, in the worship of ancestors, the tomb was a sacred spot. Every important family had its own burial place. It was generally believed that the shades of the departed could not rest if the body were allowed to remain unburied. Hence non-burial was considered a great calamity. Should

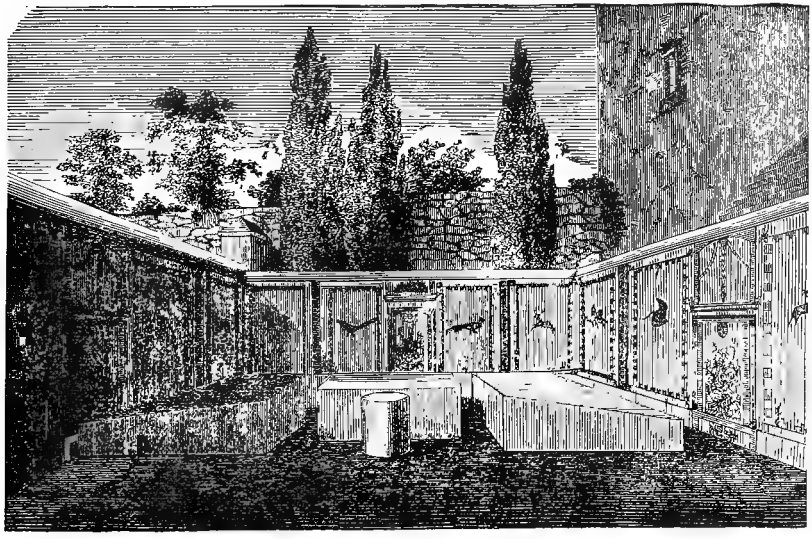
Specimens of Roman Art.

strangers chance to find an unburied body, they were expected to throw earth on it at least thrice.

Many little incidents of death-bed scenes show the survival of bits of primitive superstition. Such was the loud calling on the dead to return.[1] After death the undertakers, *Libitinarii*, were called, who took charge of all arrangements for burial. The body, when prepared, lay in

[1] Cf. Vol. II. p. 269.

state in the atrium on the *Lectus funebris*. Here friends brought leaves and flowers, and had the deceased when alive acquired the right to wear a crown, it was placed on his head. By the side of the lectus, a censer was placed; and, near the door of the house, a pine or cypress was planted, symbolical of death, and also serving as a warning to those persons who were forbidden on religious grounds to enter a house where there was a dead body.



Place of Eating the Funeral Meal.

When the day of burial arrived, a strange procession accompanied the body. In front there marched officers to preserve order, musicians, hired mourners, and *Mimi* or people who undertook to represent the traits of character of the deceased. Then followed a ghastly company, people wearing the masks of the deceased ancestors of the dead. Thus symbolically, the deceased ancestors accompanied the body of their recently dead kinsman to his grave. Then came the body, borne on the lectus, followed by mourning relatives and friends. The procession wound its way to

the Forum, and the funeral oration was delivered from the tribune.

Nine days after the burial, there came the last sad, sacrificial meal. It consisted of simple dishes, partaken of near the grave, for which purpose sometimes special triclinia (*triclinia funebra*) were built. Sometimes games were provided for the general multitude, who were likewise regaled with food and presents of money.

Offerings to Mars.

We have now tried to describe the home life, both public and private, of the Roman citizen. We must observe that the whole tendency of such a life was in the direction of immediate, practical ends. They were not, like the Greeks, discussing questions of deep philosophical and scientific import, or deciding points in fine art; but more practical questions engaged their attention; how conduct this war; how govern that province; how get the most tribute from such a people. They examined every question from such a stand point. And to their credit, be

it said, that every subject they had to settle they generally settled in a most enduring manner. To make foreign conquests, disciplined soldiers were needed; accordingly the Roman army was drilled as soldiers never were before. To get the most good out of conquered provinces, something more was necessary than to simply extort a vast tribute; accordingly, for the first time in the history of the world, an intelligent attempt was made to fuse the various conquered people into a homogeneous whole. To attract commerce to the shores, it was necessary to treat foreigners justly, extend to them the protection of laws, an idea unknown to the older tribal law; hence in Rome we find the law for foreigners, or equity, taking its rise.[1] When the time at length arrived for the old tribal customs to be codified and enlarged to suit new ideas, we find the Romans evolving that splendid product of their genius, the Roman Civil Law.

The statements just made will go far to explain the sudden rise to power of the Roman commonwealth. If we recall the political history of Rome,[2] we find that in a short time, comparatively speaking, the Romans reduced to their dominion the then known world. It is no easy matter to explain this fact. A mere knowledge of the progress of the various conquests, of the successive campaigns, of victorious battles, of the deeds of this or that general, will afford no explanation of the sudden splendor of the Roman conquest and civilization. This same phenomenon attracted the attention of ancient writers as early as the second century before Christ. At that era, we find Polybius, a Greek historian, who, as a statesman, was frequently engaged in settling political affairs with Roman generals, and who, besides, was the personal friend of Scipio Afri-

[1] This Series, Vol. II. p. 231.

[2] Above ch. iv.

canus, writing a large work on the history of the then known world with the express intention of accounting for the sudden growth of the Roman commonwealth—that growth being by far the most striking fact of classical antiquity.

It is a common-place statement, that the wisdom, the valor, the self-restraint, in one word, that the domestic virtues of the Romans were chiefly instrumental in bringing to pass the great facts of their history. In almost every hand-book of history, we find the author pointing to the virtues of a Cincinnatus, Regulus, Fabius Cunctator, Camillus, Scipio, Cato, etc., etc., as the real main-spring of Roman greatness. Now, while far from denying the beneficial influence of domestic virtue, although nobody will deny the great advantage accruing to a nation that can boast of such men, yet it is clear that these virtues, in themselves, are not sufficient to produce results equal to those that we find in the history of Rome. For every Roman who excelled in virtue of any kind, we can find a Greek who cultivated the same kind of virtue with equal success.

The Romans, themselves, taught their children to look to the heroes of Greece as their models and ideals, and the noblest Roman youth had no higher ambition than to copy the glorious king of Macedonia, Alexander the Great. The Roman historians, especially Livy and Cornelius Nepos, constantly hold up the warriors and sages of Greece as the patterns of morality, of all social and political wisdom. The Romans, themselves, therefore, never hesitated to confess that, as far as virtue and morality are concerned, other nations were on a par with them. We must look, then, for other causes, which are more or less independent of private morality, for an explanation of the

sudden and great rise in power of the Roman commonwealth.

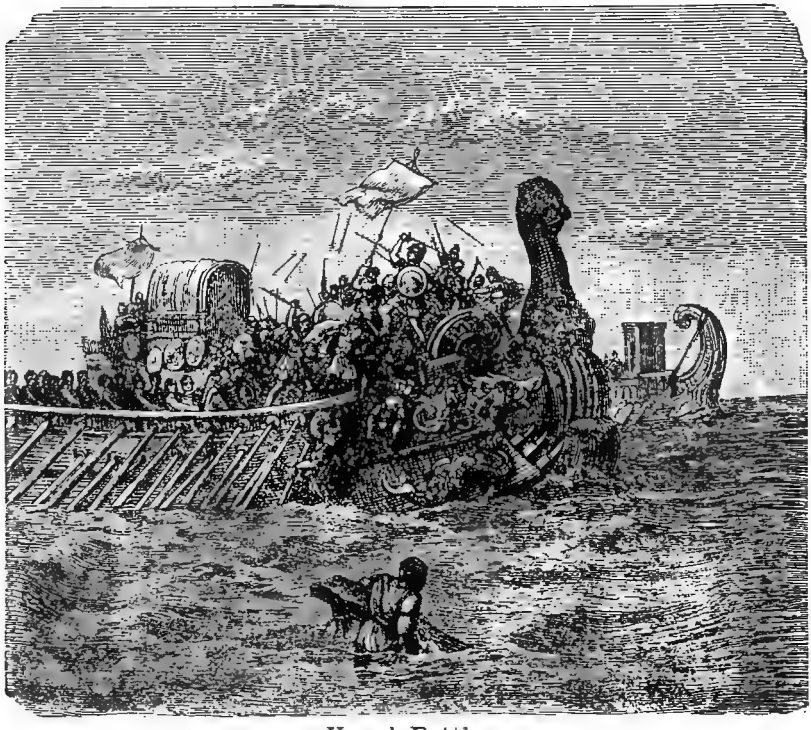
Polybius, writing as we have observed in the second century B. C., found an answer to this query in the form of government adopted by the Romans. In attempting to follow Polybius in his reasoning, we will be struck with the conservatism of the old Patrician tribes of Rome and their practical, sound sense. They indeed clung tenaciously to their rights, but were ready to yield when they saw that further resistance was useless. And, in thus yielding gracefully, they not only made the best terms for themselves, but they effected a compromise, which in turn led to the form of government which attracted the admiration of Polybius.

We must recall the constitution of tribal society in a normal state. There is first the tribal chief, an elected officer, but whose office tends to become hereditary, and whose powers, especially in times of war, are very great. Next, the tribal council, composed of the chiefs of the various phratries and gentes—all elected officers—who advised the head chief on all important matters, and whose decision even he is bound to obey. Finally, the general assembly of the people, which must be convened to discuss all laws and all proposed measures.[1] Now, as civilization advanced, the natural tendency would be for each of these departments of government to develop at the expense of the other two. The result would be, that, in the course of time and among different people, we would find representatives of the three different forms of government known to the ancients. If the office of head-chief developed at the expense of the other departments until the powers of government were absorbed by this one office, the result

[1] This Series, Vol. II ch. ii.

was a monarchy. If the council thus developed, the result was an oligarchy; or, if the general assembly absorbed these powers, the result was a democracy.

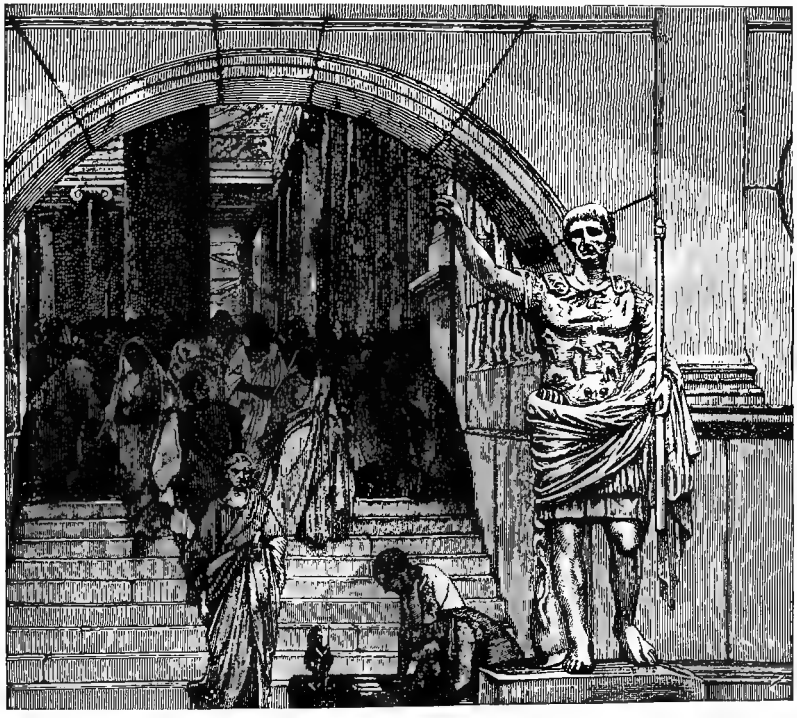
The above represents what we might call the natural development of government. But we, of course, understand that the form of government was often subverted by force. Now the ancients were acquainted with these



Naval Battle.

three forms of government and discussed the strong points of each; for, as all are aware, each had its strong and weak points. The trouble with many of the Grecian states, for instance, was that they were divided into factions, each clamoring for its desired form of government, and when one party, as at Athens, gained the ascendency, the other was almost extirpated.

Now Polybius concludes, from a study of the Roman state, that it alone of all the states of his time had a system of government, which combined the strong points of the three systems. If that be so, then, in the case of Rome, we have a normal development of tribal society, which, as above remarked, is a striking proof of the practical conservatism of the people. Turning to the gov-



Audience with a Roman Emperor.

ernment of Rome we find much to confirm this conclusion. A number of officers still exercised powers analogous to those of the old rex or tribal-chief. Such were the consuls, in a less degree the censors, and in times of emergency the dictators. The consuls were really year-kings, and the direct heirs of the older life-kings. Like the old tribal chiefs, their powers were greatest in times of war.

In point of fact, the dictator exercised greater power than a king.

The tribal council survived in the senate of Rome. It consisted of the best and wisest and, to some extent, the worthiest citizens of the state. In its meetings, the more important topics of the state were the subjects of deliberation. It was a corporation, which, in its dignity and in its wisdom, made the impression of a collection of kings. The senate occupied a position half-way between the legislative and the monarchial powers. Instead of interfering with the machinery of the state, it served as a sound and healthy check in times of political fury; and thus it promoted the welfare of the state and acquired a respect and esteem which made its decrees and ordinances, in course of time, equal to laws passed by the whole nation. It was the senate of Rome that drew up treaties, ordained regulations for conquered nations, carried on the immense political business of the city, regulated the forces of the most distant provinces, sent out armies and directed their marches.

As for the general assembly of the people, it is well known that it was in full vigor at Rome. All laws, properly so-called, were passed in the assemblies, or as the Romans called them, in the comitia, where every Roman citizen had a right to cast his vote. This assembly was indeed considered the supreme power of the Roman commonwealth, inasmuch as all was depending on laws, and laws could not be enacted by any other power than by the general assembly. It was there that the great magistrates—the consuls, the censors, the prætors—were appointed; it was there that the great leaders of the armies were elected.

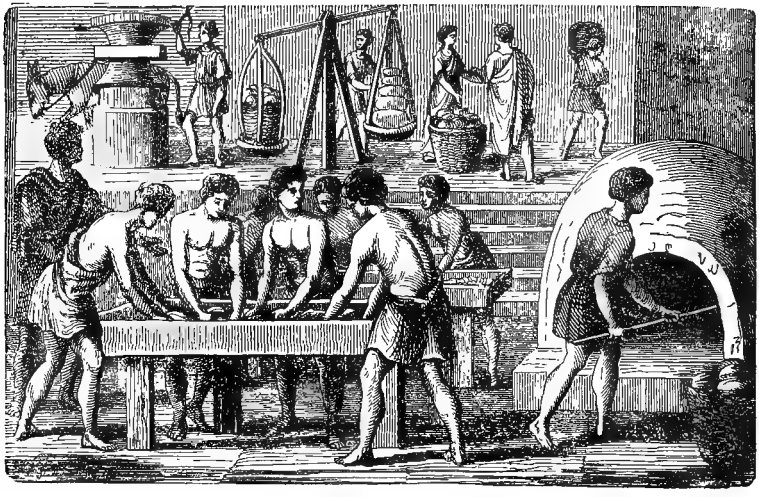
Some modern writers think with Polybius, that here

is the explanation of the sudden rise of Rome. It gives us some light but does not explain all. We need but go a little way back in time to find the same government in Greece.[1] But by the second century B. C., the ancient institutions in that country had largely disappeared, owing to the incessant conflict between the ruling and subject classes.[2] Rome had indeed this same conflict to meet,[3] but though clinging tenaciously to their ancient customs, they granted from time to time such concessions to the people as enabled them to retain a large measure of their government.

It now only remains to inquire what were the peculiar characteristics of Roman civilization, what was their part in developing Aryan civilization in general, and what was their great legacy to the civilization of the present. The Romans were not distinguished in the field of literature, science, and art. That was the province of Grecian civilization. They were distinguished in the direction of government. Away back in the night of time, we see the three tribes[4] of singular ethnical mixture[5] that composed the Patricians of Rome, rising on the banks of the Tiber. After some centuries of time, they succeeded in reducing to their power a large portion of Italy.[6] In the meantime they had passed through the conflict which came to all the tribal societies of antiquity; the conflict between the ruling tribes and their subject people, who were continually pressing for a share in the government. And we have just pointed out how from this conflict they had emerged, in the early days of the Republic, with a government which attracted the admiration of the ancients.

[1] Recall the kings, ephors, gerushia, and assembly in Sparta; the archons, council, and assembly in Athens. This Series Vol. II. p. 185 *et seq.* [2] This conflict is traced in Vol. II. p. 187 *et seq.* [3] Ibid. p. 195 *et seq.* [4] Vol. II. p. 198. [5] Above p. 266. [6] Above p. 274.

These centuries of conflict had trained them in the art of governing. The whole aim of the Patrician tribes was to retain the practical advantages of their position. This was the question that confronted the Roman citizen from childhood to old age. Their education and manner of life show that this was the main aim. We need not wonder, then, that we have before us such a prosaic matter-of-fact people, who cared little for merely intellectual pursuits, and disdained many of the more innocent enjoyments of other nations. On the contrary they



A Bakery in Rome.

delighted in the brutal games of the amphitheater, and lived only to extend their power and influence, to increase their wealth and luxury.

Their power, skill in diplomacy, and vigorous intellect were now united for the conquest of the world, and one people after another fell before them. They did not hesitate to use treachery if it would advance their ends. They understood well the art of fanning the flames of internal dissentions among a people they wished to subdue.

It is, perhaps, not surprising that they succeeded, and reduced the whole world to their power. But to their credit be it said, that the conquered provinces were organized, governors were appointed, cities built, roads surveyed and laid out, and the Roman law gradually extended over them.

Here then we see their great influence on Aryan civilization. It was a great step in advance when the numerous independent and war-like tribes of a country, like Gaul for instance, were brought under subjection to one central power, under the workings of one system of laws. Development in civilization went forward rapidly. With consummate wisdom also, the ruling powers at Rome, from time to time, extended the benefits of Roman citizenship to the more prominent leaders in their provinces. Thus was gradually built up a state of vast power, posessing a civilization, which, if it lacked the polish of Grecian civilization, embodied a great store of practical wisdom, better suited perhaps to the real wants of practical life.

One inquiry yet remains before us, what was the great legacy of the Romans to our present civilization. After our remark on the skill of the Romans in the difficult task of governing, it may not occasion surprise to learn that the answer to the question is—The Civil Law. People who would govern well must know how to legislate well. When we treated of Greek civilization, we drew the attention of our readers repeatedly to the fact that the great merit of that civilization was chiefly in the field of art. There Grecian genius showed itself at its best and in that field they continue to be the masters of the world. In Roman civilization, we find an analogous fact. The Romans were the first and the most perfect teachers of law; and their laws have come down to us in a form so lucid,

so instructive, so well arranged, that the majority of Romance nations could only accept them in spite of the fact that many of them had already developed a legal system of their own. In the field of legal science, then, we find the most important feature of Roman civilization. They

Roman Judgment Hall.

were at once the greatest law-givers, the best lawyers, and the most profound jurists. We will therefore point out the most salient points of their legal system in order to

illustrate its vast influence on the course of general civilization.

The Romans themselves used to complain that they had too many laws; but in fact, if we compare the number of their laws with those of a modern nation, we will be struck with their small number. They had, comparatively speaking, few laws and their laws were expressed in a terse, short, technical language, which however, every body understood, because every body participated more or less in the jurisprudence of the Republic. The Romans from the very first established the jury system. Every civil case was decided by a juror—eventually by three jurors—and this is one of the marked differences between the Roman and the English system. The great number of English jurors (twelve) is recognized as one of the great draw-backs of the system. In Rome one juror, as a rule, decided a case, though he generally called to his assistance two or three of the well known and learned jurists of the city, who formed his council. It is not surprising, then, that every educated Roman acquired a very adequate knowledge of the laws of his country.

In England and America, the development of law rests chiefly with the judges, and consequently every lawyer is compelled to form a vast library containing the various legal reports. In Rome, the development of law rested entirely with the jurists; and in their writings, they enlarged, commented upon, and revised the laws given in the legislature and in the senate. It is interesting to notice the form in which their writings have come down to us. In the sixth century after Christ, Justinian determined to collect the most important parts of the numerous writings of the Roman jurists into one vast collection. He entrusted his chancellor, Tribonian, with the task of collect-

ing and sifting this great mass of judicial lore. He, assisted by a number of other great lawyers and jurists, succeeded in making an abstract of the writings of thirty-nine of the best and most renowned Roman jurists, which were published under the title of "Digest".

One of the most ancient copies of this collection, a manuscript of the seventh century, inestimable in value, is still extant in Florence. It is kept under a glass cover, constantly guarded, no body being permitted to touch it unless by special permission of the municipality. In fact, so great is the value attributed to this manuscript that a formal ceremony is enacted while the spectators gaze on it. Amongst others, servants with torches in hand and soldiers with drawn swords stand around during the examination. This manuscript has been copied by various hands and its contents form the foundation of law and jurisprudence in most of the countries of Europe; though England refused to accept the Roman system of law, and, consequently, American courts, as a rule, do not pay much attention to the study of Roman jurists.

To the law of the Romans, then, we ascribe the vast importance of Roman civilization; for, as a matter of course, their law was a direct outcome of their civilization. We should estimate the value of the influence of different nations on civilization according to the lasting benefit that they were able to confer upon the world. Perhaps no nation of modern times, can compare in this respect with the Romans. We can not point to any one element in our civilization, as derived directly from the Semitic nations of antiquity. The influence of these people, though doubtless very great in developing civilization, is lost in the distance. This is true of the Assyrians and Babylonians, though they established vast empires, ruled many

millions of people, built numberless edifices of great beauty, collected large libraries, and conquered immense territories. But in the case of the Romans, we can say that they continue to exercise a great influence in the field of legal science. Every day, cases of the utmost importance are decided on the strength of the reasoning employed by some of the old jurists of Rome.

We have now finished our brief outline of Roman civilization. We have traced the rise of this people, have studied their national character, and have pointed out the direction in which they exerted their greatest influence in the development of Aryan civilization. Let us notice the rapidly widening sweep of Aryan culture. How contracted the area of Grecian civilization appears as compared with that of the Roman! And yet, less than half of Europe was brought under the sway of Rome. In tracing the political history of Rome, we have seen how that country, enervated by luxury, hopelessly divided by internal dissensions, finally disappeared as a political power before the ruthless march of the Teutonic tribes. But their culture did not disappear. It conquered the Teutonic invaders and was by them disseminated throughout the length and breadth of Aryan Europe. Let us now follow it into this, its third and last stage of development in the Medieval World.

# CHAPTER VIII.

## CULTURE OF THE MIDDLE AGES.

INTRODUCTION—Right Ideas as to the Middle Ages—Feudalism—Its Origin—Feudal Tenure—Ceremonies attending the Transference of a Fief—Duties of the Vassal—Military Service—Feudal Incidents—Reliefs—Fines—Forfeitures—Aids—Feudal Nobility—Origin of Classes—Free men—Villeins—Medieval Slavery—Feudalism, a Development of Tribal Society—Feudal Jurisdiction—Wager of Battle—Origin of this Custom—Rise of Free Cities—Chivalry—Its Origin—Influence of the Church in this Matter—The Page and his Duties—Squires and their Duties—Modes of Conferring Knighthood—The Ancient Ceremony—The Shortened Ceremony of Later Times—Classes of Knights—The Tournament—Knight Errantry—Estimation of Feudalism—Picture of the Middle Ages—The Crusades and their Influence—Powers of the Church—Estimation of Church Influence—Church Influence in the Matter of Advancing Knowledge—Trade in the Middle Ages—Social Life, etc.—Conclusion.

WIDENING stream of Aryan culture now enters on its third stage of development. By the end of the fifth century of our era, the Roman Empire, as a great political power, had disappeared. From out of the confused scenes of those far away centuries, we have traced the gradual rise of the present nations of Europe. We have yet before us the study of the culture of the Middle Ages. Greece was the solitary peak which first caught the glow of the rising sun; Rome, the mountain range shining afar; the Middle Ages, all Europe basking in the light of culture. Let us, then, enter on an investi-

HENRY VIII. CONI

NG ANNE BOLEYN.

C. V. PILOTY

gation of the culture of this last period, and learn what we can of the culture of Europe in the Middle Ages, which, in a general way, may be taken to mean the thousand years preceding the discovery of America.[1]

The middle ages have been called the dark ages, a period of superstition, an age of church rule, and similar expressions—all denoting a retrograde state of civilization, all expressive of a stage of development inferior to that of the present. It is customary to look down upon those times and to decry the customs and habits of the nations and people. It is almost generally accepted, as a statement admitting of no doubt, that the middle ages form the dark part of European history, that there is an ugly gap between the brilliant times of classical antiquity and the still greater splendor of our own modern age. It is still further held that during that time, science and literature had scarcely an existence; that people in general were indiscribably ignorant and entertained the most ridiculous opinions. No doubt, it is easy to point to many erroneous ideas prevailing throughout that period. It is one of the easiest things to discover fault in other people; or, as in our case, in the culture of other ages.

Many of the opinions universally accepted in the middle ages are now known to be errors. We no longer believe, as did the people of that time, that since the capture of Jerusalem, all children are born with four teeth less than before. In general, we no longer believe in

[1] In our view of the middle ages, we have followed several of the best acknowledged authorities about the history and institutions of those times. Our main guides were the impartial Hallam, whose statements we frequently thought of accepting in his own words without constantly alleging his name; next in importance and as a controlling check to the Protestant Hallam, we followed the Catholic Cantu, the great Italian historian. Furthermore, K. F. Eichhon, as a guide in the legal field; Michaud, as to the crusades; John Selden, concerning knighthood; Muratori, concerning the church and general history, etc.

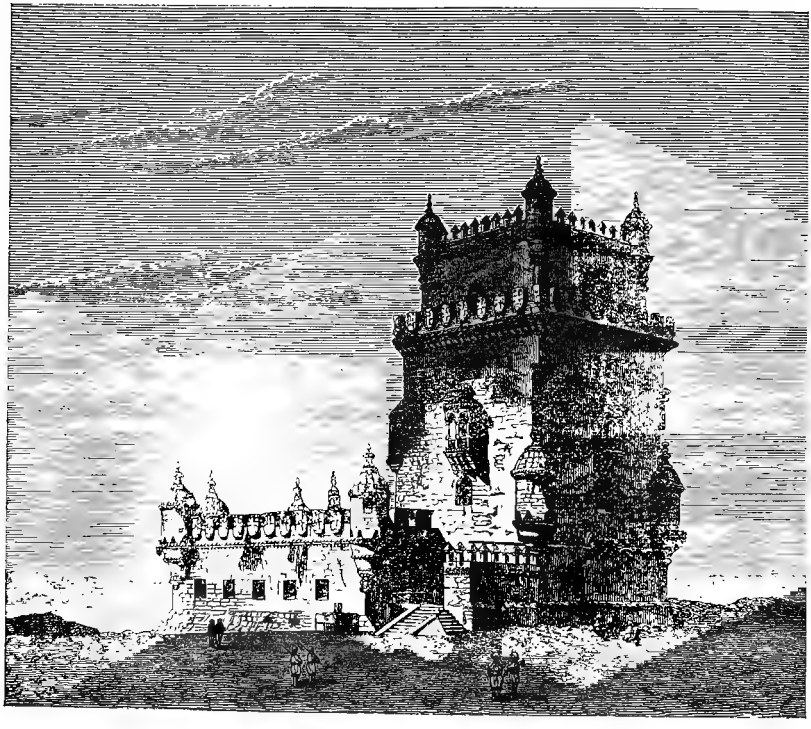
witchcraft and sorcery, though, in the middle ages, almost every one, even those most enlightened, believed in both. In the middle ages, the power of the church was supreme, and the influence of the clergy on the mental as well as temporal well-being of the people was enormous. These things have changed; and, at the present time, science and literature are flourishing. It is not strange, then, that our opinions differ, on many points, from those of the people of the middle ages, and that the influence of the clergy seems to be less than that of scientific ideas. After an earnest study of the middle ages, we find ourselves unable to agree with those who take extreme views as to the backward state of the culture of the middle ages. Far from denying the existence of many blemishes in their culture; far from denying that superstitions and false opinions were much more general in the middle ages than at present; and, far from denying that many of the institutions of those times seem to us exceedingly strange, we can but believe that the general judgment of writers on this point is far too severe. We think it has been unfairly biased by religious and party opinions. As is but natural, the historians of Protestant countries are inclined to exaggerate and thereby disfigure the features of a time in which the Catholic church reigned and ruled without opposition. To deny the many benefits conferred upon Europe and all the world by the institutions of the Catholic church is equivalent to a confession of ignorance. The institution of the Catholic church furthered the development of Europe, and, to a certain extent, preserved its very existence, and, therefore, it deserves the gratitude of mankind. It is very easy to decry, to indict, to arraign, but it is extremely difficult to prove.

In the following pages, we shall try to substantiate

our foregoing assertions; and in this rapid glance over the institutions of the middle ages, we will, we hope, be enabled to show that even those ages of "darkness," as they are sometimes called, show the presence of a large number of those goodly rays of light which only emanate from an enlightened state of society, and which tend to promote the welfare of man. We will try to show that, the church government of the middle ages did not arise from the ignorance of the people, but that it had its roots in the pressure of circumstances, which was stronger than the wisdom of a single man. We will try to show, that although literature and science were not cultivated to such an extent as they are at present, they still had a vigorous life within the walls of many convents. We will speak of the tranquil life of those Burghers who were the inhabitants of cities, and the pleasant, if narrow life of the peasantry. We will also speak of the poetry, of the music and art, of the commerce and industry of those bygone times; and, in so-doing, we hope to impress our readers with the conviction, that the middle ages, though inferior to our own time, had attractions and advantages of their own, showing that mankind never ceases in its career of progress. We need not treat of the many wars and battles, of the personal history of the innumerable princes, kings, and emperors, who ruled in the middle ages. We wish, on the contrary, to learn of the different institutions of domestic and public life, showing the manners and customs of private people, the way they earned their money, the manner in which they lived, their different professions, trades, and careers, and many other details of the home life of the people.

All have heard more or less of feudalism. Probably no one factor enters so largely into the peculiar feature of

the culture of the middle ages as feudalism. It is therefore extremely necessary to come to an understanding on that point. We must not make the mistake of supposing that feudalism was simply an invention of the middle ages; on the contrary its roots are to be found in the constitution of tribal society. Two sets of factors seem to



Feudal Castle in Rouen.

have united to bring it about. We have already had occasion to remark how, as civilization advances, the land on which a primitive tribe settled became the basis of classification; and how the gens survived in the *mark*, *gemeinde*, *commune*, or *parish*,[1] or, to speak in general terms, in agricultural communities.

1 Vol. II. p. 173.

We have also seen that this agricultural community was the land-holding body. All the joint-families forming the community had equal rights in the land, which at periodical times was divided among them. Liberty and equality, however, require for their preservation the exercise of sleepless vigilance. In the great majority of cases and in most countries, the agricultural communities did not sufficiently guard against the growing power of their village chiefs. The office was allowed to become hereditary; originally possessing no more right to the land than any other joint-family belonging to the community, they gradually were allowed to exercise property rights over the best portions of it, which finally was extended to the waste portions, and ended in the exercise of a sort of qualified ownership over all of the mark, or commune. By qualified ownership we mean that the original right of property was considered as belonging to the "lord" (for such the once elected chief had now become), and the original owners performed various acts acknowledging his supremacy.

In this way, there was steadily growing up in all the Aryan lands of Europe privileged ranks and classes. Then came the Teutonic conquest of the Western Empire. It is easy enough to see that when the conquered territory was divided the more powerful chiefs would receive grants of territory of great extent. "The cultivators of his land would either be persons settled on it by himself, or they would be vanquished provincials who had no rights which he did not choose to recognize or concede."[1] Here, then, would be a community built upon the model of the old Teutonic village community but of materials so plastic that it assumed a strangely different aspect.

[1] Maine: "Agricultural Communities."

As the conquered provinces were Roman provinces, where the Roman civil law had held full sway, and as that law gave great precision to all the relations of life, it is not surprising that feudalism assumed a thoroughly systematic form, having all the relations defined and specified. Neither is it strange that the "lord" emerges with greatly increased powers. This systematized form of feudalism now reacted on Europe, and thus, in the course of centuries, there grew up the state of society we designate as feudalism. Accounting for feudalism in this way, we perceive at once the significance of many terms.

Practically it tended to widen the chasm between the privileged classes and the masses of the people. Recognizing in a dim way the old relation of tribes-men and chief, it still sought to enforce the duties of each class—the former, the duty of obedience and military service; the latter of protection. As in the former state of society only after many formalities were strangers admitted to the tribe, so only by many formalities was land conveyed in fief. Feudalism finally became a wonderfully artificial form of government, resting down upon the land of the kingdom as a basis. Theoretically the ownership of all the land of the kingdom was vested in the crown. The most of it was granted out to a limited number of powerful leaders. Each of these proceeded to divide his territory in a similar way, thus there was a regular gradation of authority from the king to the lowest holder of a fief. With each subdivision there was created the relation of lord and vassal, with the duties we have outlined above.

Hence we can see how society in the middle ages was molded by the institution of feudalism. And we can see how necessary it is for us to make a study of it. Resting upon land as a basis, we can see how, in law, feudalism came

simply to mean a tenure of land. The land granted was a *fief*, the holder of it was a *feudary*, the service by which it was held was *feudal*. We can also see why medieval law was largely taken up with defining the rights and duties of lords and vassals.

In all cases of feudal tenure, there was a contract of support and fidelity. Whatever obligations this relation laid upon a vassal, corresponding duties of protection were imposed upon the lord. If these were transgressed on either side, the one forfeited his land, the other his right over it. Nor were motives of self interest alone appealed to. The associations founded upon ancient custom and friendly attachment; the impulse of gratitude and honor; the dread of infamy; the sanctions of religion, were all employed to strengthen these ties, and to render them as powerful as those of nature, excelling those of political society.

The ceremonies used in conferring a fief were principally three—homage, fealty, and investiture. The first was a solemn and significant expression of the submission and devotedness of the vassal toward his lord. In performing homage, his head was uncovered, his belt ungirt, his sword and spurs removed. Kneeling he placed his hands between those of the lord and promised to become his man from thenceforward to serve him with life and limb and worldly honor, faithfully and loyally, in consideration of the lands which he held under him. None but the lord in person could accept homage, which was commonly concluded by a kiss. An oath of fealty was indispensible in every transferrence of a fief, but the ceremony was less peculiar than that of homage and it might be received by proxy. It was taken by ecclesiastics, but not by minors. In language, it differed little from the form of homage.

Investiture, or the actual conveyance of feudal lands, was of two kinds, proper and improper. The first was an actual putting in possession upon the ground, either by the lord or his deputy, which is called in English law *livery of seizin*. The second was symbolical, and consisted in the delivery of a turf, a stone, a wand, a branch, or whatever else might have been made usual by the caprices of local custom.

Let us now inquire as to the duties of the vassal. These can not be exactly defined. The general statement is, that it was military service, and that, in its very nature, was uncertain. It was a breach of faith to divulge the lord's counsel, to conceal from him the machinations of others, to injure his person or fortune, or to violate the sanctity of his roof or the honor of his family. In battle the vassal was bound to lend his horse to his lord when dismounted, to adhere to his side while fighting, and to go into captivity as a hostage for him when taken. It was a question, agitated among feudal lawyers, whether a vassal was bound to fight with his lord against his own kindred; more important still was the question, whether he must do so against the king. In the works of those who wrote when the feudal system was declining or who were anxious to maintain the royal authority, this is commonly decided in the negative. There was a form of homage, prevalent in Normandy and some other countries, containing a reservation of allegiance due to the sovereign.[1] A law of Frederick Barbarossa enjoins that, in their oath of fealty to an inferior lord, the vassal's duty to the Emperor should be expressly reserved, but it was not so during the height of the feudal system in France. The vassals of Henry the second and Richard the first never hesitated to adhere to

[1] Coke on Littleton, sec. lxxxv.

them against the sovereign, nor do they appear to have incurred any blame on that account. Even as late as the age of St. Louis, it is laid down in his "Establishments" that

Storming a Fortified Town in the Middle Ages.

if injustice be done by the king to one of his vassals, the latter might summon his own attendants under penalty of forfeiting their fiefs to assist him in obtaining redress by

arms. The count of Britany, Pierre de Dreux, practically asserted this feudal right during the minority of St Louis. In a public instrument, he announces to the world that, having met with repeated injuries from the regent and denial of justice, he had let the king know that he no longer considered himself as his vassal, but renounced his homage and defied him

A measure of military service was generally settled by some usage. Forty days was the usual term, during which the tenant of a knight's fief was bound to be in the field at his own expense. In the kingdom of Jerusalem, feudal service extended to a year. It is obvious that this was founded on the peculiar circumstances of that state. Service of castle-guard, which was common in the north of England, was performed without limitation of time. The usual term of forty days was extended by St Louis to sixty except when the charter of infeudation expressed a shorter period, but the length of service diminished with the quantity of land. For half a knight's fief, but twenty days were due; for the eighth part, but five; and, when this was changed into a pecuniary assessment, the same proportion was observed. Men past sixty years of age, public magistrates, and, of course, women were free from personal service, but were obliged to send their substitutes.

A failure in the discharge of their duties produced forfeiture of the fief, but it was usual for the lord to inflict a fine, known in England by the name of *escuage*. Thus in Philip the third's expedition against the Count de Foix, in 1274, barons were assessed for non-attendance at a hundred sous a day for the expenses which they had occasioned, and fifty sous as a fine to the king; bannerets had twenty sous for expenses and ten as a fine. Knights and squires in the same proportion, but barons and ban-

nerets were bound to pay an additional assessment for every knight and squire of their vassals whom they ought to have brought with them into the field. The regulations as to place of service were less uniform than those in regard to time. In some places the vassal was not bound to go beyond the lord's territory further than he could retrace in the same day. Other customs compelled him to follow his chief upon all his expeditions.

We can see that the tendency would be for the lord to increase his power every way he could, and turn every incident of this relation to his advantage. In this way there arose what are known as feudal incidents. We must notice some of these exactions. When an heir succeeded to a fief he paid the lord a sum of money known as relief. Feudal lawyers have explained reliefs in the following manner. Fiefs, whether depending upon the crown or its vassals, were not originally granted in absolute ownership, but were renewed from time to time. Upon the death of the posessor, a sum would naturally be offered by the heir on receiving a further investiture of the fief. But another explanation, and one equally as plausible, is to suppose that reliefs arose from the inclination of the strong to oppress the feeble. When a feudal tenant died, the lord, taking advantage of his own strength and the confusion of the family, would seize the estate. Against this violence, the heir could in general have no recourse but a compromise.[1] Reliefs and other

[1] The literature of feudalism in general is enormous, but the really instructive works are few. Medieval institutions differed so essentially from our modern form of life that but few historians were able to conceive a just, clear, and comprehensive idea of them. Among them are Roth: "Beneficialwesen," of which work p. 205-422 relate to "feudal incidents," Stubbs on "Constitutional History of England," Vol. I. p. 552 and Vol. II. on feudalism. Waits' great work on "German Constitution," Vol. 7, 8, 9.

feudal incidents are said to have been established in France about the latter part of the tenth century, and they certainly appear in the famous edict of Conrad, the Salic, in 1037, which recognizes the usage of reliefs and escuage to the lord upon a change of tenancy. By the law of St. Louis, in 1245, the lord was entitled to enter upon the land if the heir could not pay the relief and posses them for a year.

Closely connected with reliefs were the fines paid to the lord upon the alienation of his vassals, and indeed we frequently find themcalled by the same name. The spirit of feudal tenure (dimly recalling the old tribal relation) established so intimate a connection between the parties that it could be dissolved only by mutual consent. If the lord transferred his rights, the tenant was to make known his concurrence, and this ceremony was long kept up in England under the name of *attornment*. The assent of the lord to the disposal by the vassal of his fief was still more essential and more difficult to be obtained. He had received his fief, it was supposed, for reasons peculiar to himself or to his family, at least his heart and arm were bound to his superior and his services were not to be exchanged for some other unknown man, who might be unable or unwilling to render them. A law of Lothair II. in Italy, forbids alienation of fiefs without the lord's consent.

This prohibition is repeated in the laws of Frederick I., and a similar enactment was made by Roger, King of Sicily. By the law of France, the lord was entitled, upon an alienation made by his tenant, either to redeem the fief, by paying the money, or to claim a certain part of the value by way of fine upon a change of tenancy. Many causes might arise by which the fiefs would re-

vert to the grantor. This might follow from the failure of heirs. Then again the fiefs were often taken from their holders as a punishment for some offense. Various causes are laid down in the decrees of Jerusalem whereby the vassal forfeits his land for a year, for his life ,or forever. Under rapacious kings, such as the Norman line in England, absolute forfeiture came to prevail and a new doctrine was introduced—the corruption of blood for acts of felony. In such a case the heir could never establish his claim to the fief, it reverted absolutely to the lord.

Another class of powers enjoyed by the lords was technically known as *aids*. These were in the nature of tribute exacted for various occasions. They depended a great deal on local custom and were often extorted unreasonably. Several are mentioned as existing in France, such as an aid for the lord's expedition to the Holy Land, for marrying his sister or eldest son, etc. This and other aids, occasionally exacted by the lords, were felt as a severe grievance, and by Magna Charta, fundamental documents of the English constitution, three only were retained—to make the lord's oldest son a knight, to marry his eldest daughter, and to redeem his person from prison. Aids are deserving of attention since they were

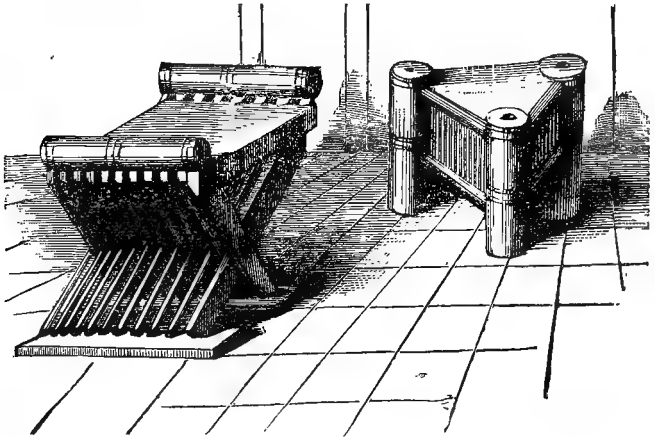
Suit of Armor.

the beginnings of taxation. They answered this purpose for a long while until the necessities and covetous policy of kings substituted for them more durable and onerous burdens. In England and in Normandy (which either led the way or adopted all these English institutions) the lord claimed the right of guardianship of his tenant during minority. He not only had the care of his person but he received the profits of the estate. This privilege seems to have been enjoyed by the lord in some parts of Germany, but in France, the custody of the land was entrusted to the next heir, that of the person to the nearest kindred of the blood who could not inherit.[1] From gross abuse of this custom in England, there arose what was known as the right of guardianship in chivalry, the temporary possession of the lands being assigned to strangers.

We will mention but one other exaction of the lord—that is the right of marriage. He could tender a husband to his female wards while under age, who could not reject him without forfeiting the value of marriage, that is, as much as any one would give to the guardian for such an alliance. This was afterwards extended to male wards, and became a very lucrative source of extortion for the crown, as well as for lords. This custom seems to have had the same extent as that of wardship. It is found in the ancient books of Germany, but not of France. The kings, however, and even inferior lords of that country, required their consent to be solicited for the marriage of their vassals' daughters. Several proofs of this occur in the history of France, and the same prerogative existed in Germany, Sicily, and England. We have been somewhat full in this matter, but the institutions of feudalism exer-

[1] Sir John Fortescue: "De Laudibus Legnum Angl." chap. xvi.

cised such a very great influence on the culture of the middle ages, that it is very necessary to understand the rights and duties which this relation created. We must notice its great influence in defining the classes of society. The possessors of beneficiary estates were in many cases the direct descendants of old tribal officials, and in all cases they were rich and influential leaders. They were intimately connected with the crown, and assisted in the exercise of justice and in the royal councils. Their sons in-



Chairs of the Middle Ages.

herited this eminence, and so, whether engaged in public affairs or living with magnificence and hospitality at home, they naturally drew to themselves popular estimation. The dukes and counts, who had changed from chiefs and leaders into lords over the provinces entrusted to them, were at the head of this noble class, and, in imitation of them, their own vassals, as well as those of the crown and even rich owners of absolute, or as it was called allodal property,[1] assumed titles from their towns or

[1] We must understand that at no time was all the land in the kingdom held by feudal tenure of a superior.

castles, and thus arose a number of petty counts, barons, and viscounts.

This distinct class of nobility grew apace with the feudal tenures. For the military tenant, however poor, was subject to no tribute but service in the field and such incidents and exactions as we have noticed above. He was the companion of his lord in the sports and feastings of his castle, the peer of his court. When he fought on horseback, he was clad in the coat of mail, while the commonalty, if summoned at all to war, came on foot with no armor of defence.[1] As everything in the habits of society conspired with that prejudice, which, in spite of moral philosophers, will constantly raise the profession of arms above all others, it was a natural consequence that a new species of aristocracy, founded upon the mixed considerations of birth, tenure, and occupation, sprang out of the feudal system. Every posessor of a fief was a gentleman, though he owned but a few acres of land and furnished his slender contributions towards the equipments of a knight.

Not all of the upper class were distinguished by actual holding of land. So, to distinguish them in this case from the common mass, two schemes were devised; namely, the adoption of sir-names and of armorial bearings. The first is commonly referred to the time when the nobility began to add the names of the estates to their own, or having in any way acquired a distinctive name of transmitting it to their posterity. As to armorial bearings, however, there is no doubt that similar emblems were, from time immemorial, used in war and peace.[2] But the general introduction of such bearings as hereditary distinct-

[1] Hallam: "View of the Middle Ages," chap. 2. part 2nd.

[2] Even in tribal society each gens had its totem mark.

ions has been attributed sometimes to tournaments wherein the champions were distinguished by fanciful devices, sometimes to the crusades where the multitude of all nations and languages stood in need of some visible token to denote the banners of their respective chiefs. In fact, the peculiar symbols of heraldry point to both these sources and have been borrowed in part from each other. Hereditary arms were, perhaps, scarcely used by private families before the beginning of the thirteenth century. From that time, however, they became very general.

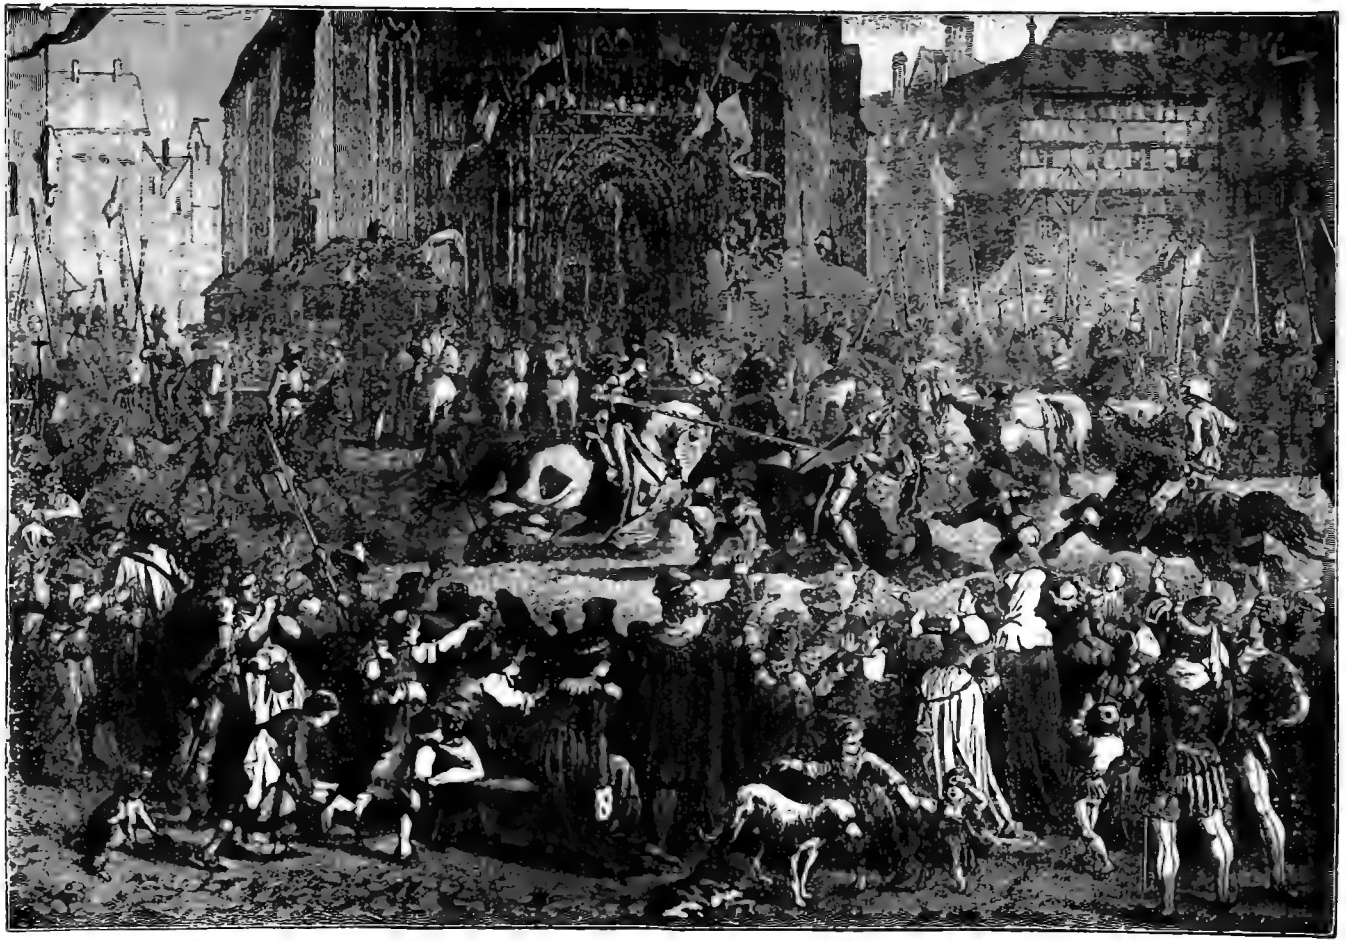
When privileges of birth were thus rendered capable of direct proof, they were increased in value, and thus a line was gradually drawn between the high-born and the ignoble classes, which finally became almost as broad as that which separates liberty from servitude.[1] All offices of trade and power, except those appertaining to the legal profession, were confined to the former class. A Plebeian could not possess a fief. Such at least was the original strictness, but as the aristocratic element grew weaker, an indulgence was extended to heirs and afterward to purchasers. They were elevated to the ranks of the nobility by the acquisition of an estate or at least by holding it for three generations. A gentleman in medieval France or Germany, could not exercise any trade without losing the advantages of his rank. A few exceptions were made, at least in the former country, in favor of some liberal arts and of foreign commerce; but in nothing did the feudal haughtiness of birth show itself more than in the

[1] The historical doctrine of armorial bearings and heraldry in general has recently been re-investigated by cool and cautious scholars. A number of them, led by Planche, Boutell, Seton, Nichols, and Lower, have set aside all the fabulous pretensions and baseless assertions of the earlier writers, have sifted the old evidence, and adduced much that is new.

disgrace which attended unequal marriages. No children could inherit a fief held immediately of the empire, unless both their parents belonged to the higher class of nobility. In France, the offspring of a gentleman by a Plebeian mother was reputed noble for purposes of inheritance and of exemption from tribute, but he could not be received into any order of chivalry, though capable of simple knighthood. Many instances occur where letters of nobility were granted to give them official rank. For several purposes it was necessary to prove four, eight, sixteen, or a greater number of quarters, that is, of coats worn by the paternal and maternal ancestors; the same practice still subsists in Germany, in Austria-Hungary, and in some other countries of Europe.

It appears, therefore, that the original nobility of the continent of Europe did not derive their rank from royal concessions. But the kings of France, before the end of the thirteenth century, began to assume a privilege of creating nobles by their own authority and without regard to the holding of land. Philip the Hardy, in 1271, was the first French king who granted letters of nobility. In the reign of Philip the Fair and his children, they gradually became frequent. This of course effected a change in the character of nobility. The privileges originally connected with ancient lineage and extensive domains, became common to the low-born creatures of a court, and consequently lost part of their title to respect. The lawyers pretended that nobility could not exist without a royal concession, and in return for their teachings, they were made official noblemen by the exercise of royal power.[1] The institutions of chivalry, as we will see, also gave rise to a vast increase of gentlemen; knighthood, on

[1] Reeves: "History of English Law," Vol. II. p. 354.



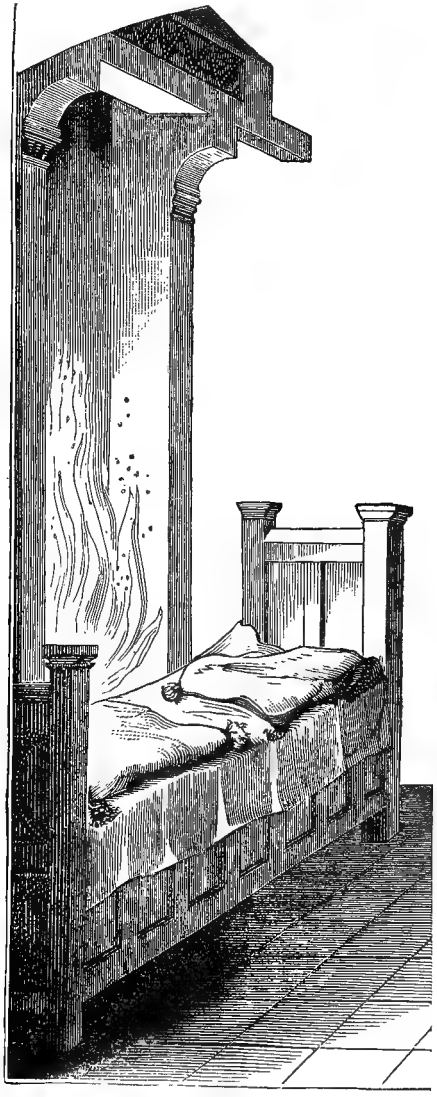
MEDIEVAL TOURNAMENT.

whomsoever conferred by the sovereign, being a sufficient passport to noble privileges. It was usual, however, to grant previous letters of nobility to a Plebeian for whom the honor of knighthood was designed.

Turning our attention now to this nobility, we learn that there were varying classes. Those in France who held lands immediately depending upon the crown, whatever titles they might bear, were included in the order of *barons*. These were originally the peers of the king's court. They possessed the higher territorial jurisdiction, and had the right of carrying their own banner into the field. To these corresponded the *vavasores majores* and *capitanei* of the German Empire. In a subordinate class, were the vassals of this high nobility. The *chatelains* in France belonged to the order of *vavasores*, as they held only secondary fiefs; but having fortified houses from which they derived their name and possessing ampler rights of territorial justice, they rose above the level of their fellows in the scale of tenure.

It will be needless to dwell upon the condition of the inferior clergy, whether secular or professed. The prelates and abbots, however, it must be understood, were feudal nobles. They swore fealty for their lands to the king or their superiors, received the homage of their vassals, enjoyed the same immunities, exercised the same jurisdiction, maintained the same authority as the lay lords among whom they dwelt. Military service does not appear to have been reserved in the beneficiary grants made to cathedrals and monasteries. When other vassals of the crown were called upon to repay the bounty of their sovereign by personal attendance in war, the ecclesiastical tenants were included within the scope of this feudal duty, which duty in general they were not reluctant to fulfill.

Charlemagne, the great emperor of Germany, exempted or rather prohibited them from personal service. The practice, however, prevailed in succeeding ages. Both in national and private warfare, we find very frequent mention of martial prelates.[1] We have many instances of their accompanying the army though not mixed in the conflict, and even the parish priests headed the militia of their villages.



Bedstead of the Middle Ages.

But not-withstanding the war-like disposition of some ecclesiastics, their general inability to protect the estates of their churches against rapacious neighbors, suggested a new species of feudal relation and tenure. The rich abbot elected an advocate whose business it was to defend his interests both in secular courts and, if necessary, in the field. King Pepin and Emperor Charlemagne are styled advocates of the Roman Church. This, indeed, was on a

1 One of the latest instances, probably, of a fighting bishop is Jean

magnificent scale, but in ordinary practice, the advocate of the monastery was some neighboring lord, who in return for his protection possessed many lucrative privileges and very frequently considerable estates by way of fief from his ecclesiastical clients.

The classes below the gentry may be divided into freemen and villeins. Of the first were the inhabitants of chartered towns, citizens and burghers, of whom more will be said presently. As to those who dwelt in the country, we can have no difficulty in recognizing, as far as England is concerned, the *socagers*, that is tenants who held land not by military service but by some other certain tenure, and a numerous body of tenants for a term of years or for life, who formed that ancient basis of the strength of England, the *yeomanry*. But in other countries freemen were not so clearly distinguished. In French records and law-books of feudal times, all besides the gentry are generally confounded under the name of villeins or *hommes de poste*. This shows the slight estimation in which all persons of ignoble birth were considered, for undoubtedly there existed a great many proprietors of land and others as free though not as privileged as the nobility. In the south of France and especially in the Provence, the number of freemen is said to have been greater than in the parts on the right bank of the Loire where the feudal tenures were almost universal. The villeins of feudal times form an interesting class of people. They seem to be the descendants of the conquered population, and thus had very few rights.

The characteristic distinction of a villein was his obligation to remain upon his lord's estate. He was not only precluded from selling the lands upon which he dwelt,

Montaigu, archbishop of Sens, who was killed at Agincourt, in 1415.

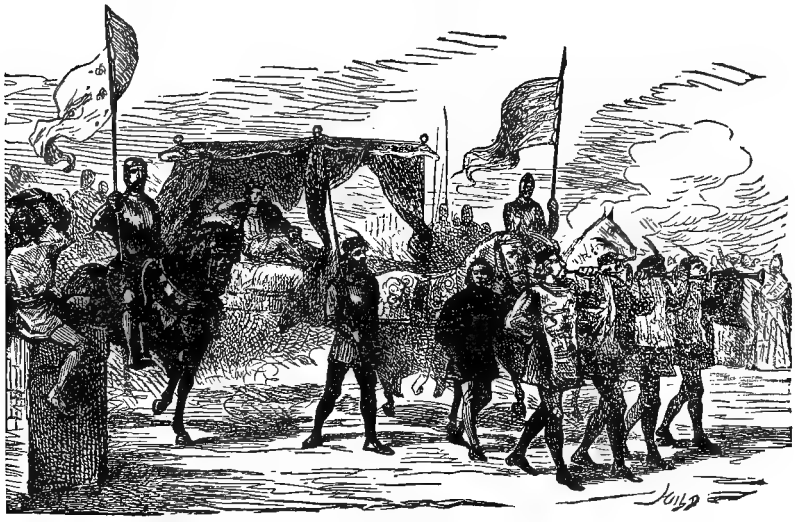
but his person was bound, and the lord might reclaim him at any time by suit in the court of justice if he ventured to stray. But equally liable to this confinement, there were two classes of villeins, whose condition was exceedingly different. In England, at least from the reign of Henry II., one only, and that an inferior species, existed, incapable of property and destitute of redress except against the most outrageous injuries. The lord could seize whatever they acquired or inherited, or convey a part of their land to a stranger. Their tenure bound them to what were called villein services, ignoble in every nature and indeterminate in every degree; the felling of timber, the carrying on of manual labor, the repairing of roads for their lord who seems to have possessed an equally unbounded right over their labor and its fruits.

In France and Germany, persons in this abject state seem to have been called *serfs*, and distinguished from villeins, who were only bound to fixed payments and duties in respect of their lord, though as it seems without any legal redress if injured by him. "The third estate of man," says Beaumanoir, "is that of such as are not free and these are not all of one condition, for some are so subject to their lord that he may take all they have alive or dead, and imprison him whenever he pleases, being accountable to no one but God, while others are treated more gently from whom the lord can take nothing but customary payments, though at their death all they have escheats to him."[1] Under every denomination of servitude, the children followed their mother's condition, except in England, where the father's state determined that of the child.

The number of people in bondage, as well as the

[1] Compare the articles "Villanus" and "Servus," in Ducange's "Dictionary of Medieval Terms."

different degrees of slavery, is one of the most striking features of the middle ages, and in no country of Europe do we see a greater variety of such people than in Germany. In Germany there was a countless array of people subject to the dominion and sovereignty of others in a variety of ways. The condition of each class being determined by a separate set of laws, each modified by different customs, and each having a different mode of



King going to a Tournament.

freeing the bondsman from his bondage. This peculiar aspect of servitude lasted up to very recent times; and, even at the present day, there is a decided state of bondage in many parts of Russia; bondage of territory, that is, where the bondsman is not permitted to leave a certain territory; bondage of community, where the bondsman is not allowed to join any other but his community; bondage of labor; and finally bondage of person.[1]

1 The most vivid picture of German serfdom and servitude is given in Just. Moeser's "Patriotische Phantasien."

As society advanced in Europe, the manumission of slaves grew more frequent. By the indulgence of custom in some places, or perhaps by original convention, villeins might possess property and thus purchase their own redemption. Even where they had no legal title to property, it was accounted inhuman to divest them of their little possessions. Their poverty was perhaps not less intolerable, upon the whole, than that of the modern peasantry in most countries of Europe. It was only in respect of his lord, it must be remembered, that the villeins, at least in England and in France, were without rights.

A villein might inherit, purchase, sue in the courts of law, though as a defendant in a real action, or suit wherein land was claimed, he might shelter himself under the plea of villeinage. The peasants of this condition were sometimes made use of in war and rewarded with enfranchisement, especially in Italy where the cities and petty states had often occasion to defend themselves with their whole population, and in peace the industry of free laborers must have been found more productive and better directed. Hence the eleventh and twelfth centuries see the number of slaves in Italy begin to decrease. Early in the fifteenth century, a writer, quoted by the learned Italian scholar Muratori, speaks of them as no longer existing. A considerable part of the peasants in some parts of Germany had acquired their liberty before the close of the thirteenth century. In other parts, as well as in all the northern and eastern regions of Europe, they remained in a sort of villeinage till very recently. Some very few instances of predial servitude have been discovered in England so late as the time of Elizabeth, and perhaps they existed even later.

When we stop and review the ground over which we

have now gone, we see much that is very different from what we are accustomed to. We are not, however, to suppose that a simple and sufficient explanation of all this is to be found in the ignorance of the people. Let us only keep firmly in mind the constitution of tribal society. Let us consider the effect of the conquest of the Western Empire of Rome by the warlike Teutonic tribes. Their tribal customs were now brought in contact with the government and laws of Rome. They had under them a large number of subject people. It is then, perhaps, not strange that the institutions of feudalism took root and grew with such a luxuriant growth, giving rise as a consequence to the orders of nobility and drawing a wide line of separation between the gentry and the common people.

In the further consideration of our subject, we must not forget that the lords repesented in many cases the old tribal chiefs, while the people under them represented either the old tribe or some constituent portion of it. Hence it is not strange to find them in the enjoyment of many privileges which in a vague sense proceed on the theory that each part of a tribe was independent in its own affairs. There are, first of all, duties of a Judicial nature. These were exercised by the owners of fiefs in different degrees. In France they were divided into the high, the middle, and the low jurisdiction. The first species alone conveyed the power of life and death; it was inherent in the baron and the castellan and sometimes enjoyed by a simple vavassor. The holders of the lower jurisdictions were not competent to judge in capital cases, and consequently were forced to send such criminals to the court of the superior. But in some places, a thief taken in the act might be punished with death by a lord who had only the low jurisdiction.

In England this privilege was known by the uncouth terms of *Infangthef* and *Outfangthef*. The high jurisdiction, however, was not very common in England except in the chartered towns. But the lord was bound to follow custom and precedents as much as was the old chief. And customs put a check in many respects on this right. Ecclesiastical lords, who were prohibited from inflicting capital punishment and were supposed to be unacquainted with

English Medieval Costumes.

the law followed in civil courts or unable to enforce it, had an officer by name of advocate or *vidame*, whose tenure of office was often feudal and hereditary. The bailiffs, provosts, and seneschals of lay lords were similar ministers, though not in general of so prominent a right in their offices, or of such eminent station as the advocates of monasteries. It seems to have been an established maxim, at least in later times, that the lord could not sit personally in judgment, but must entrust that function to his bailiffs

and vassals.[1] According to the feudal rules, the lord's vassals or peers of his court were to assist him in all his proceedings.[2] The presence of these assessors was so essential to all territorial jurisdiction that no lord, to whatever rights of justice his fief might entitle him, was qualified to exercise them unless he had at least two vassals to sit as peers in his court. In these courts cases were decided, not by the technicalities of law as it is written down in the books of professional sages, but by the dictations of common sense and natural feeling. Whenever a case was doubtful and especially where a crime not capable of clear proof was charged, the issue was decided by a combat and thus the last and final decision of the case was entrusted, as they supposed, unto God.[3]

The nobleman fought on horseback with all his arms of attack and defense. The Plebeian on foot with his club and target. The same were the weapons of the champions to whom women and ecclesiastics were permitted to entrust their rights. If the combat was intentended to settle a mere pecuniary question, or a civil lawsuit, the vanquished party of course forfeited his claim and paid a fine. If he fought by proxy, the champion was liable to have his hands struck off, a regulation necessary, perhaps, to obviate the corruption of hired defenders. Even the judge himself, whose decision seemed to imply foul play, could be challenged by one of the parties, and this means of correcting the decisions of judges was resorted to very frequently. Such was the judicial system

1 Hallam: "View of the Middle Ages," chap. 2. part 2nd.

2 Notice here the plain traces of tribal society. No chief in tribal society presumed to act without his council.

3 The best statement and estimation of the judicial combat will be found in Montesquieu's celebrated work, "Esprit des Lois," bk. 28. chap. 24, 25, 26, 27.

of Continental Medieval Europe and especially of France when St. Louis erected that great code which bears the name of his Establishments.

The rules of civil and criminal proceedings, as well as the principals of legal decisions, are there laid down with much detail, but that incomparable prince, unable to overthrow the judicial combat, confined himself to discouraging it by the example of a wiser jurisprudence. It was abolished throughout the royal domain. The bailiffs who rendered justice to the king's immediate subjects, were bound to follow his own laws. He not only appealed from their sentence in his own court of peers, but listened to all complaints with a kind of patriarchal simplicity. "Many times," says the chronicler Joinville, "I have seen the good saint, after hearing mass in the summer season, lay himself at the foot of an oak in the wood of Vincennes, and make us all sit around him. When those who came and spoke to him without let of any officer, and he would ask aloud if there were any persons who had suits, and when they appeared, would bid two of his bailiffs determine their cause upon the spot."

In passing judgment on the men of the middle ages for this custom, we must remember that trial by ordeals and by battle are as old as humanity itself. Savage nations universally employ them. Trial by battle, such as here described, proceeded on the assumption that God would grant the victory only to the one who had the best right, The last trial by battle in a civil case in England occurred in the reign of Elizabeth.[1] Customs such as these are often referred to as evidence of the dense ignorance of the middle ages. Let us not forget that though we indeed find such customs in existence, they are gen-

[1] Gilchrist: "Origin and History of Ordeals," London, 1821, p. 30.

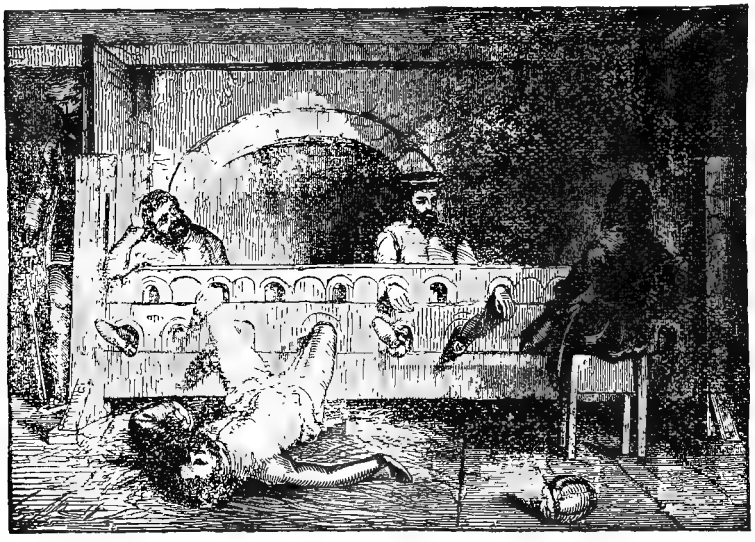
erally in the act of disappearance. The barbarous practice of duelling, which still survives, takes its rise by a similar train of reasoning.

We have dwelt to a considerable extent on feudalism, and have shown how, in every department of medieval life, it exerted an almost controlling influence. As it took many years for it to come to its full development, so its passing away was equally slow. In almost every part of Europe, its effects are felt to this day. One of the most powerful causes of its downfall was the institution of free cities and boroughs. The earliest charters of a community granted to towns in France have been commonly referred to the time of Louis VI., though it is not improbable that some cities in the south had a municipal government by custom, if not by grant, at an early period. Noyon, St. Quentin, Laon, Amiens appear to have been the first that received emancipation at the hand of this prince. The chief towns in the royal domain were successively admitted to the same privileges during the reigns of Louis VI., Louis VII., and Philip Augustus. This example was gradually followed by the peers and other barons, so that by the end of the thirteenth century the custom had prevailed over all France.

It was the gradual rise of these free cities which undermined feudalism. This shows us their great importance. It has been sometimes asserted that the crusades had a great influence in the rise of city communities. If this notion were true, this result would have repaid Europe for the crimes and miseries which attended the crusades, but it is very much exaggerated.[1] The cities of Italy obtained their internal liberties by gradual encroachments and by the concessions of the Franconian Emperors.

[1] Cf. Stubbs' "Constitutional History of England," p. 503, 623.

Those upon the Rhine owed many of their privileges to the same monarchies whose cause they had espoused in the rebellions of Germany. In France the charters granted by Louis the Fat, could hardly be connected with the first crusade, in which the crown had taken no part, and were long prior to the second. It was not until fifty years afterwards that the barons imitated his example by granting charters to their vassals, and these do not appear to have been particularly related to any of the crusades.



Punishing Offenders.

The establishment of chartered towns in France has been ascribed to deliberate policy. "Louis the Gros," says the historian Robertson, "in order to create some power that might counterbalance those potent vassals who controlled or gave law to the crown, first adopted the plan of conferring new privileges on the towns situated within his domain." But Hallam ascribes this measure to the pecuniary exigencies of both the king and his barons, for he says, they sold their concessions to the towns at the

highest price. Some cities, however, were indebted for success to their own courage and love of liberty. Oppressed by the exactions of their superiors, they had recourse to arms and united themselves in a common league confirmed by oath for the sake of redress. One of these associations took place at Mans as early as 1067, and, though it did not secure any charter of privileges, this combination is a proof of the spirit to which ultimately the superior classes were obliged to submit.

The privileges which the towns of France derived from their charters were very extensive. They were made capable of possessing common property and authorized to use a common seal as a symbol of their incorporation. The more oppressive and ignominious tokens of subjection, such as the fine paid to the lord for permission to marry their children, were abolished. Their payments of rent or tribute were limited both in amount and as to the actions for which they might be demanded. Some obtained an exemption from assisting their lord in war. Others were only bound to follow him when he personally commanded, and almost all limited their services to one, or at the utmost, very few days. If they were persuaded to extend this consideration, it was, like that of feudal attendance, at the cost of their superior. Their customs as to succession and other matters of private right were reduced to certainty and, for the most part, laid down in the charter of incorporation. The most valuable privilege which the chartered towns obtained was that of exemption from the jurisdiction of the royal as well as of territorial judges. They were subject to magistrates elected by themselves though, in some places, the lord participated in this choice. They were empowered to make special rules, or as we call them "by-laws," such as did not

contravene the provisions of their charter or the ordinances of the king.[1]

The middle ages were not only the age of feudalism, but they were also the "age of chivalry." Chivalry and knighthood not only exerted a great influence on the life of medieval times, but became an essential part of the literature of romance and song, and thus continued to be felt even after they had been crowded out of the sterner relations of life. In treating of chivalry we are not treating of some mere sentimental institution of medieval times, but of one that was very real and practical, and eminently suitable to the wants of a time that had as yet only dimly felt the influence of those causes which were to give rise to the hurried, scientific, practical life of the present. Our words knight and knighthood signified, originally, a boy or youth, but before the middle of the twelfth century, they had acquired the meaning, which they still retain in the French word *Chevalier*. Concerning the origin of knighthood or chivalry nothing beyond more or less probable conjecture is possible. It is known, however, that the medieval knights were in no way derived from the knights or equites of Rome, the knights of King Arthur's round table, or the Paladins of Charlemagne.

Some of the greatest scholars, like John Selden and DuCange, concur in tracing the ceremony of dubbing in knighthood to the ceremony, common amongst the Goths and the Franks, of adoption by arms. By means of a solemn investiture with warlike weapons, the parties participating in this ceremony thenceforth acquired the artificial character of father and son, not as in the Roman practice of adoption for any purpose of succession or in-

[1] Hallam, "Views," ch. 2. p. 2.

heritance, but in a purely honorable and complimentary manner. The Crusades had a great deal to do in the establishment of knighthood and chivalry. Vast armies were then set on foot, in which feudal rights and obligations had no place. But it was observed by the leaders, that the volunteers who flocked to the standards of the various commanders were even more efficient as soldiers than the vassals whom they had hitherto commanded. It was thus shown that pay, the love of enterprise, and the prospect of plunder were quite as useful for the purpose of enlisting troops and keeping them together, as the tenure of land and the solemnities of homage and fealty. Moreover, the crusaders who survived the difficulties and dangers of an expedition to Palestine were experienced veterans, ready to hire to the highest bidder and well worth the wages they received. It was probably owing to the crusades, that the church took the profession of arms under her protection, and, from that time, the ceremonies of initiation into it assumed a religious as well as a martial character.

Nor was this by any means a merely gratuitous patronage of blood-shed on her part. In the ages of faith and chivalry, magic and sorcery were the terrors alike of the pious and the brave, and the blessings of the priests on the warrior's weapons and armor were always regarded as the surest safe-guard against the influence of hostile spells and enchantments.[1] To distinguished soldiers of the cross, the honors and benefits of knighthood could hardly be refused on the ground that they did not possess a sufficient property qualification, of which they had, in fact, deprived themselves in order to procure their equipments for the war. Thus the conception of knighthood as

[1] Stubbs' Const. Hist., II. p. 270. Grose; "Military Antiqu. I. p. 60,

something wholly distinct from and independent of feudalism, both as a social condition and a personal dignity, was formed, and rapidly gained ground. It was then, that the analogy was first detected, which was afterward more fully developed, between the order of knighthood and the order of priesthood. Then followed the union of monachism and chivalry, effected by the establishment of the religious orders, of which the Knights Templars and the Knights Hospitalers were the most eminent examples.

In their indifference to the distinctions of race and nationality, these orders accommodated themselves to the spirit which by that time had become characteristic of chivalry, which was already regarded, like the church, as an universal institution, comprising and knitting together the whole warrior caste of Christendom into one great fraternity, irrespective alike of feudal subordination or territorial boundaries. Somewhat later the adoption of hereditary sir-names and armorial bearings, as we have already pointed out, marked the existence of a large class, who, though considered noble, were, either from the subdivision of fiefs or from the effects of the custom of primogeniture, not possessed of sufficient property to support them as their rank required. To them only two callings were generally open, that of the church-man and that of the soldier; and the latter, as a rule, possessed greater attraction than the former at that time of much license and little learning. Hence, the favorite expedient for a man of birth, though not of fortune, was to attach himself to some prince or magnate, in whose military service he was sure of an adequate maintenance, and might hope for even a rich reward in the shape of booty or ransom.[1]

1 Saint Palaye: "Memoires sur l'ancienne Chevalier," Vol. I. p. 363, 364.

From a very early stage in the development of chivalry we meet with the singular institution of brotherhood in arms, and, from it, the ultimate origin, if not of the religious fraternities, at any rate of the military companionship is generally derived.[1] By this institution, a relation was created between two or more knights by voluntary agreement, which was regarded as more intimate than those founded on the relationship of blood. Brothers in arms were supposed to be partners in all things save the affections of their lady loves. They shared in every danger and every success, and each was expected to vindicate the honor of the other as promptly and zealously as his own. Their engagements usually lasted through life, but sometimes only for a specified period or during the continuance of specified circumstances. Romance and traditions speak of strange rites, the mingling and even drinking of blood, as having in the remote ages marked the beginning of these martial and fraternal associations.[2] But in later times, they were generally made known by a formal exchanged of weapons and armor.

Knight Templar.

In warfare, it was customary for knights, who were thus allied, to appear in similar armor having the same badges so that their enemies might not know with which of them they were in conflict, and that their friends might

[1] Du Cange: "Dissertation sur Joinville," xxi.
[2] Du Cange: "Dissertation sur Joinville," xxi.

not accord more applause to one than to another for his prowess in the field. It seems likely enough, therefore, that when the Crusades had commenced the process of transforming feudalism into chivalry, bodies of men, free indeed from monastic obligations, united by engagements of fidelity, wearing a common uniform or livery, and naming themselves after some special symbol or some patron saint of their adoption, were in existence. Such bodies raised by, or placed under the command of, a sovereign or grand master, regulated by statutes and enriched by ecclesiastical endowments, would have been exactly similar to the order of the "Golden Fleece" in Burgundy, and similar orders in later times.

The knight who had "won his spurs" was more highly regarded than the knight who succeeded to them as an incident of his feudal tenure. In the eye of the law they were equal. But it was the first, and not the second who was welcomed in court and camp, and who was invited to the "round tables." Thus it became the ambition of every aspirant to knighthood to gain it by his exploits rather than to claim it merely as his right by virtue of his position and estate, no one, however, could be legitimately created a knight who was not a gentleman of "name and arms," that is, who was not at least descended from grandparents, who were, on both sides, entitled to armorial bearings, and this condition is embodied in the statutes of every body of knighthood, religious or military, which can trace its origin to a period when chivalry, was a social institution.[2]

We are now fairly launched into the consideration of the various orders of chivalry. In this it is necessary for

1 Du Cange: "Dissertations sur Joinville," xxi.

2 Nicholas: "British Orders of Knighthood," Vol. I. pt. v.

us to remember wherein they differed from the orders of nobility of feudalism. When the system became fully developed, knighthood proper was generally preceded by two preparatory stages, in which the candidate was successively a *page* and then a *squire*. In the ordinary course of a chivalrous education, the successive conditions of page and squire were passed through in boyhood and youth, and the condition of knighthood was reached in early manhood. In fact, every feudal court and castle was

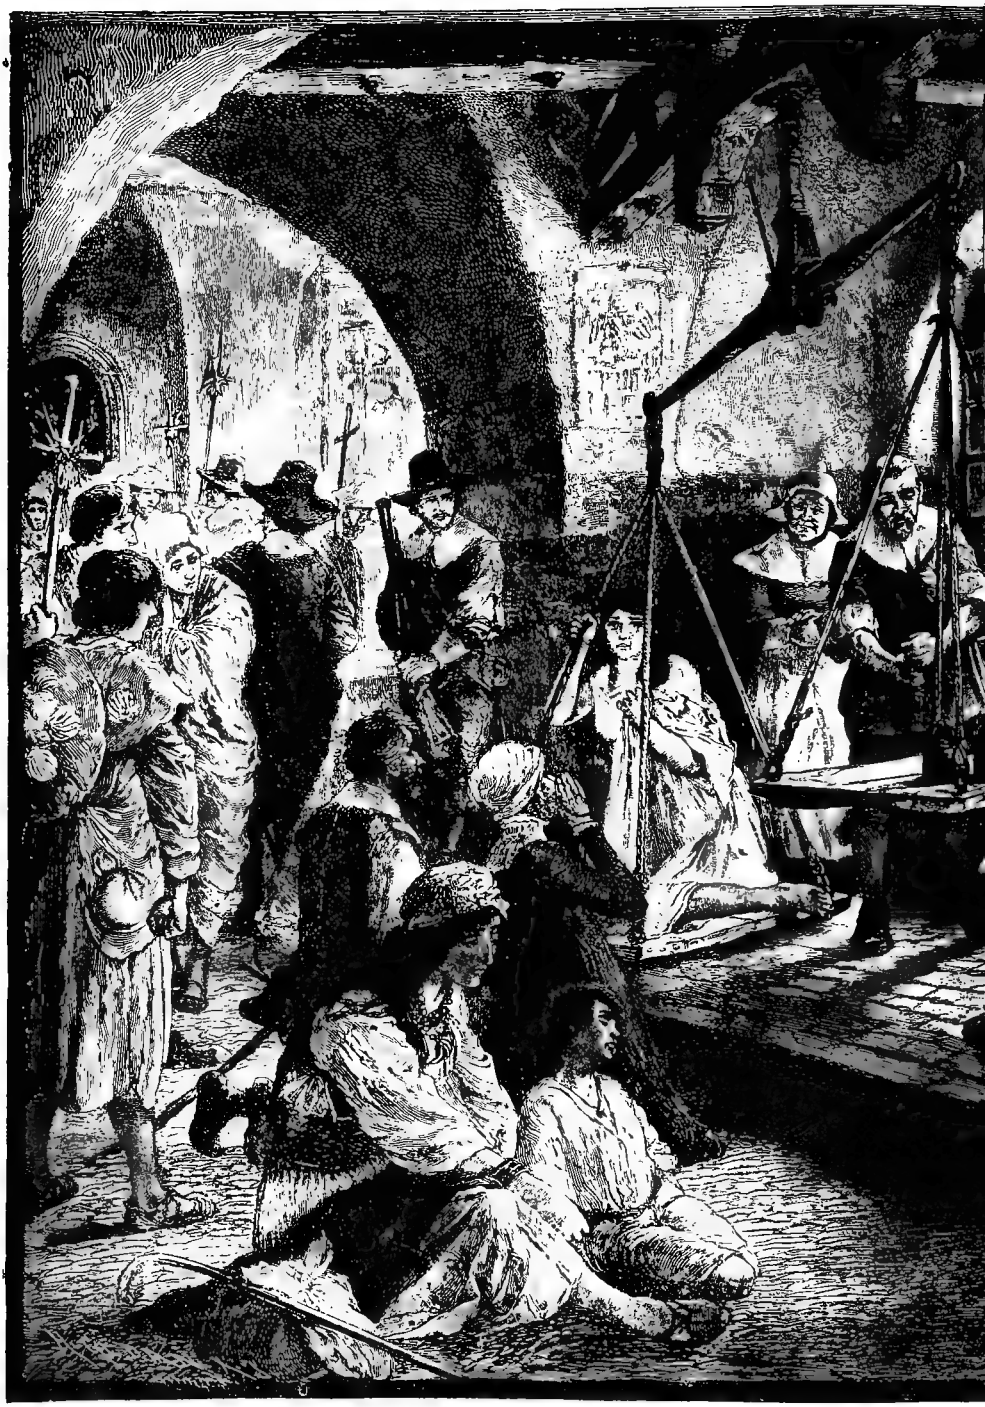
A Tournament

a school, in which the sons of the sovereign and his vassals, or of the feudary and his vassals, generally together with those of some of their allies or friends, were reared in the principles and habituated to the customs and observances of chivalry. Although princes and great personages were rarely actual pages or squires, the moral and physical discipline, through which they passed was not, in any important particular, different from that to which candidates of a lower standing were subjected.[1]

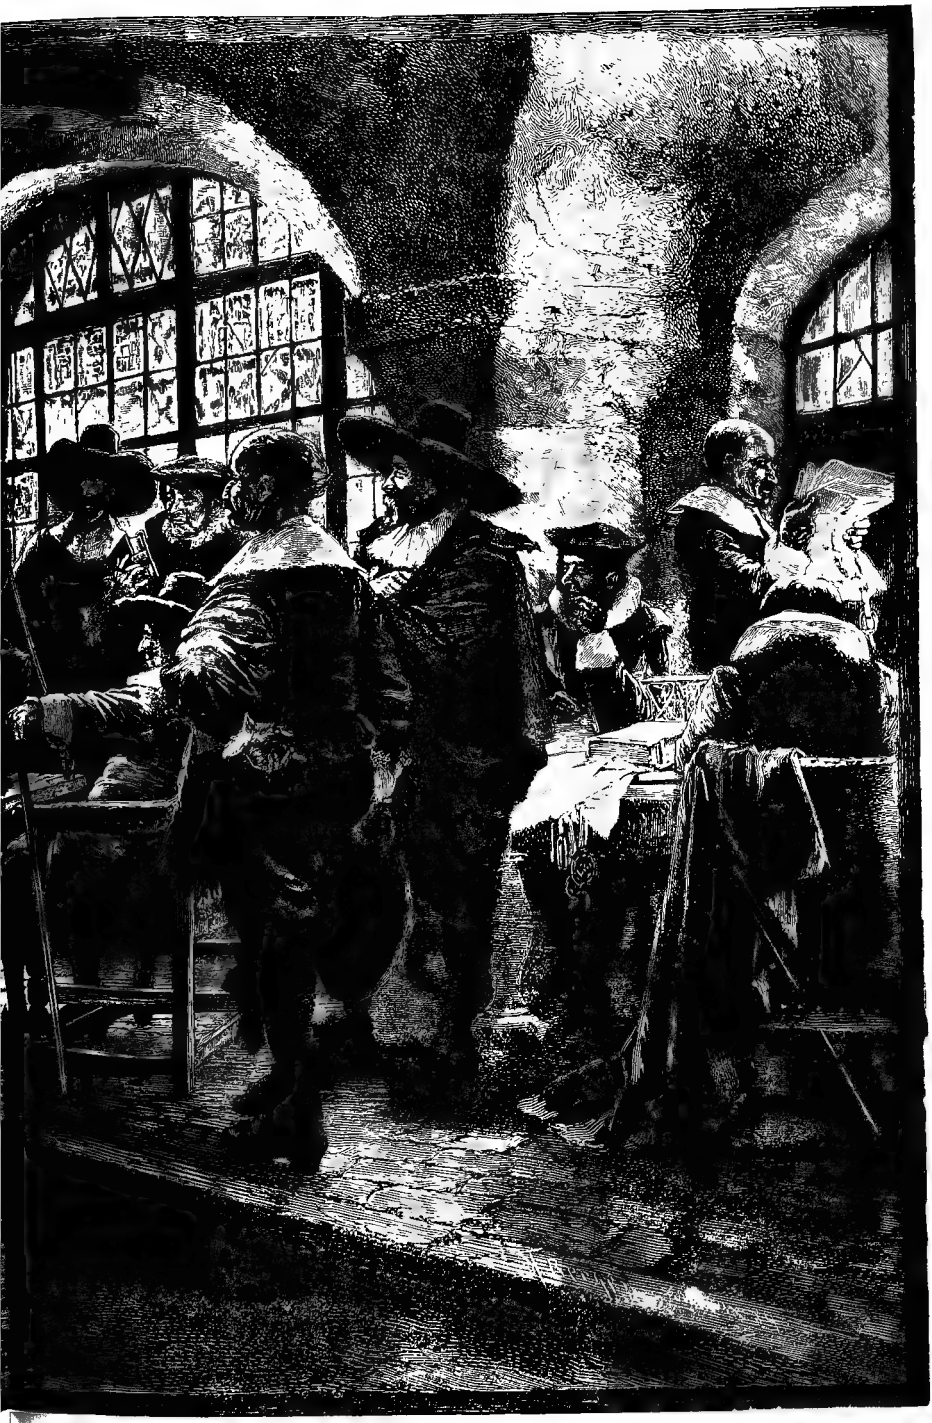
[1] Sainte Palaye: "Memoires sur l'ancienne Chevalier," Vol. I. p. 36.

The page, or as he was more anciently and more correctly called the "valet" or "damoiseau," commenced his service and instruction when he was between seven and eight years old, and continued in the same for seven or eight years longer. He acted as the constant personal attendant of his master and mistress. He waited on them in their hall and accompanied them in the chase, served the lady in her bower, and followed the lord to the camp From the chaplain and his mistress and her *demoiselles*, he learned the rudiments of religion, of rectitude, and of love. From his master and his squires, the page acquired the elements of military exercise, to cast a spear or dart, to sustain a shield, and to march with the measured tread of a soldier. From his master and his huntsmen and falconers, he learned the mysteries of the woods and rivers, or in other words, the rules and practices of hunting and hawking.

When he was between fifteen and sixteen he became a squire, but no sudden or great alteration was made in his mode of life. He continued to wait at dinner with the pages, although in a manner more dignified, according to the notions of the age. He not only served but carved and helped the dishes, proffered the first or principal cup of wine to his master and his guests, and carried to them the basin, ewer, or napkin when they washed their hands before and after meat. He assisted in clearing the hall for dancing or minstrelsy, and laid the tables for chess or draughts, and he also shared in the pastimes, for which he had made preparation. He brought his master the *vin de coucher* (the wine for the night), and made his early *refection* ready for him in the morning, but his military exercises and athletic sports occupied an always increasing portion of the day. He accustomed himself to



SUPERSTITION OF THE DARK AG



THE WITCHES' SCALE.

ride the "great horse," to tilt at the quintain, to wield the battle-ax, to swim and climb, to run and leap, and to bear the weight and overcome the embarrassments of armor.

He inured himself to the vicissitudes of heat and cold, and voluntarily suffered the pangs or inconveniences of hunger and thirst, fatigue and sleeplessness. It was then, too, that he chose his lady-love, whom he was expected to regard with an adoration at once earnest, respectful, and the more meritorious if concealed. When it was considered that he had made sufficient advancement in his military accomplishments, he took his sword to the priest, who laid it on the altar, blessed it, and returned it to him.[1] Afterwards, he either remained with his early master, relegating most of his domestic duties to his younger companions, or he entered the service of some valliant and adventurous lord or knight of his own selection. He now became a *squire of the body*, and truly an *armiger* or *scutifer*, for he bore the shield and armor of his leader to the field, and, what was a task of no small difficulty and hazard, assisted him to don his armor and mount his horse. It was his duty also to display and guard in battle the banner of the baron or banneret or the pennon of the knight. He raised his master from the ground, if he were unhorsed, and supplied him with a horse if his was disabled or killed. He received and kept prisoners if any were taken. He fought by his master's side if he were unequally matched, attempted to rescue him if captured, bore him to a place of safety if wounded, and buried him honorably when dead.

After he had worthily and bravely borne himself for six or seven years as a squire, the time came when it was

[1] Sainte Pelaye, "Memoires," Vol. I. p. 2.

fitting that he should be made a knight. Two modes of conferring knighthood appear to have prevailed from a very early period in all countries where chivalry was known, one being much more ceremonious than the other. In both the essential portion seems to have consisted of the embrace and the blow on the shoulders, with the utterance of solemn

Knighthood.

words.[1] In times of peace the ancient custom was to confer the dignity with many ceremonial observances. We must remember that chivalry was largely influenced by the

[1] This was technically known as the *accolade*. Squires were anxious to have this given only by some distinguished knight. A romantic relationship was supposed to accrue from it between the parties.

church, consequently the ceremonies were, to a certain extent, of a religious nature. It will give us a good idea of life and times in the middle ages to glance at these ceremonies.

The process of inauguration was commenced in the evening by placing the candidate under the care of "two esquires of honor, grave and well seen in courtship, and also nurtured in the feats of chivalry, who were to be governors in all things relating to him". Under their direction, to begin with, a barber shaved him and cut his hair. He was then conducted by them to his appointed chamber, hung within and without with linen and covered with rich clothes, where a bath was prepared, into which, after they had undressed him, he entered. While he was in the bath two "ancient and grave knights" attended him "to inform, instruct, and counsel him, touching the order and feats of chivalry," and when they had fulfilled their mission, they poured some of the water of the bath over his shoulders, signing the left shoulder with the cross, and retired. He was then taken from the bath and put into a plain bed without hangings, in which he remained until his body was dry, when the two esquires put on him a white shirt and a robe of russet with long sleeves, having a hood like that of a hermit.

Then the two knights returned and led him to the chapel, the esquires going before them sporting and dancing with the minstrels making melody and when they had been served with wines and spices went away, leaving only the candidate, the esquires, the priest, the chandler, and the watch, who kept the vigil of arms until sunrise, or managed to pass the night "in bestowing himself in prayers". At day-break he confessed to the priest, heard matins, and communicated in the mass, offering a taper and a piece of

money stuck in it as near the lighted end as possible, the first "to the honor of God", and the second "to the honor of the person who made him a knight". Afterwards he was taken back to his chamber and remained in bed until the knights, esquires, and minstrels went to him and aroused him. The knights then dressed him in distinctive garments and mounting their horses rode with him to the hall where

Procession in the 15th Century.

the candidate was to receive knighthood. His future squire was to ride before him bare-headed, bearing his sword by the point in its scabbard, with his spurs hanging from its hilt.

When everything was prepared, the prince or subject who was to knight him came into the hall, and, the candidate's sword and spurs having been presented to

him, he held the right spur to the "most noble and gentle knight" present, and directed him to fasten it on the candidate's right heel, which he accordingly did, kneeling on one knee and putting the candidate's right foot on his knee, signing the candidate's knee with the cross. In like manner, by another "noble and gentle knight" the left spur was fastened to his left heel. Then he, who was to create the knight, took the sword and girt him with it, and, embracing him, he lifted his right hand and smote him on the neck or shoulder, saying, "Be thou a good knight," and kissed him. When this was done, they all went to the chapel with much music, and the new knight laying his right hand on the altar, promised to support and defend the church, and, ungirting his sword, offered it on the altar.[1]

Of necessity, these ceremonies could not be gone through with in times of war. In such cases all that was necessary was the accolade. Some rather amusing instances of this occur in the annals, which illustrate knightly punctiliousness. A knight was disgraced if he surrendered himself prisoner to one not a knight, such misfortunes sometimes occurred. At times when such a calamity was impending, the fighters suspended hostilities long enough to allow the vanquished knight time enough to bestow the honor of knighthood upon his successful antagonist. He could then surrender himself without disgrace, for his foe was now a "noble knight." In course of time the ceremonial form dropped out of common usage.

Knights were divided into two classes, knight ban-

[1] Most of these ceremonies were of more or less religious significance. Thus the bath is significant of purity of soul. The bed of the rest he was hereafter to enjoy in Paradise, the red over-garment showed his resolution to shed his blood for the church if necessary. Mills: "History of Chivalry," Vol. I. p. 49.

nerets and knight bachelors. The only distinction between them would appear in time of battle. The knight banneret was entitled to carry his own banner and had under his command a more or less extensive body of men. All knights whether bachelors or bannerets were escorted by their squires. Every knight was entitled to bear a *pennon*, and every squire a *pencel*. All these flags were of a convenient size to be carried on a lance. They were distinguished by their form. The banner was cut square, the pennon was pointed or forked at its extremity, the pencel ended in a single tail or streamer.[1]

The tournament was the great feature of chivalry. They were the military games of the age; they were courteous battles between two parties of mailed warriors. All of Europe delighted in these contests. The weapons with which they fought were generally so prepared that but a small amount of danger was to be feared from them. At times the tournaments assumed an international character; heralds announced at foreign courts the intentions of their sovereigns to hold a tournament at a designated time and place, and invited "all those who valued their knighthood and respected dames and maidens to repair to the appointed city and prove their chivalry." In Germany the country was divided off in four districts in which tournaments were held by rotation.

Safe conducts were allowed to foreign knights who wished to come to a trial of skill with the knights of the country. All, however, were not allowed to engage in the contest. "None could tourney who had blasphemed God, or offended the ladies," or in general who failed in any knightly duties. The place where a tournament was held was duly prepared. It was known as the *list*. It was

[1] Grose: "Mil. Ant." Vol. II. p. 256.

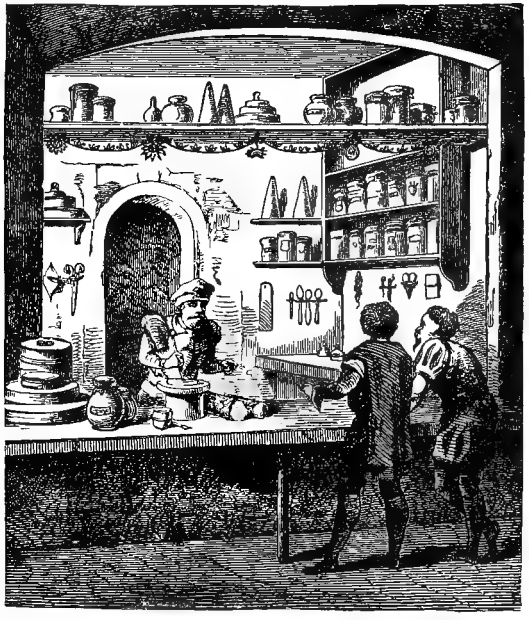
decorated with all the wealth of feudal times. "Besides the gorgeous arrays of heraldic insignia were the champions' tents; the galleries, which were made to contain the proud and joyous spectators, were covered with tapestry, representing chivalry both in its amorous and warlike guises; on one side the knight with his bright faulchion smiting away hosts of foes, and on the other kneeling at the feet of beauty." On the day of the tournament the knights were conducted with many ceremonies to the place of combat. Their arms were duly examined, and then they were arranged in order.

Entrance to the Tournament.

All being in readiness the heralds cried "*Laissez Aller.*" The cords which divided the two parties were immediately slackened, and the cavaliers, dressing their spears to their rests and commending themselves to their mistresses, dashed to the encounter while the trumpets sounded the beautiful point of chivalry for every man to do his "devoir." One encounter did not decide the matter, the fight continued. Heralds watched the encounter and noted points in honor of this or that knight. Thus if one knight succeeded in breaking his spear on the helmet of an opposing knight it counted him

ten points, etc. The contest came to an end when the lord of the tournament dropped his warder, thereupon the banners were folded and the amusements ended.

Feasting and merry-making followed the contest. The knights, gaily attired, repaired to the festival hall, each accompanied by "a lady bright." The most distinguished knights took their place near the raised upper end of the



An Apothecary's Shop in Olden Times.

long table. The minstrels struck up their music. Heralds presented to the ladies those knights who had especially distinguished themselves. The "queen of beauty and love" presented the prizes. Thanks were rendered to visiting knights from foreign countries. Dancing closed the festivities for the day.[1]

[1] This account is extracted from Mills: "History of Chivalry," Vol. I. p. 259 *et seq.*

A young knight, who had just been raised to the dignity of knighthood, generally set out in search of adventures. He was known as a *knight-errant.* His object was to gain experience in all knightly exercises. When two such wandering knights met they must needs have a personal set-to to determine which was the more skillful. Such contests were termed *jousts.* Sometimes one knight-errant would station himself at some place where he would be sure to find some one with whom to joust; at the ford of a river, or where four roads met. They furthermore made diligent inquiry for adventures, and at prominent places they would post up a notice where they could be found. In short, they were "spoiling for a fight," and took all manner of ways to be accommodated.[1]

Although simple knighthood has gone out of use on the continent of Europe, there are innumerable grand crosses, commanderies, and companions of a formidable assortment of orders in almost every part of the world, from that of the Golden Fleece of Spain and Austria to those of St. Charles of the pigmy republic of Monaco, and of King Kamehameha of the Sandwich Islands. But with the exception of the orders of Golden Fleece, founded by Philip II., duke of Burgundy, in 1429, and of the Annunciation founded by Charles III., duke of Savoy, in 1518, none of the military, as distinguished from the religious orders of knighthood, have any actual historical connection with chivalry. In England there are seven orders of knighthood—the Garter, the Thistle, St. Patrick, the Bath, the Star of India, St. Michael and St. George, and the Indian Empire. By the end of the fourteenth century, the order of knighthood, as an order formally and par-

[1] Cutts: "Scenes and Characters of the Middle Ages," p. 353 *et seq.*

ticularly dedicated to the service of "God and the ladies" and bound by solemn and express engagements to vindicate justice, to avenge wrong, and to defend the weak, unprotected, and oppressed, had disappeared.

It was with such professed objects however, that chivalry manifested itself during the early and more vigorous stages of its development, and played its part among the

School in Olden Times.

chief and certainly among the most remarkable of those influences that molded the form and directed the course of western civilization in medieval times. The common offspring of feudalism and the church, it derived its resources and its sanctions from each of its parents in turn and stood forth at once the spiritual representative of the one, and the temporal representative of the other. Whatever may have been its inherent vices and defects, it is at any

rate, indisputable that it embodied some of the noblest sentiments and engendered many of the worthy actions of contemporary mankind.

It animated poetry and it created romance and heraldry; it determined individual affairs, modified the policy of states, and generally inspired the energies while it controlled the defense of all those nations which were then, as they now are, the most enlightened as well as the most powerful in the world. Battles were commenced with religious celebrations, and armies esteemed themselves happy if they marched beneath a consecrated standard. Even in the field, and while engaged in mortal conflict, Christian knights enjoyed the duties and courtesies of their order and, if they were taken prisoner, they could count on consideration from their captors and on their freedom, when they paid their stipulated ransom. Moreover, when they took prisoners they could release them on parole to raise their ransoms, confident that they would return to captivity if the ransom could not be raised. It is indeed from the custom of chivalry that the best and most humane portions of the laws of war, in so far as actual combatants are concerned, have their origin.

It is not an altogether easy task to form a just estimation of chivalry. At the present day we are inclined to ridicule many of the ideas of chivalry, but all Europe was swayed by them, and it is necessary for us to weigh them well. The virtues it professed to teach were in many cases excellent. They included valor, loyalty, courtesy, and munificence. Valor was of course the primary qualification of a knight, but loyalty, which implied the strictest fidelity to all his engagements, to his sovereign, his lady-love, and his friends and foes alike, was only second to it in importance. Courtesy meant not only cer-

emonious politeness, but also spontaneous modesty of carriage, self-denial, and careful respect for the feelings of others. Munificence meant a disdain for money, readiness to relieve want and reward services, hospitality, and liberality in all things. We know enough of human nature to know that no discipline or watchfulness would succeed in making every member of an association live fully

Execution in the Middle Ages.

up to the ideas here set forth. It is not strange if some understood courtesy to consist of courtly acts to equals or superiors, but arrogant haughtiness to inferiors, or that extravagance was masqueraded as munificence. We all know there is such a thing even at the present day as being extremely polite, courtly, chivalrous, and all that sort of thing, and yet destitute of all the better traits of character. This was so during the age of chivalry. Still

these blemishes are inherent in human nature, and not in the institution of chivalry.

Probably in no one respect is the weakness of chivalry more apparent than in the relation between the sexes. One of the first duties of knighthood was to protect the weak, this of course included ladies. It is not perhaps strange that devotion to ladies became one of the great hobbies of chivalry. To have some lady-love was the *sine qua non* of page, squire, and knight. This romantic notion was carried to a ridiculous extent. The idea derived from romantic literature that the principal duty of knights was to roam around rescuing unfortunate females from all sorts of predicaments is, of course, an exaggeration. But still it remains true, that quite a large portion of all knightly exertions was undertaken to please some lady-love. This love was not of the Platonic kind either. So it is not strange that, although at no period were women held in greater outward respect by men, it is probably equally true that at no period did more license in the association of the sexes prevail.

Before going farther it may be well to form a mental picture of life during the middle ages, viewed in the mellow light of feudalism and chivalry. The country was somewhat wild; the forests were unsubdued over large sections; and there were quite large tracts of unclosed land. The towns were surrounded by walls having here and there lofty towers. The streets were narrow. The villages consisted of a group of cottages scattered round a wide green, with a village cross in the middle and a may-pole beside it. Castles crowned the hills, manor houses surrounded by wide moats were to be found in the valleys, and hermitages stood by lonely and dangerous fords. There were but few roads, except here and there in the old Roman

provinces, in other sections of the country they were more like green lanes with a narrow beaten track in the middle. Well trodden bridle paths led from village to village.

Strange and picturesque sights were to be seen. The young knight full of ambition to make himself a name, and to win favor in the sight of his lady-love, rode along accompanied by his squire, anxious to find some adventure to distinguish himself, or to meet with another like-minded knight with whom to cross his lance. The feudal lord with his armed retainers was to be seen riding forth from his castle, and hunting parties scoured the woods. The gentlemen would ride by in silks and velvets, in plumed hat and enameled belt, attended by his servants. The minstrel, in gay coat, sang snatches of lays as he wandered along from hall to castle. The more stately group of knights and squires hurrying along were on their way to attend some tournament. It was a wild land the people were rude, the times lawless, but every mile had its pictures for the artist, and every day offered its chance for adventure.[1]

Every one has heard of the Crusades. Probably no one set of causes contributed more to emphasize all the institutions of the middle ages than did the Crusades. They built up the Catholic Church; they contributed largely to the establishment of chivalry, though, as we shall see one of their final results was the breaking up of feudalism. The Crusades were a series of wars, undertaken professedly for the purpose of delivering the holy land from the dominion of the infidel, and so named from the cross worn as a badge by those who devoted themselves to the enterprise. These wars, it was held, were rendered necessary not only

1 Consult Cutts: "Scenes and Characters of the Middle Ages," London, 1872' p. 353.

by the profanation involved in the fact of Mohammedan rule over the country which had been the cradle and birth-place of Christianity, but by the insults and injuries constantly inflicted on Christian pilgrims.

From age to age, the belief had been growing that no work could conduce more to the soul's health, than a visit to the holy places of Palestine. In proportion to the rapidity with which this belief had spread over the Christian

Hall in House of a Lord.

world, a feeling of vehement indignation was awakened by the likelihood, if not certainty, that the Saracen conqueror would put his ban on the performance of that which was deemed to be an act of the highest Christian duty. The recitals of the wrongs perpetrated on Christian pilgrims, went far towards fanning into flame the feelings which the popes had hitherto failed to awaken in sufficient strength. The idea of an armed host, which should inflict summary

vengeance upon the oppressors of the Christians, had already dawned on the mind of the great Hildebrand, Gregory the Seventh. It had been urged by his successor, Victor the Third, but neither had struck the right chord. Such enterprises can never be set in motion with any solid results, except when the flood-tide of popular feeling gives its own weight to the sanction of religious authority.

At that time, there appeared a poor, withered-looking monk, by the name of Peter the Hermit, with the stature and ungainliness of a dwarf. Emaciated by the austerities of his self imposed discipline, this man, who had forsaken his wife and abandoned his military standard, had returned from the holy land with his heart on fire, not so much from the memory of the hardships which he had himself undergone, as for the cruelties and tortures which he had seen inflicted on his fellow Christians. Armed with the special blessing of Pope Urban the Second, he mounted his ass and, with bare head and feet, carrying a huge crucifix, traversed the German lands rousing everywhere the incontrollable indignation, which devoured his own soul His vehemence carried all before him, none the less, perhaps, because he bade them remember, that no sins were too heinous to be washed away by the water of the Jordan, no evil habits too deadly to be condoned by the one good work which would make them champions of the cross.[1]

Pope Urban however and his counselors knew well that, before the fatal die could be prudently cast, a serious task lay before them. The system of feudalism, as we have tried to show, substituted personal ascendency for the dominion of a central, general law; and, wherever the personal bond failed, their resort was inevitably to private war.

[1] Michaud: Hist. des Croisades, I. 432.

The practice of such wars had become virtually an organized trade, and if a large proportion of the population should be drawn away to fight against the infidels in Palestine, those who remained at home would be without defense. Such wars were therefore formally condemned. The women and the clergy, merchants and husbandmen were placed under the special protection of the church, and the truce of God was solemnly confirmed.

The First Proof.

Of the thousands who hastened to put on the badge, the great number were animated probably by the most disinterested motives, while some had their eyes fixed on the results of more politic calculations. For the multitude at large, there was the paramount attraction of an enterprise, which was put before them as a new mode of salvation, that enabled the layman without laying aside his habits of wild license, to reach a height of perfection

scarcely to be attained by the austere monk or the most devoted priest. Nay, more, the assumption of the cross set the debtor free from his creditor so long as he wore the sacred badge; opened the prison door for the malefactor, annulled the jurisdiction of the lord over the burgher or peasant; and enabled the priest and the monk to escape from the monotony of the parish and the cloister.

It might be thought that these privileges would tell hard on the creditors, the capitalists, and the usurers, but these reaped the most solid benefits. The princes who bound themselves by the vow must provide equipments for themselves and their followers, and carry with them sums of money sufficient for their needs. These sums must be raised by loan or mortgage; and, as all wished to get horses, arms, and money, in exchange for lands, the former became inordinately dear, the latter absurdly cheap. Thus the real gain lay on the side of the merchant and the trader or of the land owner who was prudent enough to add to his own domains by availing himself of the necessities of his neighbors.[1]

All this, however, had been effected by the authority and sanction of the Holy See, which had taken under its protection the dominion of all crusading princes. It was for the pope to decide whether those who had taken the vow should set off at once, whether some time of grace should be allowed, or whether the vows should be remitted altogether. The pope became, therefore, possessed of a dispensing power, which placed him above all other sovereigns. His gains, moreover, were immediate. The Crusades tended to merge the smaller into larger fiefs, which again were absorbed into the royal domain, thus largely promoting that growth of the sovereign power,

[1] Wilken; "Geschichte der Kreuzzuge, I. 347-468.

that in the end, broke up the feudal system. These results belonged to the distant future, but the pope was enabled, rather he was constrained, to send his legates into every land, both to enlist soldiers under the standard of the cross, and to collect money for their support.

He became, thus, at once the administrator of vast revenues, that were raised partly by subsides and imposed as a necessary obligation on the clergy, and in part by the voluntary contributions of the laity. With the pope, the ecclesiastical body generally acquired enormous power. The lands of the church, though money might be borrowed upon them, could not be alienated, but it was only in comparatively few instances that it was necessary to burden them at all. The monastic houses might send some of their members to the Holy Land, the rest remained at home and became mortgagees or trustees of the estates belonging to the crusaders. If these died without heirs, the guardians became the absolute owners; and of those who returned, not a few withdrew into a cloister, and endowed with their worldly goods the last place of resort they had chosen.[1] The narrative of the Crusades brings out with sufficient clearness, both their causes and their consequences. While the popular impulse which led to them could not issue any vigorous action without the sanction of religion, the mere authority even of the popes was powerless to set Latin Christendom in motion until popular indignation had reached the fever heat.

In reading the history of the crusades, the details of which can not, by the general character of this work form a part of the present chapter, we are able to watch the effects of enterprises in changing the face, not only of the East, but of the West, securing to the popes, the exact-

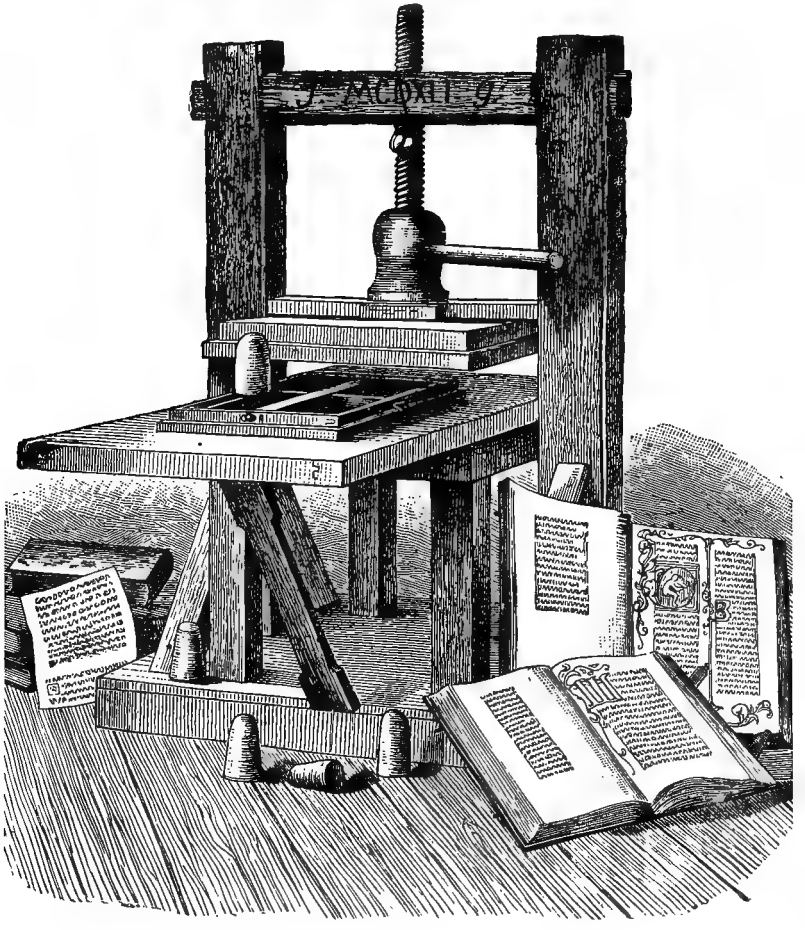
[1] G. W. Cox: "Crusades."

ion and administration of vast revenues and of a dispensing power still more momentous in its issue, strengthening and extending royal authority by the absorption of fiefs, but for the moment increasing in incomparably larger measure the wealth and influence of the clergy. We can see the introduction of feudal principles into Jerusalem and Constantinople, and can likewise mark the effects that followed the substitution of the laws of Jerusalem for the code of Rome. The story shows us, that the contact of western with eastern Christendom brought about, in some respects, results precisely opposite to those which were anticipated from it, and that the establishment of the Latin Empire of Constantinople[1] rendered hopeless that union of the churches which Pope Innocent III. had regarded as its certain fruit.

But if the Crusades thus disappointed the expectations of their promoters, they achieved some results, the benefits of which have been felt from that day to the present. They failed indeed to establish the permanent dominion of Latin Christendom, but they prolonged for nearly four centuries the life of the Eastern Empire, and by so doing, they arrested the time of Mohammedan conquests in the East. They saved the Italian, perhaps even the more northern lands of Europe from a tyranny, which has blasted the fairest regions of the earth, and if they added fuel to the flame of theological hatred between the Greek and Latin churches, if they intensified the feeling of suspicion and dislike between the western and the eastern Christians, they yet opened the way for an interchange of thought and learning, that had its result in the revival of letters and in the religious reformation that followed that revival. If again of their leaders, some showed

[1] Above p. 358.

themselves men of cruelty and insatiable greed, there were others who, like Tancred, approached the ideal of the knightly chivalry of a later generation, and others again whose self-sacrificing charity and heroic patience furnish



The First Printing Press.

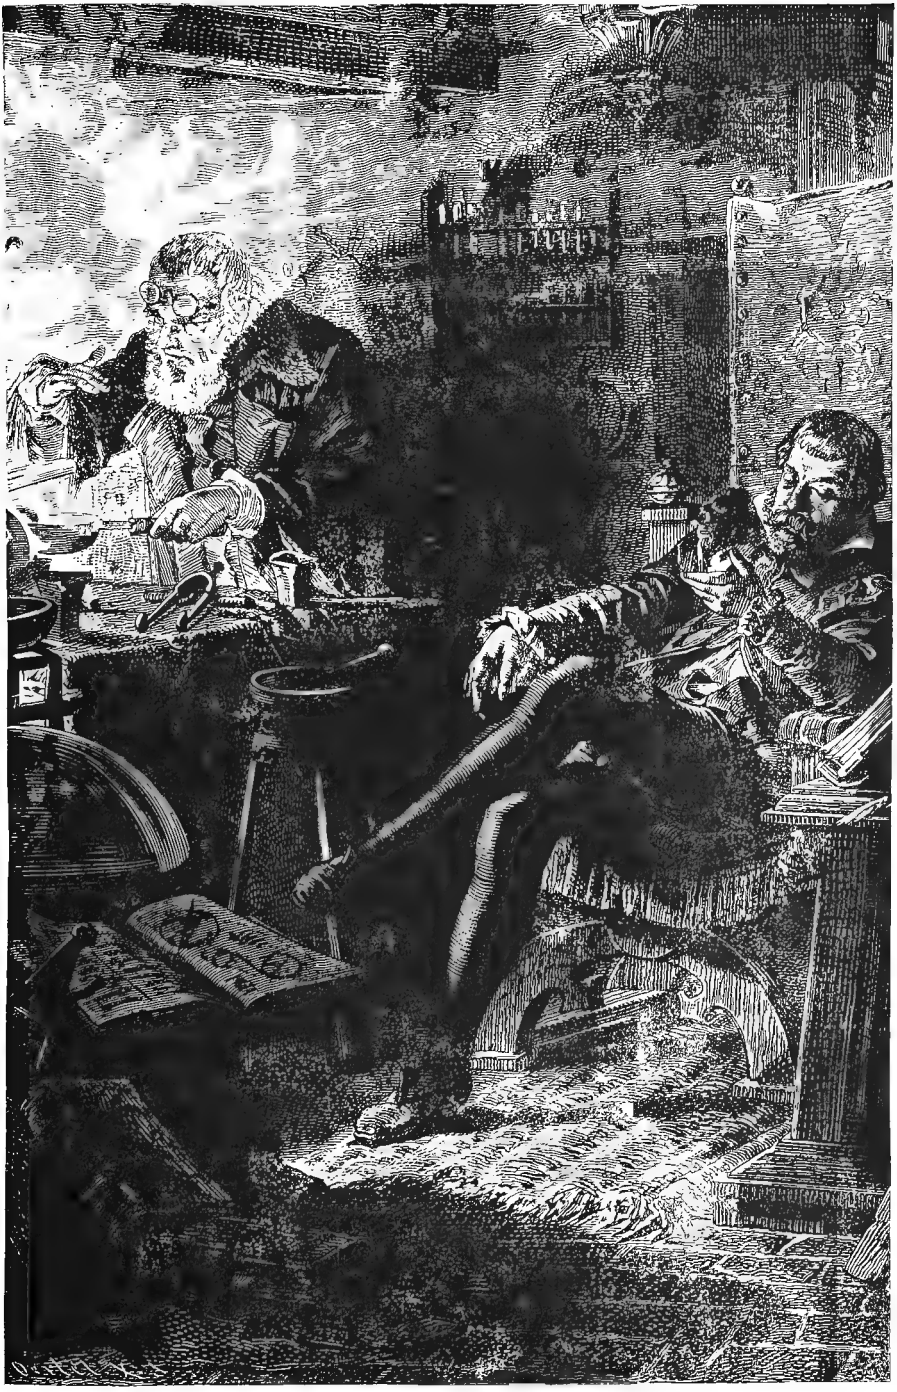
an example for all time. The ulterior results of the Crusades were the breaking of the feudal system, the abolition of serfdom, the supremacy of a common law over the independent jurisdiction of chiefs, and if for the time they led to deeds of iniquity which it would be monstrous even

to palliate, it must yet be admitted, that, in their influence on later ages, the evil has been assuredly outweighed by the good.[1]

It is necessary for us to study the Catholic Church of the middle ages. The influence and power of the Catholic church during these ages were so great, its impress on the history of the times was so incisive, that the period in question is sometimes known as the age of church rule. Our subject calls for no analysis of the doctrines of the church, but we simply want to know the nature of its power, and the character of its influence. We must not forget that the possession of land was a great source of power especially in the earlier portion of the middle ages. Though the especial domain of the church was in matters spiritual, still it has always been anxious to possess secular power. We find therefore the church in the middle ages gaining control of as much land as possible.

The church, as an organized body, never received any territorial endowments by law, but the voluntary gifts of princes as well as their subjects supplied the place of the legal provision. Large private estates, or, as they were called, patrimonies, not only in their own, but even in distant countries, sustained the dignity of the principal sees of the bishops and especially that of Rome. Many churches possessed seven or eight thousand mansi, meaning so many little landed estates. A church with but two thousand of these mansi was not esteemed especially rich. It must be remarked that much land was wild and uncultivated. Monasteries acquired legitimate riches by the culture of such tracts and by the prudent management of their revenues, which were less exposed to the ordinary

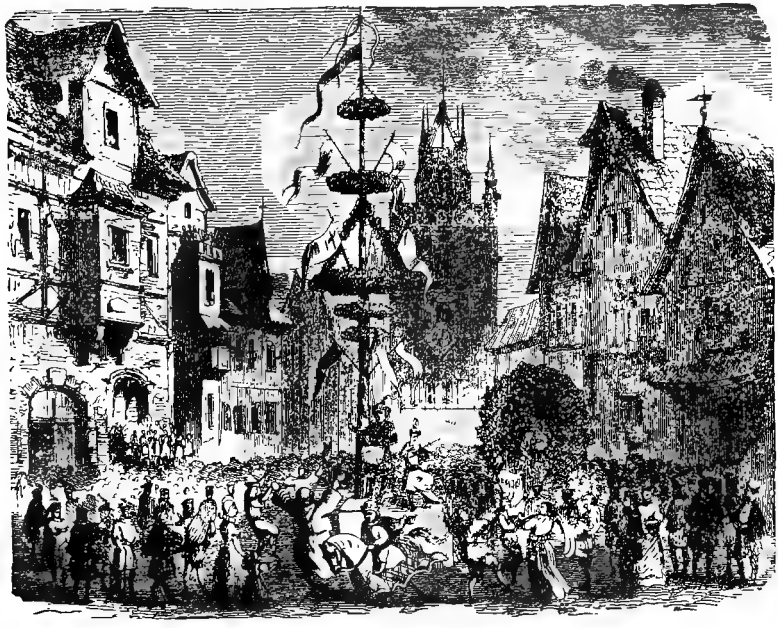
1 In the general estimation of the Crusades, we have followed the opinion and the text of Sir. G. Cox's "Crusades."



THE ALCHEMIST.

means of dissipation than those of laymen. Their wealth, continually accumulating, enabled them to become the regular purchasers of landed estates. Especially was this the case in the times of the Crusades, when the fiefs of the nobility were constantly in the market for sale or mortgage.

If the possessions of ecclesiastical communities had all been as fairly earned, we could not complain, but other



May Festival in the Middle Ages.

sources of this wealth were less pure.[1] Those who entered a monastery frequently put their whole estates into the common stock, and even the children of rich parents were expected to make a donation of land on assuming the cowl. Some gave their property to the church before entering on military expeditions; gifts were made by some

[1] Hallam. "Middle Ages," ch. vii.

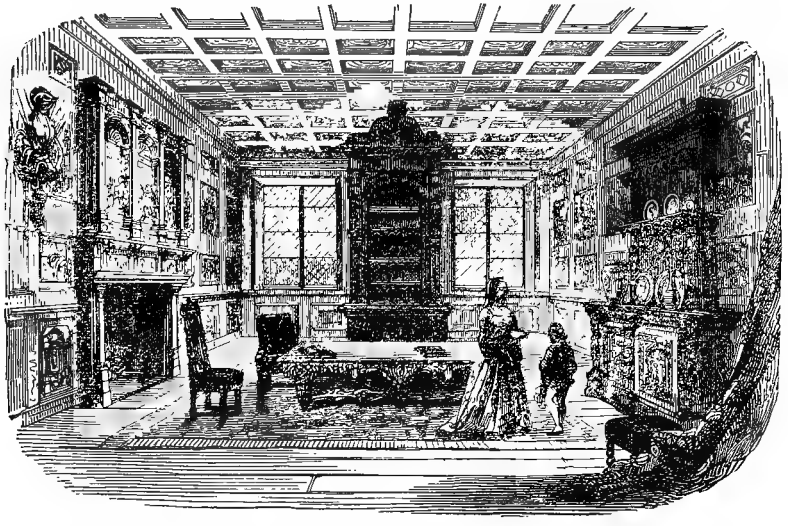
to take effect after their lives, and many bequests were made by individuals on their death-beds. Even these legacies to charitable purposes, the administration of which was generally given to the clergy, were frequently applied to their own benefit. They failed not, above all, to inculcate upon a wealthy sinner that no atonement could be so acceptable to heaven as liberal presents to its earthly delegates. To die without allotting a portion of worldly wealth to pious orders was accounted almost like suicide, or the refusal of the last sacraments, and hence intestacy passed for a sort of fraud upon the church, which she punished by taking the administration of the deceased into her own hands. This, however, was peculiar to England and seems to have been the case there only between the reigns of Henry III. and Edward III.

The church lands enjoyed an immunity from taxes, though not, as we have remarked above in general, from military service when held by feudal tenure. This being the case, we can understand how lay-proprietors acquired the custom of granting their estates to the church, but receiving the same back as a fief or lease. Such lands were now exempted from public burdens since they were church lands. Sometimes the monks misused their knowledge of writing for the purpose of forging charters in their favor, which might easily impose upon an age in which but comparatively few persons could write and the more so, since it has acquired a peculiar science to detect these frauds in modern times.[1] As an additional source of revenue and in imitation of a Jewish law, the payment of tithes was recommended or enjoined.

Yet there were many obstacles to the clergy in their acquisition of opulence. There was a return wave of

[1] Hallam, l. c.

violence that set sometimes very strongly against them. In times of barbarous violence, nothing can thoroughly compensate for the inferiority of physical strength and prowess. The ecclesiastical history of the middle ages presents one long continuation of fraud against robbery, of acquisitions, made by the church through such means as we have just mentioned, torn from her in turn by lawless power. Those very men, who, in the hour of sickness



House of a Rich Burgher of the 15th Century.

and impending death, showered the gifts of expiatory devotion upon her altars, passed the sunshine of their lives in sacrilegious plunder. Notwithstanding the frequent instances of extreme reverence for religious institutions among the nobility, we should be deceived in supposing this to be their general character. Rapacity, not less than that of the abbots, was commonly united with a daring fierceness that the abbots could not resist. In every country we find continual lamentation over the plunder of ecclesiastical possessions. Charles Martel is reproached with

having given the first notorious example of such spoliation. If it had not been for the draw-backs, the clergy must, one must imagine, have almost acquired the exclusive property of the soil. They did enjoy nearly one-half of England and, in some countries of Europe, a still greater proportion.[1] The great age of monasteries in England was the reigns of Henry I., Stephen, and Henry II. The revenue of the English church in 1337 amounted to over seven hundred thousand marks per annum.

Among the causes which served to increase the power of the church, was the right and power of excommunication, in an age of superstition this became a weapon of great power. Whatever opinions may be entertained as to its religious efficacy, excommunication was originally nothing more in appearance than an exercise of a right which every society claims, namely, the expulsion of refractory members from its body. No direct temporal disadvantages attended this penalty for several ages; but, as it was the most severe of spiritual censures and tended to exclude the object of it not only from a participation in just rights but, in a considerable degree, from the intercourse of Christian society, it was used sparingly and only upon the gravest occasions. Gradually, as the church became more powerful and more imperious, excommunications were issued upon every provocation, rather as a weapon af ecclesiastical warfare than with any regard to its original intention. Very soon, others than spiritual penalties were added to the consequences of excommunication.

By the common law of England, for instance, an excommunicated person was incapable of being a witness, or of bringing an action, and he might be detained in prison

[1] Turner: "History of England," Vol. III. p. 45. MacPherson: "Annals of Commerce."

until he obtained absolution.[1] By the Establishments of St. Louis, his estate or person might be attached by the magistrate. These actual penalties were attended by marks of abhorrence and ignominy, still more calculated to make an impression on ordinary minds. They were to be shunned, like men infected with leprosy, by their servants, their friends, and their families. Two attendants only, if we trace a current history, remained with Robert, king of France, who on account of an irregular marriage was put under this ban by Gregory V., and these threw all the meats which had passed his table into the fire. Indeed, the mere intercourse with a prescribed person incurred what is called the lesser ex-communication, or prevention of the sacraments, and required penance and absolution. In some cases a bier was set before the door of the ex-communicated individual and stones thrown at his windows. Everywhere the excommunicated were debarred regular sepulcher.[2]

But ex-communication which attacked only one and perhaps a hardened sinner was not always efficacious, so the church had recourse to a more comprehensive punishment. For the offense of a nobleman, she put a county—for that of a prince, his entire kingdom, under an interdict or suspension of religious offices. No stretch of her power was perhaps so cruel as this. During an interdict, the churches were closed, the bells silent, and dead unburied; no rites but those of baptism and extreme unction were performed. The penalty fell upon those who had neither protection nor could have prevented the offense; and the offense was often but a private dispute in which the pride of a pope or bishop had been wounded. This was the main-spring of

[1] "Coke on Littleton" [Thorne. ed.] Vol. III. p. 390 *et seq.*

[2] Du Cange, sub voce: Imblocatus.

the machinery that the clergy set in motion, the lever by which they moved the world. It might be said, that, from the moment these interdicts and ex-communications were tried, the power of the church existed only by sufferance. Nor was the validity of such denunciations supposed to de-

Treatment of Heretics in the Middle Ages.

pend upon their justice. The imposer, indeed, of an unjust ex-communication was guilty of a sin, but the parties subjected to it had no remedy but submission. After Pope Gregory VII., however, as the spirit of ecclesiastical usurpation became more violent, there grew up by degrees an opposite feeling in the laity, which ripened into an alienation of sentiment from the church.

The great reformer, and in fact the founder of the ascendency of the church, in the middle ages was Pope Gregory VII., or as he was called before being elected to the Holy See, Hildebrand. He was at once the most ambitious, the most energetic, and the greatest master of external as well as of internal politics. Previous to his time, the position of the church, although always regarded with awe and respect, was in the very best case, one of equal might and power with the influence of kings and sovereigns. It was the ambition of Gregory VII. to raise and increase the power of the church, so as to be not the equal, but the superior of all secular princes. This, the object of his life, he began to realize long before he was elected to the papal dignity. Already under his immediate predecessors, he was the main spring of the actions emanating from Rome. With great boldness he advised the pope to regard the emperors of Germany, as well as the kings of France, as his spiritual vassals, and instead of waiting for the confirmation and approval of the emperor, to ignore it totally. When Gregory ascended the Papal See, he carried his aggressive politics against the German Emperor, Henry IV., to an extreme, as we have already outlined.[1]

It is a difficult task to come to an impartial judgment on the merits or demerits of the Catholic church during the middle ages. In modern times, the position and power of the Roman church is apparently far from equaling its power during the middle ages. But this statement must be taken with many allowances, for, at present as well as in former times, the Catholic church commands an almost unbounded influence; still, admitting its truth, this statement ought not lead us into too harsh a judgment of the

[1] Above p. 372.

people of other centuries. Many, at present, think that the power of the church is deleterious to the general advance of mankind and that it ought to be curbed and controlled by the arm of secular power. During the middle ages the influence of the church was felt in almost every department of public and private life. It may well be,

Book Making in the Middle Ages.

then, that its influence, in some degree at least, was of undue dimensions; but on the other hand, we must not forget that strictly political and secular powers are also encroaching and aggressive. They, too, thrust themselves upon almost every department of private and domestic life. They deprive us of a considerable part of our

time, and exact very heavy tributes in the way of taxation.

Especially is this true of Europe where the bearing and influence of the state on pretty nearly every individual is more annoying and troublesome than the interference of the church in the middle ages. Thus nearly every European is subject to three years military service, and to all varieties of exactions as well as having to bear the burden of frequent and unreasonable taxes. Now intellectual and spiritual power, not being inferior to secular and political power, there really is very little reason to exaggerate the bad influence of the one and extol the good work of the other. Power, after all, is power, and interference remains interference, whether it comes from a pope or from a king. These considerations must give us pause when about to launch out in some denunciations against the church in the middle ages. The church numbered hundreds of thousands of members, and it is but a matter of course that in a corporation consisting of such a numerous membership, persons guilty of all kinds of misdemeanors, vices, and even crimes, creep in.

A heavy indictment has been drawn against the church in the matter of mental liberty and scientific advance. The case seems to be well made out, but it is well to see what can be said on the side of the accused. Under the name of scholasticism we generally comprise the philosophy and science of the middle ages. Many writers in our times delight in running down and decrying the efforts of medieval thinkers, but a closer study of their works generally ends with an admiration of the writers and an acknowledgment of their talent, industry, and perseverance. Several of them, like Duns Scotus Erigena, Albertus Magnus, St. Thomas of Aquina, William of Champeaux, Occam, and others are justly distinguished, and a

deeper study of their works has disclosed to us many a mine of happy and rich thoughts. The works of St. Thomas of Aquina may be fairly considered the treasury of knowledge of those times, embracing, as they do, the whole circle of sciences cultivated in the middle ages.[1]

Street Shows in the Middle Ages.

All these thinkers were under the immediate influence of the church, even members of the same; but this did not prevent them from broaching the profoundest problems and giving expression to thoughts of lasting

[1] Compare the works of Stoecker on Scholasticism, and especially the suggestive work of Pouchet on the progress of natural science during the middle ages.

value. We must not forget, either, that the church enjoined on several of its orders the obligation of copying the ancient manuscripts of Roman and Greek writers; and it is only by the industry and patience of those medieval monks that we can still enjoy the productions of classical writers. All our knowledge of Greece and Rome has been preserved by the monks, more especially by the Benedictines. In the field of history, too, we extract from their dreary tomes considerable information, not only as to ancient Greece and Rome but of the history and institutions of medieval times. But on the other hand, there is a sad story to tell. We must remember, however, that similar results would attend the establishment of any church, clothed with political power, among a people who had not yet attained a stage of great intellectual advance. When Christianity came into power under Constantine, there commenced that sad conflict between science and religion which ended some centuries later, when the church had become thoroughly established, by the subversion of science to bigotry and superstition. Thus the church which should have been the power to free men's minds from the oppressive weight of ignorance, but riveted their fetters more strongly. It is extremely probable that, had there been no organized church clothed with the power to enforce its decrees, there would have been no "dark ages," but given the foregoing the latter result followed. The church was not the cause of the superstition and ignorance of the dark ages, but the oppressive weight of ecclesiastical power put an end for many dreary centuries to further advance in knowledge.

In conclusion of our view of the middle ages, we shall devote some attention to the commercial activities of those times. From about the middle of the fourteenth

century, we find evidence of a continuous and rapid increase in wealth. Thus in 1363, Picard, who had been lord mayor some years before, entertained Edward III., the Black Prince, the kings of France, Scotland, and Cyprus, with many of the nobility, at his own house and

Attack on a Caravan.

presented them with handsome gifts. Philipot, another eminent citizen in Richard II.'s time, when the trading of England was considerably annoyed by privateers, hired one thousand armed men and dispatched them to sea, where they took fifteen Spanish vessels with their prizes. We find Richard obtaining a great deal from private

merchants and trading towns. In 1379, he got five thousand pounds sterling from London, a thousand marks from Bristol, and in proportion from smaller places. In 1386, London gave four thousand pounds sterling more and ten thousand marks in 1377. The latter sum was obtained also for the coronation of Henry VI. nor were the contributions of individuals contemptible, considering the high value of money. Hinde, a citizen of London, loaned Henry IV. two thousand pounds sterling, and Whittington, one half of that sum.[1]

A commercial intercourse between the northern and southern regions of Europe sprang up about the early part of the fourteenth century. The Italian merchants seldom undertook voyages perilous in themselves, but rendered more formidable by imaginary difficulties supposed to attend an expedition beyond the Straits of Hercules, as the Straits of Gibraltar were then called, before the magnet was discovered, its properties understood, and navigation raised to a science. The English, accustomed to their own rough seas, were always more intrepid and probably more skillful navigators, but it was extremely rare even in the fifteenth century for an English trading vessel to appear in the Mediterranean. Yet a famous military armament, destined for the crusade of Richard I., had displayed, at a very early time, the seamanship of the English. In the reign of Henry VI., England carried on a pretty extensive traffic with the countries around the Mediterranean, for whose commodities she exchanged her wool and cloth. The city republics of Venice and Amalfi kept up the commercial intercourse of Christendom with the Saracen countries before the first crusade. Scarcely known before the end of the sixth, Almalfi ran a brilliant

[1] Hallam: "View of the Middle Ages," chap. ix.

career as a free and trading republic until the middle of the twelfth century when the Normans reduced her by force of arms. But the decline of Amalfi was counterbalanced by the elevation of Pisa, Genoa, and Venice in in the twelfth and ensuing ages. These three Italian Republics enjoyed immunities in the Christian principalities of Syria, possessing separate quarters in many cities where they were governed by their own laws and magistrates.[1]

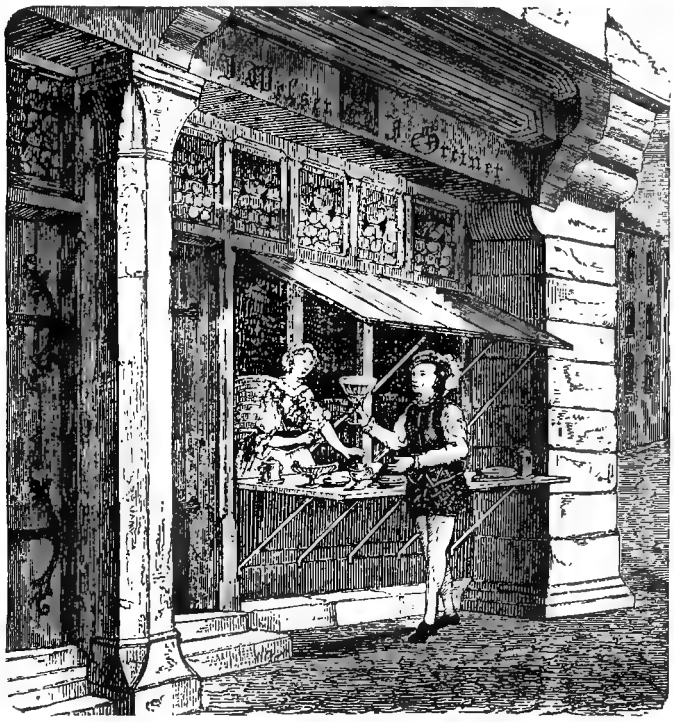
The introduction of a silk manufactory at Palermo, by Richard Guiscard in 1148, gave perhaps the earliest impulse to the industry of Italy. The Genoese, at about the same date, plundered two Moorish cities of Spain, from which they derived the same art. In the next age, this became a staple manufacture of the Lombard and Tuscan Republics, and the cultivation of mulberries was enforced by their laws. Woolen stuffs, though the trade was perhaps less conspicuous than that of Flanders, and though many of the coarser kinds were imported from thence, engaged a multitude of workmen in Italy and the south of France. Among the trading companies, into which the middle ranks were distributed, those concerned in silk and woolen manufacture were always numerous and honorable.[2]

It is perhaps impossible to ascertain the epoch when the polarity of the magnet became first known in Europe. The common opinion which ascribes its discovery to a citizen of Amalfi, in the fourteenth century, is undoubtedly erroneous. The French, as well as the Italians, claimed the discovery as their own, but whether it was due to either of these nations or rather learned from their

1 Muratori, Dissertationes, xxx.

2 Decandolle, "Domestic Plants," Silk.

intercourse with the Saracens is not easily to be ascertained. When the use of the magnet became more established, it naturally inspired a more fearless spirit of adventure. It was not, as has been mentioned, till the beginning of the fourteenth century, that the Genoese and other nations around that inland sea steered into the Atlantic Ocean toward England and Flanders. In spite



Street Scene in the Middle Ages.

of numerous obstacles, such as the general uncertainty of law and maritime piracy, the merchants of different countries became so opulent as to almost rival the ancient nobility. The trading companies possessed either a positive or a virtual monopoly, and held the keys of those eastern regions, for the luxuries of which the progressive

refinement of manners produced an increasing demand.

It is not easy to determine the average rate of profit, but we know that the interest of money was very high throughout the middle ages. At Verona in 1228, it was fixed by law at twelve and a half per cent; at Modina in 1270, it seems to have been as high as twenty per cent. The Republic of Genoa, towards the end of the

Carpenter Shop in Olden Times.

fourteenth century, when Italy had grown wealthy, paid only from seven to ten per cent to her creditors; but in France and England, the rate was more oppressive. An ordinance of Philip the Fair, in 1311, allowed twenty per cent after the first year of the loan. Under Henry III., the debtor paid ten per cent every two months, but this could not possibly have been the general practice. This was not merely owing to scarcity of money, but to the discouragement which a strange prejudice opposed to one

of the most useful and legitimate branches of commerce. Usury or lending money for profit was treated as a crime by the theologians of the middle ages. Though this opinion has been overthrown, traces of it still remain in the legislation of some modern countries. This trade in money, and indeed a great part of inland trade in general, had originally fallen to the Jews, who were noted for their usury as early as the sixth century.

The earliest bank of deposit, instituted for the accommodation of private merchants, is said to have been that of Barcelona in 1401. The banks of Verona and Genoa were of a different description. Although the former of these two has the advantage of greater antiquity, having been formed in the twelfth century, yet its early history is not so clear as that of Genoa, nor its political importance so remarkable. During the wars of the fourteenth century, Genoa had borrowed large sums of private citizens, to whom the revenues of the city were pledged for repayment. As a security, at least for their interest, the subscribers to the loans were permitted to receive the produce of the taxes by their own collectors, paying the excess into the treasury. The number and distinct classes of these subscribers, becoming at last inconvenient, they were formed, about the year 1407, into a single corporation, called the "Bank of St. George," which was from that time, the sole national creditor and mortgagee. The government of this was entrusted to eight protectors. It soon became almost independent of the state. Every member, on his admission, swore to maintain the privileges of the bank which were confirmed by the pope and even by the empire. The bank interposed its advice in every measure of government and generally, as is admitted, to the public advantage. It equipped armaments at its own

expense, one of which subdued the island of Corsica.[1]

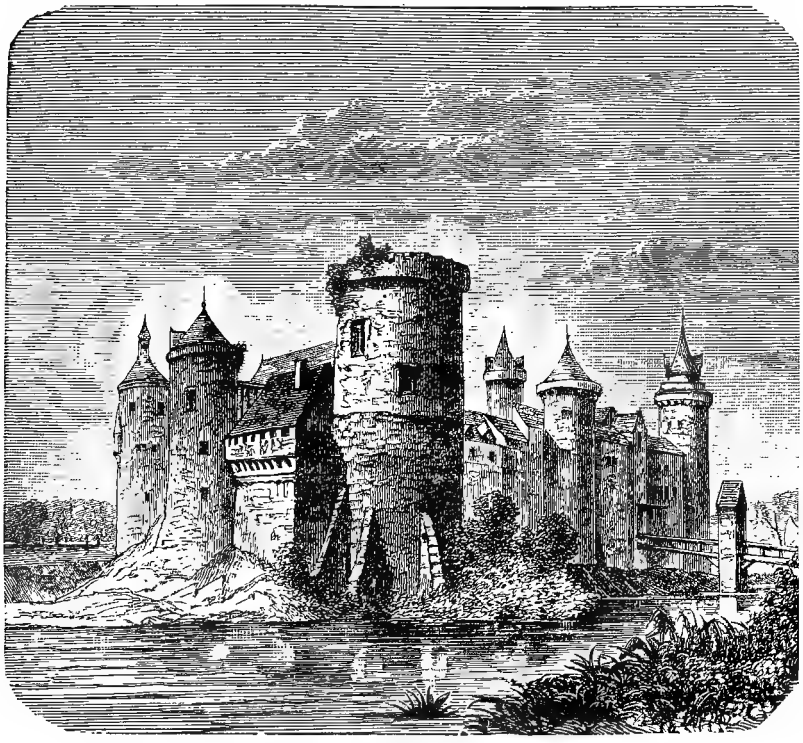
The increasing wealth of Europe, whether derived from internal improvement or foreign commerce, displayed itself in more extensive consumption and greater refinements of domestic life; but these effects were, for a long time, very gradual. It is not till the latter part of the thirteenth century, that a more rapid impulse appears to have been given to society. A writer about the era thirteen hundred describes the manners of the Italians as follows: "In those times," he says, "the manners of the Italians were rude. A man and his wife ate off the same plate, there were no wooden-handled knives nor more than one or two drinking cups in the house. Candles of wax or tallow were unknown. A servant held a torch during the supper. The clothes of men were of leather unlined, scarcely any gold or silver was seen on their dress. The common people ate flesh but three times a week and kept their cold meat for supper. Many did not drink wine in summer. A small stock of rye seemed riches. The portions of women were small. Their dress even after marriage was simple. The pride of man was to be well provided with arms and horses. That of the nobility, to have lofty towers, of which all the cities of Italy were full. But now," he adds, "frugality has been changed for sumptuousness, everything exquisite is sought after in dress, gold, silver, pearls, silks, and rich furs. Foreign wines and rich meats are required, hence usury, rapine, tyranny, fraud, etc."[2]

No chapter of national manners would illustrate so well, if duly executed, the progress of social life as that dedicated to domestic architecture. The fashions of dress

1 Hallam: "Middle Ages," ch. ix.

2 Ricobaldi, quoted in Muratori: "Dissertationes, xxxvi."

and of amusements are generally capricious and irreducible to rule, but every change in the dwellings of mankind, from the rudest wooden cabin to the stately residence, was dictated by some principle of convenience, neatness, comfort, or magnificence. Both France and England do not appear to have made great progress in domestic architec-



Feudal Castle at Rouen.

ture during the middle ages. Except fortified castles, we do not find any considerable dwellings mentioned before the reign of Charles VII. of France. Occasionally a rich merchant possessed a magnificent house in Paris or in some of the neighboring cities. Even in Italy, where from the size of her cities and social refinements of her inhabitants, greater elegance and splendor in building were

justly to be expected, the domestic architecture of the middle ages did not attain any perfection.

In several towns, the houses were covered with thatch, and suffered consequently from destructive fires. The two most essential improvements in architecture during this period, one of which had been missed by the sagacity of Greece and Rome, were chimneys and glass windows. Nothing, apparently, can be more simple than the former, yet the wisdom of ancient times had been content to let the smoke escape by an opening in the center of the roof.[1] About the middle of the fourteenth century, the use of chimneys is distinctly mentioned in England and Italy, but they are found in several of the English castles, which bear a much older date. Glass is said to have been employed in the domestic architecture of France before the fourteenth century, and its introduction into England was probably not earlier Nor indeed did it come into general use during the period of the middle ages. Glazed windows were considered as movable furniture and probably bore a high price. When the earls of Northumberland, as late as the reign of Elizabeth, left Alnwick Castle, windows were taken out of their frames and carefully laid by. But if the domestic buildings of the fifteenth century would not seem very spacious or convenient at present, far less would this generation be content with their internal accommodations. A gentleman's house, containing three or four beds, was extraordinarily well provided. Few probably had more than two. The walls were commonly bare. It is unnecessary to add that neither luxuries of books nor pictures could have found a place among furniture. Silver plate was very rare and hardly used for the table.

[1] Beckmann: "Geschichte der Erfindungen," III. p. 110.

Few things are capable of giving us a more distinct idea of the economical condition of a period of time than the general market prices of things. In the reign of Henry III. and Edward I. in other words, before 1300, the ordinary price of a quarter of wheat appears to have been about four shillings, and that of barley and oats in proportion. A sheep at a shilling was considered high.[1] An ox might be procured for ten or twelve. The value of cattle is of course dependent upon their breed and condition, and we have no early account of butcher's meat. In order to bring the prices of the thirteenth century to a level with those of the present day, we can hardly take a less multiple than about thirty for animal food and eighteen or twenty for rye. Combining the two and setting the comparative dearness of cloth against the cheapness of fuel and many other articles, we may perhaps consider any given sum under Henry III. and Edward I. as equivalent in general command over commodities to about twenty-four or twenty-five times their nominal value at present. Accustomed to judge of feudal and chivalrous ages by works of fiction or by historians who embellish their writings with accounts of occasional festivals and tournaments and are sometimes inattentive enough to transfer the manners of the seventeenth to the fourteenth century, we are not at all aware of the usual simplicity with which the gentry lived under Edward I. or even Henry VI. They drank little wine, although they generally made up for that in the way of drinking beer. They had no foreign luxuries; they rarely or never kept male servants except for husbandry. Their horses as we may guess by the price, were indifferent. They seldom traveled beyond their country and even their hospitality

1 English Shilling.

must have been greatly limited if the value of estates was really no greater than we find it in many surveys. An income of ten or twenty pounds sterling was reckoned a competent estate for a gentleman. At least the lord of a single manor would seldom have enjoyed more. A knight, who possessed one hundred and fifty pounds sterling per annum, passed for extremely rich, yet this was not equal in command over commodities to four thousand pounds sterling at present.

But this income was comparatively free from taxation; and in addition to the money, the lord had the disposal of quite an array of villeins. Sir John Fortescue speaks of five pounds a year as a fair living for a yeoman, a class of whom he is not at all inclined to diminish the importance. Still one class of laborers seem to have been better paid in the reigns of Edward III. or Henry VI. than at present. In the fourteenth century, a harvest man had four pence a day which enabled him in a week to buy a comb of wheat, but to buy a comb of wheat a man must now work six or eight days. So under Henry VI., if meat was at a farthing and a half a pound, a laborer, earning three pence a day or eighteen pence in a week, could buy a bushel of wheat at six shillings the quarter, and twenty-four pounds of meat for his family. A laborer, at present earning twelve shillings a week, can buy only half a bushel of wheat at eighty shillings the quarter and twelve pounds of meat at seven pence.[1]

It would be great historical injustice in treating of the institutions of the middle ages, to neglect the great and far-reaching influence of a people, who, by their intense interest in everything connected with civilization and by their intimate connection with medieval Europe, claim

1 Nicholl's "Illustrations," and Hallam.

our attention, if not our gratitude. We mean the people following the Mohammedan creed and more especially the Arabians of the middle ages. Their vast empire founded on the valor and military system of Mohammed soon turned to a cultivation of science and philosophy, which did not fail to bear fruit and be of great consequence both to the country where it was produced and the countries of Europe to which it was carried by the zeal and thirst for knowledge of some Christian thinkers. The Arabians, with an energy and a genius but rarely equalled, devoted their attention to philosophical and scientific studies; and many of their caliphs, like Al Manzur and the still more celebrated Haroun-al-Raschid, were eager to attract to their courts the astronomers and mathematicians of the empire.

The Arabians, highly prized the great and useful literature of the Greeks, and did not hesitate to avail themselves of the works of Aristotle, Plato, and the later school of Alexandria. They translated the works of those Greek thinkers into the classical language of Arabia; and, more than this, they unceasingly endeavored and frequently succeeded, in reforming and improving on their teachers. The great names of Averroes and Avicenna are immortal luminaries in the history of philosophy. The mathematical works of Mohammed ben Mousa enriched the science of higher arithmetic with the solution of equations of the second degree. They were equally felicitous in their study of the human body, and Arabian physicians and doctors had a reputation all over the then known world. Frederick II., the enlightened and ingenious emperor of Germany, had them as his constant companions, delighting in the conversation of those learned men, who at that time combined both the classical knowl-

edge of Greece and the newly acquired treasures of facts and ideas, found and propounded by Arabian thinkers.

The bloom and blossom of Arabian civilization centered in Spain; and it was to that land, where the Arabians long held a beneficent sway over two-thirds of the country, that many a zealous scholar of Europe repaired in order to acquire information which, at that time, he could not procure elsewhere. Geber, or as he is better known, Pope Sylvester II., was an immediate scholar of the Arabians in Spain; and it was to their instruction that he owed his remarkable skill in the theory and practice of mathematical science. Roger Bacon, the great wonder and marvel of English science in the middle ages, took a considerable part of his knowledge, his theorems, and inventions from a diligent study of the works of Arabian philosophers; and thus we may fairly state that the Arabian civilization, if it did not exercise an influence similar to that of Greek or Roman civilization, was indeed not very inferior in its consequences, having roused the spirit of self-reflection and a bolder investigation into the problems of nature and of the human mind. Many of the commonest words in our science still bear the signs of Arabian influence; and some of the noblest sciences, as for instance, algebra, retain the Arabian notation without alteration.

We must now draw to a conclusion this picture of life and times of the middle ages. Of necessity we could only touch on the main points, numberless points of minor importance having to be passed over in silence. In the last three chapters we have tried to outline the development of Aryan culture forming a counterpart to the three closing chapters of Part I., treating of the political development. Taken together, we can now understand the

"Medieval World" in culture. It has simply to do with Europe, as the Ancient World had to do with Asia and the Nile Valley. And what completeness does it give to the view to regard Europe as the home land of the Aryans, and the Aryans of Asia as simply emigrants who wandered so far to the Orient as to loose their way back.

And we hope it now becomes clear that when we talk about great eras in culture, we must make altogether different divisions than those ordinarily employed by the historians. The medieval world in culture does not at all correspond to the medieval world in history. It has reference solely to the Aryans. Aryan culture has known no backward movement. The culture of to-day is simply the development of medieval culture. We have now watched the gradual unfolding of Europe, and have drawn near to the dawning of modern times. There is something in this ever widening sweep of Aryan culture, which we have traced from its source in Greece until it has embraced all Europe, that ought to give room to the cheering belief that the Aryan people will long continue to press on in the pursuit of knowledge. Loosing ourselves in revery, we may dream of the time when Aryan language, religion, and culture shall embrace the whole world in its folds.[1]

---

1 The three preceding chapters on ancient Greece, Rome, and the Middle Ages, covering, as they do, an immense field of investigation and the vast expanse of over two thousand five hundred years, did not admit of a more elaborate treatment of special points. Accordingly the author of these three essays considered it his main duty to direct the reader's attention to the leading features only, and to adduce the necessary arguments and illustrations in order to facilitate a clear and coherent insight into the real and specific character of Greek, Roman, and Medieval Civilization.

Such a succinct picture of the past times, however, while on the one hand, it necessitates a greater amount of reasoning and generalization, does, on the other hand, lessen the bulk of mere facts, with the exception

of those, the certainty of which has long been established, and continue to form the undisturbed common property of scholars. Many of the facts proffered in the preceding three essays, but more especially in the essay on Roman civilization, [such as those concerning the dress, the meals, the buildings, the races of the Romans] have been taken from standard reference books, like Pauly's Realencyclopaedie des Klassischen Alterthums; Saglio and Daremberg's [unfinished] Dictionnaire des Antiquites Romaines; Smith's Dictionary of Roman Antiquities, and others. It being the literary custom to use small portions [in distinction to whole articles] of these and similar useful compilations freely, the present general acknowledgment will suffice as an index of some of the sources used in the preparation of the said essays. The essential and leading ideas and conceptions of the preceding essays, however, and particularly those of the essays on Rome [e. g. the discussion of the city-state, the position of women, of house-sons, of slaves, the purport of Roman games, the causes of the unique greatness of Rome, etc.] have been evolved by an independent study of the original sources, [chiefly, Livy, Dionysius H., Cicero, Polybius) together with the best works of the moderns [mainly, Niebuhr, Schwegler, Mommsen, Lange, Sir. C. Lewis, etc.] It was, consequently, thought not feasible to crowd the pages with quotations, which, by the very nature of the subject, would have been far too minute and numerous for any other than a strictly professional work, the short space allotted to the subject being a final apology for the omission of direct quotations from the Roman historians.

ELEUSINIAN FEAST.

# CHAPTER IX.

## ARYAN RELIGION.

HAVE still before us a most important field of research, to which we must now turn our attention, this is the religious development of the Aryan people. Here as elsewhere Aryan genius is preceptible. It will be found in the sequel that two very important systems of Oriental religion date from Aryan foundation, one taking its rise in India and one in Persia. Tracing this influence to the West, we find two slightly diverging systems of philoso-

phy, one taking its rise in Greece finally culminating in the philosophy of Plato; and one, originating in the conflict between Aryan and Semitic thought—especially Judaism—ultimately giving rise to the various Gnostic sects, the relations between which and Christianity, it will be the object of a future chapter to unravel.

An immense field is here disclosed to view, each and every topic mentioned is deserving of a volume by itself. Hence it is evident that we can only give an outline of all. Still this will prove interesting, and will show, as nothing else will, certain peculiarities of Aryan thought. They were the first people to seriously grapple with, and attempt the solution of, certain great problems—such as the nature of the first cause, the origin of the soul, of matter, of evil—problems which still tax the ingenuity of theologians of our own times. So we will attempt to come to an understanding on this rather diffuse subject.

But let us observe well our surroundings. We have in another place gone over the ground of "Primitive Religion."[1] We need have no doubt that the various Aryan tribes of Europe went through at least the preliminary stages of this development before any extensive migration from their common home. History opens for each great section of the Aryan race when it was in the last stage of this growth, that of polytheistic Nature Worship. It is therefore necessary to gain a slight understanding of Aryan mythology, especially as we wish to show how primitive mythological conceptions continue to exert an influence long after the people have advanced to higher grades of culture.

Now mythology happens to be one of those topics, that have so recently been made the subject of scientific

[1] This Series, Vol. II. ch. v.

study, that they are still far from being settled fields. Probably, as is true of many another branch of science, at an early stage of its history, its enthusiastic expounders claimed for it more than it could perform, and appealed to its authority where it had no jurisdiction. On the other hand, some resist its plainest teachings and, refusing the assistance it proffers them, find themselves still involved in doubt, or stubbornly cling to conclusions which they should have been willing to abandon a long time ago. A reluctance to change established views may be as prolific of error as an overweening desire to embrace theories simply because they are new. If we would really understand this subject, some general remarks must be made.

Only of late years have explorers considered it worth their while to take into account the stories and tales of savage and but partially civilized people. Now that this subject has been noticed the following statements are found to be true. Nearly all tribes of men have collections of stories that profess to explain all natural phenomena, or are accounts of the doings of supernatural beings, or of beasts gifted with supernatural power. These stories pass on into barbaric life, in which stage they are mainly accounts of the actions of supernatural beings. Advancing intelligence either clothes these stories with a religious garb, making them accounts of the actions of their gods, or adopts the principal actors in them as their own natural heroes and the time of their occurrence as their golden age.

To the above statement, we must add, that these stages are not sharply defined, but are found variously commingled among the same people, at the same time; and, further, incidents of the original stories, lost sight of in gen-

eral, are continually re-appearing as survivals in the folk-lore of the people. Now, mythology proper, at least as ordinarily understood, concerns only the religious and heroic stage of these stories, where they are mainly the accounts of the doings of gods, goddesses, and supernatural beings. But for our purpose it is better to glance at the whole story field as just laid down.

Death of Hercules.

We must recall some points of savage philosophy. We have learned that, at a certain stage, savages come upon the conception that objects have souls, and that this conception extends in the stage of Fetichism to embrace all natural phenomena.[1] It is evident, that when people in this stage of development attempt to give any expla-

[1] This Series Vol. II. p. 310 *et seq.*

nation of what is going on about them, the explanation will be colored by such belief. To illustrate, what more natural than that rude people should see in water spouts great flying dragons and serpents.?[1] How else could such phenomena be described by savages, imbued with the savage theory just spoken of? So, quite naturally indeed, the sand pillars of the desert are explained to be the flight of demons.[2]

Now we want to dwell on this point, because here is a state of mind that will most unquestionably give rise to a great host of mythic stories. Everything, to primitive man, is endowed with individuality and life. Sun, moon, and stars, the winds, clouds, storms, rivers, are present to their minds as animate bodies, living much such a life as mortals do. It is manifest that such a stage of thought will give rise to a great number of mythic conceptions. We can further see how true it is that all people, in the progress of development must come to such a stage of thought. It is sure to arise, when once the savage idea of souls has gained ground. Everything that happens will inevitably be explained in terms denoting the action of living beings. Further still, primitive man will fall back on the same line of reasoning to explain some of the most common occurrences.[3]

Let us illustrate this. At times the rays of the sun shining through the clouds present the appearance of great ropes hanging down from the sun. Savages, believing the sun to be alive, seek to explain this appearance.

[1] Tyler: "Primitive Culture," Vol I. p. 264-5. [2] Ibid.

[3] A number of scholars seem to think that primitive man could not well distinguish between the living and the not living (Sayce: "Science of Language," Vol. II. p. 264) but this theory seems to rest upon a poor foundation. (See Spencer: "Principles of Sociology.") To our mind this mystic stage arises, like Fetichism, from the savage doctrine of souls. That conception has first to be formed. [*Vide* Vol. II. ch. v.]

Thus have arisen in different localities the myths of the sun catcher. The Polynesian tribes tell how Maui and his brothers, thinking that the sun went too fast, plaited ropes and formed a noose, and then journeyed to the East; "very far to the eastward, and came to the very edge of the place out of which the sun rises." Then they spread the noose and prepared to catch the sun. At length the sun rises. "He rises up, his head passes through the noose, and it takes in more and more of his body, until his fore paws pass through; then are pulled tight the ropes." Maui then rushed upon him, bearing in his hand an enchanted weapon. "Alas the sun screams aloud; he roars; Maui strikes him fiercely with many blows; they hold him for a long time; at last they let him go; and then weak from wounds the sun crept slowly along his course."[1]

Now this story is not based on any poetical metaphor. Savages are doing just what scientific men are doing to-day, explaining as best they can in accordance with their philosophy what they see around them. On island after island different versions of this myth occur, and some say that Maui wisely refused to take off the ropes, so that he might constantly hold the sun in check. The natives say that you can still see the ropes attached to the sun when he rises and sets. Civilized children exclaim "the sun is drawing water," in such instances the Polynesian islanders would say "behold the ropes of Maui."[2]

To show how true it is, that given the same phenomena to explain, men in the same stage of enlightenment will reason the same way, we need only point out that substantially similar myths existed among our Indian tribes.

[1] Grey: "Polynesian Mythology," London, 1885, p. 35-8.
[2] Tyler: Early History of Mankind," p. 352.

Sometimes as an accident, and sometimes on purpose, the sun is represented as caught in a snare, set by some wonderful hunter. In the American stories, however, the animals liberate the sun. In one story, the mole, burrowing underground, at length sets the sun free, his eyes are, however, put out by the intense light, and ever since moles have been blind.[1] It is quite in keeping with this old mythic idea that the Incas of Peru reasoned about the sun. "He is like a tethered beast who makes a daily round under the eye of a master."[2] And it is certainly interesting to observe that this conception lingers on in European folk-lore where the sun is spoken of as if it were tethered and delayed by bands.[3]

Thus mythic conceptions, such as here shown, arise quite naturally, and have a wide range both in space and time. It will be found that such conceptions underlie the ideas everywhere entertained by partially civilized tribes of eclipses. The sun and moon are considered as alive, but at times, from some mysterious cause, they seem to be disappearing with their light and warmth. What more natural than the explanation given of some monster seeking to devour them. The sun and moon are in never ceasing motion across the vaults of heaven, they are supposed to be in flight to avoid some monster—wolf, dog, or dragon—who seems to have overtaken his prey at the moment of eclipse, and would doubtless finish them, were he not scared away by the efforts made by the natives in their behalf.[4]

Many North American Indian tribes gave the dogs a sound whipping during the eclipses, because the "big

[1] Ibid. 351. [2] Brinton: "Myths of the New World," p. 55.
[3] Grimm: "Teutonic Mythology," Vol. II. p. 745. London, 1883.
[4] Ibid. 705.

dog" was swallowing the moon and the sun, and by whipping the little dogs he might be induced to desist.[1] So the tribes in South America thought the moon was hunted across the sky by huge dogs, who caught and tore her during an eclipse, and so to scare them away, the Indians would set up a great noise and shoot their arrows athwart the sky.[2] So of the Moors in Africa. "When the sun eclipse was at its highest, we saw the people running

Assembly of the Gods on Mt. Olympus.

about as if mad, and firing their rifles at the sun, to frighten the monster who, they supposed, was wishing to devour the orb of day . . . The women banged copper vessels together, making such a din that it was heard leagues away."[3]

1 Brinton: "Myths," p. 137.
2 Tyler: "Culture," Vol. I. p. 296.
3 Grimm: "Teutonic Mythology," Vol. II. p. 707.

All the civilized nations show that they passed through the same belief. A Mongolian myth tells us of a demon who pursues both the sun and the moon, whenever he comes to hand-grips with one of them an eclipse occurs.[1] The Chinese still speak of the sun and moon as being "devoured" during an eclipse, and a great dragon is the monster doing the mischief. Nearly all of the population in Northern Asia have the same opinion. And everywhere with gongs and bells, rude music and prayers, it is to be driven away. The Finns in Europe have a similar belief. The Esthonians say the sun or moon is being "eaten," and until recently sought to hinder this process by conjuring spells.[2]

All Aryan nations passed through this stage of belief. "To this day, the Hindoos believe that a giant lays hold of the luminaries, and tries to swallow them."[3] "The Romans flung fire-brands into the air and blew trumpets and clanged brazen pots and pans." As late as the seventeenth century, people of Celtic descent were observed during an eclipse "to run about beating kettles and pans thinking their clamor and vexations available to the assistance of the higher orbs."[4] And not very long ago almanacs still represented eclipses by two dragons holding the sun and moon in their mouths.[5]

Now we have only just touched on the immense field of nature myths, we will, however, pass it by since, at present, all we wish to do is to make clear what we mean by the mythic stage of thought, and illustrate how naturally such stories might originate. As we have seen illustrated in the case of the sun-catcher, men everywhere are given to explain what they see around them. Certainly

[1] Ibid. [2] Ibid. [3] Ibid.
[4] Tyler, Op. cit. p. 301. [5] Grimm, l. c. note i.

from a very low stage of society on, man has been a theorizer. The primitive theories, however, are very crude. The point to be observed is, that these crude theories, explained in such terms that all understood them, very often indeed find embodiment in some story, and thus are kept alive as myths. We have now tried to make clear that a myth is in its origin an explanation. It is not an allegory, nor a poetical metaphor, but it is an effort on the part of primitive man to explain what he sees around him. They are the first theories of primitive science.[1] But we have been considering myths in their primitive stage. To explain their far reaching effects in the field of religion and history, we must reflect on the changes produced by time on the language in which they first find expression. For the original meaning of the words is lost sight of, partly because of changes constantly going forward in the language itself, and partly because advancing intelligence exposes the absurdity in the original explanation. So the real meaning in the old story is forgotten, all that remains is the shell.

We have now seen that myths are simply portions of the philosophy of the childhood age of mankind, often clothed in a new meaning, but not always. It is evident that all people who have achieved civilization have passed through such an age, and that barbarous people are even now in a mythical age. It is further evident that myths must embrace every department of science. We will have not only mythical religion but mythical philosophy and history as well. But the fact is, religious myths have had the most enduring life. We can all see the reason for this. Such myths would be handed down, while others would speedily be forgotten. Attempts would be

1 On this point see Fisk: "Myths and Myth Makers," p. 21

made to reconcile them with the beliefs and sciences of a new generation. It is instructive to notice the philosophers of the age of Socrates and Plato trying to explain Grecian mythology. We can furthermore see why it is, that nature myths—myths of the earth, sky, sun, stars, night, dawn, etc.—should be just the ones that would thus survive when others had been forgotten.

Many illustrations of this statement could be given, we will limit ourselves to but one, the Dawn. What is that roseate glow which lightens up the eastern sky shortly before the sun appears? The Australian tribes say that the sun is a woman. "Every night she descends among the dead, who stand in double lines to greet her and let her pass. She has a lover among the dead, who has presented her with a red kangaroo skin, and in this she appears at her rising,"[1] Strange conception, truly, but quite on a par with our Aryan progenitors, with whom the dawn was a red cow;[2] and the sun was her calf.[3] From this singular story as a starting point, we follow the conception into the poetry of the Vedas where Ushas (the Dawn) "opens the darkness as a cow her stall;" she is then represented as "full of wisdom, rich in everything;" in short, she is the author of all the good that day-light brings.[4] From this we understand the wonderful importance of cows in all the religious observances of the Hindoos,[5] and the Parsees, and let us not forget the great efficacy of the ashes of a *red* heifer among the Israelites.[6]

Let us constantly keep the foregoing in mind. Incidents of mythic story so altered that we can perhaps

6 Num. xix.

scarcely detect them are floating around the world, always ready to attach themselves to the names and memories of national heroes. The history of great kings, such as Cyrus the great and Charlemagne, is encrusted with mythical incidents;[1] and especially around the memories of great reformers and founders of new religions, such as Gautama and Zoroaster, will such mythic stories gather. Now let us attempt to learn more particularly of Aryan mythology. We have seen that as a people enter on the stage of Polytheism, the heavens and the earth, as two of the greater fetiches, take rank as two of the more powerful gods of the new pantheon. Powers are ascribed to them and hymns in their favor are sung. The Polynesian Islanders called the over-arching heaven Rangi, and supposed he was the father of all life. A most interesting story is told of the separation of Rangi and Papa, the earth.[2] Among these Islanders the myth was yet in the first stage. The meaning of the words was very plain to all.

It is hard for primitive man to form nouns with general significance. It is easier for them to give names for different aspects of the sky, such as Night sky, Day sky, Noon sky, than it is to form a general conception of Sky. Hence it is that among rude people, such as the primitive Aryans, we meet with the names of several important deities, each of which traces itself back to some aspect of the sky; each had developed from the fetich worship of the first stage. Thus among the Teutonic tribes, we meet with *Zio*, which seems to have been the day sky. As we pass away from Germany, we continually meet with this ancient divinity under new names. Among

[1] Fisk: "Myths and Myth Makers," p. 114 note and p. 199.
[2] Grey: "Polynesian Mythology."

the Greeks, we meet with *Zeus*; among the Romans, with *Jupiter*; among the Slaves, with *Svaroga*; and among the Indians, with *Dyaus*.[1]

Now let us observe the steps by which the fetich sky has emerged into the polytheistic god. The day sky was

Diana.

given a personal name. This was not a metaphor, nor a poetical fancy, for all nouns are personal. Time passes

1 *Vide* Darmesteter: "Contemporary Review." As to traces of fetich worship among the Aryans consult Keary: "Primitive Belief," p. 53.

on and the Aryans commence their victorious migrations. Language and philosophy both change. The scattered people forget the original meaning of the name of their god. He becomes simply a mythical figure. Many little incidents that were natural and true of the day sky are still told of the god, but now there is no reason in their application. They pass on into meaningless stories.

Apollo.

But the various Aryan people, as they continue on their way from the homeland, enter on new conditions of life and surroundings, or from the workings of many other causes, other personifications became more prominent than the day sky, though this is not true of all the Aryans. Among the Indians, Varuna, the night sky, usurped the supremacy, only to be in turn vanquished by Indra, the god of storms. In Germany, Odhinn, originally the god of the stormy atmosphere, became in course of time, the great god of all Teutonic people.[1] Now it is not necessary for our present purpose to give a detailed

[1] Cox: "Mythology of the Aryan Nations."

account of Aryan mythology. It is sufficient to remark that, approximately in the manner here pointed out, all Aryan people, when history first dawns upon them, were in the possession of a rich and varied mythology. The explanations and child-like theories of the primitive Aryans, retained by the conservatism so natural to all religions, now found a place in the songs, descriptive of their gods, and the meaningless, absurd, or immoral stories told of the loves, lives, and adventures of their gods and goddesses.

Leaving the other branches of the Aryans, we will turn our attention to the Aryans of Asia, who are of especial interest to us in our present inquiry. We have before pointed out that the Aryans of Asia, as far as our present inquiry is concerned, consist of two closely related people; the Iranians and the Indians. But at the time to which we now direct our inquiry, these two branches had not yet made their appearance. The people were, as yet, united. This was the Vedic age of the Aryans. We have already had occasion to refer to this expression, and have perhaps said all that is necessary on the various divisions of this mass of literature.[1]

Now a vast amount of study has of late years been devoted to this mass of literature, in order to gain therefrom a knowledge of the religious conceptions of the Asiatic Aryans when we first gain an historical knowledge of them. Let us pause to note a singular idea prevalent

[1] For further information on the Vedas consult Lang: "Myth, Ritual, and Religion," Vol. I. ch. vii. Williams: "Religious Thought in India," ch. i. Kaegi: "Rig Veda," p. 4 *et seq.* An excellent description is contained in Colebrook's "Essays," ch. i. Barth: "Religions of India," ch. i. The following volumes of the "Sacred Books of the East" are, of course, all important: Vols. I., II., VIII., XII. and XV. The introductory parts in all of these volumes give us light on this question. See also above p. 154.

among some authors. It has been supposed that the knowledge thus obtained would be that of the *primitive* religious state of the Aryans, and considerable has been said about the childlike simplicity and innocence of the same. Thus says Geiger: "We have in these hymns the picture of an original, primitive life of mankind."[1] To this, Kaegi adds that these hymns present us "religious conceptions from the earliest beginnings."[2] Similar expressions could be quoted from such men as Whitney and Max Muller.[3]

Yet a moment's consideration will show us that this is the wrong view. Instead of being a primitive stage of thought, it is really a most advanced stage. Many centuries had doubtless passed away since the Aryan migrations began. They must have slowly passed through the various stages of ancestor and fetich worship and were in an advanced stage of polytheistic nature worship. Plain traces of these stages exist. Neither was the state of society "primitive." The family was fully organized.[4] "The ranks of society were as clearly defined as in Homeric Greece."[5] Kings are frequently mentioned, poets and priests abound. The people were settled in villages, various trades were practiced; in short, society may be said to have arrived at the very verge of civilization.[6] The very language in which the songs were written was already old and decrepid, long past the bloom of youth.[7]

All this shows us how greatly we err when we regard the religion of the Vedic period as a primitive religion. Let us bear in mind the following eminently just observa-

1 Kaegi: "Rig Veda," p. 26. 2 Ibid.
3 Lange: "Myth, Ritual and Religion," Vol. I. p. 119.
4 Kaegi: "Rig-Veda," p. 14. 5 Lang, Op. cit. p. 220.
6 Ibid. 223.
7 Sayce: "Science of Language," Vol. II. p. 138 *et seq.*

tion of Lang. "In the Vedas, we have the views of the *Rishis* only, that is, of sacred poets on their way to becoming a sacred caste. Necessarily, they no more represent the popular creeds than the psalmists and prophets, with their lofty monotheistic morality, represent the popular creeds of Israel."[1] But in reality the Vedas do show us one of the most interesting stages of religious development.

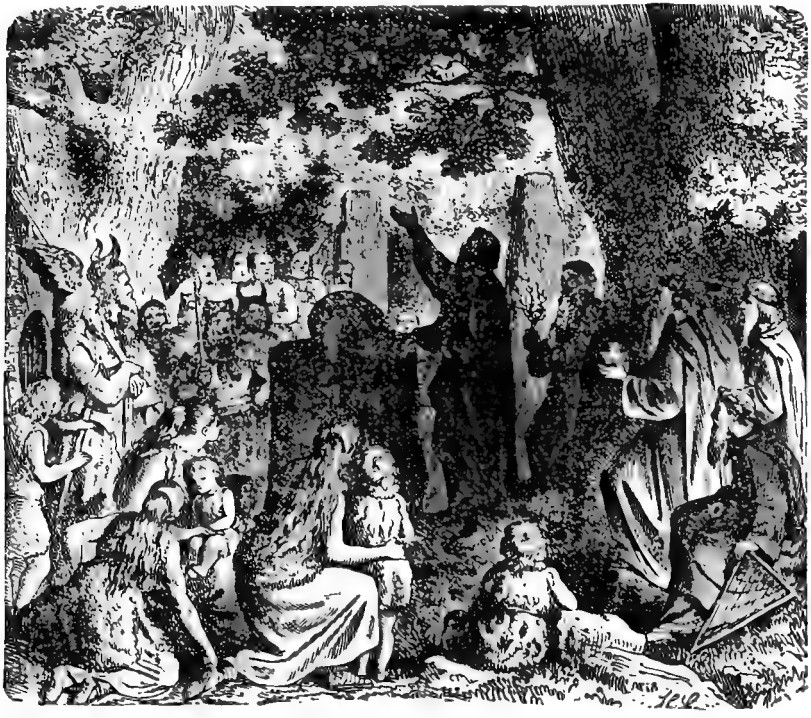
Advancing intelligence of the people in general had now begun to perceive, in a dim way, the weakness of their popular creed. They were feeling about for something to take its place. In such a stage of thought, the more intellectual class of people—the poets and priests—would take great liberties with the old mythology. The older myths and legends were in part explained away; here omitted altogether, and there softened down. Such crude conceptions of the Dawn as a red cow were replaced by long poems on the goodness, wisdom, and beauty of Ushas (the Dawn). In short, the many hued mantle of poetry was flung over the ancient mythology, concealing here and there its crudeness, and throwing an altogether different light on what remained.

As we stated, in the first or Vedic stage, the Aryans of India are not supposed to have separated into the two great streams of the Asiatic Aryans; the Iranians and the Indians. But this separation soon began to take place. One stream of the advancing Aryans set towards the West, and one debouched on the plains of Upper India. Tracing the fortunes of this eastern branch, we find them coming in contact with members of the Yellow Race—the Dravidians. The effect, on the development of religion, was two-fold. We have already traced this

[1] Myth, Ritual and Religion," Vol. II. p. 123.

influence in the development of the religious caste.[1] The Brahmans now became the body of people who are concerned with religion. The mass of the people were now released from all care in such matters. They had only to follow the directions of the Brahmans.

We need only reflect that the great mass of people change their religious opinions only with extreme slowness.



Primitive Worship among the Germans.

In the case of the Indians, the Brahmans had simply to formulate the slowly crystallizing beliefs of the popular creed, which though little affected by the Vedic movement, had finally begun to advance out of the simply primitive stage of belief.[2] This creed and belief is known to us as Brahmanism, and is perhaps the first attempt at a philo-

[1] Above p. 165.

[2] This Series Vol. II. ch. iv.

sophical system of religion of which anything is known, though it is extremely crude, and overlaid with all sorts of myths of the older period.[1] The Brahman caste was undoubtedly considerably influenced by the beliefs of the Turanian Dravidians, and incorporated, to some extent, their myths with their own.[2]

Let us consider a little farther this priestly caste of the Brahmans. Such a body of men was largely released from the material cares of life. They formed the learned body of the people, and would undoubtedly ponder over the various problems of philosophy and religion. But the conclusions they might come to among themselves, would not necessarily be communicated to the people at large, simply because they were by no means fitted to receive them. Here then we find ground for the division of religious doctrines into *exoteric* and *esoteric* doctrines. The former being the doctrines publicly taught and expounded; the latter, the secret beliefs of the priestly and learned class. We need only remark, that while in the earlier ages of the world, the distinction between these two classes of knowledge was very great,[3] yet the tendency has constantly been for this distinction to disappear; this because the mass of the people have steadily become more and

1 We use the word "Philosophical" as opposed to the mere development of mythology. An exception may come in, in the case of Egypt, but in examining Egyptian religion we failed to find much philosophy, but did observe a great deal of mythology. The Persian system of religion may be, and probably is, equally as old. We need simply remark in this place that no Semitic system of religion was based on philosophy. Let no one take offense at this statement, for religion is not a matter of philosophy but of faith.

2 Will not this explain Barth's statements of a trace of some sort of connection between Babylon and India? ("Religions of India," p, xviii) as well as Bunsen's rather labored hypothesis in "Angel Messiah." See also "Bible Folk-Lore," London, 1884, p. 4, for further particulars on this point.

3 Every system of ancient philosophy was more or less esotric or secret, known in its fullness only to the initiated.

more enlightened. Still it has never entirely disappeared, and even to this day, how frequently is the remark made in reference to some particular article of belief, that, however true it may be, the world is not yet ready for it.

Now we think it will be brought out in the sequel that the esoteric knowledge of the ancient Brahmans, slowly spreading to the west, exerted a tremendous influence on the development of religious philosophy, an influence which is felt to-day in every part of the civilized world. But for the present let us return to the consideration of Brahmanism. In accordance with what we have but just pointed out, Brahmanism itself must be studied under two heads; Ritual and Philosophy. Fortunately the ritual, or public worship of Brahmanism, need not detain us long. In Brahmanism, all worship may be summed up in one word, *Sacrifice*.[1]

Here we see an extraordinary development of one set of ideas properly belonging to primitive religion. Sacrifice begins with offerings of food to the other-selves of dead kinsmen and friends.[2] When ancestor worship has become well developed its observation of course becomes of more importance. Now, sacrifices are offered for the purpose of propitiating the household gods. The general course of development, as morality more and more attaches itself to religion,[3] is, first, for the idea to arise that the object offered in sacrifice must be something valued by the giver, something requiring *self*-sacrifice on his part.[4] Only in a developed stage does the idea arise that to obtain the

[4] Tyler, l. c. p. 359.

wished for good, the moral duties must be cultivated as well as sacrificial offerings made.

In Brahmanism the development was still in almost the first stage.[1] There were united to this, however, several conceptions belonging to a very low scale of culture, ideas that can be traced directly to savage philosophy. That is the magical efficacy of sacrifice. If sacrifices be only accompanied by the right ceremonies; if the appropriate prayers and ceremonies be offered by the appropriate person, they are all powerful. Everything that happens is to be explained as the result of some ceremonial arrangement.[2] Already in the Vedas we see the beginning of this state of mind.[3] Of course, we can see that, when the Brahman caste with its peculiar rights had developed itself, they would foster this tendency. They only, know how to perform the sacrifice, so as to compel the wished for good. Save in this enormous extension of sacrifice there was not much change in the standing of the older Vedic gods.[4]

Let us now turn to a more interesting part of our subject, Philosophical Brahmanism. Now the Brahman priesthood cared little for what we might call Dogmatic Theology.[5] In questions of rites and ceremonies, they claimed to be the sole authorities. But the most diverse opinions were allowed provided they professed to rest on the Vedas. Furthermore, when it came to the matters of speculation, the Brahman class did not always contain in its ranks the keenest thinkers. Members of the Kshatyra caste often led them in this matter.[6]

It seems to us, at present at least, impossible to trace the steps by which the Hindoos emerged from mythology into philosophy.[1] We have seen that even in primitive religion, the conception arises of one supreme God back of all the rest.[2] In the Vedic hymns this feeling often finds expression,[3] but then the people had not settled down on any one god as the supreme God. Or rather the people were in that stage of thought when any of the gods to whom sacrifice is directed becomes, for the time being, the Supreme One.[4]

But a time finally came when these "meditative Aryans", taking these old hymns as their stand-point, attempted to build up philosophical systems, they were thus employed perhaps as early as ten centuries B. C.,[5] and their theories found expression in the Upanishads or the theological portion of the Vedas.[6] It is a difficult task to extract from these Upanishads the various systems of Philosophy,[7] but we may with profit refer to the more prominent ones. The study will convince us that whether the investigator

[1] There are those who will deny that philosophy proper belongs to any of the Hindoo systems (See Schwegler: "History of Philosophy," and Williams: "Religious Thought," p. 26,) since the whole object of their research was to free the soul from the necessity of rebirth. This is certainly a very fine point to raise. Whatever *object* the Hindoos had in view, they did certainly enunciate various theories as to the universe, the soul, and the nature of deity, which they sought to support by a train of reasoning. This, however childish the theories may be, is a *system of philosophy*. The object of the Greek philosophy, we are told, was to disengage the soul from all animal passions, that it may rise above sensible objects to the contemplation of the world of intelligence. [Colebrook's "Essays, "p. 155.] This, as contrasted with the Hindoo object, is largely a "distinction without a difference."

[2] This Series Vol. II. p. 346.

[3] Rig-Veda, x. 120 127., Muller's translation, are examples of this feeling.

[4] Barth, Op. cit. p. 29. This is the stage of thought denominated by Max Muller, "Henotheism." "Origin and Growth of Religion," p. 260.

be a Hindoo, European, or American, if prepared for his work, he comes to conclusions substantially the same. This we would indeed expect to be the result since men everywhere are confronted by the same problems and have only the same elements whereby to effect their solution.

Mars.

As we have seen, the older mythology taught that the over-arching heaven and the fruitful earth were the prolific father and mother of all things, consequently also of man. As man advanced in intelligence, it seems to have been assumed that his body was indeed of the earth, earthly, but that his spiritual part was of heavenly descent.

The problems presenting themselves for solution were the nature of the relation between these two parts, the nature and destiny of the spiritual part, and how to free it from its entanglement with matter.[1] Incidentally attaching to these there were other problems pressing forward for a solution; one of which speedily became of very great importance, that was the Origin of Evil. It was comparatively easy to account for good, but whence came evil ?[2]

The slowly developing philosophy of the Brahmans began to cast itself into formal systems, one of the first was the Sankhya system. The meaning of this word is the exercise of reason or judgment.[3] As expanded by the ancient commentators, it signifies "the discovery of the soul by means of right discrimination".[4] Not a bad title for a system of philosophy. The reputed founder of the school was Capila, but around this personage, if such an one existed, have gathered innumerable myths[5] and he is generally considered as of divine origin.[6] The idea underlying this philosophy is, that true and perfect knowledge will free men from all evil. Then follows a dissertation on the means of attaining knowledge, such as comparison, inference, tradition, etc. On this part we need not linger. The most important statements of their philosophy then follow.

[1] Every religion known to the world, that reaches a philosophical stage, on its esoteric side at least, has had to grapple with and attempt a solution of these problems. On their exoteric side, however, they are either passed by, rites and ceremonies forming the whole of religion, or some formulated article of belief, drawn from sources considered by the followers of the religion in question as inspired, solve all doubts and answer all inquiries. Perhaps this is the better way, since the field of religion is not science but faith.

[2] Dean Mansell makes the two great problems of heathen philosophy to be "the problem of absolute existence, and the problem of the Origin of Evil." ("Gnostic Heresies" p. 11)

[3] Colebrook's "Essays," p. 144.

[4] Ibid. Cf. William's definition of synthetic enumeration. "Indian Wisdom," p. 91.

[5] Above p. 718.

[6] Colebrook's "Essays," p. 145. Williams; Indian Wisdom," p. 89, note 1.

It is in general very difficult to set forth the details of a philosophical system in a way at all interesting. It is, however, so necessary for a further understanding of our subject, that we must make an attempt to understand these old thinkers. As for the world of matter, they said it was eternal, and was the producer of all things. They figured it as an eternal, productive germ, and designated it by a feminine noun, *Prakriti*, the mother of all things, quite in keeping with the old mythology. But this germ, though one, indivisible, and all that sort of thing, is a trinity, a union of three qualities, each equal to the other, a perfect equipoise existing between them. These are the three Gunas, or cords, which bind the soul. The first comprising all of good, the second of evil, the third of indifference.[1]

This philosophy also declares that the spiritual part of man is eternal; not only that it will be eternal in the future, but has been in the past. This principle is designated by a masculine noun *Purusha*. But though there is only one productive germ, spirits are innumerable, each separate and independent from the others, and each has existed from all eternity. Whether this system originally admitted the existence of one supreme soul, one superior to all the others, is doubtful.[2] But certainly from the very earliest times some philosophers of this school taught the existence of such a supreme soul, *Iswara*, the ruler of the world.[3] But this supreme ruler is so far removed from other souls that he takes no interest in them.

[1] The Gunas are:

1 Sattva, equivalent to purity, goodness, etc.
2 Rajas, " passion, activity, etc.
3 Tamas, " darkness, indifference, etc.

*Vide* Williams: "Religious Thought," p. 31; Colebrook's "Essays," p. 157.

[2] The majority of authorities seem to favor the negative view; Barth: "Religion of India," p. 70; Williams: "Religious Thought," p. 33.

[3] Colebrook's "Essays," p. 154; "Indian Wisdom," p. 98. This is

The relation between these two eternal principles they consider to be as follows. The female principle, Prakriti, desires union with the male principle, Purusha. No creation takes place unless such union occurs. Here comes in the fatal entanglement of the soul with matter. The part played by the soul is simply that of a passive onlooker, still it is finally ensnared by the wiles of Prakriti. He joins himself with her and a phenomenal world and an intelligent being is produced.[1] But in this act of creation the perfect equipoise of the three qualities—goodness, evil, indifference—in Prakriti is disturbed. The soul is bound to matter more strongly by one cord than another. Hence we have all classes of beings; good, bad, and indifferent.[2]

Now, in order to keep clearly in mind the main points, that is how this system answered the problems outlined above,[3] we will pass by some points in the system, and hurry on to the final question, how was the soul to be set free from its entanglements with matter? Death would not do it, for death was simply the destruction of one gross, material body and there were several other bodies intervening between that and the soul.[4] Besides, until the soul was fully informed in this matter, it must transmigrate from body to body, in each life enjoying the rewards, or suffering the penalties for deeds done in a former body. But when the great principles of this philosophy are truly

---

the theory of the Yoga branch of the Sankhya philosophy; cf. Colebrook's remarks, p. 159.

[1] Notice the singular conclusion, there are as many phenomenal worlds and creations as there are individual beings, consequently the phenomenal world is not a real one.

[2] Let us understand that not all of these intelligent beings are human beings; some, as gods and demons, are superior to man; and some, as quadrupeds, are inferior. Colebrook's "Essays," p. 157.

[3] Page 730. [4] Colebrook, p. 155.

GERMAN FUNERAL SACRIFICE.

perceived, then will the imprisoned soul learn that it is radically distinct from matter. "Possessed of this self-knowledge, soul contemplates at ease nature, thereby debarred from prolific change."[1]

Now, before passing on to other topics, let us reflect for a moment on this system. It taught dualism;[2] the eternity of matter and spirit; all the evil of life arose from the soul yielding to the enticement of matter; the way of escape was the attainment of true knowledge by which the soul might perceive the errors of his ways, so to speak. We must notice also, the prevalence of old mythological ideas side by side with ideas advanced for that age. Quite in keeping with the old mythology, and with all the phenomena they saw around them, they accounted for all that existed by the union of a male and a female principle.[3] A slight change of name will however show that after all this system is not foolish. Suppose that instead of Prakriti and Purusha, we talk about matter and force, we are at once on grounds familiar to modern materialists.

We must also speak of one sect of the Sankhya philosophers, the *Yoga* branch. The founder of this branch distinctly affirmed the existence of a supreme soul; Capila, the founder of the Sankhya systems being, to say the least, silent on that point. From such a belief, however, other results followed. Now the object sought, was not simply to free the sonl from entanglement with matter, but further to attain union with Iswara, the supreme. To

[1] Ibid. 164.

[2] We would naturally expect dualism to precede monotheism. However Barth remarks that in the first instance this system was not dualistic; "Religions of India," p. 70.

[3] Almost all, if not all, religions seem to have passed this stage of belief. (*Vide* Inman: "Ancient Faiths;" Westropp and Wake: "Ancient Symbol Worship.") To this day in all parts of India temples are dedicated to the male and female principles.

further this end, minute rules of conduct were laid down, following which it was claimed that such union could be obtained even in this life. This union bestowed on the practitioner certain very great powers, such as clarvoyance, clairaudience, levitation of the body; or the soul was thought able even to leave the body and travel abroad and, at its will, return to its bodily domicile.

The belief that such powers are attainable to man is not confined to this sect, but is very prevalent in India. In older times it amounted to a belief in magic and sorcery. A well informed writer at the present day will certainly be chary about expressing an opinion. The remarks made on a former page[1] in regard to Shamanism apply with intensified force here. Many years are spent in the severest training, with one object in view: the development of psychic force. The apparently well vouched for results sometimes obtained are beyond any explanation we can give at present.[2] The fact is the modern world has been carried away in the pursuit of practical science. Only just within the last few years has it consented to investigate the unknown power of the human mind. But brief and as superficial as has been the examination, we begin to see that a new world of knowledge is awaiting exploration. Many years must yet pass by before a just verdict can be rendered in this instance.[3]

Perhaps it is not necessary for us to discuss at length another system of Hindoo dualistic philosophy analogous to the Sankhya system.[4] We will therefore turn at once to

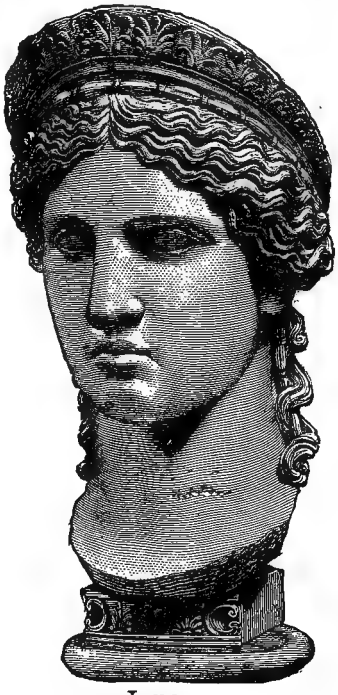
[1] Vol. II. p. 329.

[2] *Vide* "Indian Wisdom," p. 106.

[3] We would advise the reader to examine the reports of the various Psychical societies, and he will speedily see how very limited is our knowledge on this subject, and realize the truth of Hamlet's remark. "Hamlet," Act I. Scene 5.

[4] This is the *Nyaya* and its modification *Vaiseshica* (*Vide* Cole-

the most important school of Indian philosophy—the Vedanta. This school apparently started from as crude conceptions as the former:[1] the position they finally attained surpassed them. According to this school, there is but one eternal essence—pure spirit. This was called sometimes *Atman* (spirit), or *Param-atman* (supreme spirit), or Brahma.[2]



Juno.

As to the spiritual part of man, each individual spirit (*Jiv-Atman*) was a part of, or identical with, the supreme Atman, just as sparks are thrown out by a furnace fire. But not only was the spiritual part of man derived from the supreme spirit, but the material part, as well as the material universe, was derived from the same source. The Atman, in short, was the universe.[3] Indian writers made many attempts to explain their understanding of this statement. "He is," say they, "the ethe-

brook's "Essays," ch. vii.) These systems taught with singular fullness the "Atomical Theory." Their analysis would prove a surprise to those who imagine that all philosophy originated with the Greeks. We here find a fore statement of much of Greek philosophy. The doctrine of Epicurus as regards "atoms," the Aristotelian "categories," and the views of the Platonic school as regards "substance" are here stated. Indeed some of the ideas of these philosophers will bear comparison with the theories of modern chemists and physicists. [*Vide* "Indian Wisdom."]

[1] Barth: "Religions of India," p. 72.

[2] The word Brahma [final a short] is neuter and must not be confounded Brahma [final a long] masculine, the active or creative form of Iswara.

[3] Oldenberg thinks that the older texts imply that a chaotic something exists independent of the Atman: "Buddha," p. 40.

rial element from which all things proceed, and to which all return." "He is the light which shines in heaven, and in all places high and low, everywhere throughout the world, and within the human person." "He is the intelligent self, immortal, undecaying, and happy."[1] Speaking of the external world, they say he is both creator and creation, actor and act.[2]

Such was the Vedanta philosophy in its first stage. It was pure pantheism. Instead of two eternal essences, as in the Sankhya system, it admitted but one, spirit, which was regarded as both the material and efficient cause of all that exists. But time passed on and other problems pressed forward; new ideas were engrafted on the older system, and we have a philosophy not so strikingly different from the Sankhya. These new ideas seem to have arisen from an attempt to answer the remaining problem, what is the relation between the two parts of man? What is the bond which holds them together? Admitting that the material world was likewise derived from Brahma, what sort of a world was it? In answer to these queries we have the doctrine of *illusion*, such a favorite theory among later Indian scholars, but which is not found in the older Upanishads.[3]

It is extremely difficult to come at the reasonings underlying the language of the Hindoo writers on this subject. Looking around them, they of course perceived all sorts of material objects; but the very keynote of their faith was that all was Brahma. Why was not such a truth apparent at once? It must be because their intellectual power was not sufficient to penetrate the disguise. In other

1 Colebrook's "Essay," p. 217.

2 Jacobs: "Hindoo Pantheon," for a good analysis of Brahma.

3 On this point see Colebrook's "Essays," p. 242. Barth, Op. cit. p. 75.

words, it was owing to the power of *A-vidya*,[1] that is ignorance. The appearance of things must be merely illusory. The phenomenal world, all that we see around us, can have no more real existence, than the things we see in a dream. But how did this phenomenal world get started? Of course it all comes from the supreme spirit, but how from pure spirit can come the impure, illusory matter? In answer to this question, Hindoo theologians took refuge in an explanation which we shall meet with again and again in Oriental theology. The supreme god was considered as too elevated a character to concern himself in creation. He therefore by the power of illusion, created *Iswara*, the ruler of the world. But, notice, Iswara, is himself a trinity; for he is dominated by the three gunas, of which we made mention some pages back.[2]

It is Iswara that creates all things; but he and all his creations are illusions. Each human soul believes itself living an individual existence. This is simply illusion. This belief, however, is the bond, connecting spirit and matter As long as such belief is held, so long will the soul be subject to the power of illusion, and be prevented from his final union with Brahma. He must learn the great truth that the Atman is all; that he himself is the Atman; he must come by deep meditation to believe that "I am (all) existence.[3]

Here for the present, we will leave the Aryans of India. All have doubtless noticed one point. In primitive religion we had to observe that morality was not con-

1 "Indian Wisdom," p. 118.

2 See above p. 731 and note.

Dominated by Sattva, he is Vishnu the preserver.
" Rajas " Brahma the creator.
" Samas " Rudra the destroyer.

3 This last formula is of very great importance in the esoteric religion of

nected with religion at first. So when philosophy began, not much attention was paid to morality. The way of escape from evil was not by exercising morality, but in the acquisition of correct knowledge. Not action but belief was what was wanted. It is true that many painful ascetic rites are deemed efficacious, but only because they are an aid to the acquisition of knowledge. For the time being we will leave the eastern branch of the Aryans and turn to the consideration of the western or Iranian branch.[1]

At what time in the distant past, Aryan tribes commenced to spread over the plains of Iran, we can not, perhaps, decide with certainty. We are probably safe should we say that as early as 2000 B. C. the movement destined to Aryanize the country bordering on the kingdom of Assyria had begun. Fifteen centuries went by, with only occasional scattered historical references of this movement; then the veil is suddenly withdrawn, and we find the whole country stretching away to the east from the Tigris river in the possession of Aryan tribes more or less pure in ethnology.

The westward-wandering Aryan tribes, who in that primitive long-ago defiled through the dreary passes of the Hindoo Koosh mountains and began the long but grad-

---

the Orient. Its meaning is involved in the mystic A-U-M of India. It is the "Nuk pu Nuk," engraved in the roll of the dead and put in the Egyptian tombs. This same formula is also signified by the three letters i-a-o of Semitic belief, which co-alesce into Iao, the mythic name of God among them. Indeed this is expressly said to be the meaning of the ineffable name of God among the Hebrews [Exodus ii. 14] Consult Higgins: "Anacalypsis," p. 454 *et seq.* Stanly: "Future Religion of the World," p. 260 note 2, p. 304.

[1] From the necessities of the case we have had to be as brief as possible in presenting the two principal philosophical creeds of India. In addition to the authorities here quoted we would especially refer to "Hindoo Philosophy," by Ram Chandra Bose.

ually spreading conquest of Iran, carried with then the mythology and superstition that was an heritage from the pre-Vedic age; perhaps, even, the songs of the Veda were sung by their priests. But as the centuries went by a great change was effected. A system of religion gradually grew up which attracted considerable attention in the ancient world, and undoubtedly exerted a great influence on the development of the religious thoughts and beliefs of the civilized world of to-day. Let us then try to acquire clear ideas about this system.

Minerva.

It has received various names, but of late years the name of *Mazdeism* has been most commonly applied to it [1] As preliminary let us observe the two principal elements, the uniting of which formed the religion in question. The first is the beliefs brought by the first Aryan invaders

1 Their names are Dualism, Zoroastrianism, and Fire-Worship. Darmesteter: "Zend-Avesta," Vol. I. p. 1.

from the Asiatic center of Aryan dispersion. That they brought with them the mythology and songs of the Aryans of the early Vedic age is now not doubted. The name of their supreme god was derived from the Vedic title of *Asura Mazdha* "lord of high knowledge," the name of one of the spiritual attributes of Varuna,[1] and in many other cases we could show equally plain traces of this original union.[2] It was formerly supposed that this western movement of the Iranians was in the nature of a schism.[3] But this is probably the reverse of the truth, the religions became changed because the people separated.[4]

With the mythology and culture of the early Vedic age, then, the invading tribes entered Iran. They of course found the country fully inhabited and many centuries of slow fusion went by before the new religion was fully developed. All this time they were subject to the influence of the mythology and practices of the various tribes that they gradually conquered and assimilated. Here then was the second principal element in the development of Mazdeism, and it is necessary to inquire more particularly on this point.

It has been abundantly shown that the tribes in Elam and Media before the appearance of the Aryans

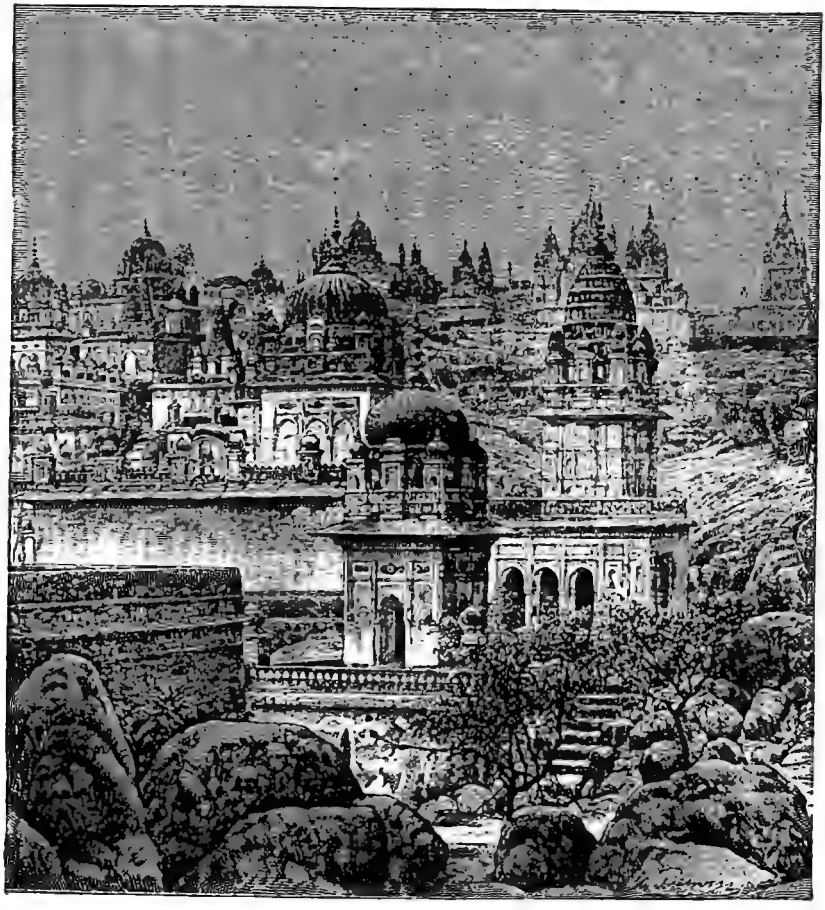
were Turanians. Like all Turanian people they had a rich mythology. But more important still was the organization of their priesthood. We have had occasion to refer to the importance of this observation several times.[1]



Temple at Benares.

It tends steadily to the formation of a powerful priestly body. Their priests were the Magi, a very much respected and greatly feared and consequently a very powerful

[1] Above p. 165.

body of men. They formed a close corporation, throughly organized and well disciplined.

During these centuries of fusion the Aryan tribes had been in general the conquerors; but as far as their religious culture is concerned, they gradually passed under the control of the Magi. Advanced to power by the half Turanian Cyrus,[1] we see them defeated in their attempt to grasp supreme power under the leadership of the false Smerdis, yet they doubtless increased in power under the Achaemenian kings. Stationary under the Greek rule, they revived under the Parthian supremacy, and triumphed with Ardeshir, the Sassanian.[2] Under the reign of this latter king, Mazdeism entered on its final stage. It is to the presence of this priestly body, influenced by ideas derived from Babylon and Assyria, that is to say by Semitic influence, that we are to ascribe a large part of what we find strange in Mazdeism.

There was once a vast mass of literature expounding the doctrines of Mazdeism, only fragments of which remain, and these fragments are of greatly different ages.[3] No doubt the Gathas are very ancient. It is by contrasting the statements in the various manuscripts that we make out the gradual development of Mazdeism. Every great religion that has moved the world is centered around an individual. A great dispute has been waged as to whether Zoroaster, the great prophet of Mazdeism, be an historical

[1] Xen. Cyrop. viii. 1-3.

[2] We have already had ocasion to mention this rise and fall. Above p. 103.

[3] The *Avesta* (Revelation) constitutes the oldest collection. Commentaries on the Avesta, composed in the Pahlavi dialect (of Sassanian times) form the *Zend*. The *Bundahis* (Original Creation) is a collection of mythological fragments existing only in the Pahlavi dialect. Of the Avesta, again, the *Gathas* of unknown antiquity form the oldest portion, the *Yasna* and *Visperad* are supposed to be more modern, and the *Vendidad*, the last in order of time.

personage or not.[1] The most eminent scholars come to directly opposite conclusions on this point.[2] We must remember that there is the utmost diversity of opinion as to when he flourished and where he was born.[3] Now it seems that the name of the chief priest of the Magi in ancient times, was the same as the name of this traditional personage.[4] This may explain the matter, for we may regard the name Zoroaster as that of an official and not of a person.[5]

It is a very difficult task to give within the limits of a few pages an outline of this religion. If in the Vedas we are presented with songs in which the older mythology is about vanishing in poetry, we are more forcibly struck with the almost complete loss of this mythology in the Avesta writings. In the very oldest or Gathic period, an extraordinary stage of development had been reached. Of course many superstitious customs still held sway; but, running through it all, was an under-current of spiritual meaning which has excited the admiration of nearly all investigators.

All nature seemed to the poets of the Gathas to teach the doctrine of Dualism. We have cold and heat, light and darkness, and so also good and evil. Among the Indians we have seen the final gathering of all the good into Spirit, and all the evil into Matter. The Iranians, on the other hand, found the presence of good and evil in every-

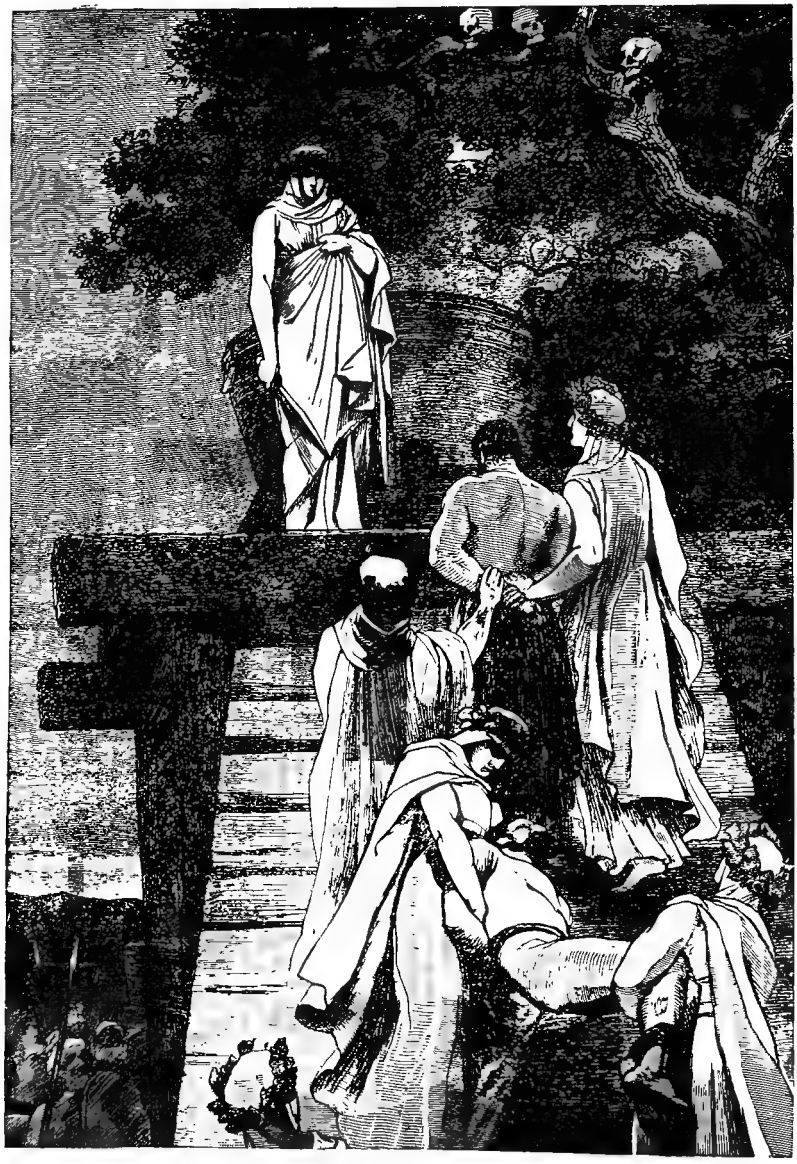
thing—in spirit as well as in matter. They therefore con-



Druid Sacrifice.

ceived that all forms of life and all forms of creation, are

the results of the combined action of two principles, forces, or tendencies independent of each other, one working for good and one for evil. Hence there is good and evil in everything—supernatural beings, men, animals and plants, and material things. These two principles are named simply a Better principle and a Worse one.[1]

The practical consequence of this belief was a division of everything between these two principles. All supernatural powers made their choice, and were exercising their powers, either on the side of the Better Way or the Worse one. The great duty of man in this life was to choose the Better Way "as to thought, as to word, and as to deed." The animal world was divided as they were supposed to have been most influenced by the one principle or the other. All animals in any way helpful to man were of course most influenced by the Better principle. We are then presented with two opposing courts in the supernatural world. At the head of each there was placed a supreme ruler, under whom were arranged the various orders of gods and genii.

At the head of the forces of the Better Way, was placed Ahura Mazda as leader, and the most powerful god as pointed out above. This god was far more ancient than the doctrines of Dualism. He is derived from Varuna, the all embracing sky. He is usually described as possessed of all the attributes of Deity. He is wise, holy, just, and benign. But at the same time other expressions occur showing that after all he was simply the *most* powerful

1 Yasna xxx. 3. Yasna xlv. 2. It is scarcely correct to speak of these principles as "personal beings." It was no doubt hard for these old poets to express their meaning. They had to use nouns of a more or less personal significance. Vide "Sacred Books," Vol. XXXI. p. 25 and p. 125, note 2. A fair statement of this article of their creed would be that they recognized two opposing tendencies in every thing.

god, not the *all* powerful one. In time of trouble he offered up a sacrifice to Vayu[1] and begged his help and protection,[2] and likewise to the goddess Anahita,[3] he offered sacrifice and presented gifts, and begged her assistance in bringing up the holy Zoroaster.[4] He too recognizes that but part of himself, his fravashi,[5] was immortal. In fact the Iranian conception of him was, that he was simply "the greatest, the best, the fairest of all beings."[6] He seems to owe much of his great power to his knowledge of magical formulæ, with one of these he confounded the evil one.[7]

Though in the Gathas he is called the "Great Creator," it is none the less true that all creations are simply the union of the two principles.[8] Under the leadership of Ahura Mazda are ranged subordinate deities. Chaldean mythology knew of "seven gods of the vast heavens, seven gods of the great earth, seven gods of the igneous spheres."[9] It is not surprising to learn of six superior gods (forming with Ahura Mazda, a group of seven), who assisted Ahura Mazda in his government; his cabinet, so to speak, each one taking a special department under his care; we must remember that the Gathas were instructions for the priests, and hence we need not be surprised to notice how refined become some of these older concep-

---

[1] The God of the Atmosphere. [2] Ram Yast, I.-3. [3] Goddess of Water.
[4] Aban Yast, v. Fargard, xix. 14. [5] Ibid. [6] Yasna xix. 15.
[7] Bundahis i. 21.

[8] Ahura Mazda is generally represented as the good principle himself. Yet in Yasna xxx. he is distinctly represented as choosing the good principle; and, if we are to judge from language, all spiritual beings (including the pre-existing souls of men,) are already in existence. They are represented as choosing which to follow. Probably as being at the head of good order, Ahura Mazda became confounded with the good principle itself.

[9] Lenormant: "Chaldean Magic," p. 17.

tions. In the Gathas these seven are the *Ameshospands*.[1] Though they are regarded as persons they are at the same time the attributes or messengers of Ahura Mazda.[2] As in general the crude conceptions must have preceded the refined, we feel confident that the Ameshospands formed the great gods of Iranian mythology, though the effort was to refine them away to mere attributes of the deity. This effort however failed, they remained distinct beings.[3]

Clear traces of the former presence of polytheism in the worship of the Iranians may be traced in other directions. Even in the age of the Avestas, prayers were to be said to numerous gods and goddesses; to Atar (fire), the son of Ahura Mazda;[4] to Mithra, the "Lord of wide pastures," who came ultimately to mean the sun;[5] to Ardvi Anahita, the goddess of water,[6] as well as to the sun and the moon.[7] As in Chaldea we find the months named after Chaldean gods,[8] so in Persia, each month was orginally named after one of the gods of the old pantheon.[9] Each day of the month was placed under the protection of one of the old deities, and a special prayer was appropriated to each.[10] Nor is the list yet exhausted, but enough has now been set forth to show the clear traces of a former polytheism. Let us simply notice, that here as elsewhere, there was probably quite a difference between the views of the priestly class and the masses of the people.

We have so far been dealing with the forces that choose the Better Way, under the leadership of Ahura

[1] Yasna xxix. 7-9. From whence comes the Amshospands of literature. [2] "Sacred Books" Vol. XXVI. Introduction p. xviii and xxiv. here, for instance two Ameshospands are represented as persons.

[3] Many other such passages could be quoted.

[4] Atas Nyasis. [5] Mihir Nyasis. [6] Aban Nyasis. [7] Korshed Nyasis. Vide, the "Nyasis" in "Sacred Books," Vol. XXII.

[9] Geiger: "Civilizations of the Eastern Iranians," p. 142 *et seq.*

[10] These prayers form the collections of the Yasts.

Mazda. Opposed to these there was a similar array devoted to the Worse Way. At the head of the forces of evil was Angra Mainyu. We cannot point back to some one god of the older mythology as the source of the conception of Angra Mainyu. The conception of him arose from the necessities of the theory, there must be some opposing leader to Ahura Mazda[1] He is, so to speak, the negative projection of Ahura Mazda,[2] and the organization of the forces of evil was modeled on exactly the same lines as those of the good. The six Ameshospands were confronted by six greater demons who formed the grand council of Angra Mainyu. In short to every force of good was opposed a corresponding evil force.[3]

We have now presented an outline of Mazdeism in its earlier stages. As time passed on, changes took place. Ahura Mazda, as head of the forces of good, became gradually confused with the good principle, and ended by being considered as identical with it. The case is similar with regard to Angra Mainyu, except that probably he never assumed a well defined form before the foregoing stage had been taken by Ahura Mazda, and consequently he was always considered the evil principle.[4] But another change still is in progress. The priestly idea of Dualism, that good and evil were *united* in the creation of all things, was probably too refined for the masses.[5] The popular idea

[1] *Mainyu* means spiritual power. Spenta Mainyu meant the best spirit (Yasna xxxiv. 2; xxxii. 16) and often means simply the spirit of Ahura Mazda (Yasna xxx. 3), in the same way as we talk of God, and God's spirit. Angra Mainyu was the evil spiritual power; in Yasna xxx. it is simply called the Worse Way. [2] "Sacred Books," Vol. IV.

[3] It may be interesting to note that Chaldean mythology knew of "Seven demons of the Igneous spheres," the opponents of the seven great gods.

[4] Strictly speaking, it was not Ahura Mazda, but his spirit, Spenta Mainyu, that was considered the good principle. Vide Geiger; Op. cit., p. lviii. [5] This is the doctrine in Yasna xxx.

was embodied in the later writings of the Vendidad,[1] and especially in the mythological collection of the Bundahis, written in the Pahlavi dialect, and belonging probably to Sassanian times.[2] The popular conception was, that, Ahura Mazda created all good things, while Angra Mainyu, for spite, so to speak, creates the bad. For every good place that Ahura Mazda creates, Angra Mainyu creates some specific evil. Ahura Mazda creates the good animals, but Angra Mainyu diffused over the earth the noxious creatures, such as snakes and scorpions. He caused blight to fall on vegetation,[3] and mingled smoke and darkness with fire.[4] Avarice, want, pain, hunger, disease, and lust were some of the sins he set in motion.[5]

A state of mind advanced enough to conceive of two first principles, one evil and one good, would take note of the further question, whether this conflct was to be eternal. Humanity, weary with striving, longs for rest. Indian philosophy looked forward to union with Brahma as the final goal. The Iranian prophets looked forward to the final triumph of Ahura Mazda over the wicked one,[6] and popular fancy dreamed of the happy paradise of Yima, where the rivers flow between ever green banks bearing never failing food and every kind of tree of the greatest, best, and finest kinds on earth, but no sin or sorrow was to enter there.[7] But these blessings were to be the reward only of those who were pure in word, in thought, and in deed. It is in the Bundahis that the six Ameshospands

[1] Cf. Fargard i.

[2] Here notice how true it is, that in sacred writings, the first writing of the priestly class is by no means a fair representative of popular opinion. We have pointed out how true that was in the Vedas, have observed it true in the sacred writing of the Hebrews, and here we find it among the Iranians.

[3] "Bundahis," iii. 16. [4] Ibid. 24. [5] Ibid 17. [6] Yasna xxx. 8.

[7] Fargard ii. 26-28.

became six archangels and the other gods became angelic powers. Each taking an active part in the work of creation.

One inquiry yet remains before us in this secondary stage of Mazdeism, and that is what was the relation of soul to matter. They taught the pre-existence of the souls of men, not until after creation was completed do they enter bodies.[1] They thought that in order for the soul to enjoy happiness of the best mental state, which was their comprehensive definition of heaven,[2] it must meet and overcome the powers of evil. Ahura Mazda is represented as giving these pre-existing souls the choice of either remaining as they were, spiritual creations,[3] and be always furnished with a protector, or to assume material bodies, meet and conquer temptations, and then enjoy an immortality of happiness with him.[4]

If we stop to survey the ground over which we have now gone, we can see how widely Mazdeism departs from the Indian philosophy. These differences, we think, come largely from Semitic sources. It is no less certain, as we shall soon show, that this systematized belief reacted on, and greatly influenced, the religion of Israel. But for the present, let us notice still a third stage of Mazdeism where we seem to have before us the influence of later Indian thought. Dualism, after all, is unsatisfactory, the world desires to get back to a First Cause. We have seen how, in the first stage, Mazdeism taught the existence of two, co-equal, co-eternal powers; how, in the second stage, Ahura Mazda and Angra Mainyu were considered to be these two

1 Yasna xxx. 7. 2 Yasna xxx, 4. 3 Yasna xxx. 7.

4 Bundahis, ii. 9-10. It may be of interest to remark that in Bundahis we have the doctrine of the resurection of the dead taught with great fulness of detail, (chap. xxx.) the final judgment is also described, and we find the final restoration of the wicked to the joys of heaven is taught.

first principles. But now the equality between them is destroyed since Ahura Mazda was to conquer in the end. In many ways, he is represented as the superior of Angra Mainyu.[1]

This was in the direction of monotheism. The step was finally taken, but not in Avesta times,[2] and Mazdeism taught the existence of one Supreme God. Both Ahura Mazda and Angra Mainyu were held to be created beings derived from one eternal essence *Zrvan Akarana* "Time without bounds." We do not gather this, however, from Persian sources, but rather from late Greek writers.[3] Thus this doctrine was subsequent to the advent of Christianity, and may have been influenced from that source.[4] But on investigation, the doctrine in question is seen to bear more resemblance to Indian philosophy. And probably the current began to set towards monotheism long before the downfall of Mazdeism.[5]

Analogous to the Vedantic system of philosophy, Zrvan Akarana, like Brahma, while the Supreme God, is far removed from all wordly affairs. Like Brahma, he hands over all the work of creation to the two subordinate gods (Ahura Mazda and Angra Mainyu), which he had produced by emanations from himself. The doctrine of

1 This comes out very plainly in Bundahis, i. Ahura Mazda is represented as omniscient, Angra Mainyu as "backward in knowledge," imposed upon through ignorance, and quite overcome by the spells of Ahura Mazda.

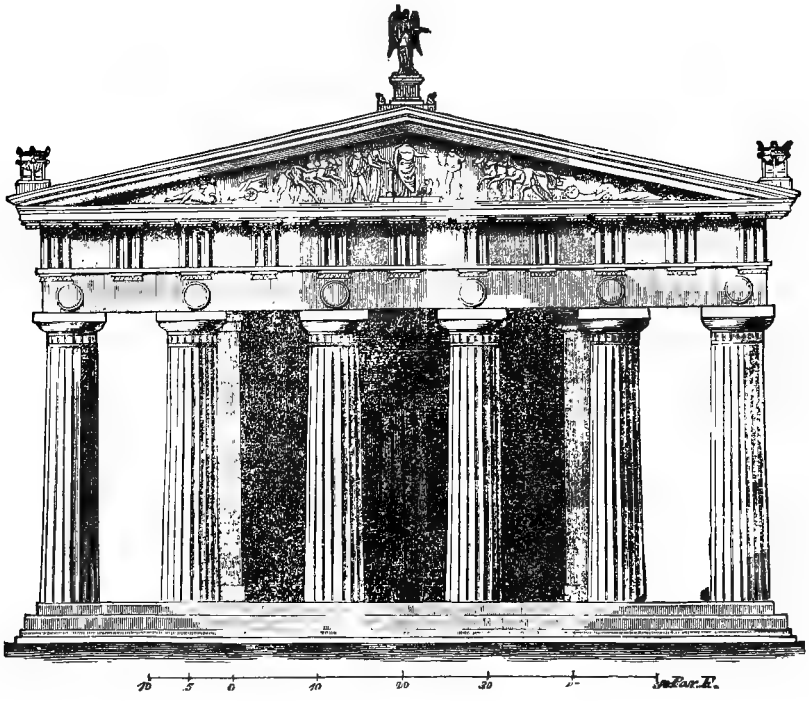
2 See West: "Pahlavi Texts," "Sacred Books," Vol. V. p. lxx.

3 On the "Boundless Time" question consult Wilson: "Parsi Religion," p. 123 *et seq*; King: "Gnostic Remains," p. 29 *et seq*: (Cf. Mansel: "Gnostic Heresies," p. 40): " Sacred Books," Vol. IV. p. lxxxii. Vol. V. p. lxx. Johnson: "Oriental Religions," Persia, p. 98 *et seq*.

4 In its first beginnings it antedates Christianity. It was known to Aristotle, and as early as the third century "Boundless Time" had been transformed into a legendary hero, "Sacred Books," Vol. IV. p. lxxxii, note 3.

5 "Sacred Books," Vol. IV., p. lxxxviii.

emanation, which is an Indian doctrine to start with and not a Semitic one,[1] is further reduced to a system, by teaching that by emanation from Ahura Mazda come the Ameshospands, and indeed all the spiritual forces under his lead.[2] It is needless in this connection to point out the similarity between Ahura Mazda and Iswara on the one hand and Angra Mainyu and Avidya on the other.



Temple of the Pan Hellenic Zeus at Aegina.

Here we will for the present drop the ancient Persians and devote our attention to the Greeks. As every one

[1] It is at any rate true that the doctrine of emanation is held by all orthodox sects in India. (Barth: "Religions of India," p. 69. Williams: "Indian Wisdom," p. xxvi.) but is unknown in the first stages of Greek thought, (Aristotle "Metap." I-3.) Pythagoras, who taught this, derived his philosophy from the Orient. The Jewish Kabalah taught this, but its source was in all likelihood India or Persia.

[2] King: "Gnostic Remains."

knows, the Greeks had a fully developed system of mythology. They had brought with them from the primitive home the greater gods of their pantheon. They had also welcomed some of the mythical divinities of the neighboring people in Asia. The Greeks had in the course of many centuries advanced through the various stages of primitive religion. We must notice one point in this connection, since on it depends much that is peculiar among the Greeks. There was no strongly organized priesthood among them. Nothing even remotely approaching the Brahman caste in India, or the Magian priesthood among the Persians. Each house-father conducted the worship of his household, and tribal officers attended to similar duties for the tribe.[1]

Important results follow from the foregoing. No collection of priestly writings, corresponding to the Vedas and Avestas, was made which the masses of the people were required to accept as infallible, inspired oracles; as a consequence, there was much greater freedom of intellectual life. Neither was there a religion of forms and ceremonies which the people were expected to follow. All this contributed in no small degree to the great excellence of the Greeks in literature, science, and art. In Greece, no system of religion, accordingly, took its rise. But their keen intellect, not fettered by the restraints just mentioned, had of course considered the problems which come to all men,[2] and had in several ways attempted to answer the same. We want to examine some of these answers.

The seventh century B. C. was one of considerable im-

[1] This was the Aryan custom. Remember that both the Iranians and Indians, who had an organized priesthood, had also in each case conquered and incorporated in their ranks well advanced Turanian people. The Druids of Western Europe are a result of the same procedure.

Above p. 730.

portance to Aryan Europe. Psammetichus, pharaoh of Egypt, threw open the ports of that country (670 B. C.), and abandoned the policy of isolation that had been pursued for ages. This must have given a great stimulus to the commercial and intellectual life, and this caused a wonderful expansion of the intellectual horizon of the Greeks. This century also witnessed the growing power of the Aryans in Asia. The tribes that were to overthrow Semitic power were growing into one homogenious whole under the head of Media and Persia. This cause, no less than the former, conduced to the expanse of the Greek intellect.

It is not strange then that, as this century drew to a close, we should find evidence of a general scepticism among the educated classes in Greece regarding the mythology still held in reverence by the masses of the people. It would not do to be too bold in openly denouncing it, but day by day the misty forms of the Olympian gods grew fainter, while philosophical speculations grew clearer. The various opinions of Greek thinkers finally assumed systematic shapes, and we are presented with what are called schools of philosophy. We must remember that no one school was peculiar to any one time. Representatives of the various schools of thought were to be found at all times. We have already had occasion to mention the views of some of the Greek philosophers. We here need only to show their position in the scale of Aryan culture. At the earliest time, we find divergent views held, and it is interesting to take a general survey of the field.

The Ionic school taught that matter was the one eternal principle. Even the gods took their origin from thence. They differed, as we have seen, as to what form of matter it was, that was the elementary substance. While one said it was water, another called it air. These

older philosophers do not seem to have concerned themselves very much with the spiritual part of man. Everything sprang from the material element assumed as the primary one.[1] But alongside of this reasoning we see another line of thought. Anaximander[2] was not willing to adopt any one concrete substance as his element, he falls back on an abstract speculation —*The Infinite*, meaning thereby, perhaps, primal matter.

This idea of the Infinite was closely akin to the Pythagorean philosophy.[3] After all researches there yet remain considerable mystery in regard to this last named school. In many ways, we detect an Oriental influence.[4] He formed a society resembling in many respects similar societies in India. Only after a long novitiate were members admitted to full membership. The life in this society was largely ascetic. They believed the body a prison for the soul. They believed in transmigration of the soul; a pure and holy life was the only escape from this evil.[5] All this betrays an unmistakable Indian influence. We must also reflect that at this time the Orphic and Bacchic mysteries spread throughout Greece,[6] and there is a strong probability that these spread into Greece from India.[7] We may therefore be sure, that the real doctrine of the Pythagoreans was a secret one, to be divulged only to the initiates. Hence perhaps, the great uncertainty in regard to it.[8] It is evident from what we have just stated that

---

1 Such is the general view of writers on this subject. Mahan: "History of Philosophy," argues the contrary view for Thales.

2 Anaximander is not always classed as an Ionic philosopher. Lewis: "History of Philosophy," Vol. I. p. 13.

8 Above p. 488.

the Pythagorean school was an exotic in Greece, still it exerted a great influence on Greek thought.[1]

In the third school of Greek philosophy, the Eleatic, we see the current of Greek thought setting steadily towards Pantheism. The "Being" of Parmenides is strikingly similar to Brahma of the Hindoos. He, equally with them, denied the reality of the phenomenal world; but, like them, he was obliged to attempt a practical explanation of it. The pure "Being" was sometimes united with an opposite influence. For instance if we call Being light, it was at times united with darkness; or if we designated it heat, it was at times united with cold; or if we call the former rare, the latter was dense. What is this but Brahma united with illusion?[2] In the teachings of Heraclitus, the obscure, Pantheism is also taught.[3] We have already pointed out how he attempted to surmount the difficulty, sure to rise in every system of Pantheism, of accounting for the phenomenal world.[4] Here notice the distinction between the Ionic and Eleatic philosophers. They both sought for some one principle or element from whence all was derived. The first school found such an element in some form of matter; the second school found it in some formal cause. The maxim of the Eleatics was that "All comes from one," this

Pythagoras.

[1] Bunsen ("Angel Messiah," p. 67 *et seq.*) writes to show that Pythagoras was a Buddhist. Cf. etymology p. 75.

[2] Zeller: "Greek Philosophy," Vol. II. p. 593. [3] Zeller, Vol. II. p. 46. [4] Above p. 491.

was but another statement of the Hindoo maxim that "the Atman is Universe."

But if both the schools so far discussed taught *Monism*, we find philosophers in Greece who taught a *Dualism*. They recognized the reality of the world of matter, but to explain the many problems, they had to conceive of the co-working of a second incorporal element. Anaxagoras (500 B. C.) thought that matter had always existed in the shape of an infinite number of elements; but these elements are not the atoms of later thought, but compound molecules which by coalescing form sensible bodies. For instance elementary molecules of flesh were conceived to exist which united to form the flesh of a body, so of all other bodies, such as stone, bone, and wood.[1] But the movement of these molecules was effected by an eternally existing *Intelligence*—in short, by *mind* or *spirit*. This is the great merit of his philosophy, still, as Anaxagoras reasoned, the great office of this intelligence was simply to energize matter, and thus his conception was far short of the conception of an intelligent ruler of the universe.[2] Diogenes of Apolonia (460 B.C.),tried to combine the doctrine of Anaxagoras with Ionian philosophy. Others again, impressed with the doctrines of Anaxagoras concerning the infinity of the molecules, but rejecting his ideas as to intelligence, introduced the Atomistic philosophy; the great leader of this school was Democritus (460 B. C.) They too believed in the eternity of matter. It existed in an infinite number of atoms, but the combination of these atoms was effected by

[1] Lewis, Vol. I. p. 87. Zeller, Vol. II. p. 332.

[2] On this important point, compare Lewis: "History of Philosophy," Vol. I. p. 76. Zeller: "History of Greek Philosophy," Vol. II. p. 344, *et seq.* Schwegler, Op. cit. p. 29. The contrary view is maintained by Mahan: "A Critical History of Philosophy," p. 186 *et seq.* Some (Mahan) have supposed that Anaxagoras derived his ideas from the Jews. This is generally given up. Cf. Zeller, Vol. I, p. 37 *et seq.*

*necessity*, not by chance as it is sometimes represented, but by inexorable laws inherent in matter.[1] Empedocles (440 B. C.) with his four elements[2] shows us the Greek intellect striving to get back to unity; for the many of Democritus, he returns to four elements, united by love, disassociated by hate.

We are now down to the age of Socrates. Taking a general view of Greek thought as far as we have gone, we notice that the tendency is in the direction of either materialism or pantheism. We need not be surprised to note that some of the acute thinkers of Greece were fast drifting towards scepticism. This result was inevitable. Philosophy was talking learnedly about the "Being" and the "Becoming," and showing how the common notions, respecting time, space, motion, etc.,[3] were all in error, denying in fact the reality of the phenomenal world. As a natural consequence, a reaction was sure to occur; and we find those subtle disputants, the Sophists, furnishing the arguments to convince the people that nothing really could be known, and that there was no real criterion of virtue.

Socrates.

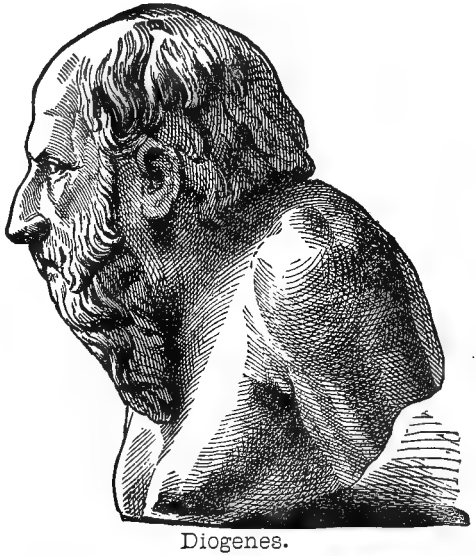
It was at this stage that Socrates appeared. An account of his life has already been given.[4] Now the great value of Socrates' teachings was not in any philosophical scheme which he supported, for he had no philosophy. But he did teach a new method of search. He did insist on a clearing up of thought. He wanted to know what people

[1] Zeller, Vol. II. p. 237. [2] Above p. 492.
[3] Above p. 491. [4] Above p. 493.

meant when they used the learned phrases of philosophy; and by a most skillful cross-examination showed them the weakness of the definition given, and attempted to asssist them to form clearer ideas. He insisted on the practice of morals, and exemplified it in his own life. Socrates thus made a great impression on Greek thought, heightened by his tragic death. The historian Xenophon wrote an account of his life.[1] After his death, several schools attempted to follow out what they conceived to be his doctrines. The doctrine of the Cynics, of which the churlish Diogenes was a member, was rather a perversion than a development of the Socratic movement.

Xenophon.

Plato, the disciple of Socrates, marks such an important epoch in Greek philosophy that we must enlarge to some extent on the account of him already given.[2] After the death of Socrates, Plato spent some years in travel and study, and acquainted himself with the philosophical views of the principal philosophic schools of that time. In this way, he became ac-



Diogenes.

[1] Memorabilia.

[2] Above p. 497.

quainted with the views of the Eleatic school, and with Pythagoreanism. Tradition relates that he traveled in *Egypt*.[1] When he returned to Athens, he established a school known as the Academy, and here he taught his doctrines, in which we find elements taken from all the older systems.

If the Pythagoreans had esoteric doctrines different from their exoteric teachings, we might reasonably look for such a distinction in the teachings of the older Academy. It is admitted that a great deal of confusion exists as to what Plato's philosophy was.[2] Scarcely one of the really important points of his theory has been left so clearly stated that all agree on what he taught.[3] It is supposed by some writers that Plato was purposely obscure on these points. He only wished to be understood by initiates.[4] This view, however, is not favored by the best scholars.[5]

The central point of Plato's teaching was the "World of Ideas." Socrates had insisted on the necessity of clear general concepts. For instance if arguing in reference to a horse, he did not want to know about some particular horse—this black one, or that red one, big or little, old or young—but a clear definition of horse in general. The importance of this will be at once apparent when we reflect how much scientific advance to day depends on this very process. Now Plato and his school, strange as it may seem to us, called such general terms as this *ideas*, and

---

1 Vide Zeller: "The Older Academy," p. 23 note.

2 Vide Lewis: "History of Philosophy," Vol. I. p. 205, *et seq.*

3 Pres. Mahan ("Critical History of Philosophy," p. 236) states five points which "all authorities admit Plato did hold and teach," yet the most of them are questioned.

4 Vide "Isis Unveiled." Vol. II. p. 39 Zeller: "Older Academy." p. 87.

5 Ibid. And yet as an initiate in the Greek Mysteries, some doctrines he either would not mention at all, or else cloak them in obscure language.

imagined them to have a separate independent existence. Every sensible thing we see around us—trees, stones, animals, material objects such as houses, bedsteads, etc.—has its living idea in the shadowy "world of ideas."

Probably with our utmost endeavors, we could not fully understand Plato's reasoning on this point. We have pointed out the Hindoo conception of Brahma, the only real existence, and all this phenomenal world is only an illus-

Plato.

sion, and have also pointed out that the "Being" of Parmenides corresponds to this idea among the Greeks. Now among the Eleatics generally, this pure Being was unity, one eternal essence. Plato's "world of ideas", taken collectively, corresponds exactly to this thought Or we may say that instead of one eternal essence, he conceived of an infinite number of such essences.

The Hindoos said that the material world was simply

Brahma conjoined with illusion. The Platonists said that sensible things are formed by the participation of the eternally pre-existing ideas with—matter. But when we seek further to know what this matter is, we find language employed that seems to come to about the Indian meaning. It is the *no-being*, the *non-existent*; it is to be apprehended neither by thought, nor by perception; it is the *empty*.[1] It does not become clear what is meant by the word participation.[2] Ideas are, in short, the only true existence. Things only really exist in proportion as they participate in the idea. From the foregoing it is seen to be hard to show wherein he differs from the Hindoo theory of things, save that they held to but one essence, he to an infinite number.

But we are not yet through with this singular theory of ideas. They were not only really existing things, but they were *powers*, he regarded them as *living*, *active*, *intelligible*, and *reasonable*.[3] In short, ideas are supernatural powers, *gods* in other words. And now notice; the supreme idea of all, that is the idea of good, becomes the Supreme God. As this is the highest and noblest concept that can be found, it is not strange that it should be considered as the Supreme God.[4] If this view be correct we can see at once that Plato's monotheism was not of a very high order.[5]

---

1. Other views of course exist, we must refer to Zeller: "The Older Academy". Alleyne and Goodwin's translation, London, 1876. p. 293 *et seq*. See also Schwegler: "Hist. of Philosophy," Sterling's translation. New York, 1885. For opposite view see Mahan, Op. cit. p. 236.

2 Zeller, Op. cit. p. 235. Ueberwig, "Hist. of Phil". p. 116.

3 Ueberwig, Op. cit. Zeller, Op. cit. p. 267.

4 In Timaeus, the Demiurge, who shapes all things for good, is the "Idea of Good," Ueberwig, p. 116.

5 Vide Zeller: "The Older Academy," p. 279 *et seq*., especially note 181. Also Schwegler, Op. cit. p. 81. We must understand however that the "Idea of God" is the highest generalization possible. It is the idea of ideas; Lewis: "Greek Philosphy," Vol. II. 259. Ferrier: "Lectures on

Plato's ideas as to the soul are equally strange. There is first of all a "world-soul" filling all space. This soul is intermediate between the ideas and the things. It partakes of the nature of both.[1] Human souls consist of three parts—the cogitative, courageous, and appetitive souls.[2] There seems to be some confusion in the writings attributed to Plato whether these three souls were equally united in pre-existing life, and whether all united were immortal.[3] But at least the highest soul of man was immortal, and indeed had existed as part of the world-soul from past eternity. It is well known that Plato also taught the transmigration of souls.

Epicurus.

Plato's methods of work were more valuable than his results. Both Socrates and Plato by insisting on the necessity of forming clear opinions of subjects discussed performed a most invaluable service for men. We need not longer dwell on Greek philosophy. The work of Aristotle has been sufficiently mentioned.[4] In the schools of Epicurus and Zeno the Stoic, we see the pendulum once more swinging towards scepticism. Such a result was to be expected. Plato's philosophy could no more satisfy them than the preceding systems.

In order to give completeness to our present review, we must glance now at the conflict between Aryan and Semitic thought. We must recall to mind that, near the

Greek Philosophy," Vol. I. p. 344. The opposite line of thought may be found in Mahan: "Hist. of Phil." p. 251.

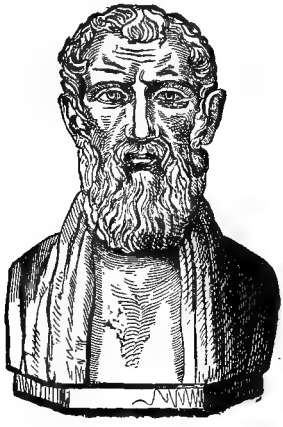
[1] Zeller, Op. cit., p. 341 *et seq.* Ueberwig, p. 123.

[2] The appetitive soul is possessed by plants, the appetitive and courageous souls by animals, but only man has all three souls.

[3] Zeller, Op. cit. p. 389. *et seq.* [4] Above p. 499.

beginning of the sixth century B. C., the kingdom of Judea was destroyed and the principal people taken captive to Babylon. When Aryan power supervened in Western Asia, these captives were permitted to return to Jerusalem. Some of them did so, and as we have seen Judaism, as a fully organized church, was then instituted. But we know that a very large number of Jews remained near Babylon, and in that section were located the principal literary institutions of the Jews.[1]

From the conquest of Babylon by Cyrus to the era of the Seleucidae, or for two centuries, Jerusalem remained tributary to Persia. It was a time of internal peace and quiet. It would be more than singular, then, if the religious beliefs of the Jews were not modified by Persian influence. And it may well be, that the religion of Persia was modified in its turn by that of the Jews. Perhaps to this period is to be traced the gradual rise of the belief that both Ahura Mazda and Angra Mainyu were subordinate to Zrvan Akarana. Those of our scholars who think that the Pentateuch of the old Testament was a late production,[2] point out many striking passages in the ritual of the Israelites and the Persians. The numerous regulations in regard to the fire on Yaveh's altar are parallelled by similar rules in reference to the fire of Ahura Mazda,[3] and other equally striking quotations could be given. It may be, however, that we have here to do with customs which arose quite independently of each other.



Zeno.

1 King: "Gnostic Remains," p. 32. 2 See Vol. II. p. 748, note.
3 "Bible Folk-Lore," p. 144, *et seq.*

But passing by that for the present, there is one point on which it is quite generally admitted that Mazdeism made itself felt. Mazdeizm taught the existence of fully organized spiritual kingdoms of good and evil. Now it is not necessary to say that these ideas were for the first time introduced into Jewish thought, but it is true that the ideas of the Jews as to angels and devils were cleared up by this contact, and they even used some of the terms employed by the Persians. In the writings of Ezekiel, and especially in Zechariah, angels play an important part. The seven ameshospands are supposed to make their appearance in the latter writer.[1] The book of Daniel shows a further advance in this direction. There, for the first time, names are given to angels, such as Gabriel or Michael;[2] and they are divided into classes, such as "Watchers."[3] But this influence shows itself still more strongly in the organization of the forces of evil. It is quite generally agreed that Satan is the Jewish version of Angra Mainyu. In this last statement we do not mean to say that the idea of Satan was unknown to the older writers, but his character there is altogether different from his character after the Captivity. In Job, for instance, he is still a servant of Yaveh and undertakes to carry out Yaveh's will.[4]

Another important point must not be overlooked. There was at Babylon a college of Magi. There were three grades of these priests. According to the Bible, Daniel, a Jew, was placed at the head of this college.[5] This priestly organization was not lost on the Jews. The great

Synagogue, as founded by Ezra, appears to have been of a similar nature;[1] the three grades of scholars—Rab, Rabbi, and Rabboni—corresponding to the three grades of Magi.[2] The sect of the Pharisees may possibly be traced back to this same period. Some have suggested that their name was derived from *Pharis*, that is "Persian."[3] In short, the ecclesiastical machinery of the Jewish state shows the impress of Persian influence. One result was the gradual formation of a body of secret or esoteric traditions, which ultimately developed into the Kabalah, to which we will refer later.

Now, in order to further understand our subject, it is necessary for us to stop talking about the sayings of the philosophers and turn to consider the state of affairs among the masses of the people. In no country, not even in ancient Greece, were the masses of the people, philosophizing or finding comfort in creeds. Let us then see how the old mythical conceptions of the people gradually changed with time. Let us notice the tendency of advancing culture to attach to the festival gatherings of primitive times more and more religious and philosophical meaning. And here we must lament that lack of space prevents our dwelling on many important details, a full understanding of which would solve many knotty points in the history of the development of religion.

Even the lowest races of men delight in festival

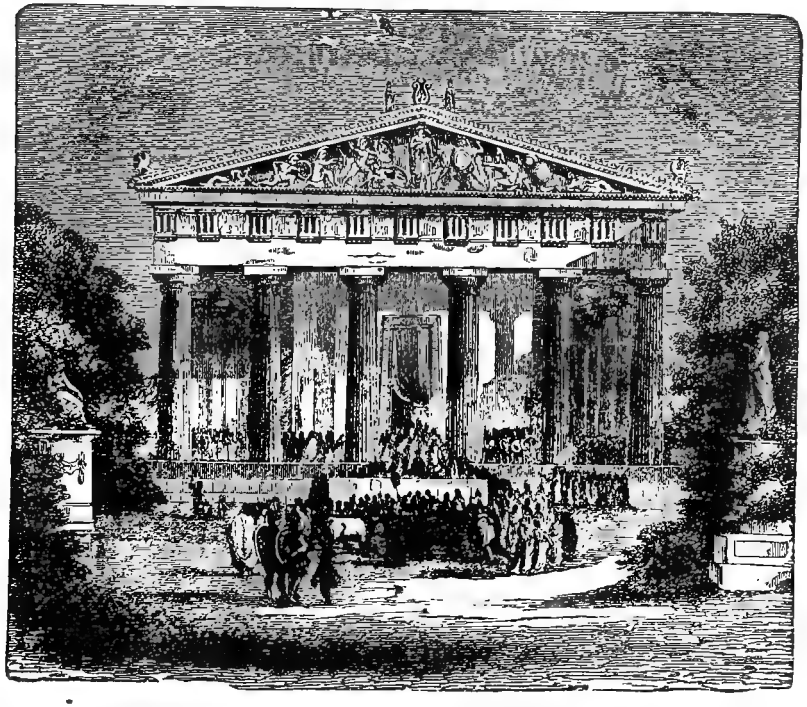
---

1 Kuenen: "Religion of Israel," Vol. III. p. 4.

2 Bunsen: "Angel Messiah," p. 84.

3 King remarks that this etymology "has something to commend it." ("Gnostic Remains," p. 33.) Bunsen suggests that this may be the source of the name. For this he is fiercely assailed by Kuenen as one who has forfeited all claims to be heard in the matter. ("Hibbert Lectures," 1882, p. 235.) This sweeping criticism is, to say the least, utterly uncalled for. It is an immaterial point in Bunsen's arguments, and he nowhere does more than suggest its possibility.

gatherings. The Australians have their *corroborree* where scenes of wild license sometimes occur. And generally all men have their feast days. Advancing intelligence tends to regulate these feasts and to make them significant. When a people enter on the agricultural life, the feasts are generally significant of some stage of agriculture; the feast of sowing, of in-gathering, etc. But as men advance, the



Festival of the Pan-Hellenic Zeus at Aegina.

great drama of the year enforces itself upon their attention, and we find feasts in celebration of the return of spring or the advent of winter. Feasts of this nature are well nigh immortal. The Christian world still celebrates the spring festival, Easter.

The priesthood, from the most savage people up, has taken advantage of these feasts to further the cause of re-

ligion as much as possible. They have tried to make them significant of important events or epochs in their religious history. We need only refer to the importance of feasts among the Jews where, for instance, the spring festival was made significant of their departure from Egypt; or to the Christian world generally, which has eagerly adopted Easter and Christmas as representatives of the birth and resurrection of Christ.

We have spoken of esoteric and exoteric knowledge. The principle of human nature which gave rise to this division of knowledge is as old as humanity itself. Among the Australians, certain ceremonies are gone through with when the boys are initiated into the ranks of men, the nature of these rites must be kept a profound secret from children and women.[1] Advancing higher we find the savage priesthood making use of this tendency also. The people are divided into various grades; initiation from one into the next higher is generally attended with many ceremonies; with each advance the candidate gains "more light." Mr. Orpen's Bushman guide was induced to explain things as far as he knew, but he soon reached the limit of his knowledge, what lay beyond was known only to men of "another dance."[2]

In a similar way Lieutenant Cushing found among our Zuni Indians secret societies, with several grades of membership, each grade being an advance on the one below it in religious knowledge. In short, this principle is world wide. Advancing intelligence in general does not do away with this means of conveying religious knowledge, but simply changes the nature of the information given. It is only necessary to remark that the Orient is now, and

[1] Vide "Kamilaroi and Kurnai."

[2] Lang: "Myth, Ritual, and Religion," Vol. II. p. 12.

probably has been since some centuries before the Christian Era, honeycombed with these secret religious societies, where they never gained such prominency as in Greece. Let us remark further that the highest knowledge taught to the highest grades of the initiates must have been substantially the same everywhere, simply because the problems and means of solution were everywhere the same. We need not be surprised, then, to find that amongst some people, the festival occasions just mentioned were made to subserve this principle also. This introduces us to what are known as the *Mysteries* which played such an important part in ancient Greece; which, surviving into Christian times, excited the wrathful notices of church writers.

We have pointed out the absence of a strong priestly body in Greece, but have also observed the tendency of the Greek mind to ponder over the many problems of religion. We have observed Pythagoras forming one of the societies to which we just referred; doubtless long before his time there had been somewhat similar associations, certain it is that the "mysteries" delighted the Greeks. Probably that tendency of the human mind which finds comfort in some formal creed (which was denied to the Greeks) found here some satisfaction. Each little town in Greece probably had its local mysteries,[1] but as time passed on and Athens grew in importance, Eleusis in Attica became the place of the celebration of the Eleusinian Mysteries, the life of which long outlasted Greece itself, since they were not crushed out till the dawn of the fourth century of our era,[2] when the emperor finally abolished them.

Without going too much into detail we must give the outline of the myth which formed the base or exoteric part of this mystery; the story which furnished the drama,

[1] Keary: "Primitive Belief," p. 222. [2] Ibid 232.

Rape of Persephone.

which was enacted at each recurrent festival. The chief personages of this story are Jupiter, Demeter, and their child Persephone. Persephone was so very beautiful that her mother hid her in a house built on purpose by the Cyclops. But Pluto had already caught sight of the maiden, and wished her for his wife. Jupiter was willing and instructed Venus, Diana, and Pallas to entice Persephone to go walking when her mother was worshiping.

Although warned by her mother not to leave the house, the maiden consents. This was Pluto's chance, and bursting through the earth he carried away the hapless maiden shrieking in his golden

JAGANNATH TEMPLE.

chariot. The grief stricken mother returns and commences a frantic search for her daughter. Helios (the sun) at length informs her of her daughter's fate. Thereupon Demeter, in anger, quits Olympus. Then the earth was no longer fruitful, nothing grew, and animals ceased to bear young. This course speedily brought Jupiter to his senses, and he sent by Hermes an imperative command to Pluto to release Persephone. Pluto did not dare to disobey, but with cunning malice he induced Persephone to eat a pomegranate seed. The effect was, that, though she was returned to her mother, still for one third of each year she was irresistably impelled to join her husband, Pluto, in the gloomy under-world.[1]

Pluto and Persephone.

Thus much for the story. It may strike some as difficult to see what religious instruction could be conveyed by it. Probably at first it was simply a nature story, a drama of the year. Persephone representing the new year, the four months, during which the earth bore no fruit, being the Winter. This may have been the first stage.[2] But when philosophy began to flourish in Greece, and men began to talk about spirit and matter and the bond between them, a new meaning was read into all these old ceremonies. The tendency in this direction would be hastened by the introduction of Dionysiac and Bacchic rites from India, and the spread of Pythagorean-

[1] Vide Keary: "Primitive Belief," p. 224 *et seq.* Also Taylor: "Eleusinian and Bacchic Mysteries," p. 87 *et seq.*

[2] This is the view of Keary, vide "Outlines of Primitive Belief."

ism.[1] Finally, about the time of Plato, it is supposed by some that a complete change had been effected in the meaning of the old drama.

According to this view, Jupiter and Demeter (heaven and earth) represent spirit and matter. Persephone their daughter is the soul. Pluto represents the body which imprisons the soul. The attendants of Persephone are all symbolical—Venus representing desire; Diana, the natural soul; and Minerva, the intellectual or courageous soul.[2] Attended by these, the immortal soul wanders forth to gather flowers, that is she becomes ensnared by the delusive attractions of sensible form, and thus is taken captive by matter (the body). Other details need not be given. It suffices to say that, in this manner, some think the philosophy of Greece was taught.[3]

The Athenians were greatly devoted to this mystery play. If a person neglected initiation into it, he was deemed atheistical (as in the case of Socrates). Before initiation into the great mysteries they had first to be admitted into the lesser mysteries at Agra by a process of purification. They were then called *mystae*, and took an oath of secrecy and received preparatory instructions. A year later the candidate might receive admission into the greater mysteries. The feast extended over nine days which we will not describe in detail. At the final initiation, the vows of secrecy were renewed, and the candidates were conducted in darkness by the hierophant, or interpreter, to the sacred inclosure. From two tablets of stone were read, by the interpreter,[4] the commandments now binding upon them. The candidates were conducted

[1] See above page 757 and note.—[2] Above page 765. [3] See Taylor, Op. cit.

[4] The two tablets of stone are *Peteroma*, the interpreter in all Oriental countries was *Peter*. Let us recall that, in the temples of old Chaldea, were to be found the two stone tablets, also recall the tablets of Jew-

into the lighted interior; where they learned the secret meaning of the rites. But what they there beheld and heard were secrets of the deepest order. Such candidates were now *epoptae*, or seers. But it seems that to some of the interior mysteries only a very limited number obtained initiation.

Demeter.

This hurried account must suffice for Greek Mysteries. In other countries, mystery plays do not seem to have been so fully acted out, but let us remember the Orient was full of secret societies, all fashioned on about the same model. And thus we see how as time passed on, and the ideas of the people in regard to soul and matter, God and man, grew clearer, there were gradually being formed two great divisions of the people, the one more enlightened than the other. We can further see how, wherever the priestly body was strongly developed, the tendency would be to confine this higher knowledge, wisdom,

ish law, and we begin to catch an idea of the antiquity of some of these rites. Did Christ have any reference to this office of interpreter in Mathew xvi. 18?

or *gnosis*, to their ranks. Now let us trace the first great revolt against this system, the rise of the first religious system world-wide in its aims.

More than one writer have traced out for us the many points of similarity between the mythology of the early Indians and the Teutonic tribes of Europe.[1] Maintaining, as we have, the European origin of the Aryans, some points in this resemblance are of especial interest. For many centuries, the Asiatic Aryans had been cut off from communication with Europe. While the Indians had been developing the system of Brahmanism, the beliefs of the Europeans were also changing. As pointed out above, Odhinn had become a great god of the Teutonic people. The Druids in Western Europe also made their appearance, and we catch sight of religious mysteries.

Near the close of the seventh century B. C., we have seen the Scyths crowding into Asia. By their inroads, the great empire of the Assyrians became so weakened that it fell before the assaults of the Medes and Persians.[2] Tradition has followed these Scyths into Western Asia. There seems to be also plain traces of their eastern wanderings. About the dawn of the sixth century, they invaded India from from the north.[3] Amongst their tribes was the Sakya.[4] Coming thus late from Europe, they probably knew of the later development of European mythology, and brought with them European customs. Amongst these was the building of chambered tumuli over the remains of eminent men,[5] and assembling there to worship his ghost. Their priests, probably organized to some extent like the Druids, were possessed of a secret

[5] This Series Vol. I. p. 201.

tradition which they brought with them "from beyond," and they probably had some idea of the worship of Odhinn.

About the middle of the sixth century B.C., Gautama (who was destined to become the head of the greatest religious movement the world has yet seen[1]), a member of the Sakya tribe, was born. Tradition has it, that he was the son of the ruling chief. A short sketch of his life has already been given.[2] Judging the man by the results of his life, we can only conclude that he was one of those rare souls but few, the equals of which, have appeared in the history of the world. He was evidently a natural leader among men, his personal character must have been high and pure, he must have deeply pondered over the question of how to elevate his fellow men, he must have felt a deep compassion for the woes of humanity. The result of all this was, that he left such a profound impress on the people of his age that time has heightened the glory of his renown, rather than allowed it to fade away. But around that name and history, myths have been exceptionally busy, as we will point out.

As we have seen, his tribe had but recently been brought into contact with Hindoo life and thought. When Gautama appeared on the scene he seems to have been impressed with Hindoo philosophy. He determined to devote himself to it, to master its deepest secrets. Abandoning his kindred, we next hear of him in the vicinity of Vaisali, near Patna, about one hundred miles south of his former home on the flanks of the Himalaya.[3]

[1] Rhys Davids: "Buddhism," p. 6. At present Christians of all denominations, including the Greek Church, are only about three-fifths as numerous as the Buddhists. [2] Above p. 171.

[3] This step constitutes the "Great Renuciation" of the Buddhists. As to the question of the location of Buddha's home, see Oldenberg: "Buddha," 95.

Here he went through the severe training of a Brahman ascetic.[1] He chose his spiritual teacher, his *Guru*.[2] By him, he was doubtless made acquainted with the secrets of esoteric Brahmanism. Under the direction of his Guru, he doubtless went through the usual steps to obtain that

Statue of Buddha.

blissful state of mind known as *Yoga*.[3] The meaning of the

[2] This teacher was Alara Kalama ("Birth Stories," p. 89.) He chose another teacher, Uddaka, later.

[3] The trance state sometimes brought about by strong religious excitement is a feeble imitation of Yoga.

mystery treatises, the sacredly guarded Upanishads,[1] was explained to him. On his part, Gautama must have faithfully observed the many hard and puerile duties of a disciple.[2] As the result of all this, he became *Brahmacharin*, a seeker of Brahma.

In order to complete his training as a Brahmacharin, he crossed the Ganges into the province of Magadha, and there for six long years he practiced the terrible austerities of the Yogis. His sanctity became noised abroad "as when the sound of a great bell is heard in the sky."[3] Five disciples choose him as master, and rendered him all manner of service.[4] These six years of Gautama's life is known as the "Great Struggle." So far, Gautama's career had not differed from hundreds of other Hindoo ascetics. But now we come to the first great feature of Gautama's system of religion.

At the present day, no one is called upon to deny that Gautama and other men of his character experience, as a reward for their acts, inward peace and joy. How can it be otherwise when they have spent years in obtaining complete mastery over *self?* But in India, at the time of Buddha and since, this knowledge was confined only to the ranks of the initiates into higher Brahmanism. Others could gain this knowledge in the same way they had. It was a personal matter, the knowledge they had acquired was to be kept secrect. And so they were content to pass their lives in dreamy meditation. Buddhist history relates the effort it cost Gautama to overcome this fatal tendency.[5] But his better nature triumphed, and he determined to preach his doctrines to all "who have ears to hear," and

[1] Lillie: "Buddha," p. 103.

[2] Vide Williams: "Hindooism," chapter iii. [3] "Birth Stories," p. 91. [4] Ibid. 90. [5] Mahavagga, i. 5.

who would "send forth faith to meet it."[1] In other words, he was about to make public the esoteric knowledge of the past; he was going to try and induce the world to accept his teachings.

In carrying out this decision, the practical talents of Gautama became apparent. "He invented the missionary He invented the preacher. He forged an apparatus of propagandism, that has never been surpassed."[2] Like other great inventors, his ingenuity consisted in making a new use of existing materials. From the very earliest times, the life of the ascetic had been a very common one in India. In the old collections of Sacred Laws of the Hindoos, we find regulations for their lives. They are required to live chastely, not to amass any store, they must enter a village only to beg, must not stay two nights in the same village, their clothes are to consist of old rags which they shall have washed, etc.[3] Nor did these ascetics always live a solitary life. One whose reputed sanctity was great would attract many followers. We have just seen that Gautama, himself, was attended by five disciples during his great struggle.

And, if we may credit recent investigators, one association of these ascetics had already become very large and numerous, and was well organized; the texts of its faith and its customs in general being not greatly different from those finally adopted by Gautama. That sect still exists in India to-day under the name of *Jains*.[4] Out of such materials, Gautama gradually perfected his plans, which

---

were for the establishment on earth of the "Kingdom of Righteousness."[1] By his followers, Gautama soon came to be called by another title, and by that he is principally known to-day. He was called Buddha, the enlightened one.[2]

One great trouble in following up the outline from this point is to determine what was the primitive custom. We know with some certainty what the method of procedure finally came to be. We can not be so sure of its first stages. Buddha first took steps to gather around him a band of disciples. The five mendicants, who had served him during his six years' struggle, were his first adherents. Others joined their ranks, and Buddha, before any great length of time, found himself at the head of sixty-one disciples.[3] Buddha adopted for the government of this order substantially the same laws as to dress and mode of life governing other ascetic bands. But we now come to the first great improvement, which shows the originality of Buddha. Heretofore, discipleship was a personal matter in India. A band of disciples would gather around a leader. His personality held them together, at his death the association was broken up. But Buddha gathered his sixty-one disciples about him and sent them forth to preach his doctrines. "Let not two of you go the same way" was his first command. It was a strange mission that these homeless, begging monks started forth to perform. They were to preach the necessity of living a "perfect and pure life of holiness."[4] But this was not all, if they found other like minded ascetics willing to embrace Buddha's doctrines, they were to be at once initiated into the order, without

1 Davids: "Birth Stories", p. 111.

2 More than one investigation has pointed out the resemblance between *Buddha* and *Woden* (Odhinn). Cf. Lillie: "Buddha and Early Buddhism," p. 230, *et seq.*

3 Mahavagga i. 10. 4 Mahavagga i. 11, 1.

journeying to where Buddha himself might be staying.[1]

A very simple innovation, this, but thereby was set in motion the lever destined to largely influence the Oriental world. Another important point was, that this "proselyting" was not solely to re-inforce the ranks of Buddhist monks, but an effort was made to reach and influence the masses of the people. This was largely a new departure.[2] Laymen, who did not feel inclined to abandon the world, were received into a sort of church membership, they formed the *Upasaka* (adherent) class. A large share of Buddha's preaching was directed solely to this class. So, from the very earliest period, they make their appearance.[3] Few and simple were the positive rules they were to follow.[4] But they were urged to walk in the "Noble Path," and to pay due attention to the monks, who, on their part, were expected to "instruct them in religious truths, clear up their doubts, and point the way to heaven."[5]

Buddha is supposed to have lived for more than forty years after establishing his order; and is supposed before his death to have seen it already grown rich and powerful. Although the Buddhist literature of Ceylon professes to give quite full particulars of this important period, it is strongly argued, that we really know but little of it, that in all probability Buddhism spread first as a secret society, and that not until all India was filled with adherents of this new religion, about the time of Asoca, was it openly promulgated.[6] We can not settle this point; but if

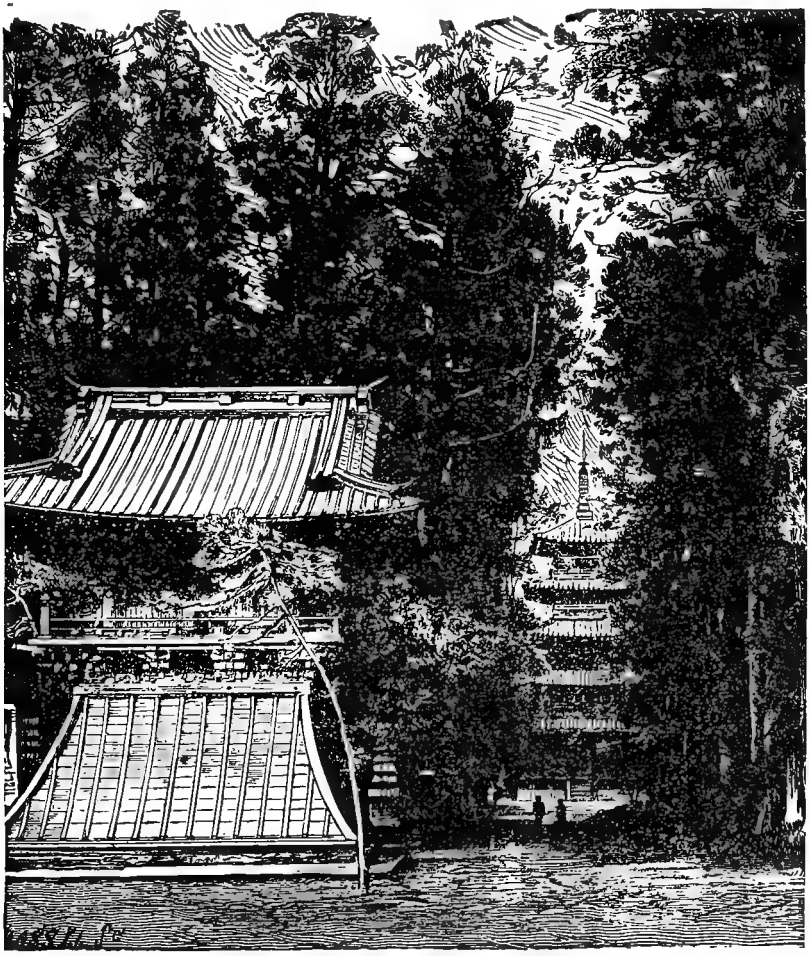
we recall the great number and influence of mystic societies in the Orient, it would not be at all strange if Buddhism grew first as a secret society.[1]



Buddhist Temple—China.

We must now inquire more particularly as to the doctrines taught by Buddha. When he made his appearance

[1] Secret in the sense that a formal initation was undergone when joining the ranks; their proceedings were more or less in secret; the laymen who gave in their adherence were not necessarily known; and the government of the order was more or less secret.

in India, we must remember that the common masses of the people were grossly superstitious. The Brahman priesthood had usurped the right to perform all religious offices. The educated classes were either passing their lives as ascetics or waging endless disputes as to the nature of Brahma, the Atman, the power of Illusion, etc. What Buddha desired to do was to substitute some practical morality for this superstition and too subtle metaphysics. All metaphysical discussions were therefore discouraged. What he wanted was actions not words. What he wanted was "no questioning about existence or non-existence, about eternity or non-eternity." He wanted the "boundless and illimitable realized but not talked about."[1] He accordingly empasized the every-day duties of morality. His discourses to the laity were almost entirely taken up with them.

If it were deemed advisable, whole pages could now be quoted with beautiful sayings that are recorded as coming from Buddha's lips. Space forbids, however, and we will only give a general idea of his teachings.[2] He aimed to awaken *spiritual* life in his hearers. He taught, that all manner of impure thoughts and unworthy actions produced pain; [3] if not in this world, then in the next.[4] He gave practical discourses on such subjects as "Earnestness," which, he says, is "the path of immortality;"[5] on "Thought," which, when "well guarded brings happiness."[6] The duty of "happiness" was pointed out. "Let us, live happily not hating those who hate us"[7] was his desire. The sin of "anger" was commented upon. He advised: "Let a man overcome anger by love, let him overcome evil by good.[8]

[1] Beal: "Romance History," p. 175. *Vide* "Sabbasva Sutta," 9.

[2] We would especially mention the following: "Sacred Books," Vols. X. and XI. Beal: "Dhammapada." Rockhill: "Udanavarga."

[3] Dhammapada. i. 1. [4] Ibid. 17. [5] Ibid. 21.

[6] Ibid. 36. [7] Ibid. 197. [8] Ibid. 223.

He insisted on the necessity of *personal* action. His last recorded words are "work out your salvation with dilligence."[1] In another place, he exclaimed "you, yourself must make an effort."[2] He condemned the idea that bloody sacrifices could atone for sin. He asked: "Having a body defiled with blood will the shedding of blood restore it to purity."[3] He condemned asceticism of all kinds. He wanted his followers to follow the "Middle Path," between the two extremes, which are a life given over to pleasure, and a life of self mortification;[4] and in all things, he insisted on upright conduct. "Great is the fruit, great the advantage of earnest contemplation, when set round with upright conduct."[5] "Good works receive a man who has done good and has gone from this world to the other, as kinsmen receive a friend on his return."[6]

It is a melancholy fact, that it is not truth that conquers the world but *organization.* Buddha clearly realized this, and forwith trained and disciplined his monks and established his order. A large part of Buddhist writings are concerned with rules for the regulation and guidance of the monks. There were two stages of initiation into the order, the *Pabbajja* and the *Upasampada.* Entry into the first grade might be as early as fifteen years,[7] provided the parents gave their consent, [8] or, in special circumstances, even younger.[9] They could not be received into full membership before the age of twenty.[10] It required a chapter of at least ten monks to confer the Upasampada initiation.[11] While, in general, this order was open to every one, yet certain classes were excluded, as soldiers,

ous and minute. Twice in each month, the monks in any given district, which was duly determined by bounds, were expected to meet and hold religious services. There was a sort of open confessional. The list of offences was gone

1 Mahavagga i. 25.

over; and, if any monk had transgressed, then was the time to make it known. This part of their work was secret, but we also read that the people went there in order to hear the Dhamma.[1] This word means the precepts of Buddha.[2] So it would seem as if we here have something in the nature of ethical discourses to the people.[3]

It is not necessary for us to speak about the order of nuns. Let us study the growth and political development of Buddhism. While he lived, Buddha was the head of the order. The books of the southern Buddhists, from which we have been quoting, and which we will consider more at large soon, represent the order as being left without a head on Buddha's death.[4] It is supposed that, for a time at least, those first disciples and companions of Buddha exercised a nominal authority.[5] We will soon show that, by the middle of the third century B. C., there was an official head to the Buddhist church, his title was "the priest of all the world".[6] Perhaps for a long time before this, there had been some such an officer as this in existence.[7]

The real history of Buddhism does not begin until the middle of the third century B. C. Buddhist histories give us glowing accounts of the rapid spread of Buddhism. Wherever Buddha went, thousands were converted and monasteries were provided in abundance by the thankful zeal of newly converted kings and princes. Within a few

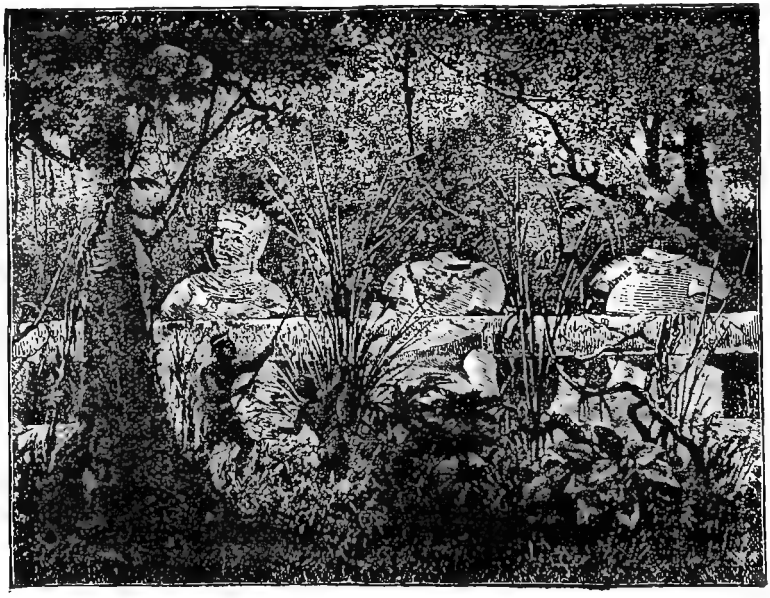
[7] The "Mahawanse," a sacred historical book of Ceylon, certainly implies that there were various grades of priests from the start. It speaks of the *high* priest who was about to unfrock some of the subordinates, immedialety after the death of Buddha. It speaks of *grand* priests, of *chief* priests, and of priests of *high degree*. What do all these expressions mean if there was no gradation of authority?

months of his death,[1] a council of five hundred monks is said to have been held to settle the articles of faith; a hundred years later, a second council is recorded. These accounts can scarcely be called historical.[2] Back of the third century B. C., we have only the uncertain light of tradition to guide us. Before that date, writing was not common in India. It was used only for imperial proclamations etc.[3] We hear considerable about the wonderful memories of the Indian priests, and how faithfully traditions are



Bas Relief-Angcor-Wat.

1 The date of Buddha's death varies widely. Muller gives 477, B. C. Rhys Davids, 412, B. C. Westergard 368-70, B. C. Kern, 388, B. C. The Southern Buddhists assume 543, B. C. *Vide* "Sacred Books," Vol. X. p. xxxv.

2 Tiele: "History of Religion," p.139. Lillie "Popular Life," ch. xiii.

3 Taylor: "The Alphabet, "Vol. II. p. 256. *et seq.* also chapter x. It was considered almost a desecration to put religious books in writing. (Rhys Davids: "Buddhist Suttas," p. xxii.) Although the knowledge of writing is mentioned in the earliest books of Ceylon, yet the Sacred Books themselves were not reduced to writing before the first century B. C. Oldenberg: "Vinaya Texts," Introduction, p. xxxiii. *et seq.*

handed down by them. But nothing is more certain than that three or four centuries of oral transmission will give us anything but a faithful account of primitive times. The tendency is inevitable for recent events, customs, and manners to be transferred to early times.

We can, then, only surmise that Buddhism grew with considerable rapidity, silently, perhaps secretly, until the era of Asoca. That king was converted to Buddhism and forthwith made it the state religion. Basking in the sunshine of royal favor, it is not surprising that Buddhism lost somewhat of its early purity, nor is it strange that the reaction should carry it in the direction of superstition and mysticism. Then it is, that we begin to hear of the "Priest of all the world," the head of the Buddhist church; then it was, that Buddha was made a veritable god, and the worship of saints became established; then it was, that the slowly enveloping myths suddenly shot up into a luxuriant growth and so completely hid the historical Buddha from sight that we can hardly be sure of any details respecting his life.

This was the "Golden Age" of Buddhism. The Achary (high priest) of Magadha grew in power and influence. Later the great monastery of Nalanda became his head quarters. His person was esteemed so sacred that even his name was not to be pronounced. Whoever was admitted to the high honor of an interview with him was expected to fall prostrate before him and kiss his feet. Such a system as this implies a well graded hierarchy. When, in subsequent years, Buddhism was crushed out of India, the achary of Nalanda took refuge in Thibet, and is probably represented by the "Grand Lama." Otherwise it would be difficult to explain why China and Japan, which derived their Buddhism from India, should acknowl-

edge the authority of this Thibetan Pontiff.[1] Many writers have traced out the resemblance between the hierarchy of the Thibetan church and the position of the Grand Lama, and the hierarchy of the Catholic church and the position of the Pope.[2]

The Catholic missionary Huc observed to his astonishment among the Buddhists of Thibet "the cross, the mitre, the dalmaic, and the chasuble—that the superior lamas carry with them when traveling or performing some ceremony out of the temple—the choral service, the exorcisms, the censers supported by five chains and made to open and shut, the blessings which the Lamas bestow on the faithful—laying their hand upon the head of the supplicant—the rosary, the practice of ecclesiastical celibacy, of spiritual retreats, the worship of saints, fasts, processions, holy water, litanies, and many other details of ceremonial which are in use among the Buddhists precisely as in our own church."[3] The Catholic bishop Bigandet speaks also of this state of affairs in Thibet and of the hierarchy in Burmah.[4] What they are describing is but the final form of the order and religion of Gautama and, when we reflect on the conservatism of religion, we will doubtless agree that in all essential points it is not materially different from the same cult in the palmy days of King Asoca.

We must now turn to the consideration of the development of doctrine in Buddhism. Many centuries have elapsed since Buddha sent forth his sixty-one disciples. His followers have now separated into two great divisions; one theistic, and the other atheistic. Considerable

4 "Life of Buddah," Vol. II. p. 261.

dispute has arisen of late years as to the priority of these schools and which better represents primitive Buddhism. It seems to us that here, as in many other cases, the truth lies between two extremes. Buddha, as a Brahmacarin, was thoroughly posted in Indian Wisdom. But his mission was to sharply emphasize the necessity of morality. This colors all his sayings. In his discourses with the young Brahmans, he does not at all undertake to overthrow their ideas as to Brahma, but does insist that the way to union with him consisted in the discharge of moral duties and in purity of life. On their part, the Brahmans recognized that he was simply a reformer. They exclaim that he "sets up that which is thrown down....points out the right road to him who has gone astray."[1]

Buddha is described as being well versed in the "way of Brahma." He talks about the "world of Brahma," and the "Brahma heaven."[2] As St. Paul many year's later points out the difference between a Jew outwardly and a Jew inwardly, between circumcision of the heart and circumcision of the flesh;[3] so Buddha points out to the young Brahmans the distinction between a Brahman, who was one outwardly, and one inwardly.[4] It seems to us therefore reasonable to agree with many scholars that Buddha meant simply to reform the Hindooism of his day.[5] He would therefore not attack its philosophy, and it is more than probable that he accepted and taught, at least to the higher order of his monks, the estoric doctrines of higher Brahmanism.

But as remarked he wanted to emphasize the moral

4 Tevigga Sutta, i. 25 etc.

5 This is now not questioned. See, for instance, Kuenen: "Hibbert Lectures," 1882, p. 256.

side of life. He well enough knew the fatal tendency of Brahmanical life. He therefore condemned metaphysical discussion. He utterly repudiated the idea that purity could come by philosophical views.[1] In one of the writings of the Southern Buddhist, a disciple comes to Buddha and requests him to clear up his doubts as to whether man is immortal or not. Buddha explained to him that knowledge on this and similar points "did not conduce to a life of holiness," and hence he refused to express himself.[2] It is not strange, then, that, as time passed on, confused and even contradictory opinions arose as to what were the beliefs and teachings of Buddha.

When Buddhism entered on its "Golden Age" under Asoca, it would be passing strange if it had retained its primitive simplicity. Judging from various symbols engraved on the ancient topes in India,[3] especially at Sanchi,[4] at that time the Buddhists worshiped first a trinity,[5] consisting of *Buddha*, *Dhamma*, and *Sangha*. These terms, indeed, earlier had a very literal meaning. The candidate for initiation into the order of monks had to proclaim three times that he took refuge in Buddha, Dhamma, and Sangha, meaning thereby Buddha, the law, and the order.[6] This was called "taking refuge in the holy triad." For all we know to the contrary, there may have been an esoteric meaning given to these phrases from the start. But it is certainly not singular that such a meaning came to be applied to them in after times. Neither is it strange that, in the esoteric meaning so applied, we find simply a statement of Indian philosophy.

[6] Mahavagga i. 12, 4.

Briefly expressed then we may say that Buddhism appears to have at that time believed in the existence of one infinite, eternal essence *Aditi-buddha*, (Supreme Buddha) corresponding to Brahma. It denied the reality of the phenomenal world.[1] Aditi-buddha in conjunction with *Dahmma* (the infinite mother of all), produced *Sangha*, the creator, analogous to Iswara.[2] Judging from the ritual (which changes much slower than the literature), from their representation of heaven (still extant in their sculptures), they further held that the highest destiny of the spiritual part of man was to be reunited with Aditi-buddha; but this was a lot attainable only by the Buddhas; other people, if worthy, enjoy a life of immortality in one of the lower heavens.

Let us recall that from a train of superstitious notions seven was a sacred number generally throughout the Orient. As there were seven great gods in the Chaldea, seven ameshospands in Persia, seven holy rishis in the Vedas, so Gautama was said to have been the seventh Buddha. Each Buddha was held to be an emanation from the supreme Buddha,(Aditi-buddha), Dhamma was the mother of each, so each was a god-man, consenting to descend from the highest heaven, Tusita, and pass a life on earth for the good of men. Such a being is also called a Tathagatha, meaning, perhaps, the coming one or the one who "was to come." Buddha explained to inquiring Brahmans that "from time to time a Tathagatha is born into the world," his mission being to "make known the higher life, in all its purity and in all its perfectness."[3]

2 *Vide* Lillie: "Buddha and Early Buddhism" ch. ii: "Popular Life of Buddha," p. 249 *et seq.* Hodgson in J. R. A. S. for 1835. Cunningham, Op. cit.

3 "Tevigga Sutta," i. 46. As for this definition, see Bunsen: "Angel

The ritual of all Buddhist countries contain references to the worship of these past Buddhas.[1] Once when Buddha was preaching, an apparition appeared in the sky. It was the throne of one of the Buddhas of the past, and from it proceeded words of praise for the Tathagatha's preaching.[2] At the Stupa of Bharhut, General Cunningham found carvings representing the thrones and holy trees of each of the great Buddhas of the past.[3]

From the foregoing, we can perhaps form an idea of the Buddhism of the first period, by which we mean from the reign of Aṣoca down to about the commencement of the Christian Era. We see the theological side, held in abeyance by Buddha himself, finally winning a large share of attention. We see the order he had established growing in power and organization. Ancestor worship, which appeals so strongly to the feelings of primitive men, had also won recognition. Saint worship had sprung up. Seven Buddhas were worshiped instead of one. Relics of the great Buddha, or of the eminent saints, were priceless relics. It is not considered improbable that religious wars were undertaken to get possession of such treasures.[4]

About the commencement of the Christian Era, we come to the first great innovation largely due to a Hindoo sect, the *Tantrikas*. This sect were great believers in the powers of magic. There were no gods, or rather their own adepts were possessed of greater power. They affirmed that everything arises from nothing. Though they made

---

Messiah," p. 18. For criticism on the same, see Kellogg: "Light of Asia, etc." p. 107. Admitting with Dr. Kellogg that the meaning is "thus come," still taking this in connection with the statement in the Sutta "that from time to time," such beings are expected to become "thus come," what is so out of the way with Bunsen's definition?

1 Lillie: "Popular Life of Buddha," p. 231, 217.

4 Ferguson: "Tree and Serpent Worship," p. lxxxviii. (Sanchi.)

use of such terms as Maker, they considered them as mere words.[1] The nature of their knowledge they guarded with the utmost secrecy. But this continued to grow and to exercise more and more influence in India. After some centuries of conflict, Buddhism took up with some of their ideas.[2]

A council, assembled by the Turanian King Kaniska

Buddhist Temple, Island of Java.

(A. D. 10), first promulgated these new views.[3] The followers of this new Buddhism were known as the followers of this *Great Vehicle.* According to the Chinese Traveler Hwen Thsang, the primitive Buddhists (*Little Vehicle*) called this movement (in reference to its Atheism) the "carriage which drives to the great no-where;" they further said that it differed in nothing from the Tantrikas' philosophy.[4]

1 Lillie: "Buddhism in Christendom," p. 217. 2 Cunningham: "Bhilsa Topes," p. 158. 3 Ferguson: "Tree and Serpent Worship," p. 64.
4 Lillie: "Populor Life of Buddha," p. 177.

Dr. Lillie further shows that though this doctrine was at first opposed by the acharya of Magadha, yet he finally accepted it. Another change had been going forward, which received the support of the new movement.

The belief had grown up, that several Buddhas had appeared in the past, and also that from time to time they would appear in the future. Those who will appear in the future are called *Bodhi-satwas*. The idea finally arose that the one destined to next appear was now enjoying a life of bliss in the highest heaven, Tusita. They gave it a pretty name, *Maitreya*, kindness. This was to be the future Buddha to rule the world. The next step was to worship this future Buddha. How early this movement arose we do not know, but the Great Vehicle movement took it up. The Chinese Pilgrim Fa Hian expressly states that the disciples of the Little Vehicle (primitive Buddhists) worshiped the Buddhas of the past, but those of the Great Vehicle worshiped the Bodhi-satwas.[1] This same traveller, who was in India about the beginning of the fifth century of our era, found Buddhist monks and monasteries in great numbers, belonging to both vehicles from Cabul to Magadha.[2] Hweng Thsang, two centuries later, found both vehicles in Magadha; Ceylon must have been a stronghold of the Great Vehicle movement, since Thsang left on record that there were ten thousand monks, followers of that vehicle on that island;[3] in general, the Great Vehicle must have been in the majority. Hweng Thsang himself presided at the council summoned by King Siladitya to settle the vehicle question. This council suppressed the Little Vehicle. By this victory, those doctrines and ideas

[3] Lillie: "Buddhism in Christendom," p. 218. Rhys Davids also shows that the worship of Maitreya existed there. ("Buddhism," p. 201.)

in Buddhism which give it the appearance of atheism, so strongly commented on by some,[1] were rendered a permanent feature.[2]

It is now necessary to glance at the development of Buddhist sacred literature. It is probable that many of the rules for the government of the order and ritual go back to a very early period. This is the part that was repeated at the fast days. Tradition doubtless clung tenaciously to the reputed sayings of Buddha. It is none the less true that the tendency would be for these collections of stories to grow with time. Asoca carved on the Bairat rock a list of seven tractates which he orders the Buddhists to recite in the temples. Besides these nothing else was to be recited. Some of these tracts can now be found buried up in the accumulation of later literature.[3] We may suppose that when the alphabet was fairly introduced such legends, histories, and doctrinal books would commence to grow. So, by the time that it was considered allowable to put the sacred literature into writing, it had grown to be quite voluminous.

About the beginning of the fifth century of our era, a young Brahman joined the Buddhist monastery at Nalanda. From his eloquence he was named *Buddha-ghosa* One day he was informed that in the island of Ceylon there was a commentary on their sacred texts, written in the Singalese language.[4] He accordingly went thither for

[1] Kellogg: "The Light of Asia etc." p. 176 *et seq.*

[2] Those who are acquainted with the discussion on Buddhism will see that we have come to the conclusions set forth by Dr. Lillie in his various works on Buddha and Buddhism, and opposed to Rhys Davids. We can not go into details further. But it seems to us that Dr Lillie amply sustains his views. See especially the new material in "Buddhism in Christendom," p. 220, and "Popular Life," chapter xvi. "The Hibbert Lectures" for 1881 gives Rhys Davids' views.

[3] Lillie: "Popular Life," p. 208 *et seq.*

[4] Muller: "Sacred Books," Vol. X. p. xxii.

the purpose of translating this back into Pali. Now Buddhaghosa, as a monk from Nalanda, was a follower of the Great Vehicle, this was also the orthodox faith in Ceylon. He had been but recently converted from Brahmanism. We of course cannot tell what school of philosophy he embraced before his conversion to Buddhism. It is at least possible that he belonged to some of the materialistic schools.[1] It is admitted that he was an able and ambitious man. He has been compared to Hildebrand.[2] It is extremely probably, therefore, that in his new translation he would insist on giving prominence to his own personal views. The importance of this becomes at once apparent when we realize the great influence he exerted on southern Buddhism.[3] Not only his commentary is employed, but, we are told, that all of the Buddhist pitakas are derived from Ceylon.[4] They were doubtless all subject to his influence. All these facts must be borne in mind by those who insist that the books of the southern Buddhists give us the truest ideas of primitive Buddhism. On the contrary, as they exist now, they give us Buddhagohsa's version of the teachings of the "Great Vehicle".

In many ways, Dr. Lillie thinks he can show that Buddhaghosa's version departed from the primitive teachings. It is difficult to account for the ritual and some of the symbols of Ceylon if Buddhism there has always been of the type described in the writings of Buddhaghosa. For instance, the worship of the seven Buddhas is covered up

[1] For instance the *Charvacas*, who were influential at an early day. They denied the existence of a soul, or of a life after death. They had confused ideas that the personal traits of character might go to another body after death. Colebrook's "Essays," p. 259-60.

[2] Ferguson: "Tree and Serpent Worship," p. 65.

[3] The Buddhists of Burmah, for instance, owe their scriptures to him Bigandet: "Buddha," Vol. II. p. 134 note.

[4] "Buddhist Suttas," p. xxii.

by a story about a charm. Yet ritual and incidental notices in the writings show that such a worship did really exist. In the Chinese Dhammapada, certain expressions occur regarding the heaven of Brahma. Buddhaghosa omits those passages, yet in other parts of his writings, clear references to them exist, showing that they must have existed in the account before Buddhaghosa. It is quite probable that he deliberately interpolated suttas before him so as to make them either teach his doctrines or else to make them contradictory.[1]

One more phase of Buddha and his life must now be treated. Around such a character as Buddha, who had succeeded in establishing a religion which by the third century B. C. was embraced by hundreds of millions of people, would speedily gather innumerable myths and legends. Nor is it at all singular that the old sun myths would once more gather around him as a center.[2] We can understand how, as his religion grew and the old formula of initiation (Buddha, Dhamma, and Sangha) grew into an expression for the trinity, Buddha himself would become deified, at least worshiped as the last of the seven Buddhas.

And this last idea, taken in connection with the doctrine of Bodhisatwa, the coming Buddha, would lead to the belief of his angelic life before his birth. Hence the legend begins with him as the anointed angel, waiting in the Tusita heaven for the hour to fully arrive; and here we be-

[1] For instance the Brahmajala Sutta. Dr. Davids quotes from it to show that the Buddhists deny, "in a complete and categorical manner," that there is any soul or any existence after death. ("Buddhism," p. 99) In the same Sutta is a passage, which Dr Davids strangely forgets to quote, which does teach, "in a complete and categorical manner," just the contrary, viz., that there are souls, and that existence continues after death. ("Popular Life" p. 223).

[2] A French scholar has written a book to show that Buddha was an altogether mythical personage. "A sun God" ("La Legende du Boudha.")

gin to notice the sun myth. He was born on Christmas,[1] because, at this time, ancient myths in many nations believed the sun of the new year to be born.[2] As a pre-existing angel, of course his earth life began by a miraculous conception.[3] His mother, though married to King Suddhodana of the Sakya tribe, was still a virgin. In a dream, she was made aware of the happy destiny in store for her, and angels informed the good king of the nature of the child to be born to him.

The queen was on a journey, when Pushya, "the king of the stars," showed by its position that the hour had come. In an Indian grove under a Sala tree, which bent its branches down to conceal her, amid many signs and wonders, the heavenly child was born. Four Brahmans received the child on a golden net, four great kings of the cosmos were present to render him homage, flowers and other offerings were presented to him, and above immortal spirits sang his praise. The holy nature of the child attracted great attention. A holy ascetic, dwelling afar, perceived by his magic power that a Buddha had been born, and he hurried to the city of Kapilavastu to see him. He took the child in his arms but wept to think he would not live to see his glory. When sent to school, he dumfounded the teachers by his miraculous knowledge. No matter how difficult the question he could answer.

Quite in the manner here pointed out there grew up a romantic life of Buddha. Every important event of his life was set off with some incident testifying to his supernatural character. These accounts must have early commenced

[1] Bunsen: "Angel Messiah," p. 23.

[2] Lillie: "Buddha and Early Buddhism," p. 22.

[3] In Egypt, India, Greece, in fact in the ancient world generally, every individual, who attained any prominence, was considered the son of some god or goddess.

to grow. Judging from the carved sculptures at the Sanchi Tope, as well as at Amrivati, the legends must have assumed a systematic shape as early as three centuries B. C.; though until they were finally reduced to writing, they would be subject to changes and new arrangements.[1]

We have now only space for a few remarks concerning the spread of Buddhism. In a general way, it is known how it spread over Eastern Asia, and even out on the islands off the coast. The Island of Java, for instance, was overrun with Buddhist missionaries at an extremely early date. Abbe Huc tells us that the fourth class of Lamas in Thibet are known as the "Wandering Lamas". Their life is devoted to wandering and preaching their doctrines. They visit every country at all accessible to them. They climb mountains, ford rivers, cross deserts, and brave all dangers. We need not doubt that we have in these wandering Lamas fair representatives of the first monks that Buddha sent forth to preach Dhamma. His command was to preach his doctrine to all without exception.

He was obeyed. His ragged missionaries traveled far and wide. Only of late years are we learning how far they did go, carrying with them the doctrines of the kingdom of righteousness. Some eminently respectable authorities think they penetrated to America. We have not space to investigate this subject. We need only remark that some of the carvings found in Central America and Yucatan are easy to explain on this hypothesis.[2] But the

[1] Beal ("Romantic Legend") gives these legends and many more. We have given quite enough to show their general character. Most any of the lives of Buddha contain incidents of these legends. Most of the incidents we have here referred to are represented in the Amrivati carvings (250 B. C. Ferguson: "Tree and Serpent Worship"). It would be well to compare what Dr. Kellogg has to say on this point, "The Light of Asia etc." p. 109.

[2] Consult Vining: "An Inglorious Columbus;" also Lillie: "Buddha

east was not the only direction of travel. They went west as well. We have referred to the connection between the name of Woden and Buddha. Long ago that quite eminent scholar, Godfrey Higgins, wrote a book to show that the Druids were in reality a sect of Buddhist monks.[1] More recently, Prof. Holmboe has marshalled a strong array of facts to show that Buddhist monks must have reached Norway.[2] Prof. Muller refers to the existence of Buddhism in Russia and Sweden.[3] The celebrated Round Tower in Ireland, dating from pre-Christian times, is thought by some to be a Buddhist monument.[4]

Here we will bring this chapter to a close. We are now down to a most interesting point in the history of religion; to the conflict between Greek Philosophy, Jewish Mysticism, Orthodox Judaism, and the doctrines of Buddha. Out of the conflict, their emerge the numerous Gnostic sects; and finally, when the hour was fully come, Christianity was given to the world. But this must be reserved for a future chapter.

---

and Early Buddhism," chapter iv. Some of the carvings to which we allude are the following (This Series Vol. I. p. 570 *et seq.*): The Statue at Copan, Stone Tablet at Palenque, Statue from Palenque, the Beau Relief at Palenque, Two Headed Monument from Uxmal, The Seated Figure over the Doorway at Uxmal, etc.

4 Lundy: "Monumental Christianity," p. 255.

Of course, any power, that aspired to a very extended sway, must sooner or later, come in contact with Babylon. The glorious reign of Nebuchadnezzar had passed into history before Cyrus had commenced to extend the boundaries of his empire. The successors of Nebuchadnezzar were not by any means his equal; and it was probably apparent that the star of Babylonia was as rapidly sinking to final extinction, as it had risen to its meridian height. When such a state of affairs exists, there is always a discontented party; and when Cyrus was planning the downfall of Babylonian power, he seems to have intrigued with the discontented party in Babylon. His intrigues were successful; and when, after his conquests over the various Aryan powers in Asia Minor, his forces appeared before Babylon, the city gates were open to him, and, almost without opposition, his soldiers entered the city. And thus Persian supremacy supervened in Western Asia. They now wielded the power once held by Assyria. The whole history of the conquest of Babylon is recorded on a terra cotta cylinder only recently discovered, so that we have historical evidence of this period in Persian history.[1]

From this, we learn that there was no long siege of Babylon. Cyrus appears as the ally of a disaffected element. His success is claimed as an evidence of favor from the gods of Babylon. Cyrus acknowledges himself, as the servant of Bel and Merodach. He showed a great deal of tact in not antagonizing the religious culture in Babylon. This kindness was even extended to the Jewish captives. With his consent, a portion of them, as an organized church, went back to their ruined city, Jerusalem, and there established Judaism.[2] Cyrus ruled until

[1] Budge: "Babylonian Life and History," p. 78.
[2] Vol. II. p. 761.

529 B. C., and it is not positively known when or how he died. There is a plain marble tomb of ancient date standing on the plain of Mergab, which has for centuries been called the "Tomb of Cyrus." It is claimed that it bears the inscription: "O, man, I am Cyrus who won dominion for the Persians, and was king of Asia. Grudge not this monument to me."[1] Recent researches have proved that this tomb can be none other than that of a female; and while the natives claim that it is the tomb of Solo-

So-called Tomb of Cyrus.

mon's mother, Dr. Oppert asserts that it is the tomb of "Kassandana, the beloved wife of Cyrus, and the mother of Cambyses."[2]

Cambyses succeeded his father as ruling chieftain without any manifest opposition, though one of his first acts was to put his brother, Smerdis, to death. Cambyses spent his short reign in extending the rule of Persia over the states of Western Asia, and especially Egypt. In this he was successful. It is related of him

# PREFACE

ARE now at the end of the line of investigation proposed for this series. Let us look over the ground whence we came. We have been considering the growth of man in culture. Our first volume is devoted to the consideration of the prehistoric period of man's life on the globe. This period, which is widely different in the various nations of the world, covers by far the largest portion of man's life. Aside from gathering information of a most interesting character on the antiquities of our own country, we wish to establish the general proposition that man's life on the globe dates from a most profound antiquity, going back indeed to a previous geological age; and we wished to show that man has lived a life of progress.

The second volume we divided into two parts. We discussed the divisions of men into races, the basis of classification, the most probable place of man's first appearance, and the condition of primitive man in culture. We aimed to trace out the origin of various social and governmental institutions. Not resting satisfied with the general statements that tribal society preceded our present form of government, we sought for the origin of tribal society itself. We took up and discussed various questions relating to primitive culture and primitive religion not usually considered in historical books. Yet their consideration is most essential in a history of culture.

We then passed in review the early history of the Yellow Races. The main position sought to be established was, as in geological history of the past one form of life slowly grows into prominence, culminates, and then declines; so did the Black Races, after long possession of the world, give place to the Yellow Races, and these in their turn give place to the Whites. The early period of half legendary history in Western Asia shows us the closing stages of this conflict between the Yellow and the White Races. We then give a further outline of the history of the Hamitic and Semitic people in Western Asia and in Egypt. Their outline, we considered, closed the ancient period of the culture history of the world.

In the third volume we entered on the Aryan age of the world. We sought to establish the European origin of the Aryans; and we aimed to show that the intellectual unfolding of Europe is like that of a cymiferous flower, the terminal blossoms are the first to unfold. Beginning with Greece, we watched the successive unfolding in culture of that country, then of Rome, and finally of Teutonic Europe. We devoted a separate chapter to Aryan religion. We do not think the Aryan race has had justice done it in this department of culture. We found that the first system of religion, world wide in its aim, sprang from Aryan beliefs.

In the present volume we have aimed to show that our present culture is simply the developed form of the culture of the Medieval World. We can not point to the merging of a new race into the light of history, possessed of the energy and buoyancy of youth, who take up the culture of the world and hurry it along to new and more exalted heights, but we can point to a combination of circumstances which resulted in starting the Aryan world forward with renewed energy in the paths of progress. These were the revival of learning, and the discovery of a new world. The revival of learning was very much assisted by the invention of printing.

In our opinion, the time has come when the general ideas as to the past of man on the globe must be reviewed and very great changes made in the current conceptions of the same. The history of man is almost the only field which has not responded to the great discoveries of modern times. Astronomy, geology, biology in both of its two main divisions, have all felt the influence of this spirit of modern learning and have accustomed themselves to new

and daring theories the comprehensive sweep of whose laws are almost startling to contemplate. It is high time to correct the exceedingly narrow views of man's past life, his progress in culture, and his destiny as a race.

This series is an effort to accomplish this work. We trust we have made it clear, that man has lived on the earth for a very long while, that his starting point was very low in the scale, that he has lived a life of progress, and that nations and races, no less than individuals, enter into the struggle of life with diverse faculties; they fulfill their allotted task and then decline in importance. Everything that goes to make up our present culture, all our governmental and domestic institutions, all our arts and sciences, the very language that we speak, are but the result of long ages of experience. It is useless to flatter ourselves that the position now reached in any of these departments of culture is the final one. When there is nothing more for man to learn, then, but not until then, may we look for change in any department of culture to cease.

A true idea of the dignity and worth of man is gained only when we take these broad general views of his antiquity and his growth in culture; when we reflect on his career in the past, we may hope to prophesy of his growth in the future. A citizen of ancient Rome in the first century of our era, could not foresee the culture of our day. It is fully as difficult for us to realize the possible civilization of one thousand years hence. Of one thing only we are sure, that advance in all departments of culture will continue. Of his life here, no less than of his life hereafter, it is true that "It doth not yet appear what we shall be."

We do not, of course, flatter ourselves that we have conclusively established every position stated. Perhaps the time and labor spent in certain directions of inquiry might have been more profitably devoted elsewhere. We believe, however, that take the entire series it will fully answer the purposes intended; that is, give full and sufficient information to those who desire to gather in a brief form the thoughts of our best scholars on these various points. We have also freely indicated to those who care to pursue the subject further where information can be obtained.

The duty of returning thanks is none the less a pleasant duty, although the same names re-appear. Again we acknowledge our

indebtedness to EMIL REICH, D. C. L., and WILLIS BOUGHTON, B. A., and we wish once more to make mention of the kind services of MR. A. W. WHELPLEY, of the Cincinnati Public Library.

In conclusion, we can only hope that as time passes on and we gain clearer light into the history of nations and races who have long vanished from the stage of action, that it will become more and more clear that the positions we have here supported as to the progress of man in culture are in the main the correct ones.

CINCINNATI, *October* 15, 1888. E. A. Allen

# Part I.

## An Outline of Modern Political History.

I. History of Discoveries.

II. Modern European History.

III. American History.

The Old World bended low beneath a load
Of bigotry and superstition dark,
When Liberty, amid the tottering thrones
Of despots born, with gladness filled the homes
Of men, e'en the Eternal City bade
Her gates imperial open wide; and, like
A cloud, the darkness lifted from the land.
Then Freedom's gentle, buoyant spirit, like
The Magi's wand, extended far across
The sea, and thereupon the gloomy flood
Was parted wide asunder and revealed
A glorious paradise for Freedom's sons.

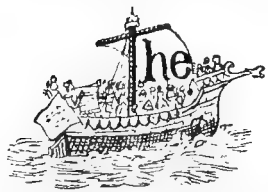
Columbia, beneath thy banner's stars,
The mind of man in rare luxuriance blooms,
Unfolding, one by one, the attributes
Of deity. In vision, we foresee
The perfect man. In form, the image of
His Maker, God. In toleration filled
With charity for all. In Reason's ways
Profound. In thought, he mounts the throne of power
And sways the world. He tries from Nature's grasp
To lure her secrets still untold till we,
Amazed at his bold course, recoil abashed.

WILLIS BOUGHTON.

# CHAPTER I.

## HISTORY OF DISCOVERIES.

INTRODUCTION—Navigation among the Ancients—Among the Phœnicians—Among the Egyptians, etc.—Greek Age of Discovery—Roman Age of Discovery—Saracen Age of Discovery—Voyages of the Norsemen—Discovery of Vinland—Icelandic Sagas—Voyages of other people to America—Venetian Explorers—Theories as to shape of the Earth—Christopher Columbus—Sources of his Knowledge—Improvement in Navigation—Outline of Discoveries.



THE GREATEST events in the world's history are never sudden in their origin. They are preceded by a long train of causes, and many years of slow preparation go by before the time arrives for the final consummation. On a large scale, we see this law exemplified in the slow changes of centuries ushering

in a new geological era. Our scholars are now ready to admit that some such a law as this prevails in the animal and vegetable world. Investigators are hard at work on this important subject, and we may hope some time to clearly understand it. Enough is now known to render it probable that advance has been by slow, almost imperceptible changes, slight modifications to fit slowly changing environments. It is not surprising, therefore, to find that man's advance in culture is subject to the same procedure.

No great and sudden changes seem anywhere perceptible. Slowly, with a certain majesty of movement, has one age of culture taken on the distinctive peculiarities of another.

To-day, we are living in a very advanced stage of society. The morning's sun brings to our doors fresh pages of the world's history—acted, written, read within a day's span of time; while ever the delicate, electric nerves of the busy commercial world are silently wafting to our receptive senses the echoes and instantaneous pictures of the most eventful deeds of men throughout earth's greatest circumference. When we compare this with the most brilliant culture of the Medieval World, we are conscious of a wonderful advance. Yet we err when we conclude that this great advance was the result of any sudden revival of learning, or followed fast the discovery of a new world, or a reformation in religion. These are but the stations reached in the course of the ever advancing intelligence and civilization of mankind. Great discoveries and marvellous inventions, advances in learning and changes in religion are not so much the inciting causes as the perfected fruits of advancing intelligence in general.

Ancient learning was one-sided, local, and territorial. It lacked that breadth of view which comes only with a

knowledge of the great world on which we live. Every ancient people, even those most advanced, thought their province or empire was the richest and fairest portion of the globe, they themselves the only civilized people, their god or gods the only true and powerful one or ones. These egotistical notions were great obstacles in the way of growing civilization. They are unfortunately very strong today; but, from the very earliest times, they have been gradually undermined by increasing knowledge of the world and its people. Only when we understand this, can we fully appreciate the importance of those gradually extending expeditions for trade and discovery which finally culminated in the discovery of the New World. In this chapter, we wish to trace the rise and progress of exploring voyages and show that an increase of knowledge as to the world and its people has always been accompanied by an increase of civilization.

Even in our own land, so full of restless people, the horizon that bounds the world in which the ordinary individual passes his life is very limited. To the great mass of mankind the knowledge of an outer, larger world is only hearsay. To the average man, a trip to a neighboring state is the event of a lifetime, the subject of many a fireside tale. Yet, when we regard the condition of early people, when the savage trail was the highway and the caravan the railway train, we can see that this knowledge was much more limited.

The yeoman was wont to stare with jealous wonderment at the daring individual who had chanced to journey a hundred miles or more and had safely returned to relate his adventures and hair-breadth escapes. A pilgrimage to Rome or to the Holy Land was so fraught with danger that the wise deemed it expedient to settle their earthly

affairs, and record their last wills and testaments before entering upon any such journeys. In those days a knowledge of the world's doing, outside of each one's neighborhood, was blank or else obtained after a long period of waiting.

It was similar in the case of villages, communities, tribes, and nations. The inhabitants of ancient Athens had little knowledge, so far as we know, of the opulent cities of the Orient, though the advance guard of Aryan immigration must have reached the shores of the Troad while yet Chaldean cities were flourishing in their Oriental grandeur. But we cannot define the boundaries of the world in those ancient times with any degree of certainty, for we know not from what distances the old Chaldean and Babylonian traders brought the wares that contributed to the luxury of that pristine civilization.

In tracing the growth of geographical knowledge from the dawn of history to the present time, we are apt to forget that the Egyptians, Hittites, Trojans, Phœnicians, etc., each in turn, must have had an extensive commerce, and therefore an extended geographical horizon. Starting from a classical stand-point, the geographical historian is apt to forget that nearly all the discoveries of classical or southern European nations are but re-discoveries, including even the discovery of America. We must remember, therefore, that the Arabs were perfectly familiar with the fact that Africa could be circumnavigated, that East Indian geography was thoroughly understood by Buddhist priests, that the commerce of the Jews extended from the Azores to China, from the Baltic to Mozambique, at a time when Europeans confined their voyages to the Mediterranean regions.[1] But classical writers did much to reduce the

[1] Draper; "Intellectual Development of Europe," p. 454.

knowledge of geography to its present scientific basis.

In tracing the gradual growth of discovery, we go back to the fifth millenary before the birth of Christ and find ourselves before the gates of old Eridu in Chaldea, situated in that happy, fertile Mesopotamian valley, so near the storied "Garden of Eden," it had become a holy city when the first glimmerings of historical light fall upon that region. We there meet with extensive systems of canals; with enormous buildings, the materials from which[1] they were constructed of necessity being brought from distant countries (for there is neither building stone nor wood in the Mesopotamian region); with beaten caravan routes; and with many other indications of a mature civilization and an extensive knowledge of the world. Perhaps the Tigris and Euphrates were navigated to their sources; perhaps there was traffic with India and China; perhaps vast caravans, loaded with merchandise and accompanied by devout pilgrims, may have been seen, winding their separate ways toward this sacred shrine.

Though we have reached the limits of historical investigation, we must realize that we have by no means found the beginnings of commerce and navigation. From this point backward, mankind is led to theorize upon the infancy and growth of discovery. The savage is represented as too timid to venture upon the waters of even a neighboring brook, and so we are told that overland travel and discovery must have preceded river navigation. But if a Byron could swim the Hellespont, we can not see why the daring nomad of primitive times should not venture upon such streams as happened in his course. Still until canoe building had reached quite a degree of advancement, it is reasonable to suppose that commerce was carried on

1 Vide this series, Vol. II, p. 651–5.

by means of the beast of burden, and discovery by the more rapid travel on horseback.[1]

Among all people and in all ages, traders seem to have been regarded with favor; even among savage tribes their appearance was welcomed with joy, and their safety from injury guaranteed. This was, of course, the case in the Orient when history first dawns upon the world. But restless bands of nomads, who exist by plunder, have always roamed over the great deserts of Asia. Then, too, fatal

A Coracle.

sandstorms might arise at any moment upon those desert wastes and overwhelm the lonely traveler, sometimes endangering whole companies. So we see that the only safety for traders in desert countries was in traveling in bands. Therefore great companies of merchants, with armed escorts, were formed from time to time at the various centers of trade. Trains of camels, laden with the produce of the

[1] Yates: "Growth and Vicissitudes of Commerce," p. 7.

land, were doubtless wont to file out of the gates of ancient commercial cities, and thread their way across the desert to a neighboring people. Such companies of merchants were called caravans and were the predecessors of the modern railway train.

In early times, distances between commercial centers must have appeared much greater than at present. The ancient traveler or merchant entered upon his journey expecting to spend many weary nights under the open sky, with the barren sand for his bed. This led such eminent and wealthy monarchs as David and Solomon[1] to construct highways over the deserts and mountains, and build public houses, about a day's journey apart, for the accommodation of caravans. These were called *caravansaries*, now represented by the inns of modern times. Such caravansaries would in time become centres of trade, from which roads diverged in every direction and where merchants met to exchange their wares. Many of the most flourishing cities of ancient times were at first nothing but caravansaries.[2]

When history dawns, there were caravan routes reaching to the remotest corners of the Old World. Since the dawn of history, Asia Minor and Egypt have been thus joined with Bactria, the Hindoo Koosh region, the Cabul valley, and India and China, while to the south and west the caravan penetrated Arabia, Ethiopia, and the heart of Africa.

During the uncertain centuries that followed the dawn of history, as the political power shifted from point to point, new routes of trade arose, and one city after another became a commercial center. It is the story of

---

2 Taylor: "History of the Factory System," London, 1881, p. 184-186.

every city re-told—a fertile country, an industrious people, a superabundance of produce drawing riches from the ends of the world, and transforming the desert into a thriving mart of commerce. We may imagine the busy scenes in the streets of Sirgulla, Ur, and other Chaldean cities—the mingled voices, the varied languages, and the strangely attired foreign merchants, earnestly engaged in bartering their wares or making purchases preparatory to departing for distant regions.

When, at last, maritime commerce is introduced, intercourse not only between different nations, but between parts of the same country as well, must have become much easier and more frequent. But we are still dealing with prehistoric times, for savages in the Neolithic stage of culture had comparatively safe and well made boats. Ancient inscriptions make mention of the "Ships of Ur."[1] Sargon of Accad, who lived about thirty-eight centuries before our era, tells us of the ark of reeds with asphalt lining, in which he, as a child, was cast away to perish.[2] Then, recalling to mind the fertility of Chaldean soil and the absence of all manner of raw material for the manufacture of clothing and other articles, and stone and wood for architectural purposes,[3] we can perceive how necessary the ships of Ur must have been to Chaldean commerce and prosperity. Enormous blocks of building stone could have been brought into the rich Mesopotamian valley in no other way so easily as by water. All these evidences point to an extensive knowledge of the art of shipbuilding in those most ancient seats of civilization.

We know that Egypt was foremost as patron of a

caravan commerce.[1] We have seen how early she was called upon to defend her coasts from invaders by way of the sea.[2] There has been found a bas-relief at Thebes, supposed to represent a naval battle between the Egyptians and the Indians that occurred about 1400 B. C.[3] But the Egyptians give no evidence that they were a nation of sailors, for they, in later times even, employed Phœnician sailors to conduct their maritime enterprises. Such a great commercial people as the Phœnicians were, no doubt, skilful ship-builders and expert sailors, venturing upon any voyage that promised them a sufficient reward. The storming of Ilios by sea proves that the more advanced nations of the twelfth century B. C. understood how to build a strong and durable class of ships.

With the advent of the Phœnicians, we begin to notice improvements in the science of navigation. The nautilus of the Mediterranean, so the poets say, first taught man the use of the sail, and the single square sail appeared upon the Mediterranean at the close of the thirteenth century B. C.[4] Still the oar continued for many centuries more the principal means of propelling a ship. The great ship of Ptolemy Philopater is said to have carried four thousand rowers.[5] Then the Tuscans invented the anchor, and soon the chains gave place to cables made of hemp, flax, or some such material manufactured in Egypt.[6] The first light-house was erected near Alexandria at the beginning of the third century B. C. It was "a white marble tower, one hundred and thirty-five feet high, on the top of

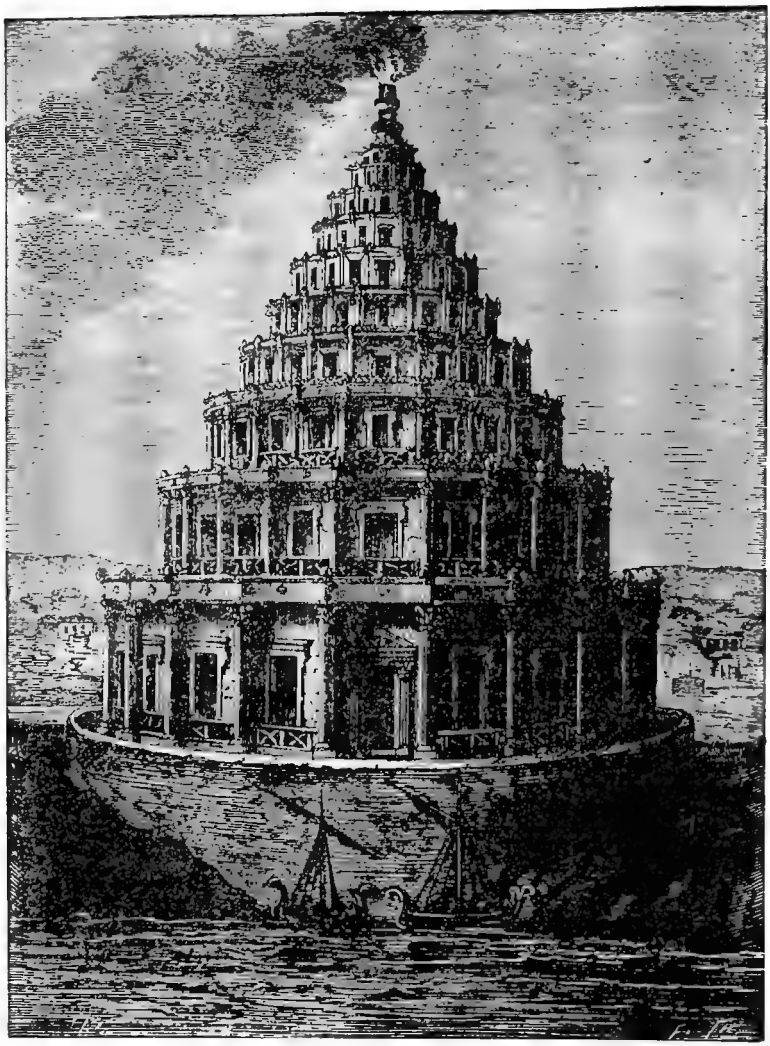
which fires were constantly maintained for the direction of ships along the coast."[1]



Pharos at Alexandria.

Still life upon the water was full of danger and un-

[1] Ibid: p. 36.

certainty. There was no mariners' compass then;[1] and the sailor hugged the land as closely as possible, or trusted to the guidance of stars. Sometimes birds were taken on board and at intervals were thrown into the air, the sailor knowing full well that they would take the shortest course to land. If no land were in sight, the frightened bird would soon rest again upon the vessel's deck. But oft the superstitious rover of the seas felt the need of the watchful care of deity, and so he prayed to the "Twin Gods"[2] for help. When he saw the fires of St. Elmo playing about the vessel's spars, he knew that he was in their immediate presence. Improved methods in ship-building kept pace with the increased knowledge of navigation. Princes and kings began to pride themselves on the magnificence of their vessels. Ptolemy Philopater built two that exceeded in size many of more recent construction. King Hiero of Syracuse built a veritable palace upon water, and sent it as a gift to Ptolemy.

As we pass over era after era of ancient history, we perceive that the centers of political power were constantly changing from one portion of the world to another. So, likewise, were the centers of commerce, but we cannot point to a time when we can assert that these ancient cities had lost or forgotten any portion of the earth's surface known to their ancestors. Assyria and Babylonia arose into power and controlled, for a time, the commerce of the world. The luxury loving people of Babylon must have ivory and pearls from India, delicate fabrics and carpets

---

1 For though the Chinese may have understood some of the properties of the magnet at an early date, we are in error to suppose that they had anything like the mariners' compass. Vide Lindsay: "History of Ancient Commerce and Ancient Shipping," London, 1874, Vol. I., p. xlii and xliii; also Yeats: "Growth and Vicissitudes of Commerce," p. 94.

2 Gemini—*i.e.*, Castor and Pollux.

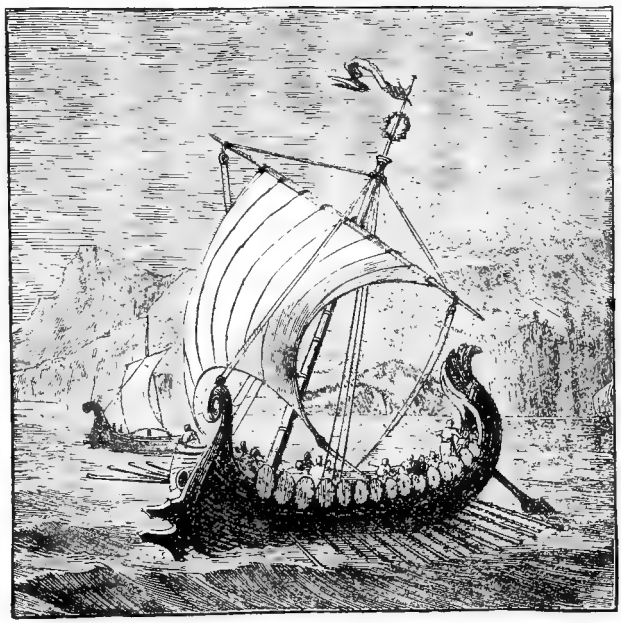
from Kashmir, their spices from Arabia, wares from Ethiopia, their Tyrian purple robes, and enormous quantities of gold, silver, tin, and copper. The demand for all these foreign articles made Babylon, in the eyes of the prophet, a "land of traffic, a city of merchants."[1]

Such was the case, too, in Egypt, whose cities commanded both the Occidental and Oriental trade. The traveler in Memphis might have met Ethiopian, Arabian, Babylonian, Indian, Median, and perhaps, Chinese merchants, bartering their wares in her markets. We must not forget the great Hittite confederacy, whose capital was the flourishing city of Carchemish,[2] the date of whose power carries us back to the fourth millenary before Christ. We are told that they were a great commercial people in the earliest times. They seem to have been the carriers for the nations of the world. The fact that they stood at the head of the commercial world is indicated by their introducing a system of standard weights that, for many centuries, was the principal system used by the trade.[3] Although we are not aware how extensive a knowledge the Hittites had of navigation, we can not believe that they were too timid to explore their own coast-lines and to utilize their knowledge of the sea in carrying articles of trade from one point to another. There is little doubt but that they were well acquainted with the coast-lines of those parts of the Euxine, Mediterranean, and Indian seas that touched their territory.

Ancient Ilios must also have been quite a commercial center, for the ruins that have been unearthed there prove that the Hittites were long accustomed to bring to her

[1] Ezek. xvii., 4.
[2] This Series, Vol. II., p. 390.
[3] Wright: "Empire of the Hittites," p. 67.

markets articles of Assyrian and Babylonian manufacture.[1] Even the Chinese put forward a claim to a share in this ancient commerce. Le Fangpao, Chinese ambassador to Berlin, has recently claimed and interpreted as Chinese, an inscription upon a vase found in the lowest stratum at Hissarlik.[2] Be this as it may, Ilios must have commanded



An Ancient Ship.

the trade of the world, and must have had an extensive knowledge of the world's geography. She no doubt had amassed so much wealth that it aroused the avarice of the piratical Greeks, by whom she was sacked. In fact, her

1 This Series, Vol. III., p.

2 European scholar, however, ridicule the idea that anything Chinese can have found its way to Hissarlik. Still there is no reason why the Chinese, even at that early time, may not have shared in the commerce of Western Asia. Such a conclusion would be directly in keeping with our ideas. Vide Low: "Maritime Discovery," London, 1881, Vol. I. p. 54.

wealth may have been the prime incentive to her destruction by the Greeks. There is little doubt that she had constant commercial intercourse with her ancestral kinsmen, the Thracians, and, perhaps, with many other people of Southern Europe. This is evidenced by the fact, that the traces of the same Hittite influence, unearthed at Ilios, have been discovered in the pre-historic ruins of some of the cities of Southern Europe.[1]

The extent of ancient commerce is indicated also by one of the earliest Biblical records. The sons of Jacob sold their brother Joseph to a company of Midianites, who took him into Egypt where they sold him.[2] Thus, no doubt, did companies of traders thread their way from the cities of one country to those of another; and, even if no Egyptian found his way to distant China, there is no good reason for supposing that Egyptian merchants did not meet Chinese traders at some mid-way caravansary, and there exchange wares, and learn of the customs of the far Orient. In the eleventh Egyptian dynasty, the first recorded voyage to that mysterious land called Punt was made. One Hannu[3] was commissioned "to conduct ships to the country of Punt, to bring back odoriferous gums."[4] Just where this Punt was, is open to conjecture. It may have been in Arabia, where the air is redolent with the perfume of spices, or it may have been in Ethiopia or India. The rarity of the occurrence, however, drew from its commander the boast that "never had a like thing been done since there were kings." The Egyptians were thus among

1 Vide This Series, Vol. III. p. 195.

2 Gen. xxxvii. 27-36.

3 It is claimed that he was a Phœnician. The name would indicate as much. The name Punt has also been traced back to Phœnician origin in the words *Porni*, *Punici* and *Punic*. Vide Rawlinson: "Ancient Egypt," Vol. II. p. 132 and 222, note 3; also This Series, Vol. II. p. 725.

4 Wilson: "Egypt of the Past," p. 132.

the earliest patrons of discovery, though they usually employed Phœnicians to conduct their voyages. The name of the classical god of the sea, Neptune, is even said to be of Egyptian origin.[1]

We have already said much about the Phœnicians[2] and their extensive commerce, but we can probably never know the extent of their knowledge of the world. They conducted the ships of Solomon to Ophir[3] and Tarshish;[4] and, if they visited both places in one continuous voyage, we must allow them a knowledge of the entire coast-line from India to the inmost harbors of the Euxine Sea. They succeeded the Hittites, and, as carriers for King Solomon, must have visited every known land, if the stories of his wealth and luxurious court life be true.[5] Tyre and Sidon were, however, flourishing commercial centers long before the time of Solomon. Whether the Phœnicians had thus early reached China and Britain is a matter for conjecture.

About the middle of the seventh century B. C., we learn[6] that Necho II., of Egypt, fitted out vessels, manned them with Phœnicians, and instructed them to follow the coast of Africa from the Red Sea around to the Straits of Gibraltar, and thence to the Egyptian capital.[7] It required nearly three years to accomplish the voyage. In Summer, they are said to have halted long enough to raise a crop of grain, before proceeding on their way. In sailing around Libya, these daring voyagers were surprised to observe the sun rising upon their right—a fact which Herodotus[8]

doubts, but we now claim this statement as the most convincing proof that the voyage was made. As a punishment, Xerxes is said to have commanded one Teaspes to make a sea-voyage around Africa, from the Mediterranean to Arabia, but this is said to have been a failure.[1] Pliny[2] mentions the voyage of one Hanno, a Carthagenian, who, when Carthage was at the height of her power, was commanded to make the voyage from that city to Arabia, which he was successful in doing. We judge from all these accumulated bits of evidence that the entire coast of the African continent was frequently visited by the Phœnicians nearly two thousand years before Da Gama's memorable voyage.

In a northerly direction, the Carthagenian, Hamilco, had been sent upon a voyage to explore the remote parts of Europe.[3] This voyage was made about the same time as that of Hanno. But now, just when they were extending their voyages in all directions, they themselves became the prey of their more warlike contemporaries, and at last they lost their nationality, utterly destroyed by the jealousy of Rome. Though they carried a knowledge of letters to other nations, unfortunately they left no records of their own voyages, hence it is impossible for us to decide how much they knew of the extent and resources of the world. We have now to place ourselves alongside of the rising Europeans, and go with them while they re-discover those parts of the world that were doubtless familiar to the more ancient people of Africa and Asia.

The first Greek historian (of whose writings any great portions are extant), Herodotus,[4] gives a description of the world as known to the Greeks.[5] If we look at the world

[1] Ibid. [2] "Natural History," ii. 67; v. 1.
[3] Pliny: Op. cit. [4] About 450 B. C.
[5] The geographical books of Homer are very blind and indefinite.

through the eyes of Herodotus, it will assume the shape and proportions of the accompanying map,[1] and we can at once see that the knowledge of the world outside of the Mediterranean region among the early Europeans, was very limited. The probabilities are that almost any one of the earlier Phœnician traders could have furnished a more perfect chart of the Old World coast-line. In fact, the Greeks, at the time of Herodotus, were just beginning to re-discover what had for many centuries been familiar to older civilizations.

Xenophon's account of the retreat of the ten thousand Greeks who accompanied the expedition of Cyrus the younger against his brother, Artaxerxes, was a great contribution to Greek knowledge of Asia. Between Xenophon and the time of Alexander the Great there appeared other works on geography and kindred subjects, chief among which was the Periplus of Scylax, the first purely geographical treatise.[2] It shows a more accurate knowledge of the coast-lines of the Mediterranean as well as the more familiar parts of Asia and Africa. Geographical knowledge among the Greeks made a great advance when Alexander the Great pushed his conquests into Asia. He took with him scholars, philosophers, and scientists, and the information that they carried back to Greece, together with that obtained on the voyage of Nearchus down the Indus and along the southern coast of Asia, gave their countrymen a much clearer knowledge of Asiatic geography than they had previously enjoyed. This knowledge was still further increased when Megasthenes returned from

The writings of the historian and geographer, Hecatæus, who wrote about the close of the sixth century B. C., exist only in fragments.

the court of Sandrocottus with information as to the Hindoos and their country. The Ptolemies finally succeeded to the throne of Egypt, and pushed their explorations into Africa, so that, in the third century B. C., the horizon of the classical world became greatly enlarged, though still vague and indefinite.

Magellan.

Corinth and Athens became at one time the great centers of eastern and western commerce. Miletus, Phocæa, Ephesus, Smyrna, Syracuse, and Massilia, though of less importance, vied with one another in commercial enterprize.[1] About the close of the fourth century B. C.,

[1] Taylor: "The Factory System," p. 192.

Pytheas, of Massilia, made his voyage to Northern Europe, exploring Britain and the Baltic regions. It only remained now for Southern Europeans to familiarize themselves with the regions already vaguely known. This result was brought about by the conquests and government of Rome. Though the Roman Empire never embraced as much of Asia as did Alexander's, their system of government familiarized them with every portion of Roman territory; while their system of roads furnished protected highways for commerce.[1]

Roman luxury has ever been the wonderment of the world. Vast fortunes were spent by her epicures for rarities for their dainty palates. The markets of the world were searched for the luxuries of all countries. Though we can not commend the spirit which initiated these expeditions, we can exult in the resulting increase of knowledge. A writer of the Imperial period says: "If a man will eat daintily, he must indulge in Lamian peacocks, Phrygian fowls, Melian cranes, Ætolian kids, Chalcedonian porpoises, Tarentine oysters, Chian mussels, Egyptian dates, Spanish acorns, sea-eels from Tarshish, pikes from Pessinus, sea-fish from Rhodes." They drank pearls dissolved in vinegar and killed nightingales for their brains alone. They wore the costliest purple robes, the rarest silks that the factories could produce, and the finest furs that the Scythian forests could furnish. Thus we can gain an idea of the world's horizon to Imperial Rome.

With a greater store of facts to draw upon, books on geographical subjects and charts began to appear. In this direction the philosophical Greek took the lead. The first charts were rude and imaginary. The earth's surface was regarded as rectangular in shape, or circular, surrounded by

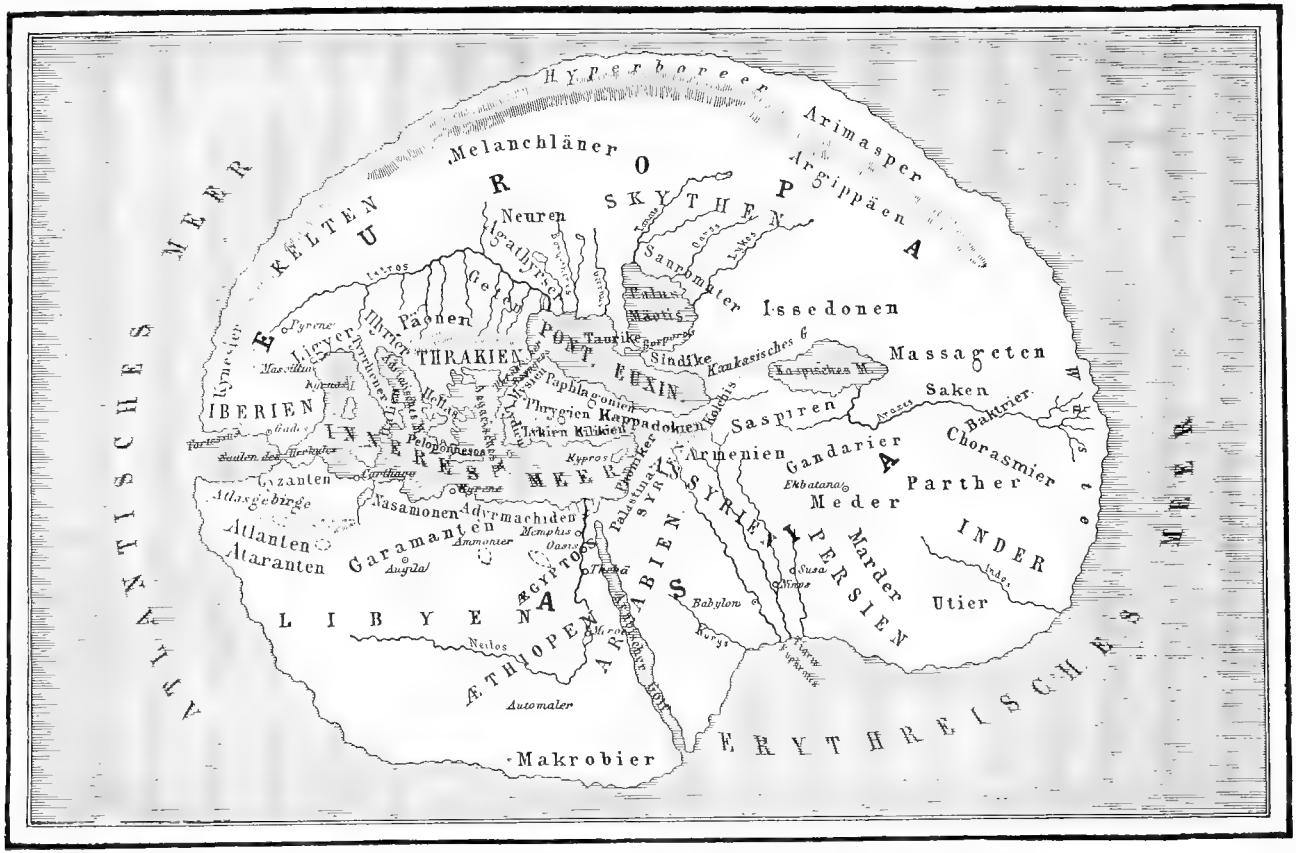
[1] Yates: "Growth and Vicissitudes of Commerce," pp. 61–2.

that endless stream, called Oceanus. Still, as early as the time of Aristotle and Euclid, the spherical form of the earth had many advocates.[1] Eratosthenes appears as the first who made the attempt to reduce the study of geography to a scientific basis. Accepting the spherical form of the earth, he attempted to locate places by means of a system of latitude and longitude which has been perfected into our present system of geographical measurement.[2]

Henceforth we are not wanting in chroniclers of the more important events of the world's history. Such writers as Polybius, Cæsar, Tacitus, Strabo, and Pliny have given us measurably full and accurate ideas of the manners, customs and knowledge of the world during the Roman period though they knew little about the far Orient. Constantinople and Alexandria became the great commercial centers of those days, especially after the fall of Tyre and the division of the Empire. Then came the rise of Mohammedan power, but fortunately the Arabs were friendly to the merchant, and even patrons of commerce. In the seventh century A. D., they gained the ascendency in Asia and Africa, and thus they not only commanded the caravan routes over which the rare luxuries that the Roman epicure demanded must be brought, but even occupied the countries where spice and incense bearing plants grew. This trade was very flourishing. So great was the demand for spices at Rome in the time of Nero, that we are told that the emperor "burnt at the funeral of his wife, Papæa, a quantity of cinnamon and cassia greater than the countries from which they are imported were capable of producing in one year."[3]

On the whole the period of Arab power in Western

[1] Bunbury: "History of Ancient Geography," p. 619.
[2] Ibid. [3] Lindsay: "Merchant Shipping," Vol. I. p. 110.



THE EARTH ACCORDING TO HERODOTUS.

Asia and Northern Africa was one of the happiest and most prosperous that these regions have ever enjoyed. The Arabs seem to have been the merchants and navigators of that period, and added considerable to geographical knowledge. The monsoon or periodical winds of the Indian Ocean were utilized, and thus voyages were made directly across the Indian Ocean.[1] Damascus and, later, Bagdad became centers of Arab commerce. From these points, caravan routes diverged toward all known lands, three of which eventually reached Canton,[2] while Arab merchants of India penetrated to the Indian Archipelago. Of especial importance were the caravans that penetrated Africa even to the banks of the Niger in search of gold, slaves, and wild beasts to supply an ever increasing demand. The eastern coast of that continent, even as far as the island of Madagascar, was well known to them. A love of travel was thus engendered. Wealthy Arabs were accustomed to send their sons to distant lands to complete their education. They were in this way able to select teachers from among the scholars of the world. It should be known

Vasco Da Gama.

1 The first voyage was made by one Harpalus, about 50 B. C. Vide Low: "Maritime Discovery," Vol. I. p. 101.

2 Yates: "Op. cit. p. 86.

that the oldest written account of China extant comes from the pen of an Arab traveler.[1] But, unfortunately, the religious feud that existed between Christian and Mohammedan grew in strength with passing time. All connection between the two gradually became severed. The Christians wanted nothing to do with the "infidels," while the Mohammedans spurned with scorn the "Christian dogs." The long and dangerous caravan route from Constantinople around the Caspian Sea, thence into China and India, rendered Oriental luxuries very expensive to the Christians, but since they regarded it infamous to have even commercial dealings with unbelievers, this was the only road open for eastern commerce. The Saracens moreover held territory on both sides of the Straits of Gibralter, and cut off much of the traffic through this gateway to the ocean. One people, however, the Venetians, continued to trade with the Saracens, and by the fruits of this trade grew into the most powerful and opulent state on the Mediterranean coast.

We must now turn our attention in an entirely different direction. While Moslem and Christian were fighting for possession and supremacy over the lands and waters already known to the world, a new race of sailors suddenly made their appearance in the Mediterranean. These were the hardy giants from the north, who, we have seen,[2] played such an important part in settling the affairs of Europe and building up modern nations. If we would follow the progress of discovery through the next few centuries, we must follow the Northmen as their ships plowed the trackless ocean. Charlemagne had watched their ships sailing the seas, and had foretold the destined power

[1] Kerr's "Voyages and Travels," Vol I. p. 48 *et. seq.*

[2] This Series, Vol. III. ch. v.

and influence of this people. We have already seen how they visited the shores of Britain, France, Spain, Italy, and Greece, how they settled Russia, and controlled the Baltic regions. Even before this, they had taken possession of the fiords and islands of Scotland and the coasts of Ireland. The vessels which they used were of an improved style, distinguished for their strength and the ease with which they could be handled. We find recorded in the Sagas a description of an old Norse vessel called "the Long Serpent," which was one hundred and fifty feet long,[1] but still dexterously handled in battle.

When, by the consent of King Aelfred, large numbers of Danish Northmen became English subjects, they seemed to bear with them the spirit of discovery and adventure, besides furnished the king with the best material from which to construct a navy. But his voyages of discovery concern us the most. Aelfred had, no doubt, heard much of the homeland of these daring Northmen and his first voyage was mainly in that direction, and was commanded by a Dane named Othere. As a result of this voyage, the English were made acquainted with the Baltic shores and the coasts of Norway and Lapland.[2] Nor did King Aelfred's enterprise stop here; for, learning of the distress of some Christians at St. Thomas, on the Malabar coast of India, he is said to have dispatched vessels, loaded with supplies for them, and thus established a trade with India[3] which was kept up during his entire reign.[4] In such ways, Aelfred gained much information, which he embodied in a geographical history of the world that exists among his other literary works.[5]

[1] Vide Lindsay: "Merchant Shipping," Vol. I. p. 334. For a translation of the Sagas, see Parker: "Fleets of the World," p. 168 *et seq.*

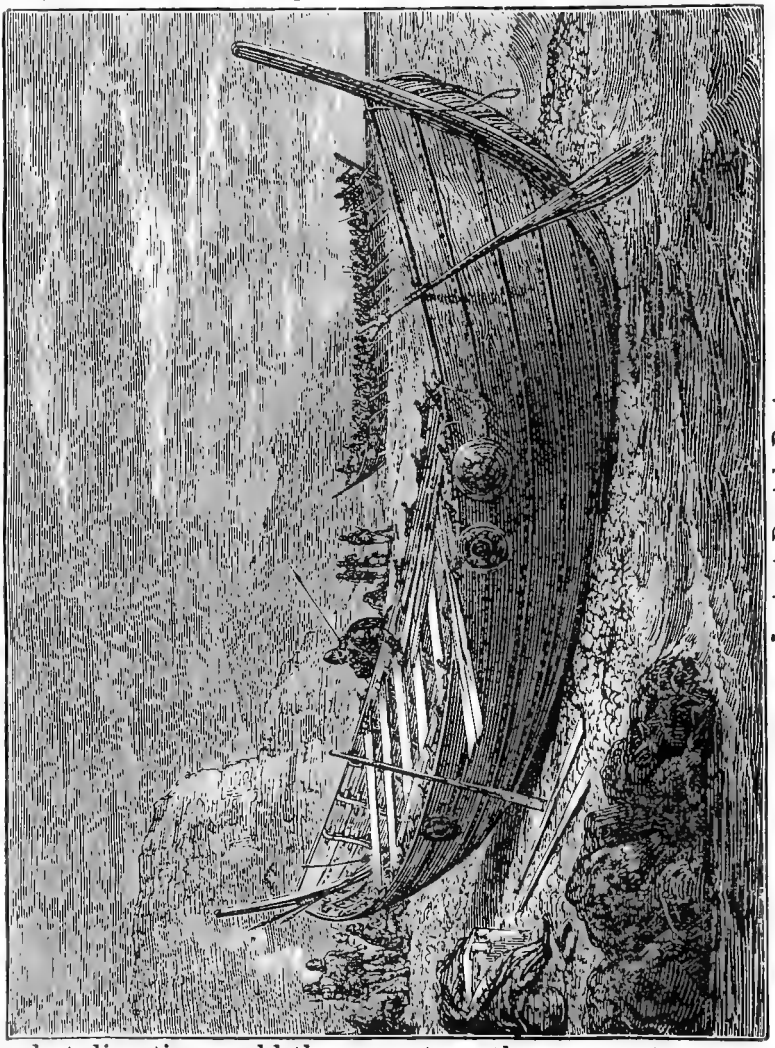
By the close of the ninth century, then, these Northmen had formed permanent homes in Britain, France, Russia, and Iceland, while few places near the sea-coast or larger rivers of Europe were safe from their ravages. In



Ancient Danish Boat.

what direction could they now turn the prows of their long ships? The answer to this question is Iceland, "the land of frost and fire." This island has an interesting history,

which we must glance at for a moment. We must remember that it was the haven toward which persecuted Northmen turned, sure of protection if only by the isolation of the place.

Iceland had become known to the Northmen as early as the last years of the ninth century, and was colonized before the tenth century began; but there is a tradition that even these Northmen expelled from that island some Irish settlers who had preceded them there.[1]

So great became the desire to migrate to Iceland, that it was at last forbidden by royal proclamation.[2] Here in their isolation dwelt for a long time a peculiar people. They breathed the air of independence and developed into a flourishing little republic. Iceland, especially the southwestern part, was a much more attractive country then than now. It was a fertile, alluvial district, for Hecla had not then burst forth in flame, and showers of sand and floods of lava were unknown. It was a veritable Eden to the Northmen who had lived in snow-bound Norway.[3] There several families grew in wealth and influence, equal in their little sphere to many petty princes of the continent. In 983, they colonized Greenland, and thenceforth communication between the two countries was kept up.[4] In the place of books,[5] however, they had their professional reciters who were expected to memorize and relate, from time to time, the events that transpired in their lonely home, and the deeds of heroism with which their lives abounded.

5 Except, perhaps, Runic writing.

As time went on, just as in the case of their classic brethren, there arose a race of poets, who gathered all these sacred tales together, and, beautifying them with song and poetic coloring, were wont to follow, with their listening groups of hardy Northmen, the heroes of their songs on long and perilous journeys. A mass of traditions thus arranged was called a *Saga*, while the reciters were called *Sagamen*. The republic grew and throve; and these sagas and sagamen increased in like proportion. Every prominent hearthstone probably echoed oft repeated songs, and thus the long and bitter winter evenings were happily whiled away. Time passed on, and pious monks arrived in Iceland bringing with them Christianity and letters. One of the first results was to reduce the sagas to writing. The monks were busy copying and embellishing the epics which they heard at every fireside. Their task was not a tedious copying of dry annals. Their pens noted beautiful thoughts, charmingly expressed; thrilling adventures told with life-like power; true historical sketches; and even fiction—in short, all forms of literature, heightened by the rythm and metre of the poet's art.

Many volumes of literature were thus produced in Iceland. They were not hastily written, but carefully transcribed on parchment and beautifully embellished. Every page is a perfect specimen of the penman's art.[1] The thirteenth century was the "golden age" of Icelandic literature. A vast number of sagas were reduced to writing. Each class of literature was a masterpiece of its kind. The fictions are complete works of the novelist's art. The historical sagas have, many of them, been verified by inscriptions and other evidences, so that historians have

[1] Vide fac-simile of these parchment manuscripts in Rafn.: "Antiquities Americannæ," Hafnæ, 1831; also Sclafter, Op. cit. p. 10.

felt inclined to place reliance in them. During our own century, the most of these old volumes have been gathered into the libraries of Copenhagen and Stockholm, where modern scholars have interpreted their contents for us. It will interest us, perhaps, to glance at some of these old sagas.[1]

Among this mass of literature, there are two sagas that have revolutionized early American history. These are the "Saga of Erik the Red" and "Saga of Thorfinn Karlsefne" (the Hopeful). The former is supposed to have been written in Greenland, but the manuscript was transferred to the island of Flatey, near Iceland. There it has been preserved for us. From the manuscript itself, historians have fixed the date when it was reduced to writing as between the years 1387 and 1395.[2] The latter saga is thought to have been written by Hank Erlenson, who was chief governor of Iceland in 1295. It forms a part of the Arnæ-Magnean collection of old Norse manuscripts, consisting of two thousand volumes, now stored in the royal library at Copenhagen.[3]

The Saga of Erik relates, first, his own voyage to Greenland and subsequent colonization of that country. Then we are told of one Bjarni, who attempted to follow his father, one of Erik's companions, to Greenland.[4] None of the sailors with Bjarni knew the way, but they did not doubt that they could find the country. Knowing that it was a mountainous, icy land, they determined to sail until they found such a country. They put to sea (A. D. 986) and

---

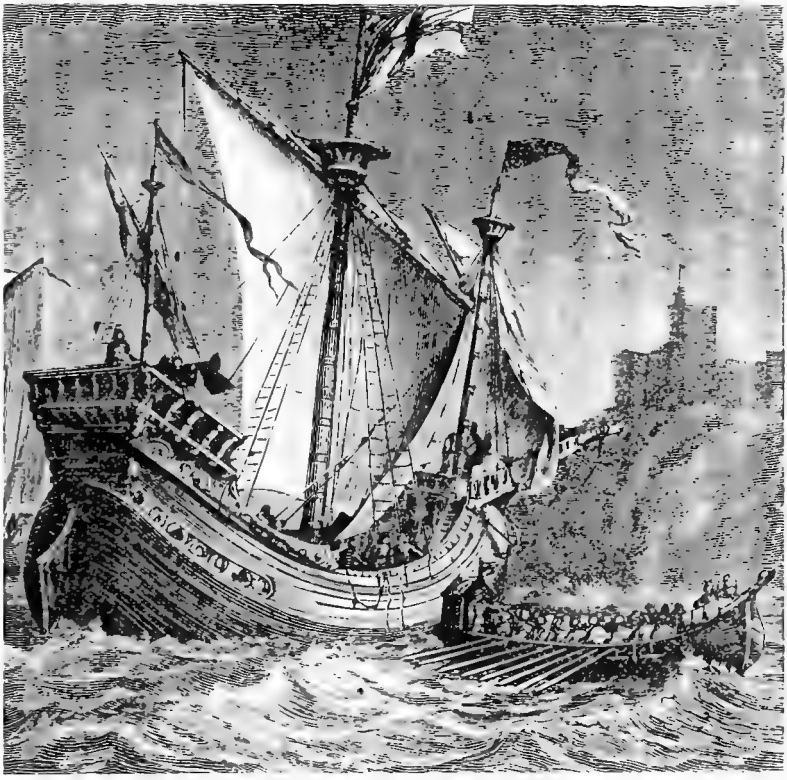
[4] These facts about Erik the Red, and other Greenland discoveries are found in Old Norse, Danish, and Latin, in Rafn, Op. cit. pp. 3-76.

sailed before fair winds for three days, then there arose north-winds and fogs, and for many days they knew not where they were. When it cleared up they continued their westward journey for another day before they saw land. They sailed close to this land which was covered with wood, but was mountainless. Bjarni claimed that it was not Greenland, "because in Greenland are said to be high ice-hills." So he bade his men sail on. They sailed again for two days, when another land came in sight, but it was flat and wooded. So he bade them again sail on. They put out to sea, and, before a south-west wind, sailed for three days more, when they sighted land which, to Bjarni, appeared "little inviting." They spread their sails to the breeze again and spent four days more upon the sea, when they reached a fourth land, which, Bjarni pronounced to be Greenland, and such it proved to be.

The subsequent career of Bjarni does not interest us. He paid a visit to Erik, Earl of Norway, became one of his courtiers, but afterwards returned to Greenland where he dwelt with his father. It was always a matter of regret that he did not land and explore the three countries which he sighted when he was searching for Greenland. Curiosity in regard to them grew apace, and a spirit of adventure having for an object voyages of discovery, sprang up. This spirit finally reached Brattahlid, where dwelt Erik the Red and his three sons, Leif, Thorvald, and Thorstein. Leif, the oldest of these sons, determined to explore the lands which Bjarni had discovered. So he bought the latter's ship and engaged thirty-five men to accompany him. Among them was one Tyrker, a German, who had dwelt in a land where the vine was cultivated.

They therefore prepared their ship and put to sea. They first touched an ice-bound coast, upon which was no

grass; but a floor of flat stones led from the sea to the neighboring mountains. They landed, and Leif called this country Helluland.[1] They sailed on, and found another land, flat and covered with wood. They cast anchor, went ashore, and named the country Markland.[2] They immediately sailed out to sea again, and continued on their



English Ship of Fifteenth Century.

journey for two days before a north-east wind. At last they reached a sound with a large island on one side and a high promontory on the other. They landed and felt that it was good for them to remain here for the winter. So at high tide they passed up a river to a lake, and there

[1] "Flat Stone Land," Supposed to be Newfoundland, vide Rafn, Op. cit. [2] "Woodland," Nova Scotia.

cast anchor.[1] They busied themselves for a few days, erecting houses and booths to shelter them from the winter storms; and then they set about exploring the surrounding country.

This was indeed a fortunate land in the eyes of these Northmen. The rivers were full of large salmon, and the climate was so mild that they judged that cattle would not need house-feeding in winter, for the grass was scarcely withered by the frost. Then, too, the days were of more equal length than in Greenland, "for on the shortest day was the sun above the horizon from half-past seven in the forenoon till half-past four in the afternoon."[2] It happened one evening that Tyrker, the German, did not return to the houses, and much fear was entertained for his safety. But when they went to search for him, they met him returning in a drunken condition, from grapes that he had discovered and eaten. When he had sufficiently recovered from his drunkenness, he explained to them about the grape and its value. From this circumstance they called the country Vinland. They spent the balance of the winter loading their vessels with grapes and grape wood. When their ships were loaded they put to sea and sailed direct to Greenland. This was A. D., 1000–1001.

This winter Erik the Red died, and Leif came into possession of his father's estate. The next year, Thorvald, the second of Erik's sons, determined to visit Vinland. He spent a pleasant winter in the houses that Leif had built. But in the summer following, he was killed in a battle with the natives,[3] and was buried on the coast of

[1] Probably in the vicinity of Nantucket. Rafn, Op. cit

[2] Slafter: "Voyages," p. 33. From this statement the latitude has been reckoned at 41°, 43′, 10″ (Ibid. note 28). Professor Rafn calculated it 41°, 24′, 10″. Vide "Antiquitates," xxiv. cf. Horsford: "Discovery of America by Northmen," Boston, 1888, p. 67 *et seq.*

[3] The description of these natives seems to show that they were Es-

Vinland. The third son, Thorstein, then attempted to go to Vinland, to bring his brother's body home. But it was a tempestuous summer, and he made no headway. At last his vessel drifted to a settlement on the western coast of Greenland where he also died. His wife, Gudrid, returned to Leif with his body and the sad tidings.

In the fall of 1006, there came to Brattahlid an Icelander named Thorfinn Karlsefne, who shared the hospitality of Leif Erikson during the winter. He was a successful trader and an honorable man. So when, at Yuletide, he asked Leif if he and Gudrid might marry, the nuptials were celebrated without delay. In the spring, Karlsefne and his wife, Gudrid, determined to make a voyage to Vinland. They organized a company consisting of one hundred and sixty men. The company visited Helluland and Markland, and, at last, landed in the vicinity of Martha's Vineyard.[1] It was not all harmony among the company and a part turned homeward. Traditions are divided as to whether they were lost or reached the coast of Ireland, where they were made slaves. But Karlsefne remained in various parts of the land for three winters, trading with the natives. The first autumn (1007) there was born to him a son whom he called Snorri. At last (1010), they became discouraged at continual fighting with the natives, and returned to Greenland. Thence Karlsefne sailed to Norway with a ship "so nicely laden that it was generally admitted that a more valuable cargo had never left Greenland." He, however, removed to Iceland where he purchased an estate. There his descendants dwelt for several centuries and were ranked among the

kimos, which at that time probably inhabited the eastern coast of the United States. Vide This Series, Vol. I. p. 299

[1] The Saga of Karlsefne is given in three languages in Rafn: "Antiquitates, pp. 79-200.

noble inhabitants of the island. After his death, Gudrid made a pilgrimage to Rome. In the meantime, Snorri built her a church, and upon her return she became, for the rest of her life, a nun and a recluse.[1] In 1011, Freydis and her husband conducted another small fleet of vessels to Vinland, where they wintered in the dwellings erected by Leif. This company seems to have been gathered from the scum of society, and Freydis was about the worst fiend among them. She caused a large number of the party to be killed, even murdering the women herself. The balance of the party returned to Greenland where Freydis fell into disgrace because of her crimes in Vinland.[2]

Such are the contents of the two Sagas that are now in the library at Copenhagen. But there are other very interesting sagas, one of which refers so prominently to this newly found country that we should become acquainted with an outline of its contents.[3] In the latter part of the tenth century, there dwelt on the western coast of Iceland a lady named Thurid, who, though married and much respected, chanced to shower so many favors on Bjorn Asbrandson, the champion of Breidavik, as to cause evil reports to be circulated, and lead people to suspect that Bjorn was the father of Thurid's son, Kjartan. These reports coming to the ears of that good dame's brother, who was prefect of that province,[4] he went to Bjorn and

---

[1] Slafter: "Voyages." Vide his translation of Icelandic Sagas, pp. 43, 69, 110; also Rafn: "Antiquitates," p. xxxiv.

[2] We may mention among those who accept these sagas as historical, Prof. Vigfusson, of Oxford, Eng.; Konrad Marer, of Germany; Paul Riant, of France; J. Elliot Cabot and Edward Everett of this country. Horsford: Op. cit. p. 18.

[3] This narrative is taken from "The Eyrbyggja Saga, or early annals of that district of Iceland, lying around the promontory of Snæfells, on the western coast. It is clearly shown to have been written not later than the beginning of the thirteenth century."—Slafter, p. 79, note 91.

[4] This was Snorri Godi, a really historical personage, and a promi-

advised him to leave the country. Bjorn sailed away but his ship was never after heard from.

Thirty years afterward, one Gudleif Gudlaugson made a trading voyage to the western coast of Ireland, but when he undertook to return to Iceland he met with north-east

Sir Francis Drake.

winds. The ship was thus driven far away to the west and south-west. At last the unfortunate sailors sighted

nent man in Icelandic history. His real name was Thorgrini Thorgrinisen, born 964, died 1031.

land. The summer was far spent, so they determined to land and at least refresh themselves. They had been on shore only a short time when a great band of natives fell upon them and made them prisoners. Then there was a council held as to their disposal. Some advised making them slaves, others were for killing them outright. While they were yet wrangling, there appeared in the distance a much larger company of natives in whose midst rode a large, dignified chieftain. As they approached the prisoners perceived that he was white, though very old, possessing long white beard and hair. Their fate was left to his decision. He addressed them in the Norse language, and in particular enquired concerning Thurid and Kjartan. He told them to enter their ships and sail away, for it was not in accordance with the laws of the natives to give their prisoners freedom. He consigned to Gudleif's care a ring for Thurid and a sword for Kjartan, advising none of his friends, should they suspect who he was, to attempt to find him, as his age was so advanced that he might expect death at any hour. Of course this could have been none other than Bjorn, the champion of Breidavik.

Now a word as to the position of the country visited by Gudlaugson. If we should draw two lines — one from the western coast of Ireland toward the south-west, and another from the western coast of Iceland toward the south-west, marking the probable routes along which Bjorn and Gudleif had respectively sailed in going to this country, these two lines would intersect on the southern coast of our country near the shores of Georgia or Carolina. So we are to conclude that it is somewhere in these regions that Bjorn was found, and that there he was left to die among the natives. This region seems to have been known to these early people, as well as to the inhabitants

of Ireland, as "White Man's Land" or "Great Ireland." Professor Rafn thinks that it was south of Chesapeake Bay, including North and South Carolina, Georgia, and East Florida.[1]

Thus far we have given in a condensed form the contents of the more prominent sagas relating to westward voyages of the Northmen from Iceland and Greenland. Now it is evident to every one that the land that these explorers visited and attempted to settle could have been none other than that of North America; and, if these records be true, it is evident that the Northmen were acquainted with our shores from Newfoundland to Florida for five centuries before Christopher Columbus made his memorable voyages. As to the truth of these records, not only is it a fact that few historians are now found who dispute them, but there is considerable circumstantial and corroborative evidence to uphold the truthfulness of their contents.[2] Although various nations have sought stolen honors by claiming a knowledge of America before the time of Columbus, these records from the north deserve more than a passing notice. The voyage of Leif Erikson to "Vinland the Good" is recorded in both the Heimskringla, or history of the Norwegian Kings, the author of which was Snorre Sturleson, born in Iceland in 1178, and called the Northern Hero-

1 Slafter: "Voyages," p. 96, note 108. Also Rafn: "Antiquitates Americannæ," p. xxxviii.

2 Alex. Von Humboldt refers to the discovery of America by the Northmen as "undoubted." Vide "Cosmos," Vol. II. p. 603. In regard to these Northmen discoveries, Horsford writes as follows: "Somewhere to the southwest of Greenland, distant at least a fortnight's sail, there were, for three hundred years after the beginning of the eleventh century, Norse colonists on the coast of the continent of America, with which colonies the home country maintained commercial intercourse." He also quotes from a letter from Nordenskjoll, as follows: "The Norsemen made numerous long voyages out from Greenland for centuries, and established colonies on the American continent." "Discovery of America by the Northmen," Boston, 1888, pp. 17-19.

dotus,[1] and in the History of Olaf Tryggvason. The former fixes the date by stating that it was the same year that Christianity was introduced into Iceland, and that was A. D. 1000. This was fourteen years after Bjarni discovered Vinland.

The Saga of Thorfinn Karlsefne introduces us to such prominent historical characters that we can not pass it by as mere fiction. Thorfinn was a wealthy Icelandic merchant "descended from an illustrious line of Danish, Swedish, Norwegian, Irish, and Scottish ancestors, some of whom were kings or of royal blood." His son, Snorri, was born in Vinland and lived there until three years old. He inherited his father's Icelandic estate. A grandson of Snorri became Bishop Thoslak, and gave Iceland its first code of ecclesiastical law which is still extant. A great-grandson was raised to the episcopal dignity; another descendant was similarly honored. In our own century, we can mention, as lineal descendants of Thorfinn Karlsefne, Professor Magnussen and the great sculptor, Thorwaldsen of Copenhagen.[2]

Neither are we entirely dependent upon this one saga for our knowledge of Thorfinn and his voyage to Vinland. There is a fragment from a[3] geographical treatise, written near the end of the fourteenth century, which describes the location of these new lands as follows: "South of Greenland is Helluland; next lies Markland; thence it is not far to Vinland the Good. . . . It is related that Thorfinn Karlsefne, cut wood here to ornament his house. . . . Leif the Lucky first discovered Vinland." Then there exists another geographical fragment[4] under the title of

[1] Vide "North American Review," Vol. XLVI. p. 185.

[4] Codex, No. 115.

Gripla, written before the time of Columbus, which describes the location of Vinland in about the same words.[1]

While all these evidences are of Icelandic origin, we are not lacking corroborative evidence from other sources. Toward the close of the eleventh century, one Adam, canon of Bremen, was attracted to the court of King Sweno, of Denmark, by that monarch's reputation as a patron of letters. While there, Adam collected materials for an ecclesiastical history which he published at the close of the eleventh century. In that history, occurs the following passage: "Besides it was stated (by the king), that an island had by many been discovered in that ocean, which was called Winland, because vines grow there spontaneously, producing excellent wine; for that fruits not planted grow there of their own accord, we know, not by vague rumor, but by certain testimony of the Danes."[2]

With such testimony staring us in the face, it is useless to deny that the Northmen were aware of the existence of the American continent for a number of centuries before the time of Columbus. How frequently they made voyages across the ocean is a question open to conjecture. It is claimed that Bishop Eric Upsi, the first Bishop of Greenland, "undertook in 1121 a Christian mission to Vinland."[3] And a very recent writer claims that there are records in the Church archives at Rome, not only of this mission but also of the visit of Lady Gudrid to Rome immediately before she entered the convent that her son,

Snorri, built in Iceland.[1] The extent of the Northmen's knowledge of the American coast-line is further indicated by the Runic inscription discovered in 1824 on one of the Woman's Islands, Baffin's Bay, at the latitude of 72° 55′. It tells us that it was placed there "on the Saturday before the day of victory,"[2] in 1135. We are further told that, "more than six hundred years before the bold expeditions of Parry and Ross, the colonists (of eastern coast of Baffin's Bay) very regularly visited Lancaster Sound and a part of Barrow's Straits for the purpose of fishing. The locality of the fishing ground is very definitely described, and Greenland priests from the Bishopric of Gardar, conducted the first voyage of discovery (1266)."[3] The last recorded voyage from Greenland to Markland (Nova Scotia), occurred in 1347.[4]

There is no doubt that the honor of being the dis-

[3] Humboldt, Op. cit.

[4] In passing, a word about the decline of Greenland may interest our readers. Greenland retained communication with Scandinavia for four centuries, and a flourishing commerce existed between these countries. But Queen Margaret (1353-1412, vide Vol. III. p. 404) forbade intercourse with Greenland except upon royal permission. This was a death-blow to that island, which early in the fifteenth century became lost to Europe. It was re-discovered in 1721 by Hans Egede; vide Slafter: "Voyages," p. xxxv. By referring to This Series, Vol. III. p. 404 *et seq.*, it will be seen that Sweden was, for the next two centuries, busied freeing herself from the Danish yoke, and in fighting her wars in Germany, Poland, and Russia, and that Norway and Denmark were united under one sovereign who became more and more involved in the troubles of Europe. It can scarcely be assuming too much, then, to believe that these restless Northmen had warlike employment enough for their subjects to keep them at home, and thus would expeditions to Greenland and Vinland become less and less frequent, and, finally, a knowledge of the way thither be forgotten.

coverers of the American continent has led other nations to put forth false claims. But we detect nothing of that kind in regard to the claims of the Northmen. Their sagas are beautifully and simply written and force the impress of their truth upon the mind. If it be asked why a knowledge of these early voyages has been so long kept from the pages of our histories, we must say with Professor Rafn that it is the fault of the historians themselves. These manuscripts have existed ever since the close of the fourteenth century. Their contents formed the folk-lore of Iceland in her most flourishing days, and the savants of Copenhagen have ever since known of Vinland the Good.

Adam of Bremen knew of Vinland, and told the world about the new country. Malte-Brun claims that "to entertain a doubt of the truth of accounts so simple and probable would be an excess of scepticism."[1] And now we are informed that the records have been for seven centuries buried in the archives at Rome. Whether it has been the policy of writers among Romance nations to disregard these records, whether it has been the policy of the authorities at Rome to bury the records of every enterprise not conducted by Christians,[2] it is not in our province to state. They are generally accepted as reliable records, and the Northmen are at last receiving the honors so long illegally borne by southern navigators.[3]

[1] Vide "North American Review," Vol. XLVI. p. 167 and references. Also Malte-Brun: "Universal Geography," Philadelphia, Vol. III. p. 132.

[2] The Northmen were still pagans when their first voyages were made, and the above is the opinion, positively and rather spitefully expressed, of Miss Marie A. Brown. Op. cit.

[3] As stated, many nations have claimed the honor of discovering America, and to our surprise considerable can be said in favor of some. For instance, vide Vining: "An Inglorious Columbus," New York, 1885, for the claims of the Buddhist priests. Bowen: "America Dis-

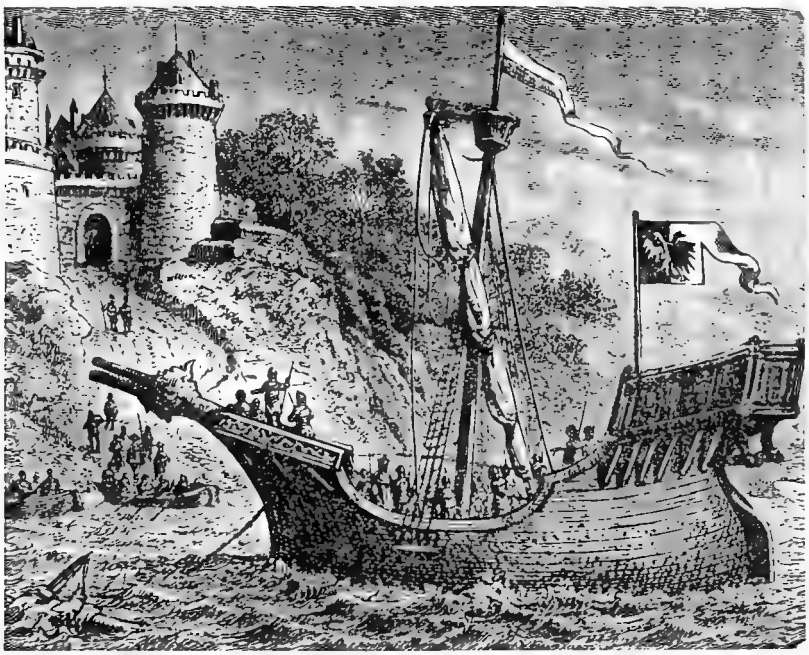
We will now turn our attention once more to Southern Europe. While the Northmen were busy with their northern and western voyages, and with their settlements in England, Normandy, and Russia, the Mongols were overrunning the Mohammedan cities of Asia and interfering with their commerce. Pisa, Genoa, and Venice now assumed control of the trade routes throughout Mediterranean regions. Traders followed the crusaders to the East, and these armies of crusaders, themselves, in marching across Europe, made it possible for merchants to follow. As the Moors, however, held both shores of the Straits of Gibralter, it was dangerous for merchantmen to attempt to carry their wares to the northern shores of Europe by water.

When Venice gained the ascendency and controlled the trade of the Levant, her fleets were dispatched, necessarily in large companies, one to the Black Sea, one to Cyprus and Egypt, one to Greece, and the all-important "Flanders Fleet" to Bruges. Each of the latter expeditions occupied a year or more. As soon as the Flanders fleet reached the Downs, the ships separated and spent the year in visiting the ports of Britain, Normandy, Flanders, and Holland, exchanging eastern wares for western produce. In the North, the Hanseatic League was organized probably in the twelfth century.[1]

covered by the Welsh," Philadelphia, 1876; and Humboldt: "Cosmos," for the claims of the Irish. In fact the oldest sagas relating to America speak of the claims of the Irish. Ewbank, in "Historical Magazine," August, 1867, concludes that there is enough evidence in ancient records "from which to infer that an active European navigation in the north seas was carried on in the fourth and succeeding centuries, equalling that of the Scandinavian rovers" of later times. But in general, the claims of these other various people do not rest on any good historical ground. Future discoveries may however give them greater value.

[1] For the dispute about the date of the organization of the Hanseatic League, vide Taylor: "Factory System," p. 208, note.

The origin of this great commercial league may probably be traced to the uncertainty of protection from the existing governments. Among the petty, quarreling princes who tried to rule Europe at this time, there was little safety for any trader who carried wares worth seizing. The Hanse League was one of those organizations of cities for the protection of commerce, that were so com-



Hanseatic Ship.

mon at that time. It finally came to embrace "eighty of the most considerable places" in Northern Europe. Lubeck, Cologne, Brunswick, and Dantzig were the leading towns. In foreign parts, they had four principal factories, one each at London, Bruges, Bergen, and Novgorod.[1]

Now this organization was not a club of merchants, such as we would now expect to find, but it was a strongly

[1] Taylor, Op. cit. p. 208.

organized political and commercial body. Lubeck was its capital, and presided over all the discussions of the League. It became powerful enough to keep its standing army, and wage wars to enlarge or protect its influence. Its managers, especially in its foreign stations, were subject to the strictest discipline. Marriage was forbidden them, and absolute secrecy as to the workings of the League was enjoined. Upon the decline of the Hanse League, the Netherlands rose to a commanding place among the commercial nations of the world.

Cortez.

During all this time, however, there appeared to be no particular advance in discoveries. But there was a decided advance in the science of navigation, the art of ship-building, and the invention and improvement of nautical instruments. Their ship yards were now able to turn out such ships as the Bucentaur, in which the Doge of Venice went out annually with great pomp and rejoicing to espouse again the Adriatic,[1] and in these stronger made vessels, seamen dared venture further from the land. By construction and improvement in the use of sails, greater speed could be attained than ever before. But above all in usefulness was the discovery of the magnetic needle and the invention of the mariner's com-

[1] It was the custom in Venice for the Doge to enter this vessel once a year, and cause it to be rowed out into the Adriatic Sea, and then to cast a ring into the sea with these words, "We wed thee with this ring in sign of a real and perpetual dominion."—Lindsay: "Merchant Shipping," Vol. I. p. 475.

pass, whereby the sailor could watch his course in the darkest night and in the severest storm. There was now no danger of becoming hopelessly lost, though still there seems to have been many superstitious fears regarding the unknown borders of the ocean world. But there had already begun to dawn upon the world a new era. Science and education took a great leap in advance. Such men as Albertus Magnus, Roger Bacon, and Vicenzius Beauvais had lived; and they had dared to think for themselves in spite of the anathemas of Church.[1] They dared to use every source for obtaining information, whether it were to learn of science from the Arab unbelievers, or to search for truth side by side with the older Greek philosophers. They dared further to give the results of their investigations and speculations to the superstitious world.

As a consequence, geographers now began to study the speculations of the Alexandrian, Greek, and Latin philosophers of centuries before, and reason upon the shape of the earth. They dared follow Pythagoras and Aristotle in believing the earth to be a sphere. They dared follow infidels into the field of astronomy, and study the movements of the heavenly bodies. They dared busy themselves in the occult science of chemistry, and thus was gunpowder discovered, that completely revolutionized military weapons and the science of war. The printing-press appeared. Such travelers as the Polos and Mandeville had demonstrated that there were many powerful nations in the East, and the storied wealth of these Oriental countries excited the cupidity of all. Freedom of thought was springing up among European people. Formerly it had been considered impious to have any

[1] Roger Bacon was by two popes imprisoned on the accusation of practising magic. Vide Humboldt: "Cosmos," Vol. II. p. 615.

dealings with infidels,[1] now Europeans sought some method whereby to secure a share of the gold and pearls and precious stones, out of which the Khans of Cathay are said to have built their idol temples.[2] Then, too, as wealth and culture, with their accompanying demands for rich food and fine clothing, spread toward the north, there was increased demand for spices, silks, pearls, gems, and everything of this kind.

Pizarro

The problem that now troubled the Christian nations was how to reach these lands—Cathay, Arabia, Ethiopia, India, China, Chipangu. Unbelievers jealously

[1] Taylor: "Factory System," p. 206.

[2] For a description of the travels and discoveries of Marco Polo, vide Yule: "Travels of Marco Polo," London, 1871.

guarded the gates to these wealth producing regions, and levied a tax upon all the luxuries that flowed along these channels of commerce. Travelers to these regions, like Polo, were detained for many years, and only with difficulty brought back anything with them. In this dilemma, it is not singular that commerce turned anew to the sea. When the Moors were driven from the Straits of Gibraltar, and even before that, Prince Henry the Navigator, of Portugal, conceived the idea of reaching Cathay (China) by sailing around the coast of Africa and procuring thus, first hand, the spices of Arabia and the jewels of India. Thus was instituted a season of re-discovery, for, as we have seen, the Phœnicians had, eight centuries before, sailed from the mouth of the Nile to Arabia; and Asiatic waters have ever since been known to their successors, the Arabs.

We are down to a most interesting time in the world's history. In 1435, Christopher Columbus was born in the city of Genoa.[1] He enjoyed the benefits of a most liberal education for his times. Of course, Latin was the all-essential language, and he was early taught to read it fluently. At the University of Pavia, he studied geometry, geography, astronomy, and navigation; and he was proficient in drawing and designing. Nourished in such a maritime center, it is not strange that we find such an enterprising spirit as that of Columbus anxious to be upon the water. He was therefore connected with the navy of John of Anjou in his unsuccessful attempt to seize the throne of Naples, an ancient inheritance of the Angevins.[2]

As Prince Henry of Portugal was by all odds the

[1] Vide Washington Irving: "Life and Voyages of Christopher Columbus," New York, 1867, Vol. I. p. 20.

[2] Vide This Series, Vol. III.

most enterprising patron of discovery at this time, we are not surprised to learn that Columbus soon found his way to Lisbon. There he married the daughter of a Portugese navigator, and thus became acquainted with the plans of Portugese sailors. Sometimes he made voyages to the coasts of Africa or the islands in African seas, but the most of his time was spent in making charts. In this way, he could prosecute the study for which he had the

Raleigh.

greatest liking and which was to prepare him for his later success in discovery.[1] This profession, besides, introduced him to the most enterprising and learned men of the Mediterranean regions.

He accepted the theory that the earth was round; and

[1] Irving, Op. cit. p. 42.

by an acquaintance with the travels of Polo, he perceived how little a portion of the earth was known to Europeans. Then the thought that the riches of Cathay (China), the home of the great Khan, whom Polo visited, and whose towers were plated with gold and silver,[1] could be reached by sailing west came into his mind.[2] Now that there were lands way out in the western ocean, was no new idea among the people of Southern Europe. Here were the "Isles of the Blest," and here was the Atlantis of Plato, and so the Hesperides had ever been striving to entice to their realm each rising Hercules in search of the golden apples[3] of Juno. So, likewise, the happy hunting grounds of the American Indians were situated far to the west. It seems that mankind has ever striven to follow the sun to its bed as it nightly sinks from sight beneath the ever receding horizon.

Columbus began to treasure up every rumor or bit of information that tended to corroborate his theory. A stray bit of wood that drifted to Madeira or the Azores was unlike anything growing in known lands. It came from the west. Then the so-called idle tales of mariners driven out at sea sighting land in the western ocean were

---

1 Yule: "Marco Polo," Vol. II. p. 73.

2 Here we must distinguish between the discovery of Columbus and that of the Norsemen. As early as 1474, he had reached the conclusion that by sailing west he could reach India, and so expressed himself in a letter to Dr. Paulo Toscanelli, of Florence. As we shall see, three years later he visited Iceland. But the knowledge that Columbus had arrived at was scientific. The knowledge of western lands among the Norsemen was accidental. They sailed the seas in search of lands to plunder; and thus discovered Vinland. The knowledge Columbus undoubtedly gained in Iceland must have greatly strengthened his previously formed theory.

3 The eleventh labor, which Eurysthenes imposed upon Hercules, was to visit the Hesperides or "western maidens," and gather the golden apples of Juno.

of value to him.[1] But more significant to us than any of these enticing allurements is the statement of Christopher Columbus, in a work on "the Five Habitable Zones of the Earth," that, in 1477, he visited Iceland.[2] It does not detract anything from the great navigator's genius to suppose that there he learned of the voyages of the Northmen to Vinland, but it does detract from his thoroughness as a student to suppose that he could thus visit the very hot-bed

Cabot.

of northern maritime enterprise without enquiring into the knowledge which these people possessed of the western ocean. He drew his information from every possible source. He may even have seen the records of these voy-

[1] These might well have been founded on facts; as witness the discovery of the coast of Brazil by Cabral in 1500.

[2] Humboldt: "Cosmos," Vol. II. p. 611.

ages that are said to be filed away in the libraries at Rome.

Finally (1481), there came to the throne of Portugal a monarch (King John), who was determined to prosecute still further the plans of his illustrious grand-uncle, Prince Henry the Navigator. John encouraged men of science and learning to gather around his court. He became impatient at the slowness with which his seamen crept down the western coast of Africa, so he ordered his ablest astronomers and geographers to hold a council[1] for the discussion of the best methods of advancing discovery. The result of this conference "was the application of the astrolabe to navigation, enabling the seaman, by the altitude of the sun, to ascertain his distance from the equator."[2] Now with the compass to direct his course, and the astrolabe to tell his distance from the equator, the seaman banished much of his fear of the trackless ocean. No matter how long the storm, as soon as the sun did appear, he could at least find his way to land. It was at such a time that Columbus brought his plans of western discovery to maturity. He thought it useless to attempt such a voyage without royal authority. He laid his plans before King John, but the latter's counsellors, after trying to rob Columbus of his cherished desire of being the first to make this voyage by sending a ship to give the route a trial, ridiculed the idea of there being antipodes. Thereupon Columbus left Lisbon in disgust, and took his journey into Spain.

Columbus is first[3] noticed in Spain in conference with the Dukes of Medina Sidonia, and Medina Celi, who in

[1] These were his two physicians, Roderigo and Joseph the Jew, and Martin Behem.—Irving: "Columbus," Vol. I. p. 65. [2] Ibid.

[3] In 1485, vide Irving's "Columbus," Vol. I. p. 75, note.

wealth and power ranked next to royalty itself. Though he met with encouragement from them, they finally refused aid through fear of the jealous displeasure of their sovereigns in case of its success. He, however, bore a letter from the latter to Queen Isabella, recommending the voyage. Columbus now became a follower of the court of Ferdinand and Isabella, who were too busy with their war against the Moors to have time to consider his petition or give him an audience. But here Columbus formed valuable acquaintances, and to whomsoever he demonstrated his plans and theories, he carried conviction. Six years were consumed in vain endeavors to gain a decision from these sovereigns. Then, disgusted and discouraged, Columbus turned from the court determined to seek aid elsewhere. Then it was that he appeared at the gate of the Convent of Santa Maria de Rabida, and asked food and shelter for his child.

From that time, the tide seemed to turn in his favor. He was again summoned to the Spanish Court; and, at sunrise, on the 3d of August, 1492, we find him in command of three small vessels sailing out of the port of Palos in search of a new route to India. He took the course from Palos to the Canaries. Thence he sailed toward the west. It mattered not if the needle of the compass did vary, it mattered not if his crew did become descouraged and mutinous, he kept toward the west. Over the "grassy sea" they sped and over such an expanse of water that the most daring seamen gave up hope of ever returning. Ten long weeks passed since they left the port of Palos. But at last the signs of land became more and more encouraging. The songs of the warblers resounded from their mastheads and cheered them on their way. On Friday morning, October 12th, 1492, amid the

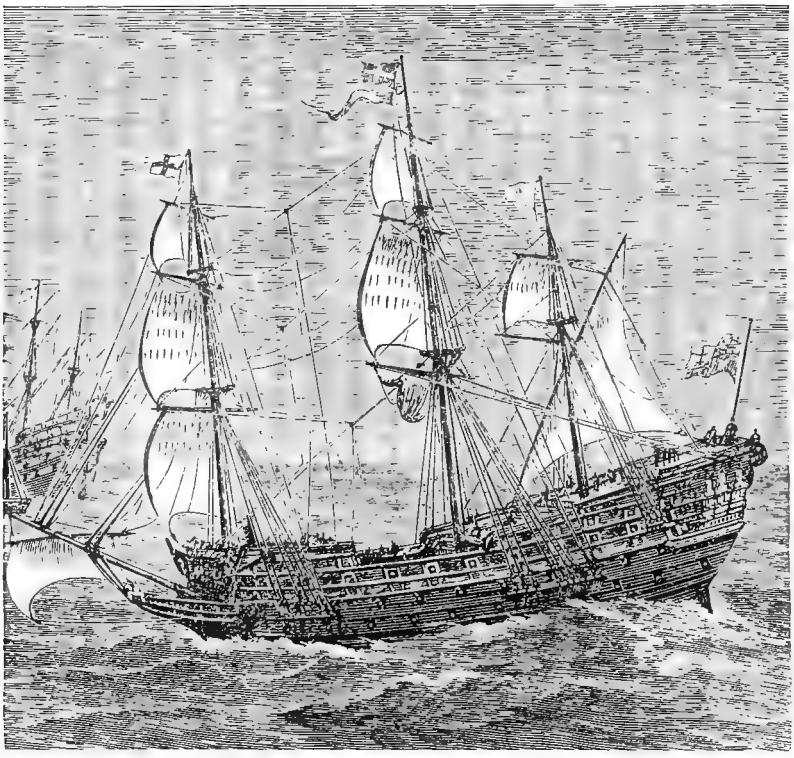
prayers and rejoicings of both admiral and crew, the small party of Europeans landed on the island of Guanahani, one of the Bahama Islands, and dedicated a new world to Spanish rule and to Christianity.

Columbus made three other voyages to the New World, in the third (1498), only, touching the continent. But he died in the belief that it was only a new route to

Frobisher.

Cathay that he had found for the Spanish monarch. The news of his first voyage spread rapidly over Europe. Henry VII. of England immediately authorized John and Sebastian Cabot to discover lands in the western ocean. They touched the eastern coast of our country (1497), even before Columbus had found the mainland. The Spaniards followed the voyages of Columbus with further expeditions of discovery and colonization. This was to

them Cathay, the land of gold and jewels, where might be found the fountain of everlasting youth. They sought these everywhere. In the last year of the fifteenth century, an expedition sailed from Spain bearing among its number a Florentine merchant and geographer, by name Amerigo Vespucci. He made other voyages to the New World, all of which he described in letters written at the time. Some



The Great Harry.

of these letters passed into print, and the name of that Florentine merchant has ever since clung to our country.

Now every American is so familiar with these early voyages of discovery and colonization, that an extended account of them would be out of place in a work of this

character. We can refer to only a few of the more important voyages that gave to Europeans a knowledge of the world almost as it exists to-day. In 1497, Vasco da Gama, sailing under the auspices of the King of Portugal, doubled the Cape of Good Hope, and found the nearest way by water from Europe to India. Portugal then for a time commanded the trade of the Orient.

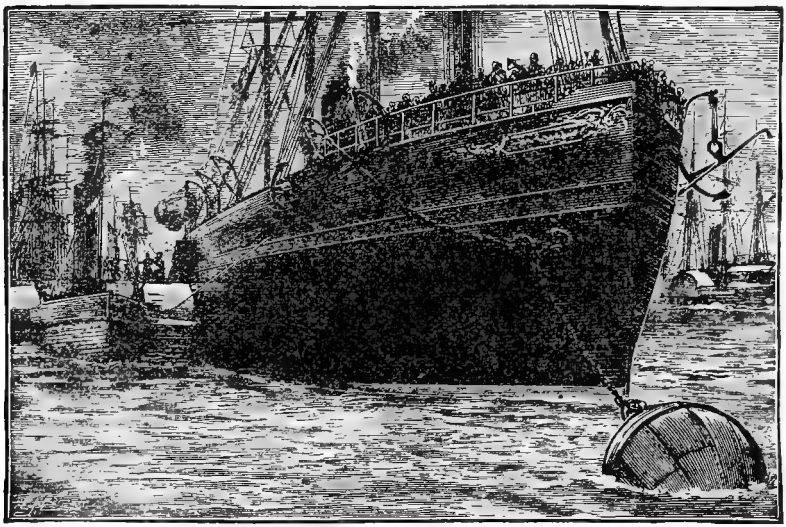
The Spaniards pushed their discoveries in the west. Brazil, Yucatan, Florida, the Pacific Ocean, Mexico, and Peru were all discovered and taken possession of in less than two score years from the time that Columbus first saw the American shores. The Portugese did not wait long before they also sent an expedition to this continent under the command of Cortereal, but their object seems to have been to capture natives to be sold in the Spanish markets as slaves. It proved to be an unfortunate venture and the Portugese never gained a lasting footing on the northern part of the continent.[1]

The French early entered the field of western discovery. The names of Verrazzano,[2] Cartier, Roberval and Champlain established the French claim to American territory, although the Cabots had at an earlier day discovered these regions for England. This was in the vicinity of the St. Lawrence. These explorers were at once followed by fishing vessels. Three years from the date of the first French voyage, there were observed in the haven of St. Johns, Newfoundland, eleven Norman sails, and one Breton, engaged in the fisheries there. The expeditions of Ponce de Leon and of Ferdinand de Soto (Spaniards),

[1] Vide Bancroft: "History of the United States," Boston, 1854, Vol. I. p. 14.

[2] Edward Everett Hale, in his "History of the United States," New York, 1887, most emphatically doubts the voyage of Verrazzano to America. Most authorities mention it as undoubted.

laid the whole southern part of our country[1] open to Spanish colonization. But the French Huguenots forestalled them in establishing a settlement on the coast of Florida. The religious zeal, jealousy, or general bloodthirstiness of the Spaniards led them to murder these colonists and occupy the location, founding there the first permanent settlement of Europeans on the American continent. They called it St. Augustine.

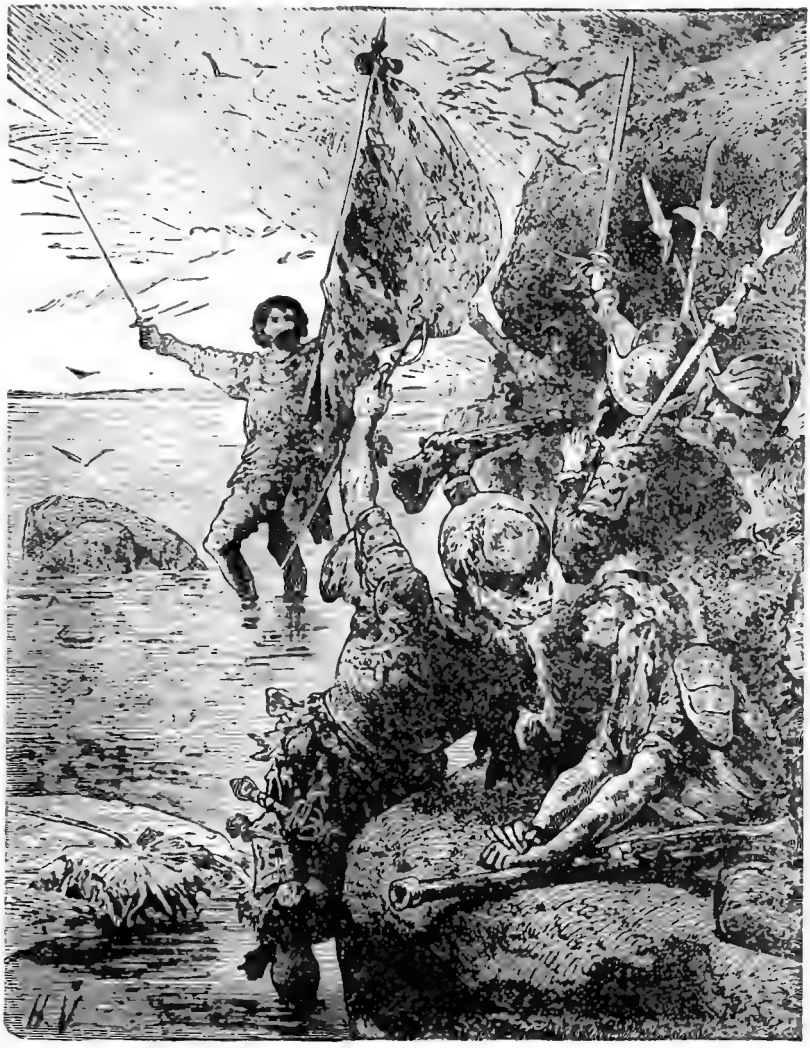


An Iron Ship.

Early in the sixteenth century Magellan started out on his memorable voyage of discovery. Though he did not live to see Spain again, in less than three years, his ships returned by the way of India and the Cape of Good Hope, thus being the first to circumnavigate the globe. The expeditions of John Hawkins and Sir Francis Drake, though under the English flag, seem to have been little more than buccaneering adventures in which it is

[1] Vide Shipp: "De Soto and Florida," Philadelphia, 1887.

claimed that "Good Queen Bess" shared. They captured negroes in Africa, and sold them as slaves to the West Indian colonies.[1] The voyages of Frobisher and Davis



Balboa Taking Possession of the Pacific.

made the northern shores of the New World known to

[1] Low: "Maritime Discoveries," Vol. I. p 272-3. Lindsay: "Merchant Shipping," Vol. II. p. 123 *et seq.*

Europeans. The Pacific coast had been explored by Grijalva, Alvarado, and Cabrillo in the first part of the sixteenth century; but toward the close of that century, Drake entered the Pacific and explored the coast to about 48° north latitude, thence returning to England by the way of the Cape of Good Hope. The cargo and prizes that he had captured from the Spanish netted the owners of his ship, the Golden Hind, two million dollars of our money.[1] For his success and gallantry, Queen Elizabeth visited his ship, when he reached London, and conferred upon him the order of knighthood The close of the sixteenth century ushers in the period of colonization in what is now the greatest nation of this New World. We will learn of its history in another chapter.

From the limited horizon of ancient Chaldea, we have watched the growth of discovery until it has embraced the world. We must not, however, conclude that civilization, even in the most ancient times, was confined to any one, limited spot. Though we have but here and there a ray of historical light to guide us in a knowledge of distant times, we see that every Chaldea has had its Elam; every Egypt, its contemporary Hittites; every Ilios, its neighboring Hellas; every Rome, its rival Persia. As every rising nation has had to discover for itself much of the world that is really old in culture, so Japan, in our own day, is learning that there are many civilized peoples outside of its own sea-girt isles; so is England discovering in India many signs of a culture more ancient than its own.

But we can safely say that the number of contempo-

[1] The Portugese claim that as early as 1520, when Magellan was just finding his way into the Pacific, some of their ships, sailing east from Molucca, crossed the Pacific and struck the coast of California. Vide Winsor: "Narrative and Critical History of America," Boston, Vol. III. p. 68, note 2.

rary, cultivated nations has been constantly on the increase, since history began. As soon as one continent became occupied, a limitless population spread into another. When the Old World became crowded, the glittering gold and sparkling jewels of unknown lands formed an enticing bow of promise whose widening span lured the more venturesome spirits onward until it surrounded the globe. And now mankind settles to rest again, as it did eight centuries ago, as firm as ever in the belief that there are now no more worlds to find. The Age of Discovery reached its zenith when the happy Columbus entered the harbor of Palos with tidings of a New World.

# CHAPTER II.

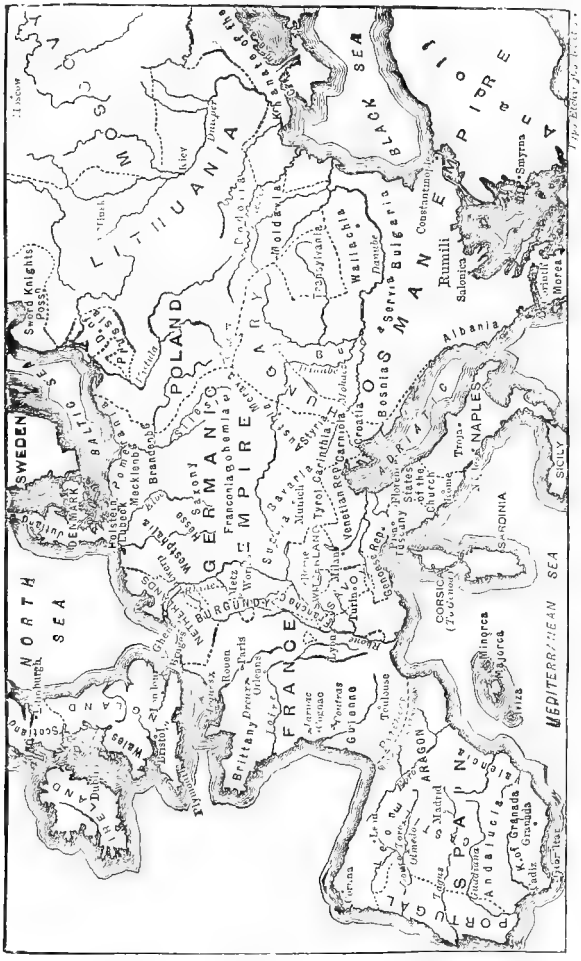
## MODERN EUROPEAN HISTORY.

GENERAL INTRODUCTION—Review—English History, Sixteenth Century—French History—Elizabeth's Reign—The Stuart Dynasty—The Protectorate—The Age of Louis XIV.—Rise of Sweden—Of Russia—Decline of Spain—The Thirty Years' War—Wallenstein—Wars of the Spanish Succession—Charles XII. of Sweden—The Bourbon Family Compact—England in the Seventeenth Century—Wars of the Austrian Succession—Rise of Prussia—The Seven Years' War—Frederick the Great—Joseph II. of Austria—Causes Leading to the French Revolution—The Grievances of the People—Louis XVI—The Reign of Terror—Career of Napoleon Bonaparte—The Russian Campaign—European History Since the Abdication of Napoleon—The Revolutionary Struggles in Europe—The Franco-Prussian War—TheRusso-Turkish War—General Conclusion.

IN a general way, the medieval period of European history is said to have terminated with the discovery of America, the invention of printing, and the Protestant Reformation under Luther. But we have taken exception to this view, regarding these important movements as the results of advancing intelligence in general. We can, however, willingly admit that, beginning with the sixteenth century, the intellectual development of Europe had reached such a stage of growth that advance in many directions was exceedingly rapid.

PETER THE GREAT AFTER THE BATTLE OF PULTOWA

We desire in this chapter to obtain a general view of political movements in Europe during the last four centuries, drawing from them, of course, such results as are of especial value for our general inquiry, the rise and progress



Europe of the Fifteenth Century.

of our present state of culture. The era commences with the subserviency of the masses of the people to privileged classes. The divine rights of kings and the general idea that lords and knights of various degrees were in every

way superior to the general mass of the people, were the prevailing ideas of Europe at the opening of the sixteenth century.

Now the present day is not inaptly called the reign of the common people. We have shown that in a former stage of culture the tendency of advancing civilization was to bring to the front individuals and individual rights. That law still holds good, with the further idea now finding expression that one individual's rights were not different from, or superior to another's. Along that line of thought, the conflict was waged for some centuries, and, unfortunately, is not yet finally settled. We will, however, see running through European history of the last few centuries the rising importance of the common people.

Turning now more particularly to Europe, we resume the historical thread dropped in a former volume.[1] At the beginning of the sixteenth century, Louis XII. occupied the throne of France. He had inherited the Italian wars of Charles VIII. with Spain. Each king claimed authority over a number of Italian cities, which led to constant wars for their possession. While this exhausted the resources of both France and Spain, it was still more ruinous to the unfortunate cities themselves. The deaths in succession of Henry VII. of England, Louis XII. of France, and Ferdinand I. of Spain gave the European world three great rulers who may be appropriately called the *tres magi* of European history during the first half of the sixteenth century.[2] These were, respectively, Henry VIII., Francis I., and Charles I. The

[1] Vide Vol. III. ch. v.

[2] Lord Bacon gave this title to three other rulers, viz.: Henry VII., Louis XI., and Ferdinand the Catholic. Vide Patton: "Mediæval History," p. 76.

Hapsburg princes had by this time come to regard the Imperial crown as their inheritance. Charles I., being a Hapsburg, soon succeeded to the Imperial throne (as Charles V.) Spain was now the controlling power of Europe, although Francis I. invaded her possessions as often as he could find the least excuse for so doing. As a

Francis I.

result of one of his invasions of Italy, he spent a year as a royal captive at Madrid.

When Charles V. abdicated his throne, he gave the Imperial crown to his brother, Ferdinand I., the Spanish crown to his son, Philip II. Although the Spanish kingdom and the empire were thus divided, Spain continued,

under Philip II., to hold the ascendency over other European powers. The second half of the sixteenth century witnessed many other changes among the great rulers of Europe. Henry II. ruled the French for thirteen years when the sovereign power passed into the hands of the infamous Catherine de Medici, wife of Henry, who by intrigue had been named as regent for the minor heirs. Her sons, Francis II. and Charles IX. were crowned in succession but speedily removed by the connivance of their mother who is also regarded as the instigator of that horrible butchery of Protestants in Paris and throughout France, known as the massacre of St. Bartholomew. Her third son, Henry III., ruled for fifteen years, when he was succeeded by Henry of Navarre, under the title of Henry IV., who by the celebrated Edict of Nantes proclaimed religious freedom to all his subjects (1598).

Thus much by way of review.[1] Turning to England we find before us a most interesting age. The English throne was occupied in rapid succession by the three children of Henry VIII.—Edward VI., son of Jane Seymour; Mary, daughter of Catherine of Aragon and wife of Philip II. of Spain; and, finally, Elizabeth, daughter of Anne Boleyn, who wore the crown into the next century. Elizabeth's reign was remarkable for its length, for almost universal peace and prosperity throughout her possessions, and for the great number of eminent men whom England produced during this period. Shakespeare, Bacon, Spenser, Ben. Jonson, Knox, Drake, Raleigh, and others, by their literary genius, their enterprise, and their advanced ideas, won for her reign the appropriate title of "Elizabethan Age."

Now Elizabeth was by no means a perfect sovereign.

[1] Vide This Series, Vol. III. p. 390 *et seq.* and 423.

She was, on the other hand, weak and injudicious in many respects. As far as personal character was concerned, she certainly was not in advance of her times, though history records no court scandals. Exceedingly avaricious, she did not hesitate to bestow honors upon Hawkins and Drake (the most notorious freebooters of the age) for a share in their spoils, reaped from the sale of unlawful prizes, and the gains from cargoes of negroes, captured in Africa and sold in the West Indies contrary to existing treaties with Spain.[1] Partially as a result of a long series of trespasses upon treaty rights, and of buccaneering against Spanish commerce, at the close of Elizabeth's reign, Philip II. fitted out the greatest fleet the world had ever seen for the conquest of England. This was the great Spanish Armada. A kindly storm, however, by wrecking the armament, saved the trembling queen and her frightened subjects from an invasion that would probably have proved disastrous to the British. The Spanish fleet was almost annihilated (1588).

Nor was Elizabeth free from the fears and jealousies of many a person of meaner station. Ruled by these baser passions, we find the "Virgin Queen" treating her kinswoman, Mary Queen of Scots, in that cruel and illegal manner which has forever tarnished her name. Jealous of the latter's beauty, and fearful of her title to the English throne, Elizabeth kept her in unlawful confinement for a long period of years, and finally sent her to the block. The empty accusations of conspiracy against the sovereign's life and opposition to reform were the only excuses that could be advanced to cover the act.[2] Still Queen Elizabeth was unusually successful in holding popu-

1 Lindsay: "History of Merchant Shipping," Vol. II. p. 123 *et seq.*
2 Vide Knight: "Pictorial History of England," Vol. II. p. 539 *et seq.*

lar favor, and usually found, among her tools and favorites, a scape-goat for her misdeeds or mistakes.

Now we are not concerned in writing a full and exact history of the succession of the various princes to the different European thrones. It is sufficient to state that the century closed with the Hapsburgs still in possession of the

Elizabeth,

Imperial (Germanic-Roman) throne. But the supremacy of Spain in European affairs was giving way before the rising power of France. We must, however, note the change in favor of toleration which was at that time spreading over Europe. The Northern German states were the cen-

ter of religious agitation, and Charles V. had been so occupied with his wars with France that he had not been able to enforce the decrees of his own diets. Emperor Maximillian II., who succeeded Ferdinand I., was the "first European sovereign to adopt toleration, not from policy but from principle."[1] The English had cast off allegiance to the pope, and Elizabeth was on the whole extremely tolerant, although English Reformers were from the first clamorous for the blood of Mary Queen of Scots, because she was a Catholic. The Edict of Nantes promised the French religious freedom. Reform had triumphed in Scotland, Poland, and Sweden.[2] This was the dawn of better times for Europe; though, as the result of dissensions arising among the reformers themselves, the following century witnessed much cruel fighting among the various religious factions. Each sect, as a general thing, submitted itself to the protection of a political ruler who had some personal aim in espousing the cause of religion; and thus "religion was made subordinate to politics."[3]

Soon after the seventeenth century opens upon Europe, Queen Elizabeth was succeeded by James VI. of Scotland, son of Mary Queen of Scots, who, as James I., introduced the Stuart kings to England (1603). The Britons were not well pleased with their foreign king and his Scotch courtiers, but were somewhat appeased by the cessation of the border warfare between the two kingdoms, for England and Scotland were henceforth united. The Catholic element in the kingdom, however, was far from being satisfied with the Stuart king, because James had renounced

[1] Labberton: "Historical Atlas and General History," New York, 1887, p. 124. This subject will be treated more extensively in a subsequent chapter.

[2] Gregory: "Handbook of History," p. 33.

[3] Ibid.

the faith of his mother and adopted the established religion. This course of action led to the "gunpowder plot," in which conspirators, under the lead of one Guy Fawkes, planned to blow up the Protestant king and his entire parliament. Fortunately a timely warning led to the arrest and execution of the conspirators instead of their intended victims.[1]

Subsequently, James gained the ill-will of his Protestant subjects by justly declaring that, whereas this small band of conspirators were alone cognizant of this plot, only the guilty should be punished. The fact is, ideas of toleration were so narrowed by the spirit of the times that the reformers had at least hoped for an extensive persecution of the Catholics. In this, the English king seems to have been in advance of his age. But there is another side to his character. For, while he could have materially hindered Queen Elizabeth in her persecution and criminal slaughter of his mother, Mary, he contented himself with too tardy and idle remonstrances. And later, by withholding his aid from his son-in-law, he caused the ruin of Frederick V., elector of the Palatinate,[2] the first leader of the Protestant cause in the Thirty Years' War.[3] Also on mere accusation of having been connected with a conspiracy to dethrone the king, that eminent navigator, Sir Walter Raleigh, was confined to the Tower for thirteen years, and then ordered to the block. Thus do we gain a true picture of a king who is further described as a pedant and a believer in the "divine right of kings."[4]

When his son, Charles I., came to the throne, as

[1] A good account of this conspiracy is contained in Hume: "History of England," Vol. IV. pp. 400-405.

[2] The Palatinate was a small territory along the Rhine. Vide Vol. III. p. 343. [3] See below.

[4] Vide Hume, Op. cit. p. 494.

might be expected, he entertained still more strongly these same ideas. In trying to enforce them, the king found himself involved in a dispute with Parliament which finally ended in his deposition and execution. In attempting to assert his supposed rights, Charles tried browbeating, arresting, and imprisoning members of Parliament. Then Parliament was dismissed, the king trying for eleven

Mary Stuart.

years to rule without its aid. Money, however, must be raised; and, among other schemes to procure it, was his plan for raising "ship money," really a tax for the support of the navy. This brought into prominence the celebrated patriot, John Hampden, who resisted the collection even in the courts, though, of course, he was defeated.[1]

[1] On this subject see Knight: "Pictorial England," Vol III. p. 197 *et seq.*

The immediate cause of the outbreak against Charles was a rebellion of his Scottish subjects, because the king had tried to enforce a new liturgy in their churches. To put down this rebellion, money was necessary. To raise

Execution of Charles I.

money, Parliament must assemble. Another Parliament was therefore called, but shortly dissolved. Another call was soon issued and the celebrated "Long Parliament" (so called from the length of its session) began its work.

Instead of turning its attention to a settlement of the Scottish difficulty, this Parliament began, at once, to adopt measures for resisting the tyranny of the king. Almost the first act was the arrest, trial, conviction, and execution of his chief adviser, Stafford, whom Charles ignominiously deserted to his fate.[1]

Though the king made many promises to Parliament, he did not hesitate to break them whenever he saw fit. Still Parliament removed one barrier after another that stood in its way. At length, the crisis arrived. Parliament submitted to the king nineteen propositions which tended to greatly increase its power. These were of course rejected; and Parliament forthwith appointed a "Committee of Public Safety," raised an army, and civil war began. "Charles unfurled the royal standard at Nottingham." His followers were called "cavaliers," and the rebellious subjects "roundheads."

The parliamentary army was victorious at Marston Moor and at Naseby, Oliver Cromwell having greatly distinguished himself. Finally, Charles surrendered to the Scotch, who sold him to Parliament, by which latter authority he was kept in confinement until a dispute between the Puritan and independent factions was settled by placing the latter into power. The Independents controlled the army, with Oliver Cromwell as general. They carried matters with a high hand; obtained possession of the king; utterly defeated the Scots at Preston Pans; and, finally, tried, condemned, and executed the king himself—an act that has since been condemned by all mankind (1649).[2]

[1] For this trial, see Macaulay: "History of England," Vol. I. p. 98.

[2] Vide Labberton: "General History," p 131. This verdict is just, though this conflict and its results eventuated in great good for the cause of constitutional liberty.

For the sixteen years following, England was ruled by Oliver Cromwell, who exercised all the powers of a king, even to the appointment of his son as his successor, though he would accept no other title than that of Lord Protector. This period in English history is, therefore, called the Protectorate. The House of Peers was abolished and the Commons constituted the only popular assembly.

Charles I.

Cromwell's government was vigorous both at home and abroad, and is an honorable epoch in English history. But Richard Cromwell was a failure as a ruler; and, after a few month's trial, withdrew from public life. Charles II., the profligate son of Charles I., though he had previously made several futile attempts to seize the throne, was called from his wanderings to become King of England, though made entirely dependent upon Parliament for his revenue.

In the reign of Charles II., there occurred in London, the "great plague" and the "great fire."[1] The superstitious regarded these as visitations of Divine wrath because of the shameful profligacy of the king.[2] Aided by the Cabal,[3] "a most tyrannical and unscrupulous agent of royal prerogative," the king was able to extort money from Parliament for purposes of defense, only to waste it in riotous living, while he was usually a pensioner of the French king. England sank to so low an ebb that the war vessels of Holland, with whom a war arose, even entered the Thames and threatened the British capital. Still it is claimed that this was a season fruitful in reforms and that the very profligacy and wantonness of the king left Parliament free to legislate for the people.[4]

Upon the death of Charles, Protestant England was thrown into a state of fear and anxiety by the accession of Catholic James II. His declaration of toleration (a just measure), followed by the arrest and trial of seven bishops for not reading it from their pulpits, was a further cause for alarm. Then began that train of events which led to William of Orange, husband of James' daughter, Mary, being called to the English throne. James took refuge in France, and England thus became involved in the long-existing struggle between Holland and France. Still the reign of William has been called, all things considered, "the most successful and the most splendid recorded in the history of any country."[5]

---

[1] For a description of these calamities, consult Knight: "Pictorial England," Vol III. pp. 695-699. Macaulay: "History of England," Vol. I. p. 181. Hume: "History of England," Vol. VI. p. 50

[2] Vide Buckle: "Civilization in England," Vol. I. pp 279-80.

[3] So called from the initial letters of the names of his cabinet, viz: Clifford, Ashley, Buckingham, Arlington, and Lauderdale.

[4] Vide Buckle, Op. cit. p. 275 *et seq.* [5] Buckle, p. 290.

Such is an outline of events in England during the seventeenth century. During this period in France, we learn of the rule in succession of three statesmen who must be ranked among the few great men of all times. These were Richelieu, Mazarin, and Louis XIV. The first two were cardinals and were in succession raised to the office of prime minister of France, during the reign of Louis XIII. and the minority of Louis XIV. Mazarin was a pupil of Richelieu, and Louis XIV. a pupil of Mazarin. As long as they followed the teachings of their great master, Richelieu, France firmly held a ruling place among the powers of Europe; but when at last Louis ventured to strike out a new course of action for himself, his power began to decline.

As Richelieu cuts so important a figure in French history, we must glance at the succession of events leading to his rise in power. Louis XIII. had ascended the throne upon the death, by assassination, of his father, Henry IV. Louis was nine years old at this time, so his mother, Mary de Medici, was made regent. Under Henry IV., the great financier, Sully, had restored the credit of France and had paid a great share of the debts of the crown. But the regent mother could not firmly control the nobility who forced Sully to retire. Affairs became so turbulent that the regent assembled the great council of the people, the nobility, and the clergy, known as the States-General. Its deliberations was a scene of stormy disputes, and it was finally dissolved. This was its last meeting until the troublous times of the Revolution, nearly two hundred years later.

At this council, appeared a young priest, who soon arose to the rank of cardinal, and two years more saw him prime minister of France. This was Richelieu. He at

once gained complete control over the young king, even to the banishment of the regent mother and another son from court. He put down the nobles and made the king's power absolute throughout his kingdom, before interfering with general European affairs. The greatest internal troubles were the rebellions of the Huguenots, though they were at last forced to yield to the laws of the lands,[1]

Cardinal Mazarin.

not simply because they were Huguenots, but because they were rebels. This is evident from the fact that they were still guaranteed the protection of the existing edicts of toleration.[2] Both the king and his distinguished minister died within the same five months. Louis XIV., at the age of five years, succeeded to the throne (1643). Another cardinal and a pupil of Richelieu, Mazarin, became prime minister, and the queen mother, Anne of Austria, regent. But Mazarin had not his master's ability, and his season

[1] Russel: "History of Modern Europe," Vol. III. p. 144 *et seq.*

[2] Buckle: Vol. I. p. 416.

of power was a turbulent one. He seems to have been hated by a large share of the population. During the civil war known as the Fronde, the court was driven, not only from Paris, but Mazarin was forced to leave the kingdom. But he was recalled again when the war had been brought to a close.

When Mazarin died, Louis took the reins of government into his own hands, and ruled for fifty years with such success that the "Age of Louis Fourteenth" is sometimes called the most brilliant era in the history of France.[1] His ambition, however, led him into many wars, which will be mentioned hereafter. He erred in departing from the policy of the great statesman, Richelieu, for he revoked the "Edict of Nantes," and forbade the Huguenots to leave the kingdom. Thus was begun a cruel, religious persecution which, in spite of the care of the king to prevent it, drove a hundred thousand families into foreign countries, where they were gladly welcomed on account of their wealth and industrious habits. It was indeed a great loss to France for which no mere brilliancy of reign could atone. The century closes on that country with Louis XIV. still in the vigor of his reign.

Holland and the Spanish Netherlands were a bone of much contention among the powers of Europe during this century. The latter, though often the battle ground for the armies of France and Spain, remained at the close of the century, as at the beginning, in the possession of Spain. On the other hand, the Dutch had jealously guarded their freedom so dearly bought by William the Silent. The

[1] Gregory: p. 57. But of this same reign Buckle more justly remarks (Vol. I. p. 491 *et seq.*), that it "must be utterly condemned if it be tried even by the lowest standard of morals, of honor, or of interest." Probably the greatest blot on it is the cruel religious persecution that he sanctioned.

princes of Orange were usually the leading figures in Dutch history, though in the third quarter of the century the republican element under John De Witt dominated. The Dutch became masters of the sea, formed the great Dutch East India Company, and vied with England in commerce and colonization. This was the period of their settling our own country in the vicinity of New York and the Hudson River. At the close of the century, through two successive marriages,[1] William and his wife, Mary, succeeded to the English throne, thus uniting the fortunes of England and Holland against Louis XIV. of France.[2]

Northern and Eastern Europe began to take a more active part in international affairs during the seventeenth century than previously. The young Gustavus Adolphus ascended the throne of Sweden and, early in the century (1611), became the leader of the Protestant League. He raised his country to a height of power that she had never before enjoyed, and one winter held his court at Mayence, upon the banks of the Rhine. He added greatly to Swedish territory, but was killed in battle at the moment of his greatest victory, and while still in the prime of life. He had, however, already rescued Protestantism from an early death, and thus rendered an immortal service to civil and religious liberty. At the close of the century (1697), Sweden again flashes out before the world like a meteor, when Charles XII. arms himself against his allied enemies.

He was only fifteen years of age when Russia, Poland, and Denmark thought it an opportune time to snatch from him some of his cherished possessions. Their dream of

1 William II. of Orange and Mary, sister of Charles II.; and their son, William III., of Orange, and Mary, daughter of James II.

2 For the history of the struggle of Holland against the usurpation of France, see Russell: "Modern Europe," Vol. II. p. 461 *et seq.*

easy conquest was rudely broken. They found that they had challenged one of the greatest generals of the age. He did not wait their convenience, but was first in the field. He compelled the Danes to sue for peace, and defeated forty thousand Russians at Narva with a force of but nine thousand Swedish soldiers. He placed a king of his own

Charles XII.

choice upon the throne of Poland; and then he entered Russia to dethrone Peter the Great. But here his star suddenly waned, he suffered such a terrible defeat before Pultowa that he was never again able to rally an army of conquest. This brings us down to the opening of the eighteenth century.

The seventeenth century closed on Russia rising in culture and taking her place among the powers of Europe under its great sovereign, Peter the Great, who introduced many reforms and many new branches of industry. He built for himself a capital, our present St. Petersburg. Henceforth, international affairs of Europe cannot be settled without consulting the interests of this new power. Near the close of this century, the Turks invaded Hungary and for the last time laid siege to Vienna (1683). When almost upon the point of victory, John Sobieski appeared with a Polish army and drove them farther back from the borders of Germany than where they had stationed themselves for years.[1]

From her position as the foremost power of Europe, Spain witnessed a gradual decline all through the seventeenth century. Philip III. was the first ruling sovereign. He it was who drove the remnant of the Moriscoes, or descendants of the Moors, from Spain. They were given thirty days to leave the kingdom on pain of death for noncompliance. Vessels were ordered to transport them to the shores of Africa, where they bore with them five-sixths of Spanish wealth, for they were the merchants of the kingdom, peaceful and industrious.[2] Such a course as this inflicted a greater blow on Spanish prosperity than could have been wrought by an armed invasion of some hostile power (1609). Philip IV. was sixteen years old when he became king of Spain. He busied himself and drained his treasury with useless wars against France. Spain speedily became so weakened that Portugal was enabled to again assert her freedom, the powers of Europe acknowledging

---

[1] To give completeness to our present review, we have here briefly retouched some topics already treated in Vol. III. ch. v.

[2] Patton: "Modern History," p. 216.

her independence (1640). Charles II. succeeded to the Spanish throne at the age of four years with his mother as regent. This whole reign was a season of disputes about the regency. The queen-regent's favorites[1] became unpopular. Don John of Austria, natural son of Philip IV., was called into power as prime minister. But, upon his death, the queen returned to power. Then, too, it became probable that Charles would die childless, and as he was the last of the Spanish Hapsburgs, the subject of Spanish succession became of international importance. Before this question was settled it involved Europe in the convulsions of war.

Even before the death of the king, there were three claimants to the Spanish throne—The Dauphin (crown prince of France); Joseph, the Electoral Prince of Bavaria; and the Emperor Leopold. The Prince of Bavaria, though named by Charles as his successor, died before the king. Then Charles named Philip of Anjou, second son of the Dauphin, as his heir. He was indeed the nearest male heir, for his grandmother was the oldest daughter of Philip III. and his mother, the oldest daughter of Philip IV., but both of these princesses, upon marrying into the royal family of France, had solemnly renounced all claims to the throne of Spain. Emperor Leopold was son of a younger daughter of Philip IV., who had not renounced her claim to the throne of her father. He was, besides, a Hapsburg. In the first year of the eighteenth century, the Spanish king died. Louis XIV. had his grandson crowned at once as Philip V., while Emperor Leopold declared his second son king, under the title of Charles III. Thus opens the "War of Spanish Succession."[2]

[1] The Jesuits, Mitard and Valenzuela. [2] On this question see Labberton: "Historical Atlas and General History," pp. 135-6.

We have thus far been learning the names and stations of the chief characters who were upon the stage of European history in the seventeenth century. Let us now turn to review those great international struggles that shook the civilized world. Combining the two, we will then have a fair idea of the political development in Europe. Heretofore the wars of Europe, except the Crusades, were petty struggles for supremacy among the princes of some one kingdom, or at most between two nations. Now we are to view Europe in a state of turmoil, where a number or, perhaps, all the great powers were constantly involved. The idea of a balance of power was gaining ground. It had first been advanced by Henry of Navarre, but he died before he could execute his plans. It simply means that the territory of Europe had become so adjusted among the rising modern nations that every established power was interested in the succession of the princes and the plans of conquest that transpired in all the other countries.

In 1618, war finally broke out in Europe. It lasted for thirty years and is known as the "Thirty Years' War." The real cause of this war was of a religious nature. The Protestants of the Empire were fearful of intolerance on the part of a promised succession of emperors. There had already been found two strong parties in the empire —the Protestant Union, headed by Frederick V., Elector Palatine and son-in-law of James I. of England; and the Catholic League, headed by Maximillian, Duke of Bavaria.

Emperor Matthias was childless, and was likely to be succeeded by his cousin Ferdinand, a strong Catholic. Indeed the Emperor had already secured for Ferdinand the crowns of Bohemia and of Hungary. The Bohemians

however deposed him and called Frederick V. to their throne. In the mean time, Ferdinand had become emperor as Ferdinand II., and called upon Maximillian and the Catholic League to champion his cause in Bohemia. Then followed four years of war known as the Bohemian-Palatine period. Frederick, looking in vain for aid from England, was defeated in nearly every battle, and finally was driven from his hereditary possessions in the Palatine. The most distinguished general of this period was Tilly who led the troops of Maximillian.[1]

New leaders of the Protestant cause arose in what was called the circle of Lower Saxony. These states chose as their leader Christian IV. of Denmark, who forthwith warned the Emperor against quartering troops upon the princes of this circle. Ferdinand continued the practice as well as took occasion to increase his forces. Thus began the Danish period of the Thirty Years' War (1625) Count Ernest of Mansfield entered into the war, but in trying to carry it into Austrian territory was utterly defeated and died. The Danish king marched to meet the imperial army under Tilly but was defeated.

The greatest military commander, unless we except Gustavus Adolphus, of this age now offered his services to the Emperor. This was Wallenstein, duke of Friedland, who raised a large army at his own expense and made war against the Protestant princes. Everything fell before him. Denmark was overrun and the king driven out upon his islands. All of Northern Germany submitted and peace was established (1629.) Now the Emperor determined to kill Protestantism, and to reduce the German princes to the condition of the nobility in other monarchies.

[1] For this period see Kohlrausch: "History of Germany," New York 1876, p. 318. *et seq*

Bohemia felt the extreme force of his anger where many were executed, and Catholic worship was restored. So zealous was Wallenstein in carrying out the edict of restitution, restoring all lands that had been seized from the church by laymen during this Danish period, that even the Catholic princes clamored for his dismissal. He was at last retired from command of the army.

Gustavus Adolphus.

It is said that on the same day that Wallenstein was dismissed by the Emperor, Gustavus Adolphus crossed from Sweden into Northern Germany to champion the Protestant cause (1630.) Heretofore, success had been with Ferdinand and his Catholic armies. The great statesman Richelieu, had at last become alarmed at the power of the Hapsburgs, and had promised material aid to the young king of Sweden. Gustavus met Tilly at Leipsic where the

imperial army was utterly defeated. The next winter Gustavus held his court at Mayence on the Rhine, "the head of Protestant Germany."[1] Success followed the young king everywhere and now the Protestant princes flocked to his camp. The next Fall in an engagement with Gustavus, Tilly, the imperial commander, was defeated, and in a subsequent battle he not only suffered a defeat, but received his death wound.

Wallenstein was now recalled to aid the Emperor. He came on the conditions, that he be made supreme commander, that he be allowed to raise his own troops, and that he be not subject to a second dismissal at the will of his enemies at the imperial court. The Emperor was willing to concede everything for the assistance of his greatest general. Again enormous numbers of soldiers flocked toward Wallenstein's camp, attracted by the scent of rich plunder. For it was of necessity granted that Wallenstein's army should support itself from forage gathered in the countries through which it passed.

Gustavus seized and fortified Nuremburg, and Wallenstein pitched his camp near by. But no battle was fought there. Then the Swedish king led his forces into Bavaria while Wallenstein entered Saxony. Gustavus turned about and followed the imperial army into Saxony. The armies met on the plain between Lutzen and Leipsic, and the greatest battle of the war was fought. Although Gustavus lost his life, the Swedish army was victorious and the greatest imperial general of the age was defeated. The great Protestant leader was gone, however, and Germany was at the mercy of Wallenstein. Jealousy on the part of imperial princes, and fear lest he were planning to build for himself a kingdom in the heart of Germany, led

[1] Labberton "General History," p. 129.

again to his dismissal from the chief command, and at last to his assassination (1634).

Now France could oppress her own Huguenot subjects, but at the same time support the Protestant princes of Germany and thus reduce the power of the Hapsburgs.[1] Still Richelieu did not engage actively in the war. He sought rather to keep the flames of war burning in order that they might destroy the Austrian royal house. Twelve years before the end of the war, this great statesman began to negotiate a treaty that would benefit France. About this time, Ferdinand III. became emperor, and a speedy settlement of affairs was looked for. But the Swedish general, Torstenson, kept up the struggle with a considerable degree of success, although it is claimed that now such generals as Torstenson, Banner, and Wrangel, Protestants; and Piccolomini and Merci, imperialists, were fighting for glory rather than for any particular cause.[2] The death of Richelieu and Louis XIII. postponed the proposed treaty until the Hapsburgs had tested the strength of their successors.

The Spaniards, hereditary enemies of the French, joined the imperial cause.[3] This led to renewed activity. The French general, Conde, won the great battles of Freiburg and Nordlingen, while the great Swedish generals, overran the whole of Northern Germany, and made even Vienna tremble. The Emperor was at last willing to come to some terms. Envoys from the various states assembled

---

[1] Though this is the usually accepted idea, Buckle shows very plainly that Richelieu, though a cardinal, did not advocate intolerance, but that the French Protestants were allowed perfect freedom of worship, denied Catholics in their midst, and that Richelieu's policy was to suppress rebellion but to confirm all articles of religious freedom allowed by existing edicts. Vide Vol. I. p. 412 *et seq.*

[2] Labberton, Op. cit. p. 130.

[3] Kohlrausch: "History of Germany," p 340 *et seq.*

at Osnaburg, and, after five years of wrangling, Germany and the empire were forced to submit to the dictation of foreigners anxious for spoil. Sweden, and particularly France, which had stood aloof but had figured every way to keep the cauldron of war boiling on German soil, now put in claims for heavy damages.

As a contemporary German writer said about these delegates at Osnaburg, "They already, in the very heart of Germany, discuss and dispute together over Germany, as to what they shall take from, and what they shall condescend to leave us, what feathers they shall pluck from the Roman eagle, and therewith decorate the Gallic cock."[1] At last the peace of Westphalia was signed, closing the war (1648). It established the individual independence of German princes, so long as they formed no alliance detrimental to the interests of the empire; it provided for the payment of indemnities to Sweden and several other states; it legalized the independence of the Swiss states; it restored the heir of Frederick V. (who had died) to the greater part of his possessions in the Palatine, and made him the eighth elector;[2] it gave Sweden a part of Pomerania, Wismar, and the Bishopricks of Werden and Bremen, and three votes in the German Diet.[3]

But France did not forget her own interests. She "received the bishopricks of Metz, Toul, and Verden, as much of Alsace as had belonged to Austria, the Sundgan, and the important fortresses of Brisach and Philipsburg." And Germany was forced to destroy a number of fortifications along the Upper Rhine, thus leaving the way clear for further conquests in the empire.[4] Thus ended the war which had devastated Germany, season after season, for

[1] Ibid. p. 345. [2] Vide Vol. III. p. 376.

NAPOLEON I, AS EMPEROR

thirty long years, and annually cost her millions of dollars. All that was gained by the war as a heritage to mankind was a spirit of greater toleration. We can but regret, however, the state of bigotry and persecution that necessitated this pearl of priceless value being bought at such a cost of life and bloodshed.

Cromwell.

Spain had not been a party to the treaty of Westphalia, and so hostilities did not cease between that country and Louis. On the other hand she had assisted the Frondeurs in their rebellion against their king and especially against his minister Mazarin. This was sufficient provocation for war. In fact hostilities had never really ceased. The French general, Conde, for siding with

the rebels, had been forced to find a home in Spain. Smarting under a sense of injustice, he afterward led a Spanish army into France.[1] Cromwell was now at the head of affairs in England, and formed an alliance with France. The English fleet swept the seas of Spanish vessels, and even blockaded some Spanish ports.[2] This war was closed by the peace of Pyrenees, whereby Louis obtained the Spanish princess, Maria Theresa, in marriage and large additions of territory. Conde was pardoned and restored to his possessions.

Seventeen years later, this marriage led to another war with Spain, for Louis supported his wife's claim to the Spanish Netherlands and to Burgundy, although one of the terms of the marriage was that she give up all claims as heir to Spanish possessions. The spirit of ambition thus displayed by Louis aroused the nations of Europe and led to the formation of the Tripple Alliance, or the union of England, Holland, and Sweden against France, which finally resulted in the treaty of Aix-la-Chapelle (1668). Louis had to content himself with French Flanders;[3] but he was only abiding his own time for revenge. Mazarin died, and Louis grasped the reins of government, determined to rule alone. He called to his assistance the great financier, Colbert, who managed to supply the king with means for accomplishing his vast schemes.

The storm first broke over Holland. Louis was enraged at the Dutch for the seeming obstruction to his plans, and so he began to scheme for the conquest of Holland. First he purchased the neutrality of Sweden and of Charles II. of England. Then he sent his armies under

Conde and Turenne into Holland, where William of Orange was rapidly rising through the confidence of the people to the position of leader. By cutting dykes and

Louis XIV.

flooding large portions of his country, the latter checked the advance of the French (1672). The Dutch fleet was

now overmatched by the combined French and English navies. Van Ghent and De Ruyter were the commanders of the one, the Duke of York and Earl of Sandwich of the other.[1]

Holland was making every endeavor to obtain help in this unequal struggle. Sweden was in the pay of Louis, but the Prince of Orange enlisted the sympathies of Spain and Austria, or rather they saw that their own peace and safety were connected with those of Holland. England withdrew from the coalition with France. The struggle raged with varying success. Frederick William, the Great Elector of Brandenburg, joined the allies and defeated the Swedes; but Duquesne, the French admiral, defeated the Spanish and Dutch in three naval battles in the Mediterranean, in one of which battles De Ruyter was killed. Turenne, one of Louis' best generals, was also killed shortly before this time. Finally Louis signed the treaty of Nimeguen (1678). France gained possession of Franche Comte (the Burgundies) "and many large fortresses and towns in Flanders,"[2] and the Great Elector, Frederick William, restored his Swedish conquests in Pomerania. The sleepless ambition of Louis soon brought on another war. Anxious to have a share in the business of all other European powers, he put forward the claim of his sister-in-law, Charlotte Elizabeth, to a portion of the Palatinate. In the meanwhile, the League of Augsburg had been formed among the states of the Empire, Spain, and Holland as a protection against the power of Louis.[3] Because this league protested against this claim of Louis and urged the fulfillment of the treaties of Westphalia, the

Pyrenees, and Nimeguen, Louis ordered his armies to devastate the Palatinate. William of Orange had now become king of England, so that the natural English senti-

William, Prince of Orange.

ment of enmity against France was nourished and inflamed by their king. Then, too, Louis had enlisted himself in the

cause of the deposed English king, James II., and hoped to restore him (1686).

But Louis had passed the summit of his power. All Europe was uniting against him. The forces of Holland, Spain, the Empire, Sweden, Denmark, and Savoy, known as the Grand Alliance, were united against France. Louis was not at all dismayed, but marshalled his armies and sent them into the field. Fate was for a time kind to him. His generals, Luxembourg and Catinat, were victorious in a number of battles; but France felt unable to continue the unequal contest. Louis ceased hostilities and retired into his own kingdom. This was but a preparatory step to the peace of Ryswick which closed the war (1697). Louis restored all of his conquests and acknowledged the Prince of Orange as William III. King of England.

The motives that Louis had in dropping this contest were probably two-fold. First, France had become completely exhausted by her continued wars; and, second, Louis was planning to place his son, the Dauphin, or at least his grandson, Philip of Anjou, upon the Spanish throne. Just as the seventeenth century was closing, Charles II. of Spain breathed his last, willing his throne to Philip of Anjou, who was crowned Philip V. The house of Hapsburg was changed for the house of Bourbon.[1]

We have once more arrived at the War of the Spanish Succession, and have now considered under two aspects the political events of the seventeenth century. We will commence the eighteenth century with this war. Leopold considered his son, Charles, entitled to the Spanish crown. While Philip was acknowledged as king at Madrid and in Castile, Leopold's son was declared Charles III. and his standard was raised in Catalonia, Aragon, and the

1 Above p. 100.

Balearic Islands. Louis reigned for fifteen years in the eighteenth century, thirteen of which were occupied with this "War of the Spanish Succession." William III. died in the second year of the century and Louis supported the son of James II., or the Pretender, in his claims to the English throne. Thus Louis soon found himself in-

Prince Eugene.

volved in another war with the allied powers of Europe, under the lead of three great men—Marlborough, the English general; Eugene, the prince of Savoy and Imperial general; and Heinsius, grand pensionary of Holland.[1] This was the war of the Spanish Succession. In addition, Louis had internal troubles, for the Calvinists of

[1] Vide Labberton, Op. cit. p. 136.

Cevennes were in open and armed rebellion. Marlborough and Eugene are spoken of as supreme in their own countries. "In the summer they fought, and in the winter they governed and negotiated."[1] Such were the leaders with whom Louis had to contend. While one French army was trying to subdue the Calvinists, another, under Tallard, met Marlborough and Eugene at Blenheim, where one of the most terrible battles of history was fought. The slaughter was so great that only a fraction of the French army reached the Rhine.

France was now almost exhausted, and Louis was willing to purchase peace at almost any price. But the terms offered by the allies, one clause of which was that Louis should send an army into Spain to dethrone his own grandson, were, of course, rejected. However, after the fall of Marlborough in England, after the death of Emperor Joseph, and the Hapsburg claimant to the Spanish crown became Emperor, the alliance dissolved and the various powers formed separate treaties with France, which are comprehended in the Treaty of Utrecht (1713).[2] Philip V. remained king of Spain; Emperor Charles V. received Mantua, Naples, Milan, and the Spanish Netherlands; Italy and Flanders became alienated; Victor Amadeus of Savoy received Sicily; and England was secured in the possession of the fortress of Gibraltar, commanding the entrance to the Mediterranean.

Thus was ushered in the eighteenth century. While Louis XIV. was almost dictating to the great powers of Western Europe, the world was astonished by the sudden appearance on the stage of action of two soldier-rulers in Northern and Eastern Europe. We have already mentioned their names—Charles XII. of Sweden, and Peter

[1] Ibid. [2] Ibid. 137.

the Great of Russia. The first decade of the century witnessed the brilliant part of the former's career. We have already seen him dictating to the Danes, the Saxons, and the Poles. We have seen him defeating the armies of Peter the Great at Narva, but have also seen his army almost annihilated by the Russian Tzar at Pultowa. Hoping for a turn of the tide, Charles spent five years in vain endeavor to arouse the Turks against Russia, and then returned to his kingdom to organize new armies and plan new victories in the Baltic regions. Prussia, Russia, and England had, in his absence, taken possession of some Swedish territory along the Baltic, and Charles, though overmatched, was about to try to recover his territory when he was killed—shot, it is thought, by one of his own attendants. This Northern war was ended by the peace of Nystadt, which gave Russia her Baltic provinces.[1] Peter was vested with the title of Emperor of all the Russias, and styled "the Father of his country," Peter the Great (1721).

The Swedish crown now passed to a succession of weaker monarchs, the king loosing much of his hereditary power, until the last third of the century, when Gustavus II. occupied the throne. He restored the power of the king, and waged a successful war against Russia, the old enemy of Sweden. After Peter the Great, none of the sovereigns of Russia were remarkable for strength or energy until Catherine II., dethroning her husband, Peter III., usurped the powers of the throne. "She reigned with great sagacity and brilliancy,"[2] and we might add very despotically as well. Another Turkish war occurred during her reign.[3] Holland, Belgium, and Denmark played unim-

1 Labberton: "General History," pp. 141-2.

2 Gregory: "Handbook of History," p. 124.

3 For which see Russell: "Modern Europe," pp. 521-2.

portant parts in the affairs of this century. Italy was mostly divided among the other powers of Europe. Spain had come to occupy a secondary place in the affairs of the continent, although her power was by no means to be ignored. Philip V. ruled nearly half a century. By seiz-

Catharine II.

ing Sardinia and Sicily, he brought the great Quadruple Alliance (England, France, Holland, and the Empire) against him, forcing him to give up these two islands, and to dismiss his prime minister, the ambitious and offensive Alberoni (1718). The last years of his reign were occupied by a war with England, arising on account of his punishment of English smugglers captured on his coasts.

Philip left one son, Don Carlos, king of Naples; another, Philip, Duke of Parma; and his Spanish crown to another, Ferdinand VI. Thirteen years afterward, Don Carlos became King of Spain as Charles III. These three Bourbon kings instituted reforms that were gradually raising their country in prosperity and power, and would have finally resulted in elevating Spain to its former place among European nations, had their successors pursued the same wise policy.[1] In the reign of the last of the three, was formed the Bourbon Family Compact by which the kings of France and Spain bound themselves to protect each other from all enemies. The enemies of one were the enemies of the other and the possessions of the different branches of the house of Bourbon became as one nation—the subjects of any part were admitted to naturalization in all other Bourbon dominions. It was under Charles III. that Spain allied herself with France to assist the American colonies in gaining their independence. An attempt was made during this war to drive the English from Gibraltar, but the fort was besieged in vain. Charles IV. wore the crown when the century closed.

Let us now glance at England. We have already noticed the connection of this country with the wars of Louis XIV. William III. was succeeded by Anne, another daughter of James II., and wife of the Danish prince, to the exclusion of the Pretender (son of James II., acknowledged by Louis as James III.), and the war dragged along. Her reign[2] was rendered remarkable by the number of brilliant authors who wrote at this time. Such were Addison, Steele, Swift, Pope, Thompson, Young, and Watts. Though Anne was the mother of seventeen

1 Vide Buckle: "History of Civilization," Vol. II. p. 92 *et seq.*

2 Buckle calls her a "foolish and ignorant woman."

children, none of them lived to succeed her. Consequently, on her death, George of Hanover, a descendant of Elizabeth, daughter of James I., was crowned king. In his person, England had a king who could not speak the language of the people over whom he was called to rule (1714).

Anne.

We are to notice another effort of the Pretender to secure the crown. He landed at Peterhead, but soon returned to France. During the reign of George I., England became a party to the Quadruple Alliance against Spain, mentioned above. The South Sea[1] Scheme, a wild speculating plan for creating an extensive trade with Spanish South America, and by its profits paying the public debt,

[1] Consult Knight: "Pictorial England," Vol. IX. pp. 372-3.

was one of the unfortunate events of this reign. But at last Sir Robert Walpole became first lord of the treasury, and premier of the English cabinet. His long term of twenty-one years was a season of prosperity to England. His was a peace policy. Being a whig, his measures met with bitter opposition from the tories.

Here then we are introduced to the two political parties in England who were striving for supremacy. The tories were the conservative party believing in the old institutions—the ancient constitution, the divine right of kings, etc. The whigs were the progressive party. The latter came into power in the time of William III. (Prince of Orange), and maintained itself at the head of affairs for half of a century. Bolingbroke, one of Queen Anne's favorites, who had exiled himself upon the accession of George I., was soon pardoned and became one of the most bitter leaders of the tories against the government of Walpole. Still the latter continued to rule the kingdom until long after the accession of George II. (1727).

George II. became involved in a war with Spain, to which we have already referred, although Walpole was always for peace. In the war of the Austrian Succession, that distracted the powers of Europe during the middle of the century, England sided with the Austrian Queen, Maria Theresa, this too, even while the war with Spain continued. King George accompanied the troops. At the battle of Fontenoy, in Belgium, the English army suffered a great defeat. Once more England suffered from the ambitious dreams of a descendant of James II. His grandson, Charles Edward, supported by the French, landed in Scotland, captured Edinburgh, was victorious at Preston Pans, and then advanced on England, but was

utterly routed at Culloden, barely escaping to the Continent. The Treaty of Aix-la-Chapelle restored peace to Europe (1748).[1]

Scarcely eight years passed before England became involved in another continental war known as the Seven Years' War.[2] France, of course, sided with the enemies

Walpole.

of England. This war extended to the colonies that these two nations had planted, side by side, in both America and the East Indies, known in American history as the French and Indian War. In fact, the American colonies had been fighting for two years when war was declared (1756). William Pitt, the Great Commoner, was at this juncture called upon to form a ministry. The success of

1 This treaty must not be confounded with the earlier Peace of Aix-la-Chapelle. See above. 2 Described below.

England during this part of the century is greatly due to his skillful management.

In India, the famous Surajah Dowlah was induced by the French to march upon Calcutta, and the story of the prisoners in the deadly Black Hole is connected with his name (1757). But Lord Clive[1] at last conquered this native chieftain, drove the French from Calcutta, and "laid the foundations of the great empire of the English

George III.

in the East Indies."[2] The English were successful upon the sea also, under Admirals Boscawen and Hawke. But, in the midst of this war, George II. died, and George III. "the best of the Hanoverian kings," succeeded to the throne (1759).[3] The war in America also finally turned in

[1] Vide Macaulay: "Essays," Lord Clive. Gregory, p. 94.

[3] The following is Buckle's estimate of George III.: "Every liberal sentiment, everything approaching to reform, nay, even the mere men-

favor of the English. Havana was taken and the French possessions conquered. At the Peace of Paris between England, France, and Spain, England obtained the French possessions east of the Mississippi, and from Spain, Florida (1763).

William Pitt had retired from the premiership, to be succeeded by the Earl of Bute, and then by George Grenville, who was the author of the "Stamp Act," which was

William Pitt.

the first act that led the American colonists to resist the English government. The second term of William Pitt, now Earl of Chatham, was short. He came into power too late to prevent the American war. But it was in the premiership of Lord North that the war of the American Revolution occurred. We will treat of that in a future

tion of inquiry, was an abomination in the eyes of that narrow and ignorant prince. Without knowledge, without taste, without even a glimpse of one of the sciences, or a feeling for one of the fine arts, education had done nothing to change a mind which nature had more than usually contracted."

chapter. During the ten years of this struggle for independence, however, England became involved in war with France and Spain. The exercise of her assumed right to search vessels belonging to neutral countries for articles contraband of war, led to the formation of the great "Armed Neutrality" for the protection of neutral vessels. By the terms of this league, Russia, Prussia, Sweden, Denmark united for the protection of their merchants. The Peace of Versailles closed this war and established the independence of the United States.

At the close of this war, William Pitt, "the younger," became prime minister of England at the early age of twenty-four. In India, Tippoo Sahib, Sultan of Mysore, rose in arms against the English, but Warren Hastings concluded a satisfactory treaty of peace with the Sultan. Upon the return of Hastings to England, however, he was impeached for maladministration. After a trial of seven years, in which Burke, Fox, and Sheridan distinguished themselves by their eloquence, he was acquitted.[1] At the close of the century, England, as well as the rest of Europe, was disturbed by the great French Revolution, and clubs of sympathizers were formed throughout the country. Fox and Sheridan favored France, while Burke bitterly denounced the violence of the republicans.

From the first, the English government had sided against Republican France, by forming a league with Prussia.[2] Three years later, a general coalition was formed by the monarchs of Europe against the spread of republican ideas and particularly against the new French govern-

---

2 Vide the French History of M. Thiers: "Histoire de la Revolution Francaise," Vol. I. p. 212 *et seq.*

ment. England was the prime agent in this movement.[1] Lord Nelson, one of the greatest admirals that the world has ever known, commanded the English fleet during this troublous time. He succeeded in driving Napoleon's fleet from the Mediterranean, and, at the beginning of the new century, the Danish fleet was defeated by him in the harbor of their own capital, Copenhagen.[2] Lord Nelson was killed at the battle of Trafalgar just as he was gaining another great victory over the French (1805).

Toward the middle of the eighteenth century, the German states became involved in a war over the succession to the Austrian possessions of the Emperor. This war has been called the "War of the Austrian Succession." Charles VI. of Austria, knowing that the male line of the Hapsburg princes would become extinct upon his death, laid his plans to place the succession upon his daughter, Maria Theresa. In order to avoid trouble, Charles had issued his celebrated "Pragmatic Sanction," appointing his daughter heir to his thrones. The closing years of his life were occupied in securing the consent of other European powers to this arrangement, and the Emperor died believing that there would be no opposition to his disposal of the Hapsburg crowns.

But, as we have noticed before, there was rising in Northern Germany a comparatively new state, whose king was destined to vie with the Hapsburgs in power and, finally, to secure the Imperial crown. This was Prussia, whose king, Frederick William I., had organized a powerful and well-disciplined army. He died the same year as Charles VI. (1740). He left his crown, army, and a full treasury to his son, Frederick II., better known to history

[1] Op. cit. Tome III. pp. 276-7.

[2] Vide Southey: "Life of Lord Nelson," London, 1867.

as Frederick the Great. Frederick, not regarding himself as a party to the Pragmatic Sanction, at once demanded Silesia as a possession of the Prussian crown. On Maria Theresa's refusal to give up that state, Frederick poured his armies into Silesia and took it by force.[1]

This act of Frederick let loose the "dogs of war," all the more as the powers of Europe, except Russia, seemed to think the time had come to dismember the Austrian empire. The elector of Bavaria, a descendant through the female line from Emperor Ferdinand I., modestly claimed the Austrian possessions as his own; France claimed Belgium; and Spain, Milan. Finding herself thus surrounded by greedy enemies, Maria Theresa threw herself upon the loyalty of her Hungarian subjects, who rallied at once to her aid. Although she found that a secret alliance had been concluded by France, Spain, Bavaria, Saxony, and Prussia, her armies were soon in the field, and fought with considerable success. Prussia finally withdrew from the alliance, and England came to the assistance of the Empress-Queen. Her armies met with one success after another. But Frederick again joined the alliance, and the French gained a victory at Fontenoy.[2] By this time the elector of Bavaria had died, and his possessions had passed to his son, who consented to the election of Francis Joseph, husband of Maria Theresa, to the Imperial throne; so that, after eight years of war, the Peace of Aix-la-Chapelle was signed. Maria Theresa was confirmed in her Austrian possessions; her husban Francis Joseph, was made emperor; Frederick II. held Silesia; and nearly all other conquests were restored. Thus was ended the War of the Austrian Succession.

[1] On this, vide Macaulay's Essays, and Kohlrausch: "History of Germany," pp. 376-7. [2] Above p. 121.

Eight years of comparative peace followed, but there seems to have been a restless spirit abroad in Europe. Maria Theresa with regret saw Frederick occupying the rich field of Silesia. George II. of England feared lest his Hanoverian possessions would be snatched from him. So France, Prussia, and Sweden quietly plotted together, while Austria, England, and Saxony were as busily forming counter-plots. Each faction was endeavoring to gain as many allies from the other powers as possible.[1] In the shifting around that followed, England was induced to break with Austria and unite with Prussia. France and Austria, who had been enemies for three hundred years, were constrained now to unite their forces. Sweden was controlled by France, so that Frederick at last realized that a powerful coalition of Austria, Russia, France, Sweden, and Saxony was forming to humble him. Thereupon he demanded of Maria Theresa a plain statement of her intentions. Her answer being evasive, Frederick poured nearly seventy thousand admirably disciplined soldiers into Saxony, demanding passage-way into Bohemia, and the great "Seven Years' War" was begun. This proved to be one of the most unfortunate wars of modern times, and it presaged the future greatness of Prussia.

Great battles were fought in rapid succession. Frederick astonished the world. His armies gained victories at Prague, Rosbach, Leuthen, Breslau, Crevelt, Schweidnitz, Zorndorf, Minden, and Torgau. But he met with many severe defeats, and his resources became so exhausted that, had not Russia, under Peter III., indirectly aided him by deserting the allies, Prussia would almost certainly have been overthrown. Frederick was able to form a not dishonorable treaty, for the Peace of Hubertsburg closed

[1] Vide Kohlrausch, Op. cit. p. 382.

the war by replacing everything as it was at the close of the previous war, and thus Silesia remained attached to Prussia. Germany, however, had been completely devastated, and nearly nine hundred thousand lives had been spent to settle the affairs of Europe (1763).

The last third of this century witnessed the disgraceful partitions of Poland among her more powerful neighbors. Surrounded by Russia, Austria, and Prussia, her rich fields were envied by the monarchs of these countries. Her crown was elective and the cause of much quarreling. Finally Russia, Austria, and Prussia, agreed to share among themselves the better part of her territory. By the first partition Russia obtained twenty-five hundred square miles; Austria, thirteen hundred; and Prussia, seven hundred. Twenty years later, Prussia received more than a thousand, and Russia more than four thousand square miles of Polish territory. Before the close of the century, the remainder of Polish territory was unequally divided among these three greedy neighbors. By these partitions of Poland, Russia increased her territory by one hundred and eighty one thousand square miles; Austria, by forty-five thousand; and Prussia, by fifty-seven thousand.

Joseph II. succeeded his father, Francis I., as emperor of Germany, and finally succeeded his mother, Maria Theresa, in her Austrian possessions. Joseph II. was unfortunate in many respects. He endeavored to raise the condition of his subjects, but failed in many of his most cherished plans. He joined Catharine II. of Russia in a war against the Turks, but the powers of Europe were alarmed at the possible growth of the members of this new alliance. Therefore the Christian nations, England, Holland, and Prussia, formed a coalition to assist the Turks. But upon the death of Joseph and the accession

of his brother, Leopold II., Austria adopted a peace policy and a great war was averted. Austria became involved in the wars of the French Revolution (for the un-

Early Turkish Warfare.

fortunate French queen, Marie Antoinette, was a sister of Leopold) and at times was left almost alone to face the armies of Napoleon. In the beginning of the next cen-

tury, Leopold became first Emperor of Austria, giving up his title as Emperor of Germany. The German Empire, as successor to the old Roman Empire, ceased to exist, and the German states were severed for three-fourths of a century, when they were re-united under the lead of Prussia.

The greatest event of European history during the eighteenth century was the French Revolution, of which we will now attempt a connected account. We have already traced the history of that nation down to the close of Louis XIV.'s long and active reign (1715). His great-grandson, Louis XV., a boy five years old, was his successor, with the profligate Duke of Orleans as regent. The government of France adopted a peace policy toward England.[1] Though a Bourbon occupied the Spanish throne, we have seen how the powers of Europe became alarmed at the ambitious plans of Alberoni, Philip V.'s minister, and how France became united with her hereditary enemies, by joining with England, Holland, and the Empire to form the great Quadruple Alliance against Spain. This alliance soon brought the Spanish monarch to his senses. He dismissed his minister and accepted the terms of peace that the alliance offered him.[2]

The spirit of speculation was rife in Western Europe about this time. Great schemes were daily formed for the rapid accumulation of wealth. We have already seen how financial ruin was brought upon many wealthy people in England by investing their money in the South Sea Bubble. In France, this was preceded by a scheme equally as ruinous. It was about five years after the accession of Louis XV. that the Scotchman, John Law,

1 See Russell: "Modern Europe," Vol. III. p. 99.
2 Above.

announced his great Mississippi Scheme. It was proposed to form a company for working the mines of fabulous wealth that were supposed to exist along the banks of the great American river. Shares were sold at enormous prices, but proved to be worthless paper. The money was squandered, and the speculators beggared, while Law was forced to fly for his life.[1]

John Law.

Philip, Duke of Orleans and regent of France, died, after having ruled for eight years. He left a reputation as "one of the most elegant, accomplished, and dissipated men of his time." After his death, France was ruled by Cardinal Fleury, whose policy was peace. Such too was that of Walpole across the Channel, so that Europe was

[1] Vide Russell, Op. cit. pp. 142-3.

blest with comparative rest for nearly twenty years.[1] Then the French king tried to force his father-in-law, Stanislaus, upon the people of Poland, as king. This family scheme was objected to by both Russia and Austria. The brief war that followed closed by making Stanislaus Duke of Lorraine, with the proviso that, upon his death, the duchy should become a French possession, which accordingly it did some thirty years later.

Louis XV., by this same treaty, became a party to the Pragmatic Sanction. But no sooner had Charles VI. died, than the French, claiming Belgium, supported the elector of Bavaria in his struggle for the Imperial crown. We have already given the results of this struggle in which all Europe became involved. During the last years of his reign, Louis was governed by a succession of abandoned mistresses, most noted of whom were Madame de Chateauroux, Madame de Pompadour, and Countess du Barry. But in those days, kings looked upon such a dissolute sort of life as did George II. of England, "that gallantry was becoming a prince."[2]

In her struggle with England, about the middle of the century, for American possessions, France lost Canada and most of Louisiana. Louis XV. was the originator of that family compact between the Bourbon rulers that united other powers against that family.[3] But just as the last quarter of the eighteenth century began, Louis died, and the crown passed to his grandson, Louis XVI. He is mentioned as an "amiable, but awkward young man of twenty." Though free from many of the vices of his predecessors, he was lacking in those qualities necessary for one who would wear the crown during such troublous

1 Ibid. 148.

3 Above.

times as were now upon France. For, on the whole, the young king had come into possession of no enviable heritage; the treasury was exhausted, and the country was on the verge of civil war.

The king seems to have been bent on giving his subjects as good a government as possible, so he made the aged Maurepas prime minister. First Turgot and, afterward, Necker were called to the chair of minister of finance. But the nobility had set their influence against all the reforms proposed, and these able financiers were forced to give place to others more popular. Since the later years of Louis XIV., the spirit of oppression had been gaining strength in France until now "a supreme and irresponsible control was exercised over the whole country by the clergy, the nobles, and the crown." "Everything was for the governors, and nothing for the governed." Had Louis wished—and he seems to have endeavored to do it—to give his people more liberties, the influence of the clergy and profligate nobility in governmental circles would have forbidden it. As it was, "there was neither free press, nor free parliament, nor free debates."[1] Such were the times in which Louis XVI. was called to the throne of France. One gleam of light shines out in the darkness of these times, though here we have to thank the feeling of enmity toward England, which led France to aid the American colonies in their struggle with England. But this point will be considered later.

In spite of the persecution against freedom of thought instituted by Louis XIV.,[2] there had ever been a few fear-

---

[1] Buckle, Vol. I. pp. 539-543.

[2] Vide Buckle, Op. cit. p. 494 *et seq.* for a scathing though just review of the "Age of Louis XIV. and the resulting influence that led down to the French Revolution."

less writers, who, though knowing full well the dangers of their course, were bold enough to proclaim advanced ideas. Through a long line of unfortunate authors, whose martyrdom had given strength to the cause of freedom, there had arisen a class of writers who were fearless and tireless in their criticisms of both Church and State. Such were Montesquieu, Voltaire, and Rousseau. They pictured to the people their deplorable condition. The unequal division of the land, the arbitrary nature of the government, and the injustice of taxing only the industrious classes, as well as the burdensome tax on certain necessary articles, such as salt, etc., were all held up as grievances to the people who were ever willing listeners.[1] Nothing but a violent revolution that would stir up the whole social fabric of the kingdom could change the nature of things in France. Even at the cost of the torrents of blood that were shed, we can but see the justness of the cause that led the oppressed and down-trodden people of all occupations to rise against an idle, profligate nobility, who lived in ease and luxury, who reaped the profits of the labors of the industrious, and who, by their corrupt lives, disgraced the laws of civilization.

When, however, Parliament refused to sanction the measures proposed by Louis' new minister, Colonne, it was banished to Troyes, though speedily recalled to Paris. Necker was at last re-appointed minister of finance, and he united with Parliament in demanding that the States-General, that had not met for nearly two hundred years, should be assembled. This demand was finally granted. The delegation consisted of twelve hundred members, representing the people, the nobility, and the clergy, though the representatives of the first were just equal in num-

[1] Patton: "Modern History," p. 398.

ber to those of the other two. The King and the nobility were desirous of forming two assemblies, and so demanded that the popular representatives vote by themselves. This they refused to do. Finally the popular delegation organized themselves into a "National Constituent Assembly," and compelled such representatives of the nobility and clergy as were desirous of legislating at all, to unite with them in deliberating upon public affairs.[1] But a number

Storming of the Bastile.

of the nobility, alarmed by popular risings in their provinces, hurridly emigrated to foreign lands. An indication of the intensity of popular feeling at this time was the storming of the Bastile or state prison, because of rumors that the King was assembling at Versailles an army to march upon Paris. The prison was left a mass of ruins, and the commandant was killed.

[1] Vide Thiers: "Histoire de la Revolution Francaise," Vol. I. p. 39.

This National Constituent Assembly finally prepared a new constitution, which it presented to the king. Louis accepted it and confirmed it with his oath, though it stripped him of his most cherished prerogatives, depriving him of the support of the nobility and of such executive power as might control the excesses of the Assembly.[1] After establishing this constitution, the Assembly dissolved, declaring themselves ineligible to membership of the Legislative Assembly for which the new constitution provided. Thus, by their own act, did they deprive their country of the help and counsel of her ablest men just when she was most in need of such help.

At last, the royal family, terrified at the course affairs were taking, attempted to escape into German territory, where the King knew that the Emperor and other rulers awaited him with troops and assistance to enforce his authority at Paris. But through the suspicion of an official at Varennes and the mild disposition of Louis, they were stopped and returned to Paris, prisoners. It must be observed that, during all this trouble, the most radical Revolutionists could not honestly charge their king with a desire to avenge insults or assert his rights by the shedding of blood; but he calmly and manfully attempted to maintain his authority without violence. He was from this time, however, a virtual prisoner in his own palace.

The new national Legislative Assembly of 1791 convened October first. It was by no means a body of the ablest men of the nation, because they had barred themselves out. The nation was at the mercy of some seven hundred inexperienced men, who were divided into the most hostile factions, willing to enact the most extreme measures submitted by their leaders. The Assembly soon became

[1] Thiers, Op. cit.

divided into four bodies—the Feuillants, the Center, the Girondists, and the Cordeliers or the Mountain. The last two parties were the ruling spirits of the Assembly. The Girondists were moderate republicans, while the Mountain were the fierce democrats. The former gained a majority, forced the King to form a Girondist cabinet, and they ruled France.

Execution of Louis XVI.

They then forced Louis to declare war against Emperor Francis II. who, as the queen's brother, was naturally endeavoring to unite the sovereigns of Europe in some plan to aid the French monarch. In addition, the sovereigns of Austria and Prussia were harboring many of the French nobility who had fled from their homes, and whom

Court Painter to the Emperor of Germany

the more radical members of the Assembly wished to have declared traitors. This action of the European sovereigns alarmed the Revolutionists to such a degree that a Parisian mob stormed the royal palace. The King was forced to throw himself upon the Assembly for protection; and the members of the royal family were thrown into the Temple as prisoners. One month later, the mob butchered the inmates of the various prisons. As the first month of the new year was drawing to a close, the King himself, calm and manly to the last, was guillotined. Before the year closed, Queen Marie Antoinette was beheaded, as was also the King's sister, Elizabeth.

In the meantime, the National Legislative Assembly had given place to a National Convention,[1] of which the Girondists and the Mountain were the leading factors. The former were losing their power, while the latter were increasing in strength. The power of the latter lay not in their numbers, but in the fact that they were "supported by the Jacobin Club,[2] the Commune,[3] and consequently the Parisian mob, which was then the chief power in the state."[4] In September previous to the death of the king, this convention had abolished royalty and declared France to be a republic; and, in the following March, a "Committee of Public Safety" was appointed under the presidency of Marat. Scarcely two months passed when he fell by the

---

[1] On this point, vide Labberton: "General History," p. 146.

[2] This was one of the most celebrated organizations of the Revolutionary period. It was organized soon after the assembling of the States-General, and advocated the extremest revolutionary measures in government. Its name came from the place of assembly, a convent of the Dominican Friars of St. James.

[3] *Commune* is the French word for municipality. Every town and village in France has its Commune, in which is vested the corporate property.

[4] Ibid.

hand of the assassin, Charlotte Corday, who suffered death as a penalty for the deed.[1]

Next the Girondists fell before the increasing power of the Mountain, and more than a score of them were sent to the block. The "Reign of Terror" began (1793). Still, at this time, there were three parties; one led by Herbert, clamorous for terror and blood; another by Desmoulins and Danton, and the third under Robespierre. The last named character was at the head of the Jacobin Club. He represented Paris in the National Convention, and soon became the leading figure in France. It is hard to conceive of his strange position. He is said to have remonstrated against the frightful massacres that were occurring. Still he claimed that "there are periods in revolutions when to live is a crime." With this as a motto he directed the hand of Charlotte Corday against his rival, Marat; advocated the deaths of the Girondists; and overthrew the Herbertists and Dantonists, sending their leaders to the guillotine.

Robespierre now ruled without a rival. Military tribunals were erected, and France swam in the blood of her citizens. No distinctions were made. All offences were punished alike with death, and the command of Robespierre was often the only form of trial allowed the victims. Titles of rank and fortune had from the beginning been forbidden. *Citoyen* and *citoyenne* took their place. The King was tried as Louis Capet, and the assumption of any distinctive rank was equivalent to a death warrant. But these bloody measures at last recoiled on their chief supporter. Robespierre fell by means of the same methods he advocated. His enemies becoming powerful, led him without trial to the same scaffold from which the blood of

[1] Vide Thiers: "Histoire de la Revolution Francaise," Vol. IV. p. 251.

thousands of his victims had for months almost incessantly poured (1794).

The fall of Robespierre led to a new order of things. A new constitution was adopted. The government now became vested in a Directory of five men, assisted by two chambers or legislative assemblies; the lower chamber was styled the Council of Five Hundred; the upper, the

Robespierre.

Council of the Ancients, consisting of two hundred and fifty members. For nearly five years France enjoyed a better form of government than at any time since the fall of the monarchy. But the whole nation was in a deplorable state of ruin. Throughout the country agriculture, art, and manufactures were neglected. The State had absolutely no resources, and the roads, canals, etc., were fast falling to ruin. Yet, during all this time, the unpaid,

unfed, and unclothed armies of the Republic were holding their enemies at bay; for, all the crowned heads of Europe had early become alarmed at the spread of republican ideas. There was, from the day of the death of Louis XVI., organized opposition, throughout Europe, to the new government. Among the first commanders of the French army, was Marquis de Lafayette, but, as he sympathized with the king and the nobility, he was soon obliged to seek safety by flight into Belgium.[1] Carnot managed the military affairs for the Republic for a long time. He adopted the plan of promoting to higher rank such soldiers as from time to time distinguished themselves in actual service. And thus we always find the ablest men in command of the armies. Such were Hoche, Pichegru, and Kleber, who were everywhere successful over the allied powers.

While this revolutionary spirit centered around Paris, we must bear in mind that all the cities of France were imbued with the same spirit; and the communes of Lyons, Rheims, Orleans, and Versailles acted in unison with the commune of the capital, butchering such of the nobles as had not previously sought protection in flight to foreign states. The military tribunal at Nantes put fifteen thousand people to death, while at Paris, the number of executions averaged three hundred and fifty per month.[2] In the mean time, the English and Spaniards had occupied Toulon, and the French government determined to compel them to withdraw. Dugommier conducted the seige, and Napoleon Bonaparte was in command of the artillery.

[1] Lafayette was a pure patriot. But any appearance of an inclination to show justice was regarded as a sign of enmity to popular interests. Vide: "Student's Modern Europe," pp. 526-7; also Buckle, Vol. I. p. 337, where Burke's opinion of Lafayette is criticised.

[2] Patton: "Modern History," p. 405.

Here it was that this young Corsican came first into such prominence as to be marked for promotion. Just as the National Convention was transferring its power to the Directory, there occurred great popular uprisings in Paris, and Bonaparte, who was present as a subordinate officer of the republican troops, gained an easy but a bloody victory over the popular mob.

The Directory prepared for a vigorous prosecution of the war with the allied European powers. A triple campaign against Austria was decided upon. This was the war that witnessed the meteor-like rise of Napoleon. The general outlines of his life are so well known that we need only refer to them in general terms. From this time, for twenty years the history of France and that of Europe centers around this military genius, whom it took the allied forces of all the powers of Europe to check in his career of success. At the head of his army, Napoleon entered Italy; and Savoy, Milan, Lombardy, Parma, Naples, Mantua, and Rome were either conquered or obliged to sue for peace. Finally the Peace of Campo Formio closed the campaign by giving Belgium to the French, and Venice to Austria (1797).

Napoleon's next great campaign was directed against Egypt, planning to make this his center of operations, and seize from England her Indian possessions. But the annihilation of his fleet by Nelson in the harbor of Alexandria compelled him to change his plan and attempt the conquest of Syria. Thence he returned to Paris where the Directory was unable to govern in harmony. A revolution occurred at this time, and the Directory was supplanted by the Consulate (1799). Three consuls were chosen with Napoleon Bonaparte as First Consul for ten years. He soon submitted a new constitution to the vote of the

people. It was adopted and made France in reality a military monarchy. Napoleon was then the ruler of France. About two years later, he was made consul for life, with the right of naming his successor. And two years more saw him hereditary Emperor of France (1804).

But when Napoleon was made First Consul, he found France surrounded by bitter enemies. A second coalition had been formed among the powers of Europe to oppose French encroachment. The last year of the eighteenth century saw Napoleon's armies again crossing the Alps, and at the same time invading Germany. Napoleon's star was now in the ascendant; apparently nothing could stand before him. The victories of Marengo and Hohenlinden[1] led to another treaty of peace and gave Napoleon a chance to prepare for a proposed invasion of England. An army of one hundred thousand men was organized undoubtedly with this end in view. England made great preparations for defence, and was seemingly as anxious for the war as France. But the other powers of Europe were as much alarmed as was England, and a third coalition between England, Austria, Russia, and Sweden was formed. Napoleon was, of course, obliged to change his plans and guard his inland boundaries from the attacks of the allied armies.

Three years of war occurred, in which Napoleon's armies won great victories over Austria, Russia, and Prussia, at Austerlitz, Jena, Auerstadt, and Friedland; compelling Austria to the humiliating peace of Presburg (1805), Russia to that of Tilsit (1807), and wresting a large tract of territory from Prussia. Still it was not all victory for the great Napoleon, for Nelson again crushed the French navy at Trafalgar; and at the battle of Eylau

[1] Here the French were commanded by Moreau.

Czar Alexander, of Russia, also claimed the victory. England, too, energetically persevered in her hostilities against the Emperor.

Napoleon, however, was master of Western Europe. He made Holland a kingdom, with his brother, Louis, as king; his brother, Jerome, was made king of Westphalia; his brother, Joseph, was given the crown of Naples; while

Lord Nelson.

Napoleon himself became king of Italy. Then he united with Spain in a project to divide Portugal between them, the sovereign of the latter country fleeing to Brazil. Soon after this there arose a dispute over the succession to the Spanish crown, and the French Emperor conceived the idea of driving the Bourbons from that throne. The kingdom of Naples was taken from his brother, Joseph, and given to his brother-in-law, Murat. Then a French army entered Madrid, and proclaimed Joseph Bonaparte king of Spain.

But this act aroused the dormant patriotism of the Spanish. They arose against the foreign king. England sent an army to assist them, one of the commanders being Sir Arthur Wellesley, afterward Lord Wellington, who soon succeeded to the chief command in Spain.

Wellington.

As long as Napoleon himself could be present to direct the affairs in Spain, the French cause was successful. But when he was called away to conduct a campaign against Austria, even the victories of his generals were weakening to his cause. Although some fourteen German states had formed the confederation of the Rhine, with Napoleon as

protector, England, Prussia, Austria, and Russia, resumed hostilities against Napoleon almost as soon as his armies retired from their various territories. Called from his Spanish conquest into Austria, he conducted the battle of Wagram that forced Emperor Francis I. to sue for peace. This same year Napoleon divorced his wife, Empress Josephine, and the next year Maria Louisa, daughter of Francis I., Emperor of Austria, became his wife (1809).

For three years after the battle of Wagram, Napoleon was busy trying to solidify his empire. In fact, he gave the French people a much better government than they had previously enjoyed. "Western Europe received in the Code Napoleon, a law, which to an extent hitherto unknown in Europe, brought social justice into the affairs of life. The privileges of the noble, the feudal burdens of the peasant, the monopolies of the guild passed away."[1] And above all, the law was a protection to the ordinary citizen, although there was little of what we call liberty known to the French people under Napoleon.

Alexander I. of Russia, was the first monarch who dared to defy Napoleon by violating his Berlin Decree, which blockaded the ports of Europe. In 1810, he opened the ports of Russia to all ships bearing neutral flags, and even placed a duty upon some French imports. Napoleon could not brook this seeming challenge, and began at once to prepare for war. Two years later, at the head of six hundred thousand men he began his march for Russia. He met the Czar on the field of Borodino, and was successful. Then Alexander, by a well planned retreat, led the Emperor into the heart of Russia. At last the spires of Moscow met their sight, and amid cheers the French

[1] Labberton: "General History," p. 148.

marched upon the city. They found it entirely deserted, all the inhabitants having followed the Russian army.

Two days later, flames burst forth in several places in the city, and it was soon a mass of smoldering ruins. It was winter and the French army was forced to retreat. Then it was that the Czar and his army appeared. They followed the French closely. They were accustomed to this severe weather which killed the French by thousands. Napoleon reached France almost alone. So complete was the Emperor's control over his subjects that another army was soon raised for him. But his disastrous Russian campaign proclaimed to Europe that this great "military phenomenon" was not invincible. All Europe now united against him. The final struggle occurred the next year. The Emperor met the army of the allies at Leipsic, and was defeated. He retreated into France. As the year 1813 closed, the allied army crossed the Rhine. Two months later, Paris surrendered and Napoleon himself became a prisoner of war. He was banished to the isle of Elba in the Mediterranean, there to dwell with the empty title of emperor. The Bourbons were restored, a brother of Louis XVI. becoming Louis XVIII., king of France (1814).

It lacked only a few days of one year from the surrender of Paris, before all Europe was alarmed by the report that Napoleon had escaped from his island prison. Landing at Cannes with fifteen hundred men, he marched toward Paris where his name was enough to draw all his old soldiers to his side. His entry into Paris was in the nature of a triumph, Louis XVIII. withdrawing to Ghent. Twenty days from his landing at Cannes, he was again dwelling in the Tuileries, and again ruling France. Thus began his "reign of one hundred days." More confident

of success, and more determined than ever to free the continent from such a dangerous ruler, the sovereigns and princes of Europe united firmly to drive Napoleon from his throne. But the Emperor's movements were rapid. He raised a large army, determined to crush the English

Abdication of Napoleon.

and Prussians before they could unite with the Austrians and Russians. For this purpose he marched into Belgium, and met the English under Wellington at Waterloo. The allied army under Blucher, however, arrived on the field

in time to render most material assistance. The smoke arising off this memorable field forever obscured the rapidly setting star of Napoleon. He was defeated and further struggles were useless. He surrendered to the British government, and the ship, Bellerophon, carried him first to London and then to the lonely, ocean isle of St. Helena, where the allies decreed he should spend the remainder of his life under the guard of the English. His captivity was ended by death six years later.

After the Peace of Paris, the great powers of Europe set about adjusting the affairs of that continent. Now the Pentarchy of great powers—Austria, France, Great Britan, Prussia, and Russia—was recognized as controlling the affairs of Europe, but, in special cases, Spain, Portugal, and Sweden were consulted. At the Congress of Vienna, these eight powers took measures for the division of the booty accumulated by Napoleon. France was cut down to about the boundaries of 1790. The masterpieces of art which Napoleon had brought from Rome and elsewhere to decorate his capital were ordered to be torn from their places and returned to their original owners. Austria received large Italian possessions. Prussia was given increased German territory. Russia extended her boundaries to the north, to the west, and to the south. Belgium and the Dutch provinces became the kingdom of the Netherlands.

In Spain, the Bourbons were restored in the person of Ferdinand VII., who proved to be an oppressive despot. The power of Spain had steadily been waning, and since the death of Ferdinand, few nations have witnessed as great and continuous internal troubles as has that once powerful state. The rulers have never been noted for their strength or for their brilliancy. In Italy, the new

arrangement of the great powers caused much internal trouble. The spirit of independence and the demand for a united Italy had not been entirely stifled, and there were usually secret organizations for the furtherance of these ends.

Germany and Austria were in a very unsettled state. As we have seen, the German Empire had for a time been

Isabella II.

suspended. Emperor Francis II. had resigned his German Imperial crown, but had become Emperor Francis I. of Austria. The German states were clamorous for constitutions vesting some political rights in the people at large. Though the princes were ever ready to promise, and even grant, such constitutions, few ever meant to see them enforced. Austria, under both Francis I. and Ferdinand II., was in a state of constant turmoil. The cen-

tral government was opposed by all the various elements of which the population of the empire was composed. There were the Magyars of Hungary, and there was a large Slavic population. The Magyars were divided into two parties—the Old Magyar party and the New Hungarian party.[1] The former were for depriving all others, except members of their own race, from all share in the government. The latter, led by Kossuth, were in favor of admitting all Hungarians to office. The Slaves were boldly advocating *Panslavism*, whereby all the Slaves of Europe were to become united as one people under one ruler. Then, too, German liberalism was spreading also into Austria. Prince Metternich was at this time prime minister of Austria, though virtually ruler of the Empire, and wished to be dictator of all the German states.

Thus matters stood when the revolutionary period dawned upon Europe. About the year 1848, there began in Europe a great revolution. This was but the breaking out of the spirit of opposition on the part of the masses of the people against the hereditary rulers and privileged classes, the people demanding a share in the government. In some cases, the movement was crushed, yet the agitation there started was not in vain. The trouble commenced in France. Louis XVIII. had been succeeded on the throne of France by Charles X. and he by Louis Phillippe, who sought at one blow to deprive the French people of many of their political rights which were so dearly bought by the blood of the great Revolution. The people demanded reform, and this was refused by the king. The republican spirit was aroused, and the king was driven from his throne. France now entered upon her second period as a republic. The Commune and the rabble again tried to

1 Labberton: "General History," p. 151.

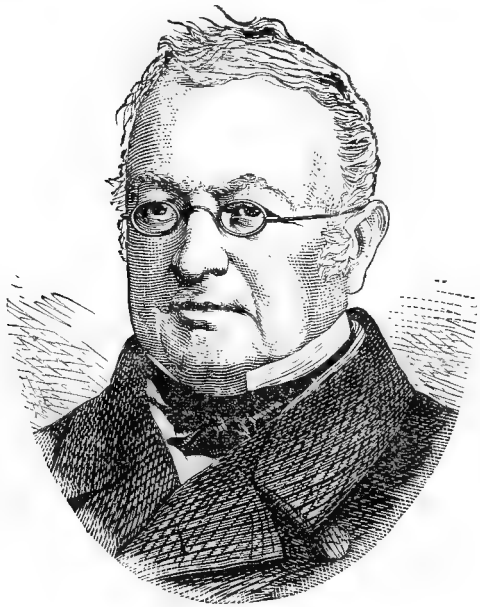
gain the power that they held during the Reign of Terror, but the citizens and the national guards held firmly the ruling power until Louis Napoleon, nephew of Napoleon I., was elected president by an overwhelming majority of popular voters (1848).

The president was assisted by a legislative assembly, consisting of seven hundred members, elected by a vote of the people. Thus the Revolution in France was completed. Although not eligible to a second term of office, Napoleon, by a bold stroke, caused himself to be elected, under a new constitution, for a term of ten years. This was accompanied by the midnight arrest and imprisonment of the leading republicans and Orleanists, by dissolving the Assembly, by crushing a revolt in Paris, and by submitting the question to a vote of the people.[1] President Napoleon was so popular that many wished to make him emperor. So the following year the question of the restoration of the Empire was carried by a vote of the people, and Louis Napoleon was made Emperor Napoleon III. (1852).

The Revolution in France was a signal for revolutions throughout Europe in general. The various factions of Austria also demanded a constitution. The Hungarians had placed themselves under Kossuth, and had gained possession of both Pesth and Vienna. Ferdinand fled to the Tyrol, and sent an Imperial army to subdue the Hungarians. The Slavic subjects now rose in insurrection. The Imperial forces, commanded by Windischgratz and Jellachich, besieged Vienna and reduced it to subjection. Trouble then arose at court, and the Emperor was forced to abdicate. His nephew, Francis Joseph, accepted the crown. But Hungary, refusing to recognize a change of

[1] On this see Patton: "Modern History," p. 421.

monarchs, rose in rebellion, chose Kossuth governor, and drove the Imperial army out of the kingdom. Thereupon Russia interfered. The Hungarians still fought with terrible vigor, but the armies of the two emperors forced them into submission, and Francis Joseph became emperor amid horrible acts of cruelty toward the rebellious subjects.



M. Thiers,

The German people also arose against their princes and demanded a German parliament, and the rulers were forced to yield to their demands for constitutions. But in many cases the same rulers felt at liberty to violate the constitutions thus granted. A "preliminary parliament" of the German states was held at Heidelberg for the purpose of drafting a German constitution. The old German Empire was revived, governed by an emperor assisted by a parliament. The new Parliament, when it assembled, chose

Frederick William IV. of Prussia, Emperor. But he declined the honor offered him in this way, and the Parliament gradually grew in disfavor with the people. The remnant was finally dispersed by the Wurtemberg government.

Still the King of Prussia was not averse to wearing the Imperial crown of Germany. But the Emperor of Austria was anxious to revive the old Empire with Austria at its head. So that a couple of years later there were two congresses in session—one at the Prussian capital, Berlin, and one at Frankfort, under the lead of Austria—for the purpose of organizing a German confederation. War between Austria and Prussia seemed inevitable, but Czar Nicholas, the most powerful ruler in Europe at this time, interfered in favor of Austria. England and France sided with the smaller German states, and matters were adjusted as they stood at the close of the first imperial period in French history.

England had avoided war by making occasional concessions to the demands of her subjects from the time of King John down to that of the four Georges and William IV. But the nineteenth century has witnessed greater strides in reform than ever before. The reigns of the last two Georges were filled with clamors and public meetings for granting greater privileges to the commonalty of English people. Sometimes these enormous meetings were dispersed by military force,[1] but the spirit of liberty increased in strength and determination.[2] Such was its influence that it threw the English people on the side of Greece, in her fight for independence. The Catholics, too,

[1] As at Manchester in 1819.

[2] This was strongly manifested in the parliamentary motion of 1823, condemning slavery and hoping its speedy abolition. This was consummated in 1833. See Gregory, pp. 155-7.

were granted political freedom, and Daniel O'Connel became a member of Parliament.

William IV. had hardly ascended the throne (1830), when Lord Russell introduced his great Reform Bill, allowing political privileges to what have been termed the middle classes. It finally passed Parliament.[1] Thus England was revolutionized without war, sixteen years before agitation on the continent had reached a climax. The agitation did not cease here. Although the young and everywhere popular queen, Victoria, ascended the throne (1837), the question of greater reforms was kept before the people. The reformers were called Chartists, and demanded universal suffrage, vote by ballot, annual parliaments, equal electoral districts, no property qualification for Parliament, and payment of members. The second, fourth, and fifth of which demands have since become laws.

Six years after the accession of Queen Victoria, the "great agitator," O'Connel, began with renewed energy the agitation of the Irish question, which has not yet been settled. The question then was for the repeal of the union of Ireland with England. Great mass meetings were held all over Ireland to discuss this question. Then, too, the poorer people in the kingdom demanded the repeal of laws imposing duty upon breadstuffs. Sir Robert Peel was prime minister, and during his administration the "Corn Laws" were repealed.[2] While the continent was settling its affairs, Prince Albert[3] was holding the great exhibition or world's fair in London; and such men as Gladstone and Disraeli were rising to commanding places

[1] See Mackenzie: "The Nineteenth Century," London, 1880, p. 144.

[3] Prince Albert, Duke of Saxe-Coburg-Gotha, to whom the Queen was married, Feb. 10, 1840.

among English legislators. The last half of this century has witnessed many political changes, at which we will now glance. In Italy, the people had forced the rulers to grant constitutions, and to lead them against the Austrians in hope of driving the latter out of Northern Italy. The Pope was driven from Rome, and deposed as a temporal ruler. The ambition of Napoleon led him to interfere in this quarrel. In the final settlement of Italy, Victor Emmanuel became king of Sardinia, but the Pope was re-established under French protection. Denmark was having trouble over the succession of its sovereigns and the disposition of the duchies of Sleswick and Holstein. The German states then interfered. Czar Nicholas finally stepped in and adjusted affairs by establishing the law of male succession, and by naming Prince Christian of Glucksburg as heir to the crown.

The Czar of Russia was about the only monarch from whom his subjects did not force concessions. Indeed Nicholas was the autocrat of Europe at this time, but he overreached his power when he sent his armies south to conquer the Balkan Peninsula. Thus he brought on the Crimean war, which united England, France, and Turkey against Russia. The Czar's forces were exhausted in less than two years, and he was forced to a treaty which excluded his ships from the Black Sea. Then he planned to weaken his neighbor, Austria, by encouraging Sardinia to renew the war with that power for Italian independence. France gave more material aid, and the future unity of Italy was guaranteed by uniting Lombardy and Central and Southern Italy under Victor Emmanuel, King of Sardinia.

Shortly afterward, Nicholas was succeeded by Alexander II., who so occupied himself in the adjustment of his

internal affairs[1] as to be unable to carry out the plans for Denmark that his predecessor had made. No sooner had Prince Christian become Christian IX. then there was trouble in Germany over the duchies of Holstein and Schleswick. Prussia and Austria, conjointly, wrested them from the Danish king; but then they quarreled over

Nicholas I.

the division of the spoil. William I. had become King of Prussia, and Herr Otto von Bismarck-Schoenhausen had become his leading minister.

Prince Bismarck at last warned Austria that further communication in regard to the Schleswick-Holstein matter

[1] This great work was the abolition of serfdom. See Rambaud: "Popular History of Russia," Vol. III. p. 221 *et seq.*

would be unnecessary. The Austro-Prussian war of 1866 resulted. Bismarck first assured himself of the neutrality of France, while Austria tried to stir up the German states against Prussia. The great Prussian victory of Konigsgratz decided the war. Austria lost her Italian possessions, and the result was all Italy, except Rome, became united under one king. Austria was also obliged to agree

Bismarck.

to the dissolution of the Germanic Confederation, and obliged to consent to the "North German Confederation."

Returning to France, we find the popularity of Emperor Napoleon III. on the wane. Then, too, for various reasons, trouble with Prussia was brewing, because of the result of the Austro-Prussian war, which so greatly enlarged Prussian power. Napoleon demanded "the cession of the left bank of the Rhine" to France. This

demand was, of course, rejected. Four years later, the crown of Spain was offered to Prince Leopold of Hohenzollern, who was a relative of King William. As this would increase the power of the Hohenzollern princes, Napoleon objected, and, in the interests of peace, the prince retired. Still Napoleon was not satisfied and demanded a pledge from the Prussian king that he would not again allow Leopold to urge the claim. This was refused.

All this was child's play. The fact is, the two nations had made up their minds to test the question of strength, and were simply casting about for some excuse to give the civilized world for beginning war. The French representative at Berlin, Benedetti, was finally made the cat's paw to pull the chestnuts out of the fire. An imaginary insult to France by Bismarck was made the occasion. To such a poor shift as this were these two civilized nations put for an excuse to offer to the world at large. Napoleon believed that a war would make him popular. His ministers and generals assured him that everything was in readiness for war, but the opposite proved to be the case.

Germany, on the other hand, was thoroughly prepared. King William and Prince Bismarck knew well the power of Prussia. There were a million men at the disposal of the Prussian authorities when war was declared, for many of the German states offered to aid King William. France was not prepared, and had only about one third as large an army. Marshal MacMahon was the greatest military leader that France could boast of, but he was defeated by the Germans, under the Crown Prince of Prussia, at Weissenburg and at Worth. Next another French army, under Bazaine, was defeated at Gravelotte. The French then concentrated their forces in Sedan, where, two months

and a-half after he had declared war, Napoleon surrendered with eighty-four thousand men. The four months siege of Paris then ensued, and peace followed the fall of the French capital.

As a result of this war, France lost Alsace and Lorraine, agreed to pay Germany one billion dollars, and her government was revolutionized. Napoleon was deposed, and France has ever since nominally enjoyed a republican form

Victor Emmanuel.

of government. But to Prussia, the result was still more momentous. Ten days before the Peace of Paris was signed, all the German princes met in the Hall of Mirrors in the palace of the French kings, at Versailles, and there they organized the present German Empire, with the king of Prussia as hereditary emperor. King William became Emperor William I. of a united Germany.

The effect of this war was felt even in Italy, where French troops were stationed to protect the temporal possessions of the Pope. Under the patriot general, Garibaldi, the Italian army had driven out of Italy all foreign powers, and had united the peninsula under Victor Emmanuel of Sardinia. When war between France and Prussia became unavoidable, the French troops where withdrawn from Rome, and a few weeks later those of Victor Emmanuel entered the Imperial City, though under the imprecations of the Pope, and made it again the capital of a united Italy.

One other European war has occurred since the Franco-Prussian war, and that is the Russo-Turkish war. "Iran and Turan have ever been at feud," and Russia cannot help looking with a longing eye at the Turkish capital, to occupy which has been the ambition of her princes since Rurik first led his bold Northmen across the Baltic. The Turkish states of Herzegovnia, Bosnia, and Bulgaria were continually defying the central government and often in a state of open or semi-rebellion. This caused the surrounding powers—Austria, Germany, and Russia—considerable uneasiness. Then, too, the cruel and even barbarous methods of warfare employed by the Turkish government rendered its existence, in the heart of Christian Europe, obnoxious.

At last, the three surrounding powers drafted a "Note," demanding of Turkey that, in administering the government of Herzegovnia and Bosnia, five points must be observed—"unlimited religious freedom; abolition of the system of farming the taxes; the application of the direct revenue of Bosnia and Herzegovnia for the benefit of those provinces; establishment of a special commission, consisting in equal parts of Moslems and Christians, to watch

over the execution of the reforms; and improvement of the industrial condition of the country population."

England is too much interested in the affairs of Turkey to allow the other European powers to overpower that government, seemingly foreign to Aryan Europe. So she demanded that the integrity of the Osmanli Empire must be respected. When the other powers presented the Berlin Memorandum demanding an armistice of two months that the demands of the insurgents might be re-

President Grevy.

spected, England refused to unite with them in presenting this memorandum. But the Sultan accepted it, was deposed, and was succeeded by Murad V. and he, soon, by Abdul-Hamid II.

But the revolt in Herzegovnia and Bosnia continued, and it was countenanced by the government of Servia whose army was recruited from the Czar's forces. The Sultan's

troops were successfully pressing onward into Servia until Russia ordered them to halt. In the meantime, Alexander II. had demanded a better government for the Sultan's Christian subjects. A "conference of the great powers" was held in Constantinople and it urged the Sultan to adopt reforms in government. The Czar intimated that, if steps for a better administration of affairs were not taken soon, he would use force to compel such steps.

The Sultan was assured by England that, as far as England was concerned, there would be no compulsion. The Sultan objected to such interference on the part of other powers as contrary to the treaty of Paris, for Turkey had had no voice in the conference at Constantinople where the demands made upon her originated. Two weeks after the Porte's reply to the Protocol (demands of the Constantinople conference of great powers), Russia declared war, and before night fifty thousand troops were marching toward Turkey. And, in January of the following year, they demanded, at the gates of Constantinople, submission on the part of the Sultan to a treaty, which, after modification by the famous Berlin Congress (1878), gave Herzegovnia and Bosnia to Austria, declared Servia and Roumania independent, made Bulgaria a self-governing tributary, granted Montenegro enlarged territory, gave Cyprus to England, gave Russia portions of Asiatic Turkey, and, in fact, broke the power of Turkey in Europe.

We will not continue this sketch of European history farther. At the moment of present writing (1888), no great changes have taken place in the political map of Europe, since its reconstruction at the hands of the Berlin Congress. But every one knows that Europe is one vast military camp. All the nations have put forth their greatest exertions to be prepared for a storm which seems

to be gathering in the political sky. He would be indeed a bold prophet who would undertake to forecast the future. It only remains for us now to review this entire period and see if we can not make out some great, general forward movements. If such prove to be the case, then we may await with confidence the future results of passing years.

Nations and races have a life history no less than individuals. In this brief review, we have seen several nations successively reach the summit of power, and apparently enter their period of decline and ever-lessening influence. Intermixed in this matter, there is also an interesting point for the anthropologist to consider. That is the question of race. Now we have seen that the three great branches of European Aryans were the Celts, the Teutons, and the Slaves, and have indicated the Teuton as the parent stem. If we observe that Portugal, Spain, France, and Italy—the so-called Romance nations—are also the ones most Celtic in ethnology, it will not escape us that they all have apparently passed their period of greatest power. If Italy appears to be an exception, we must remember that Italy has but recently succeeded in uniting under one government a number of separate states.

The Teutonic branch is the most important figure in the history of Europe. As an historical fact, it was Teutonic power that overthrew the Western Roman Empire, and in the confederation of Germanic states that Empire was afterwards revived. To-day, the Teutonic nations of Europe stand at the summit of power. There remains to be considered the Slavic branch. Russia is the Slavic nation of Europe. While Teutonic Europe is divided into a number of nations, such as Germany, Austria, England, etc., the Slaves, except a few unimportant provinces, are

united. Ever since pre-historic times, the Teutons and the Slaves have faced each other in Europe, and often in hostile array. We anticipate that the great conflict of the future is to be along that line. Not only the political supremacy in Europe, but that in Asia as well, hangs in the balance.

Glancing over the conflicts of the past few centuries, we see that great movements, involving the welfare of the race, go forward with almost irresistible force. To the immediate onlooker of the time, or to the casual historian, the pages of history seem largely taken up with the petty deeds of individuals. But individual intrigues, wars for personal aggrandisement, even if they result in the momentary elevation of this or that state, are but trifles borne along on the surface of the current.

Take, for instance, the idea of toleration in religion. Do we not see this idea continually gathering force and making greater headway until it carries all before it? We see Europe deluged in blood, that this idea may prevail. Many of these wars were undertaken for selfish, dynastic purposes. History seems to be full of the doings of this king or emperor, of the great battles of this general or admiral. But after all, when we stand off and survey the whole movement, those wars and intrigues are but conflagrations incited by the friction of the onward march of the idea of toleration. They may appear in history as the efforts of a De Medici to change the succession in France, or, as the "Thirty Years' War," but the real cause lies deeper.

Probably a more striking illustration can be drawn from the development of the idea that the rights of the masses of the people are superior to those of the privileged classes. Recall the long train of events, extending over a century of time that led up to the French Revolution. It

was but the gathering force of this idea. What a great conflagration thence ensued. In that lurid glare, how strongly stands out the figure of Napoleon Bonaparte! But look again, as the smoke of Waterloo clears away, Napoleon, the individual, has disappeared. But not so the idea leading up to the Revolution itself. The rights of privileged classes received a blow, and scarcely fifty years later we see nearly every country in Europe wresting constitutions from their rulers. And in this case, the end has not been reached. The agitation still continues, and let us hope, without accompanying bloodshed, more glorious results will soon be reached.

This is the lesson we would draw from European history. It is no slight task to bring, in an at all connected way, within the short compass of one chapter the story of political life and times in Europe during the last three centuries. Of necessity, we have had to be extremely brief, omit many important points, have had to overlap the accounts here and there; but in the path here marked out, we hope the reader can gather a connected idea of the main thread of events, and see the force of our conclusions.

# CHAPTER III.

## DEVELOPMENT OF THE UNITED STATES.

INTRODUCTORY—Voyage of Columbus—Discoveries of the Cabots—English Colonization—Virginia—Plymouth Colony—Formation of the Thirteen Colonies—Colonial Troubles—Royal Usurpation—Wars with the French Colonies—French and Indian War—The Causes of the Revolution—Outline of the Revolution—Formation of the United States—Organization of the North-west Terrritory—Purchase of Louisiana—War of 1812—Explorations of the West—Purchase of Florida—Annexation of Texas—War with Mexico—The Mexican Concession—The Gadsden Purchase—Settlement of the Northern Boundary—Purchase of Alaska—Growing Importance of Slavery—The Causes of the Civil War—Outlines of the Civil War—Conclusions.

THE TIME has now come when we are to turn from the development of Aryan life in Europe and the East, and watch it as it crosses the Atlantic and takes possession of the New World. This is a most important epoch in the history of culture. We have seen the Hellenic Aryans assimilating the culture of the Orient, and carrying it forward to greater heights. We have watched the successive unfolding of other parts of Europe in the light of this culture. Grown bolder, we have seen the enlightened nations of Europe fitting out their expeditions for trade and discovery. We want now to follow those expeditions across the Atlantic, and study in particular the development of our own country; watch the growth of the small settlements along the shore, until they form a nation

NORSEMEN DIS

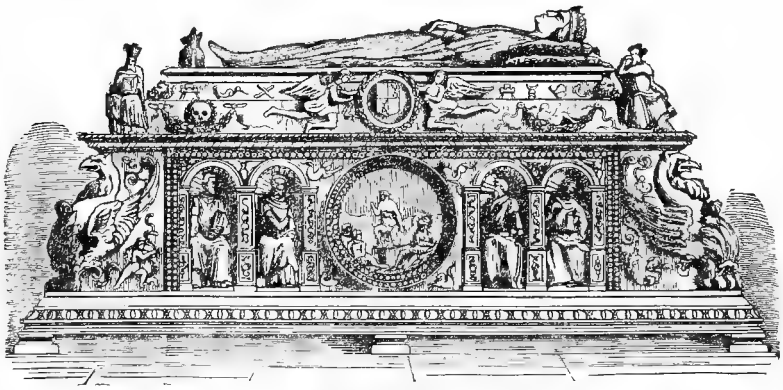
AMERICA.

and claim as their possession the fairest portions of the New World.

As we have seen, the port of Palos had been chosen by Spanish officials as the point from which Columbus should sail on his voyage of discovery. Thither he journied, full of joy, bearing a royal order from Ferdinand and Isabella for that almost insignificant port to furnish him with vessels, and to man them for this foolhardy enterprise of a madman—for such was Columbus and his expedition considered to be. But royal mandates must be obeyed, though this took the flower of the population and drew some loved one from nearly every family in the village. For seven and a-half months, the little port was in mourning for those whom they daily imagined were being consumed by the hideous monsters, with which their superstition peopled the trackless ocean. But one Spring day, nearly four centuries ago, one might have heard the joyous tones of ringing bells floating out upon the mid-day air of Andalusia's most happy port. The garments of mourning were changed for the gay attire of festive days. For in the harbor of Palos rode at anchor the storm-worn caraval of Columbus, just returned with tidings of a newly-found world.

A thrill of wonder ran through the Old World as the rumor spread, that the dark and restless waves of the Atlantic, far to the west, broke on the shores of another world. People flocked from far and near if only they might gaze upon the countenance or touch the garments of the greatest navigator that the world had ever seen. The learned discussed the almost incredulous existence of antipodes. Embassadors hastily wrote long letters to their monarchs, describing the strange discovery, and descanting on its importance. Kings and princes paused in their

plans of war and conquest to listen to the marvellous tales of these wondrous regions. The once mourning Palos now prided itself on being the home of those mariners who had accompanied the great explorer upon his expedition. Ferdinand and the fair Isabella impatiently waited at Barcelona in state for Columbus to visit them, that they might, from his own lips, learn of the most wonderful event of their reign. Like the triumph of a Roman conqueror was the journey of Columbus to the Spanish court. No honor was lacking in the showers of favors that were cast upon him. No courtier was preferred before him. The rabble



Tomb of Ferdinand and Isabella.

that cried madman at him some months before, were now ready to fall down and worship him.[1]

It little concerns us whether the Chinese Hwui Shan or Prince Madoc, of Wales, first visited our country. It matters not how long the Northmen were sailing to and from our shores. It makes little difference where Columbus gained his information of our Western land. The truth or falsity of traditions on these points ought not to detract from the merits and even genius of the one man of his time who, through reasoning, proved and insisted,

[1] Irving: "Life of Columbus," Vol. I. p. 281 *et seq.*

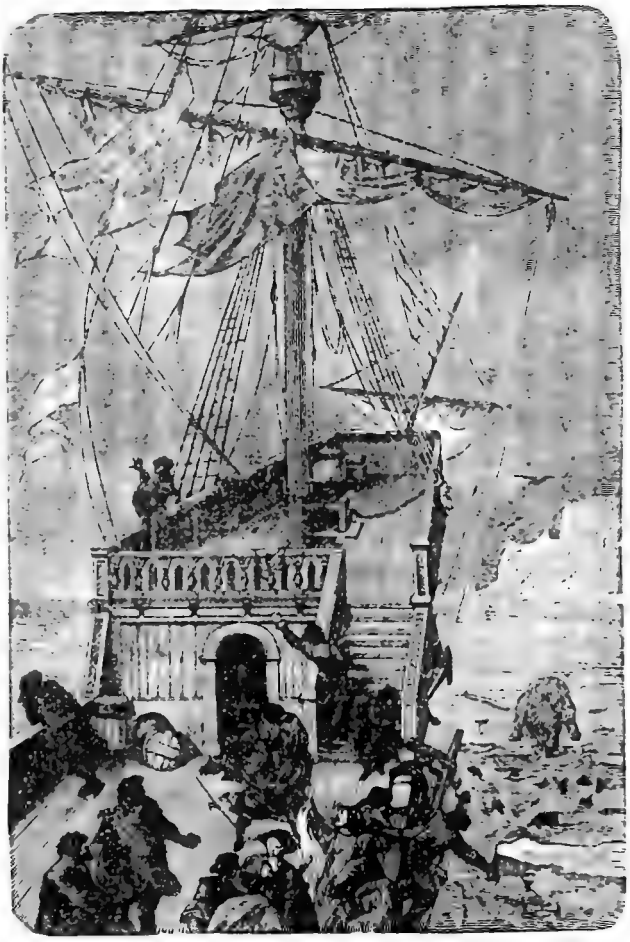
against the flippant arguments of the so-called learned men of his age, that land could be reached by sailing west; who persevered until he had demonstrated the truth of his theory, and brought to Europe a knowledge of a new world when her people were ready to enter and possess the same. All glory to the Northmen voyagers who found and forgot the way to our shores, but America will never forget the man who finally opened her ports to the onward pressure of Aryan migration.

After Columbus had pointed out the way, the Spaniards spent nearly three quarters of a century in searching for gold in this new world, in exploring the coasts of America, and in establishing settlements, before their colonists reached the territory of the present United States. It is true that De Leon, De Soto, and others had explored the wilds of our Southern States and found the great "Father of Waters;" but the sixteenth century was more than half gone before the town of St. Augustine was founded on the banks of the St. John's River, in Florida, and before the Franciscan monks had planted their mission at Santa Fe, in New Mexico. As is well known, these were the first two permanent settlements in the territory of the United States.

At that time, Spain and Portugal were leading the powers of Europe in enterprising discovery. It is not at all strange that other nations were backward in joining in these enterprises when we learn that the Pope (Alexander VI.), had issued a bull, generously confirming to Portugal all new lands that might be discovered east of a certain meridian, and to Spain all territory to the west of same.[1]

[1] The first meridian chosen was to be one hundred leagues west of the Azores and Cape de Verde Island. But subsequently the line was removed two hundred and seventy leagues further west. Vide Low: "Maritime Discovery," Vol. I. p. 253.

But as soon as the spirit of religious freedom began to spread over Europe, other nations determined to seek a share in the western discoveries, and the Pope's bull dropped out of sight. England was first, as we have seen,



Cabot Discovering Labrador.

in following Spain across the Atlantic.[1] Upon the discoveries of the Cabots, England based her claim to much

[1] Portugal sent out some ships, but the greater portion of her colonists settled in South America.

of the territory of the present United States east of the Mississippi.[1]

The French were not long in following the example of England. Five years after the Cabots made their voyages (1497), numbers of French fishing smacks made annual expeditions to the coasts of Newfoundland for the fish that there abound. French explorers, however, confined their voyages mostly to the region of the St. Lawrence and its bay. They called this territory New France. But the Huguenots, unable to bear the persecutions at home, were the first to seek that religious freedom which it is our proud boast that the shores of America have always extended to the persecuted. Three years previous to the founding of St. Augustine, a party of French Huguenots, or Protestants, landed on the shores of Florida, and there sought to build them homes where they could worship God in peace.

No persecution is so cruel as religious persecution. In this instance, it followed the colonists across the Atlantic. The Spanish surprised the settlement, and killed the colonists simply because they were Protestants. Though this was avenged (though not officially) by the French, it resulted in the founding of St. Augustine by the Spaniards (1565). In the North, the French were more successful. During the first decade of the seventeenth century, they laid the foundations of permanent settlements at Annapolis (then Port Royal Nova Scotia) and Quebec.

The period of English colonization began with the attempts, though unsuccessful, of Sir Walter Raleigh to plant a colony on the coasts of the Carolinas. Though failures, these voyages led to such a knowledge of America

[1] Vide Justin Winsor: "Narrative and Critical History of America." Boston, Vol. III. article by Charles Deane, pp. 1-59.

and its resources, that the English began to form systematic plans for colonizing the New World; and, while the French were settling the St. Lawrence region, the English were sending colonists into the more tempting regions of

Virginia and the Potomac Valley. After Raleigh's various attempts to settle America had failed, and after the East India Company, by its unheard of success, had demonstrated the value of co-operation in prosecuting plans for

commerce or settlement, companies were formed for colonizing America.
